# AUTHOR'S ACKNOWLEDGMENTS

## from the Fourth Edition

There are many people who have come and gone in my life and have contributed to my books in many different ways, but I want to dedicate this to three loyal and true friends who are no longer with me: Judge Wendell W. Mayer, Charles R. Cripe, and Skeeners Balch. I also wish to acknowledge the following people, who both advised and supported me as I prepared and wrote the fourth edition of this book: my daughters, Ruby Hines and Cheryl Keene; my grandchildren, Lisa, Ryan, and Rachel; my brother, Al Henning; and my research and editing staff, Jeffrey W. Hallinger and Gary L. Loderhose and editor Amy Tecklenburg.

My gratitude also extends to Laurence Royse, D.Sc.; Aftab J. Ahmad, Ph.D., consulting molecular biologist; Philip Domenico, Ph.D., microbiologist and nutrition editor; Deborah A. Edson, R.Ph.; James J. Gormley, editor-in-chief, *Remedies Magazine*; and also to members of the faculty of Southwest College of Naturopathic Medicine, Paul Mittman, N.D., president, and Mona Morstein, N.D., associate professor, all of whom graciously assisted in preparing and reviewing this book.

Finally, I would like to thank all the readers who have remained loyal throughout the years.

*Phyllis A. Balch*

# P R E F A C E

A wise man should consider that health is the greatest of human blessings.

—Hippocrates

Socrates once said, "There is only one good, knowledge, and one evil, ignorance." This statement should guide us in all of our actions, especially where our health is concerned. Too many of us do not have the slightest idea of how to maintain good health. When illness strikes, we rely on our doctors to cure us. What we fail to realize is that "the cure" comes from within. Nature has provided us with a wondrous immune system, and all we have to do is take proper care of this inner healing force.

Does this sound too simple? Basically, it is simple; our modern lifestyles have gotten us off the right track, with fast foods, alcohol abuse, drug dependencies, a polluted environment, and high-tech stress. Nature intended to fuel our inner healing force with the right natural substances to enable the body to function up to its fullest potential. Nature's resources—whole foods, vitamins, minerals, enzymes, amino acids, phytochemicals, and other natural bounties—are designed for use in our immune systems. However, because most of us have a profound lack of knowledge as to what our bodies need to function properly, we find ourselves out of balance and susceptible to all sorts of illnesses.

All individuals should take an active role in the maintenance of their health, the prevention of disease, and the treatment of their disorders with the guidance of a health care professional. The more we take it upon ourselves to learn about nutrition, the better prepared we will be to take that active role. A good diet coupled with medical advice offers the best chance of living a healthy life. Attitude is also an important factor in the processes of health maintenance and healing. We must have a positive state of mind in order to bring harmony to the body. The realization that body (lifestyle), spirit (desire), and mind (belief) must come together is the first step to better health.

This book is the culmination of half a lifetime of study, work, and research. It is intended to provide you and your health care professional with a more natural approach to healing, which may be used in conjunction with your cur-

rent medical treatment. A number of the suggestions offered, such as intravenous therapy, can be administered only by or under the supervision of a licensed physician. Also, because our body chemistries differ, some of us may have allergic reactions to certain supplements.

Before taking any nutritional supplement, check with your health care professional regarding its appropriateness. For your children, always check with their pediatrician first.

Should you experience an allergic reaction, especially abnormal bowel function (such as diarrhea), to any supplement, immediately discontinue use of the supplement. You should never attempt to treat yourself without professional advice.

No statement in this publication should be construed as a claim for cure, treatment, or prevention of any disease. It is also important to point out that you should not reject mainstream medical methods. Learn about your condition, and don't be afraid to ask questions. Feel free to get second and even third opinions from qualified health professionals. It is a sign of wisdom, not cowardice, to seek more knowledge through your active participation as a patient.

Every effort has been made to include the latest research available on nutritional healing. We also have added new disorders at the suggestions of our readers. All the information in this book has been carefully researched, and the data have been reviewed and updated throughout the production process. Because this body of knowledge promises to continue growing and changing, we suggest that when questions arise, you refer to one of the health or medical organizations in the Appendix for up-to-date information on treatment and prevention of disorders, or ask your health care provider. We will strive to keep abreast of new scientific information, treatments, and supplements.

Nearly nine hundred years ago, Moses Maimonides said, "The physician should not treat the ailment, but the patient who is suffering from it." This book was designed to meet the differing needs of individuals and to help each person create his or her own nutritional program.

# HOW TO USE THIS BOOK

This is a comprehensive in-home guide that will help you achieve and maintain the highest level of health and fitness through careful dietary planning and nutritional supplementation.

Even if you are healthy, you will benefit from this book because it gives advice on how to achieve and maintain optimum health, build up your immune system, and increase your energy level. Written by a certified nutritionist, this book blends the latest scientific research with traditional treatments. It provides all the information you need to design your own personal nutritional program. In addition, the author offers traditional and up-to-date home remedies, and suggests healthful modifications in diet and lifestyle.

It is important to stress that the suggestions offered in this book are not intended to replace appropriate medical investigation and treatment. The supplements and medications recommended for a particular disorder should be approved and monitored by your medical doctor or trained health care professional. If surgery or other conventional medical interventions are crucial and cannot be avoided, the nutritional supplements can shorten healing time.

The book is divided into three parts. Part One discusses the basic principles of nutrition and health, and lists and explains the various types of nutrients, food supplements, enzymes, antioxidants, and herbs found in health food shops and drugstores. Part Two is divided into sections on common disorders, from acne to cancer to yeast infection, arranged in alphabetical order. Each section discusses how to identify the symptoms and suggests ways to correct or treat the disorder through dietary guidelines and a supplementation program. Some contain helpful diagnostic self-tests to help you determine whether or not you have the condition in question. Part Three offers descriptions and explanations of traditional therapies and conventional treatments that can be used in conjunction with a nutritional program. Also discussed in Part Three are a number of alternative therapy approaches, such as acupressure and acupuncture, aromatherapy, Ayurvedic medicine, Chinese medicine, chiropractic, color therapy, fasting, glandular therapy, homeopathy, hydrotherapy, hyperbaric oxygen

therapy, light therapy, magnet therapy, massage therapy, and music/sound therapy. In addition, there are insets throughout the book providing in-depth coverage of important topics. The ramifications of different drug therapies are discussed and the latest medical updates are provided.

Also included, in an appendix, is information on how to find some of the products recommended in this book, along with a recommended reading list and a list of health organizations and the addresses and/or phone numbers at which they can be reached for information. In a nod to current technology, website addresses are given as well. A glossary is provided for easy reference.

Although a healthy diet is the backbone of any nutritional program, we believe that most if not all people should supplement their diets with the proper nutrients to achieve wellness. Nutritional deficiency diseases such as scurvy are rare, but these are only the tip of the iceberg when it comes to the problems a lack of adequate nutrition can cause. Nutritional deficiencies can cause a variety of symptoms, in addition to weakening the body's defenses against serious illness. Moreover, nutritional requirements can be influenced by many factors. People who are heavy alcohol drinkers, cigarette smokers, prescription or recreational drug users, and/or dieters are at a greater than normal risk for deficiencies, as are adolescents, elderly people, pregnant and nursing women, women who take oral contraceptives, people with certain genetic disorders, people who eat poor diets, and people with diabetes or other chronic illnesses. Unfortunately, a large percentage of the population fits into one or more of these categories.

The supplementation programs recommended in this book should be followed for three to twelve months, depending upon your individual needs and the recommendations of your health care provider. Start by taking nutrients classified "essential" and "very important" for the relevant disorder. Many times, the nutrients recommended for a particular disorder can be found in a single product. Before you start taking them on a regular basis, test the supplements one at a time to find out if you have a reaction to any of them. If you do not find relief within

thirty days, add the supplements from the "helpful" list to your program. Each of us is unique; you may need all the nutrients listed, or you may be deficient in only a few. If you still do not notice an improvement after a month, consult your health care provider. You may suffer from malabsorption.

Always take supplements with a full glass of water. Nutritional supplements are concentrated and can overburden the liver if not enough liquid is consumed with the supplements. Water enhances absorption and is needed to aid in carrying the nutrients to the cells.

If you follow a nutritional supplementation program for

longer than a year, change brands periodically so that you do not develop an intolerance or build up a resistance to one or more of the ingredients in one supplement. You can become intolerant to the ingredients in vitamins and other supplements just as you can to foods. Learn to listen to your body. Given time, you will notice changes in your body and be able to identify their cause. After the supplementation period for a certain disorder is completed, decrease supplement dosages gradually so that your body has a chance to adjust. Keep in mind, though, that virtually all of us need to supplement our diets with the basic nutrients for optimum wellness and illness prevention.

PART ONE

---

Understanding  
*the*  
Elements of Health

# Introduction

The body is a complex organism that has the ability to heal itself—if only you listen to it and respond with proper nourishment and care. In spite of all the abuse our bodies endure—whether through exposure to environmental toxins, poor nutrition, cigarette smoking, alcohol consumption, or inactivity—they still usually serve us well for many years before signs of illness may start to appear. Even then, with a little help, they respond and continue to function.

The human body is the greatest machine on earth. Nerve signals travel through muscles at speeds as fast as 200 miles per hour. The brain puts out enough electric power to light a 20-watt lightbulb. If your leg muscles moved as fast as your eye muscles, you could walk over fifty miles in one day. According to scientists, bone is among the strongest building materials known to humankind.

Think of your body as being composed of millions of tiny little engines. Some of these engines work in unison; some work independently. All are on call twenty-four hours a day. In order for the engines to work properly, they require specific fuels. If the type of fuel given is the wrong blend, the engine will not perform to its maximum capacity. If the fuel is of a poor grade, the engine may sputter, hesitate, and lose power. If the engine is given no fuel at all, it will stop.

The fuel we give our bodies' engines comes directly from the things we consume. The foods we eat contain nutrients. These nutrients come in the form of vitamins, minerals, enzymes, water, amino acids, carbohydrates, and lipids. It is these nutrients that sustain life by providing us with the basic materials our bodies need to carry on their daily functions.

Individual nutrients differ in form and function, and in the amount needed by the body; however, they are all vital to our health. The actions that involve nutrients take place on microscopic levels, and the specific processes differ greatly. Nutrients are involved in all body processes, from combating infection to repairing tissue to thinking. Although nutrients have different specific functions, their common function is to keep us going.

Research has shown that each part of the body contains high concentrations of certain nutrients. A deficiency of those nutrients will cause the body part to malfunction and eventually break down—and, like dominos, other body parts will follow. To keep this from happening, we need a proper diet and appropriate nutritional supplements. Brain function, memory, skin elasticity, eyesight, energy, the ratio of lean-to-fat tissue in the body, and overall health are all

indications of how well the body is functioning. With the help of the proper nutrients, exercise, and a balanced diet, we can slow the aging process and greatly improve our chances for a healthier, pain-free—and possibly longer—life.

If we do not give ourselves the proper nutrients, we can impair the body's normal functions and cause ourselves great harm. Even if we show no signs of illness, we may not necessarily be healthy. It simply may be that we are not yet exhibiting any overt symptoms of illness. One problem most of us have is that we do not get the nutrients we need from our diets because most of the foods we consume are cooked and/or processed. Cooking food at high temperatures and conventional food processing destroy vital nutrients the body needs to function properly. The organic raw foods that supply these elements are largely missing from today's diet.

The past decade has brought to light much new knowledge about nutrition and its effects on the body, and the role it plays in disease. Phytochemicals, also known as phytonutrients, are one example of the results of this research.

Phytochemicals are compounds present in plants that make the plants biologically active. All fruits and vegetables contain phytochemicals. However, since few people eat enough fruits and vegetables to get the optimum amount of phytochemicals from diet alone, supplementation is recommended. Phytochemicals are not nutrients in the classic sense, but they determine a plant's color, flavor, and ability to resist disease. Researchers have identified literally thousands of phytochemicals and also have developed the technology to extract these chemical compounds and concentrate them into pills, powders, and capsules. These products are included under the term "nutraceuticals." The FDA uses the term "dietary supplement" to define natural compounds like phytochemicals.

Your body's nutritional needs are as unique to you as your appearance is. The first essential step toward wellness is to be sure you are getting the correct amounts of the proper nutrients. By understanding the principles of holistic nutrition and knowing what nutrients you need, you can improve the state of your health, ward off disease, and maintain a harmonious balance in the way nature intended. Part One of this book should provide you with a clear understanding of the vitamins, minerals, amino acids, enzymes, phytochemicals, and other nutrients you need, as well as important information on natural food supple-

ments, herbs, and products that enhance nutrient activity. Eating a healthful diet and supplementing your diet with appropriate nutrients will help to assure that your organs, cells, and tissues get the fuel they need to operate properly.

The nutrients suggested in this book promote healing and wellness by allowing the body to heal and reinvigorate itself.

# Nutrition, Diet, and Wellness

## UNDERSTANDING THE BASICS OF NUTRITION

Good nutrition is the foundation of good health. Everyone needs the four basic nutrients—water, carbohydrates, proteins, and fats—as well as vitamins, minerals, and other micronutrients.

To be able to choose the proper foods, and to better understand why those foods should be supported with supplements, you need to have a clear idea of the components of a healthy diet.

It is now a requirement in the United States that all packaged foods have a nutrition label that tells the consumer what is actually inside the package. This system may not be perfect, but it is a big improvement over no labeling at all, the situation that existed only a generation ago. Keep in mind that all fresh, minimally processed foods, such as grains purchased in bulk, meats, fruits, and vegetables, do not carry labels. However, they are inherently healthier than packaged foods because they have more beneficial nutrients and fewer harmful ones. For example, unlike processed items, these foods are naturally high in potassium and low in sodium.

Let's look at one of these labels and see what it tells us. Look at Figure 1.1 below, which happens to be a label for a package of macaroni and cheese:

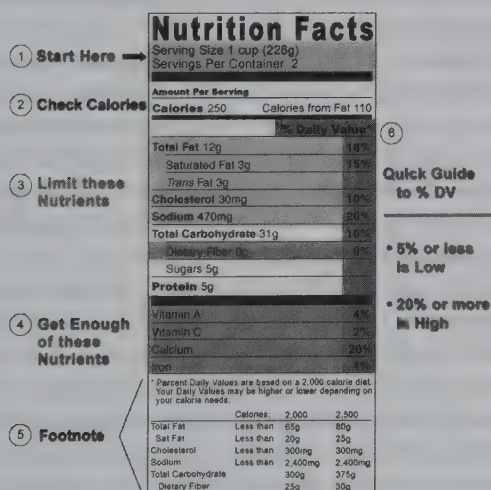

Figure 1.1

- There are 250 calories in this product, and 110 calories (almost half the calories in the product) come from fat (panel 2). This is not a good sign. A rule of thumb is that fat should contribute no more than 30 percent of the total calories per serving.
- Note the total fat, cholesterol, and sodium information (panel 3). The amount of total fat (bad) is shown, as are the amounts of saturated fat (bad). It's also important to pay attention to how much sodium the product contains and to maintain total intake below the suggested daily value.
- Panel 3 also gives the amount of dietary fiber (good), sugars (bad), and protein (you need some at each meal), and panel 4, selected vitamins and minerals (good).
- The footnote panel (5) gives target information for various nutrients based on a diet containing a total of 2,000 or 2,500 calories per day. This may or may not be useful to you, depending on your particular situation and calorie goal. It is important to be aware also that the percentages given in the preceding are percentages of a 2,000-calorie diet and are *not* a percentage of the amount we actually recommend for good health or to maintain a healthy weight.

There is still some question as to the benefits of the current food labeling system. Some are calling for a thorough assessment of whether the new labeling has actually enabled consumers to make healthier food choices. Some of the major food companies such as Kraft Foods and major grocery store chains such as Stop & Shop are already creating new labeling systems to help consumers make better choices. This section of the book will discuss the items shown on the nutrition label—and more—and also how they affect your health.

## The Four Basic Nutrients

Water, carbohydrates, proteins, and fats are the basic building blocks of a good diet. By choosing the healthiest forms of each of these nutrients and eating them in the proper balance, you enable your body to function at its optimal level.

### Water

The human body is two-thirds water. Water is an essential nutrient that is involved in every function of the body. It helps transport nutrients and waste products in and out of

- The serving size is listed at the top of the label. All of the daily value percentages are based on this amount. It's good to keep in mind that the serving size listed on the label may not correspond with what many people consider a serving or portion of the product.

cells. It is necessary for all digestive, absorptive, circulatory, and excretory functions, as well as for the utilization of the water-soluble vitamins. It is also needed for the maintenance of proper body temperature. Each day the body loses up to 1 quart of water each from the kidneys and skin, about 1 cup from the lungs, and ½ cup from feces—a total of about 6 to 10 cups. To replace the water lost, males need to consume about 15 cups of fluid and females about 11 cups.

Ingesting an adequate amount of water each day—whether by food or water—is essential to maintain good health. Usually urine will be pale yellow in color if the body is sufficiently hydrated. It is possible to get a good portion of your daily intake of water—at least ten 8-ounce glasses—not from the tap, but from fruits and vegetables, which are loaded with water, some up to 90 percent water. Although recent studies have shown that beverages such as juices and sodas can be counted toward the daily fluid requirement, obtaining proper levels of fluids from fruits and vegetables and noncaloric beverages such as water and herbal tea is preferable, especially for weight control. For details on choosing the best water, *see* WATER in Part One.

## Carbohydrates

Carbohydrates supply the body with the energy it needs to function. They are found almost exclusively in plant foods, such as fruits, vegetables, peas, grains, and beans. Milk and milk products are the only foods derived from animals that contain carbohydrates.

Carbohydrates are divided into two groups—simple carbohydrates and complex carbohydrates. *Simple carbohydrates*, sometimes called simple sugars, include fructose (fruit sugar), sucrose (table sugar), and lactose (milk sugar), as well as several other sugars. Fruits are one of the richest natural sources of simple carbohydrates. *Complex carbohydrates* are also made up of sugars, but the sugar molecules are strung together to form longer, more complex chains. Complex carbohydrates include fiber and starches. Foods rich in complex carbohydrates include vegetables, whole grains, peas, and beans.

Newer classifications for carbohydrates are based on their glycemic indexes (GI). The index is a scoring system to show how much glucose appears in the blood after eating a carbohydrate-containing food—the higher the number, the greater the blood sugar response. So a low GI food will cause a small rise, while a high GI food will trigger a dramatic spike. A GI of 70 or more is high, a GI of 56 to 69 is medium, and a GI of 55 or less is low. Most simple carbohydrates raise blood sugar levels more than complex ones, but not always. For example, white bread raises blood sugar more than table sugar because sugar has a lower GI. Eating foods with high glycemic indexes can lead to obesity, heart disease, and diabetes. (The glycemic index of foods can be found on [www.mendosa.com/gilists.htm](http://www.mendosa.com/gilists.htm) and

[glycemicindex.ca](http://glycemicindex.ca).) Simply put, adopting a low-glycemic index diet is healthier. Low-glycemic index foods include fruits, vegetables, meat, oils, and dairy products. Most grain-based foods, especially those that are highly processed, have high glycemic indexes.

Carbohydrates are the main source of blood glucose, which is a major fuel for all of the body's cells and the only source of energy for the brain and red blood cells. Both simple and complex carbohydrates are converted into glucose. The glucose is then either used directly to provide energy for the body or stored in the liver for future use. If a person consumes more calories than his or her body is using, a portion of the carbohydrates consumed may be stored in the body as fat.

Due to complex chemical reactions in the brain, eating carbohydrates has a mild tranquilizing effect, and can be beneficial for people who suffer from seasonal affective disorder and/or depression.

When choosing carbohydrate-rich foods for your diet, choose unrefined foods such as fruits, vegetables, peas, beans, and whole-grain products, instead of refined, processed foods such as soft drinks, desserts, candy, and sugar. Refined foods offer few, if any, of the vitamins and minerals that are important to your health. Foods that are rich in nutrients are called nutrient-dense foods. A healthy diet should consist mainly of these foods and avoid those that are nutrient-poor. In addition, eating large amounts of simple carbohydrates found in refined foods, especially over a period of many years, can lead to a number of disorders, including diabetes and hypoglycemia (low blood sugar). Yet another problem is that foods high in refined simple sugars are often also high in fats, which should be limited in a healthy diet. This is why such foods—which include most cookies and cakes, as well as many snack foods—are usually loaded with calories.

A word is in order here regarding fiber, a very important form of carbohydrate. Referred to in the past as “roughage,” dietary fiber is the part of a plant that is resistant to the body's digestive enzymes. As a result, only a relatively small amount of fiber is digested or metabolized in the intestines. Instead, most of it moves through the gastrointestinal tract and ends up in the stool.

Although most fiber is not digested, it delivers several important health benefits. First, fiber retains water, resulting in softer and bulkier stools that prevent constipation and hemorrhoids. A high-fiber diet also reduces the risk of colon cancer, perhaps by speeding the rate at which stool passes through the intestine and by keeping the digestive tract clean. In addition, fiber binds with certain substances that would normally result in the production of cholesterol, and eliminates these substances from the body. In this way, a high-fiber diet helps lower blood cholesterol levels, reducing the risk of heart disease.

It is recommended that about 50 to 60 percent of your total daily calories come from carbohydrates. If much of your diet consists of healthy complex carbohydrates, you

should easily fulfill the recommended daily minimum of 25 grams of fiber. Fiber should come primarily from a wide variety of fruits and vegetables. Whole grains are better than highly processed ones because they contain more fiber. Fiber is either soluble or insoluble. The soluble type is broken down in the large intestine (colon). Insoluble fiber is not digested and is simply excreted in the stool.

## Protein

Protein is essential for growth and development. It provides the body with energy, and is needed for the manufacture of hormones, antibodies, enzymes, and tissues. It also helps maintain the proper acid-alkali balance in the body.

When protein is consumed, the body breaks it down into amino acids, the building blocks of all proteins. Since protein is essential for life, other foods such as fruits and vegetables, which are alkaline-producing, need to be consumed to balance the body. Some of the amino acids from proteins are designated *nonessential*. This does not mean that they are unnecessary, but rather that they do not have to come from the diet because they can be synthesized by the body from other amino acids. Other amino acids are considered *essential*, meaning that the body cannot synthesize them, and therefore must obtain them from the diet.

Whenever the body *makes* a protein—when it builds muscle, for instance—it needs a variety of amino acids for the protein-making process. These amino acids may come from dietary protein or from the body's own pool of amino acids. If a shortage of amino acids becomes chronic, which can occur if the diet is deficient in essential amino acids, the building of protein in the body stops, and the body suffers. The brain will trigger the muscle cells to release vital proteins to support the body. However, in extreme cases, some patients develop cachexia, which presents as weight loss, muscle atrophy, and severe fatigue and can result from a poor dietary protein intake. (For more information about amino acids, see AMINO ACIDS in Part One.)

Because of the importance of consuming proteins that provide all of the necessary amino acids, dietary proteins are considered to belong to two different groups, depending on the amino acids they provide. *Complete proteins*, which constitute the first group, contain ample amounts of all the essential amino acids. These proteins are found in meat, fish, poultry, cheese, eggs, and milk. *Incomplete proteins*, which constitute the second group, contain only some of the essential amino acids. These proteins are found in a variety of foods, including grains, legumes, and leafy green vegetables.

Although it is important to consume the full range of amino acids, both essential and nonessential, it is not necessary to get them from meat, fish, poultry, and other complete-protein foods. In fact, because of their high fat content—as well as the use of antibiotics and other chemicals in the raising of poultry and cattle—most of those foods should be eaten only in moderation. Many animal

proteins are now available without hormones, or the animals are organically fed and hormone-free, so this risk can be mitigated by choosing these meats. It is best to trim all visible fat—including skin—from animal proteins and use low-fat or nonfat dairy products. Doing this will help reduce the risk of heart disease while still allowing for adequate intake of protein.

Fortunately, the dietary strategy called *mutual supplementation* enables you to combine partial-protein foods to make *complementary protein*—proteins that supply adequate amounts of all the essential amino acids. For instance, although beans and brown rice are both quite rich in protein, each lacks one or more of the necessary amino acids. However, when you combine beans and brown rice with each other, or when you combine either one with any of a number of protein-rich foods, you form a complete protein that is a high-quality substitute for meat. To make a complete protein, combine *beans* with any one of the following:

- Brown rice
- Corn
- Nuts
- Seeds
- Wheat

Or combine *brown rice* with any one of the following:

- Beans
- Nuts
- Seeds

Recent research indicates that it is possible to adequately meet your essential amino acid needs by eating an assortment of protein-containing foods over the course of the day and that there may be no need to combine proteins in one meal.

The problem is that many Americans eat too much protein, especially at one sitting, largely as the result of a diet high in meat and dairy products. Protein synthesis (manufacturing of new proteins for the body) works best when the protein is consumed on a regular basis throughout the day. However, if you have reduced the amount of meat and dairy foods in your diet, you should make sure to get 50 to 60 grams of protein a day. To make sure that you are getting enough variety of amino acids in your diet, add protein-rich foods to meals and snacks as often as possible. Eat bread with nut butters, for instance, or add nuts and seeds to salads and vegetable casseroles. Be aware that a combination of any grains, any nuts and seeds, any legumes (such as beans, peanuts, and peas), and a variety of mixed vegetables will make a complete protein. In addition, cornmeal fortified with the amino acid L-lysine makes a complete protein.

All soybean products, such as tofu and soymilk, are complete proteins. These foods have high levels of fiber, and soy has been found to be the healthiest source of protein, more so than any other food. Soybean protein makes up 35 to 38 percent of its total calories, offers all eight essential amino acids, and is high in vitamin B<sub>6</sub>. The average American consumes only about 10 milligrams of soy protein per day, although the American Heart Association suggests that consuming at least 25 grams per day may re-

duce the risk of heart disease. Available in health food stores, tofu, soy oil, soy flour, soy-based meat substitutes, soy cheese, and many other soy products are healthful ways to complement the meatless diet. Fermented soy products, such as miso, tempeh, fermented tofu, and soymilk, are now widely available and are loaded with isoflavones, which are immediately bioavailable, and they have more genistein (soy isoflavones) and nutrients than regular soy. They also fit in with Asian dietary practices. Fermentation yields more nutrients such as beta-glucan, glutathione, and the B-vitamins than standard products.

Low-fat yogurt is the only animal-derived complete-protein source recommended for frequent use in the diet. Full-fat yogurt is loaded with saturated fats and should be avoided or used as a treat. Yogurt is made from milk that is curdled by bacteria; it contains *Lactobacillus acidophilus* and other “friendly” bacteria needed for the digestion of foods and the prevention of many disorders, including candidiasis. Yogurt is also a good source of calcium and other essential nutrients. Some yogurts have other healthy bacterial strains added to them.

Do not buy the sweetened, flavored yogurts that are sold in supermarkets. These products contain added sugar and, often, preservatives. Instead, either purchase fresh unsweetened yogurt from a health food store or make the yogurt yourself and sweeten it with fruit juices and other wholesome ingredients. Yogurt makers are relatively inexpensive and easy to use, and are available at most health food stores.

## Fats

Although much attention has been focused on the need to reduce dietary fat, the body does need fat. During infancy and childhood, fat is necessary for normal brain development. Throughout life, it is essential to provide energy and support growth. Fat is, in fact, the most concentrated source of energy available to the body. However, after about two years of age, the body requires only small amounts of fat—much less than is provided by the average American diet. If you are an adult, about one-third of your calories should come from fat. Of that total, one-third should be saturated, one-third polyunsaturated (corn oil and fish oil), and one-third monounsaturated (olive oil).

Excessive fat intake is a major causative factor in obesity, high blood pressure, coronary heart disease, and colon cancer, and has been linked to a number of other disorders as well. To understand how fat intake is related to these health problems, it is necessary to understand the different types of fats available and the ways in which these fats act within the body.

Fats are composed of building blocks called *fatty acids*. There are three major categories of fatty acids—saturated, polyunsaturated, and monounsaturated. These classifications are based on the number of hydrogen atoms in the chemical structure of a given molecule of fatty acid.

*Saturated fatty acids* are found primarily in animal products, including dairy items such as whole milk, cream, butter, and cheese, and fatty meats like beef, veal, lamb, pork, and ham. The fat marbling you can see in beef and pork is composed of saturated fat. Some vegetable products—including coconut oil and palm kernel oil—are also high in saturates. The liver uses saturated fats to manufacture cholesterol. The excessive dietary intake of saturated fats can significantly raise the blood cholesterol level, especially the level of low-density lipoproteins (LDLs), or “bad cholesterol.” (For more information about cholesterol, see HIGH CHOLESTEROL in Part Two.) Guidelines issued by the National Cholesterol Education Program (NCEP), and widely supported by most experts, recommend that the daily intake of saturated fats be kept below 10 percent of total caloric intake. However, for people who have severe problems with high blood cholesterol, even that level may be too high.

*Polyunsaturated fatty acids* are found in greatest abundance in corn, soybean, safflower, and sunflower oils. Certain fish oils are also high in polyunsaturates. Unlike the saturated fats, polyunsaturates may actually lower the total blood cholesterol level. In doing so, however, large amounts of polyunsaturates also have a tendency to reduce levels of high-density lipoproteins (HDLs), or “good cholesterol.” For this reason—and because polyunsaturates, like all fats, are high in calories for their weight and volume—the NCEP guidelines state that an individual’s intake of polyunsaturated fats should not exceed 10 percent of total caloric intake.

Recently the concept of “good” and “bad” fats has surfaced. Good fats are polyunsaturated and include those listed above. Newly added to this list are the omega-3 fats, which don’t affect cholesterol levels, but may reduce the risk of heart disease by keeping blood flowing freely. Omega-3 fats are essential for life, but since the 1900s people have been eating fewer of the foods that contain them. The polyunsaturated fats commonly consumed in the United States come from vegetable-based oils like corn, sunflower, and cottonseed oil and contain omega-6s. Although they are also essential, you only need to consume a teaspoon a day of these oils to meet your total omega-6 needs.

Over time, the intake of omega-6s has dwarfed that of omega-3s; our ancestors used to eat these fats in a one-to-one ratio. Many scientists believe that this shift in dietary intake of fats has led to many of the chronic diseases of aging seen today like heart disease, diabetes, and arthritis, and depression. The best way to balance your omega-3 to omega-6 ratio is to eat fish at least twice a week, and use canola oil rather than omega-6-rich vegetable oils. Most people have a ten-year store of omega-6 fats in their bodies. Therefore, it doesn’t make sense to worry about getting enough every day. Olive oil contains hardly any essential fatty acids. Flax oil is rich in omega-3 fats, but only about 5 to 10 percent of the omega-3s in flax is usable by the body. Nevertheless, it is low in omega-6s, so it can be used, but only in uncooked items, as heat destroys the omega-3s.

Another caveat concerning polyunsaturated fats: vegetable shortening and stick margarine are made of liquid polyunsaturated fats, which means they should be healthful, but they are so highly processed that they are not. It is preferable to substitute soft-tub margarine, which is less processed than stick margarine, on your toast. It does not perform well when heated, however, so use stick margarine and vegetable shortenings when cooking—they are still preferable to butter.

*Monounsaturated fatty acids* are found mostly in vegetable and nut oils such as olive, peanut, and canola. These fats appear to reduce blood levels of LDLs without affecting HDLs in any way. However, this positive impact upon LDL cholesterol is relatively modest. The NCEP guidelines recommend that intake of monounsaturated fats be kept between 10 and 15 percent of total caloric intake.

Although most foods—including some plant-derived foods—contain a combination of all three types of fatty acids, one of the types usually predominates. Thus, a fat or oil is considered “saturated” or “high in saturates” when it is composed primarily of saturated fatty acids. Such saturated fats are usually solid at room temperature. Similarly, a fat or oil composed mostly of polyunsaturated fatty acids is called “polyunsaturated,” while a fat or oil composed mostly of monounsaturated fatty acids is called “monounsaturated.”

One other element, *trans-fatty acids*, which used to be in many food products, is thought to play a role in blood cholesterol levels and other factors that increase the risk of heart disease. Also called *trans fats*, these substances occur when polyunsaturated oils are altered through hydrogenation, a process used to harden liquid vegetable oils into solid foods like margarine and shortening. As of January 2006, the FDA has required all food manufacturers to list the trans-fat content on the nutrition label. Almost immediately products free of trans fats emerged on the market. Today you won’t find many products that contain trans fats. If you do see trans fats on the label, you should avoid products where there is more than 0.5 gram per serving. Your total intake should be less than 1 percent of total caloric intake or about 2 grams per 1,800-calorie diet.

It is clear that if your goal is to lower blood cholesterol, polyunsaturated and monounsaturated fats are more desirable than saturated fats or products with trans-fatty acids. Just as important, your total calories from fat should range between 20 to 35 percent of daily calories.

## The Micronutrients: Vitamins and Minerals

Like water, carbohydrates, protein, and fats, and the enzymes required to digest them, vitamins and minerals are essential to life. They are therefore considered nutrients, and are often referred to as *micronutrients* simply because they are needed in relatively small amounts compared with the four basic nutrients.

*Recommended Dietary Allowances* (RDAs) were instituted in 1941 by the National Academy of Sciences’ U.S. Food

and Nutrition Board as a standard for the daily amounts of vitamins and minerals needed by a healthy person. These RDAs were the basis for the U.S. Recommended Daily Allowances (U.S. RDAs) adopted by the Food and Drug Administration (FDA). The U.S. RDA used to be the term that was used on food labels. However, the provisions of the Nutrition Labeling and Education Act and the Dietary Supplement Act of 1992 required a change in food product labeling to use a new reference term, Daily Value (DV), which began to appear on FDA-regulated product labels in 1994. Today you can look at any food or dietary supplement label and see the percent DV of all essential nutrients contained in the product. DVs are made up of two sets of references: Daily Reference Values (DRVs) and Reference Daily Intakes (RDIs).

DRVs are a set of dietary references that apply to fat, saturated fat, cholesterol, carbohydrate, protein, fiber, sodium, and potassium. RDIs are a set of dietary references based on the Recommended Dietary Allowances for essential vitamins and minerals and, in selected groups, protein. The term *RDI* replaces *U.S. RDA*.

In 1998 the Food and Nutrition Board published new guidelines for healthy eating and called them Dietary Reference Intakes (DRIs). These can be used for planning and assessing diets for healthy people.

The goal is to have these guidelines, which make up the DRI, replace the previous RDA standard.

The amounts of these nutrients defined by the DRI give us about twice the amount needed to ward off vitamin deficiency diseases such as beriberi, rickets, scurvy, and night blindness. What they do not account for are the amounts needed to maintain maximum health, rather than borderline health. Moreover, they are not good at providing an individual’s need but rather population norms.

Scientific studies have shown that taking dosages of vitamins above the DRIs helps our body work better. The DRIs therefore are not very useful for determining what our intake of different vitamins should be. We prefer to speak in terms of *optimum daily intakes* (ODIs)—the amounts of nutrients needed for vibrant good health. This entails consuming larger amounts of vitamins than the DRIs. The nutrient doses recommended on page 11 are ODIs. By providing our bodies with an optimum daily amount of necessary vitamins, we can enhance our health. The dosages outlined in this book will enable you to design a vitamin program that is custom-tailored for the individual. Many nutrients with a DRI also have a corresponding Tolerable Upper Level of Intake (UL), which is higher than the DRI but that has been found to be safe (to learn the ULs for all vitamins and minerals, go to <http://fnic.nal.usda.gov>). Do not take more than the UL for any nutrient (unless your health care provider recommends that you do) because it is not safe to do so based on what we know today. The ULs are constantly under scrutiny. For example, scientists have called for the FDA to increase the UL for vitamin D.

## FDA'S NEW GOOD MANUFACTURING PRACTICES

Ideally, all of us would get all the nutrients we need for optimal health from fresh, healthful foods. In reality, however, this is often difficult, if not impossible. In our chemically polluted and stress-filled world, our nutritional requirements have been increasing, but the number of calories we require has been *decreasing*, as our general level of physical activity has declined. This means we are faced with needing somehow to get more nutrients from less food. At the same time, many of our foods are depleted of certain nutrients. Modern farming practices have resulted in soils that are lacking in selenium and other nutrients.

Harvesting and shipping practices are dictated not by nutritional considerations but by marketing demands. Add to this extensive processing, improper storage, and other factors, and it is little wonder that many of the foods that reach our tables cannot meet our nutritional needs. Getting even the DRI of vitamins from today's diet has become quite hard to do. This means that for optimum health, it is necessary to take nutrients in supplement form. Dr. Bruce Ames, a well-known nutritional scientist, argues that low dietary intakes of vitamins and minerals is widespread in the United States and that this may accelerate chronic diseases of aging like cancer.

Everyone would benefit from taking dietary supplements given the nature of the food supply. And supplements have become much safer. As of July 2008, all companies that manufacture dietary supplements must follow Good Manufacturing Practices (GMPs). The FDA has established guidelines for manufacturing procedures so that you actually get the nutrients that are advertised on the label. Also, the new requirements dictate that the products are clean and free of harmful bacteria and other toxins. The FDA now requires manufacturers to store all the ingredients used in a product after the product has been sold. Each product must have a name and phone number to call if a user becomes ill. The batch number of the product then can be matched to the stored product to help figure out why someone has had an adverse reaction.

### *Nutrients and Dosages for Maintaining Good Health*

The table on the following page—which includes not just vitamin and mineral supplements, but other supplements as well—should be used as a guideline. Although the amounts listed as ODIs are safe (they will not cause toxicity), they should be varied according to a person's size and body weight. People who are active and exercise; those who are under great stress, on restricted diets, or mentally or physically ill; women who take oral contraceptives; those on medication; those who are recovering from surgery; and smokers and those who consume alcoholic beverages—all may need larger-than-normal amounts of certain nutrients.

In addition to a proper diet, exercise and a positive atti-

tude are two important elements that are needed to prevent sickness and disease. If your lifestyle includes each of these, you will feel good and have more energy—something we all deserve. Nature has the answers we need to maintain our health, but you need to know what nutrients you are taking to make sure all the pieces of the puzzle fit together.

If you are not used to taking supplements, especially in larger-than-normal doses, your body may need time to adjust. Always take a multivitamin/multimineral supplement with food—if possible, with the biggest meal of the day—to avoid stomach upset and foster better absorption of the nutrients. Otherwise, if the tablet can be split in two, take half in the morning and half at the evening meal.

Daily dosages are suggested; however, before using any supplements, you should consult with your health care provider. The dosages given here are for adults and children weighing 100 pounds and over. Appropriate dosages for children vary according to age and weight. A child weighing between 70 and 100 pounds should be given three-quarters the adult dose; a child weighing less than 70 pounds (and *over* the age of six years) should be given one-half the adult dose. A child under the age of six years should be given nutritional formulas designed specifically for young children. Follow the dosage directions on the product label. Many products have not been directly tested for use by children, so be sure to check with the child's health care provider before giving any supplement to a child. Besides vitamins and minerals, other nutrients that have been tested in children include *Andrographis Paniculata*, cranberry, echinacea, evening primrose oil, garlic, ivy leaf, and valerian.

I recommend using only quality supplements from a reputable source. Lower-priced supplements can mean lower quality, with higher levels of fillers and other undesirable ingredients. Give your body the best—it deserves it. Of course it is better to take the supplements than not, so if you can't afford the higher-quality vitamins, then use the lower-cost ones. If you cannot locate one or more of the supplements recommended in this book, you can call, write, or e-mail one of the sources listed in the Appendix.

For your reference, both milligrams (mg) and micrograms (mcg) refer to specific weights. An international unit (IU), by contrast, is the amount of a vitamin, mineral, or other substance agreed upon by the International Conference for Unification of Formulae to elicit a certain biological activity. Thus, an international unit of one vitamin will be of a different weight than an international unit of a different vitamin. It is a useful gauge for how much of a particular vitamin or mineral you are taking, but in terms of weight it is meaningful only for that particular substance and no other. Studies have found that people who regularly take supplements typically have a better quality of life, a lower risk of heart attack and diabetes, and lower blood pressure compared to those who do not take supplements.

Vitamins	Optimum Daily Intakes*
Vitamin A (retinol)	5,000–10,000 IU
Carotenoid complex containing beta-carotene	5,000–25,000 IU
Vitamin B <sub>1</sub> (thiamine)	50–100 mg
Vitamin B <sub>2</sub> (riboflavin)	15–50 mg
Vitamin B <sub>3</sub> (niacin) (niacinamide)	15–50 mg 50–100 mg
Vitamin B <sub>5</sub> (pantothenic acid)	50–100 mg
Vitamin B <sub>6</sub> (pyridoxine)	50–100 mg
Vitamin B <sub>12</sub>	200–400 mcg
Biotin	400–800 mcg
Choline	50–200 mg
Folic acid	400–800 mcg
Inositol	50–200 mg
Para-aminobenzoic acid (PABA)	10–50 mg
Vitamin C with mineral ascorbates (Ester-C)	1,000–3,000 mg
Bioflavonoids (mixed)	200–500 mg
Hesperidin	50–100 mg
Rutin	25 mg
Vitamin D <sub>3</sub> (cholecalciferol)	400 IU
Vitamin E (d-alpha-tocopherol)	200 IU
Vitamin K (use natural sources such as alfalfa, green leafy vegetables)	100–500 mcg
Essential fatty acids (EFAs) (primrose oil, flaxseed oil, salmon oil, and fish oil are good sources)	As directed on label.
Minerals	Optimum Daily Intakes
Boron (picolinate or citrate)	3–6 mg
Calcium (citrate, ascorbate, or malate)	1,500–2,000 mg
Chromium (GTF, picolinate, or polynicotinate)	150–400 mcg
Copper	2–3 mg
Iodine (kelp is a good source)	100–225 mcg
Iron** (ferrous gluconate, fumarate, citrate, or amino acid chelate; avoid inorganic forms such as ferrous sulfate, which can oxidize vitamin E)	18–30 mg
Magnesium	750–1,000 mg
Manganese	3–10 mg
Molybdenum (ascorbate, aspartate, or picolinate)	30–100 mcg
Potassium (citrate)	99–500 mg
Selenium	100–200 mcg
Vanadium (vanadyl sulfate)	200 mcg–1 mg
Zinc	30–50 mg
Amino Acids***	Optimum Daily Intakes
Acetyl-L-carnitine	100–500 mg
Acetyl-L-cysteine	100–500 mg
L-carnitine	500 mg
L-cysteine	50–100 mg
L-lysine	50–100 mg
L-methionine	50–100 mg
L-tyrosine	500 mg
Taurine	100–500 mg

Optional Supplements****	Optimum Daily Intakes
Chondroitin sulfate	As directed on label.
Coenzyme Q <sub>10</sub>	30–100 mg
Cryptoxanthin	110 mcg
Flavonoids (citrus fruits and berries)	As directed on label.
Garlic	As directed on label.
Ginkgo biloba (herb)	As directed on label.
Glucosamine sulfate	As directed on label.
Lecithin	200–500 mg
Lutein/lycopene	As directed on label.
Pectin	50–100 mg
Phosphatidyl choline	As directed on label.
Phosphatidyl serine	As directed on label.
Pycnogenol or grape seed extract (OPCs)	As directed on label.
Quercetin	70–140 mg
RNA-DNA	100 mg
Silicon	As directed on label.
Soy isoflavones (genistein)	As directed on label.
Superoxide dismutase (SOD)	As directed on label.
Zeaxanthin	90 mcg

\*Be careful not to confuse milligrams (mg) with micrograms (mcg). A microgram is 1/1,000 of a milligram, or 1/1,000,000 of a gram.

\*\*You should take iron supplements only if you have been diagnosed with a deficiency of this mineral. Always take iron supplements separately, rather than in a multivitamin and mineral formula.

\*\*\*See AMINO ACIDS for more information. You should not take individual amino acids on a regular basis unless you are using them for the treatment of a specific disorder.

\*\*\*\*See NATURAL FOOD SUPPLEMENTS for more information.

Other supplements that you may wish to take for increased energy include the following:

- Bee pollen.
- Coenzyme A.
- Coenzyme 1 (nicotinamide adenine dinucleotide with high-energy hydrogen, or NADH; sold under the brand name Enada).
- Free form amino acid.
- Kyo-Green from Wakunaga of America.
- N, N-Dimethylglycine (DMG).
- Octacosanol.
- Siberian ginseng.
- Spirulina.
- Wheat germ.

In addition, there are many good formulas on the market specifically formulated to help meet the nutritional needs of infants and children, among them Mycel Baby Vites from Ethical Nutrients, a highly absorbable liquid multivitamin formula.

**Synergy and Deficiency**

Data compiled by the U.S. Department of Agriculture indicate that at least 40 percent of the people in this country routinely consume a diet containing only 60 percent of the Recommended Daily Allowance (RDA) of each of ten selected nutrients. This means that close to half of the population (and very likely more) suffer from a deficiency of at least one important nutrient. A poll of 37,000 Americans conducted by Food Technology found that half of them were deficient in vitamin B<sub>6</sub> (pyridoxine), 42 percent did not consume sufficient amounts of calcium, 39 percent had an insufficient iron intake, and 25 to 39 percent did not obtain enough vitamin C. Additional research has shown that a vitamin deficiency may not affect the whole body, but only specific cells. For example, those who smoke may suffer from a vitamin C deficiency, but only in the lung area.

Whenever you seek to correct a vitamin or mineral deficiency, you must recognize that nutrients work synergistically. This means that there is a cooperative action between certain vitamins and minerals, which work as catalysts, promoting the absorption and assimilation of other vitamins and minerals. Correcting a deficiency in one vitamin or mineral requires the addition of others, not simply replacement of the one in which you are deficient. This is why taking a single vitamin or mineral may be ineffective, or even dangerous, and why a balanced vitamin and mineral preparation should always be taken in addition to any single supplements. The following table indicates which vitamins and minerals are necessary to correct certain deficiencies. The best way to avoid interfering with the natural synergies among nutrients is to take supplements with meals, unless otherwise instructed. Food stimulates the natural digestive processes and contains natural nutrients to foster the digestion and absorption of nutrients from food and supplements.

Vitamins	Supplements Needed for Assimilation
Vitamin A	Choline, essential fatty acids, zinc, vitamins C, D, and E.
Vitamin B complex	Calcium, vitamins C and E.
Vitamin B <sub>1</sub> (thiamine)	Manganese, vitamin B complex, vitamins C and E.
Vitamin B <sub>2</sub> (riboflavin)	Vitamin B complex, vitamin C.
Vitamin B <sub>3</sub> (niacin)	Vitamin B complex, vitamin C.
Vitamin B <sub>5</sub> (pantothenic acid)	Vitamin B complex, vitamins A, C, and E.
Vitamin B <sub>6</sub> (pyridoxine)	Potassium, vitamin B complex, vitamin C.

Biotin	Folic acid, vitamin B complex, pantothenic acid (vitamin B <sub>5</sub> ), vitamin B <sub>12</sub> , vitamin C.
Choline	Vitamin B complex, vitamin B <sub>12</sub> , folic acid, inositol.
Inositol	Vitamin B complex, vitamin C.
Para-aminobenzoic acid (PABA)	Vitamin B complex, folic acid, vitamin C.
Vitamin C	Bioflavonoids, calcium, magnesium.
Vitamin D	Calcium, choline, essential fatty acids, phosphorus, vitamins A and C.
Vitamin E	Essential fatty acids, manganese, selenium, vitamin A, vitamin B <sub>1</sub> (thiamine), inositol, vitamin C.
Essential fatty acids	Vitamins A, C, D, and E.

Minerals	Supplements Needed for Assimilation
Calcium	Boron, essential fatty acids, lysine, magnesium, manganese, phosphorus, vitamins A, C, D, and E.
Copper	Cobalt, folic acid, iron, zinc.
Iodine	Iron, manganese, phosphorus.
Magnesium	Calcium, phosphorus, potassium, vitamin B <sub>6</sub> (pyridoxine), vitamins C and D.
Manganese	Calcium, iron, vitamin B complex, vitamin E.
Phosphorus	Calcium, iron, manganese, sodium, vitamin B <sub>6</sub> (pyridoxine).
Silicon	Iron, phosphorus.
Sodium	Calcium, potassium, sulfur, vitamin D.
Sulfur	Potassium, vitamin B <sub>1</sub> (thiamine), pantothenic acid (vitamin B <sub>5</sub> ), biotin.
Zinc	Calcium, copper, phosphorus, vitamin B <sub>6</sub> (pyridoxine).

There are certain cautions that you should take into account when taking supplements. Antibiotics interfere with the natural balance of normal intestinal flora needed to produce vitamin K, which is necessary for normal blood clotting and maintaining the integrity of the bones. Too much coffee and/or caffeine-containing soft drinks can interfere with calcium metabolism. Aspirin can irritate the gastrointestinal tract, and may cause gastrointestinal bleeding.

Aspirin can also interfere with the absorption of B vitamins and vitamin C. If you are taking aspirin daily for cardiovascular health, it is better to take baby aspirin—studies have shown that it is less irritating to the gastrointestinal tract, and it works just as well as ordinary aspirin. Baby aspirin usually has 80 milligrams of aspirin, but check with your health care provider before using aspirin in this way.

**BASIC GUIDELINES FOR SELECTING AND PREPARING FOODS**

Clearly, a healthy diet must provide a proper balance of the four essential nutrients, as well as a rich supply of vita-

mins, minerals, and other micronutrients. However, it is not enough simply to purchase foods that are high in complex carbohydrates with low-glycemic indexes, fiber, and complementary proteins, and low in saturated fats. Food also must be free of harmful additives, and it must be prepared in a way that preserves its nutrients and avoids the production of harmful substances.

When nutritionists talk about diet, they are referring to live whole foods—unprocessed food with nothing added or taken away. Whole foods are more healthful because they contain no potentially harmful ingredients. In addition, plant foods are full of hundreds of phytochemicals that can help prevent disease and keep the body healthy. These are our front-line defenders against cancer and free radicals (see Phytochemicals on page 14). Foods known to supply important phytochemicals include soybeans and soy products, broccoli, citrus peels, flax, garlic, green tea, grapes, and tomatoes. In order to optimize your phytochemical intake, it's important to consume a biodiverse diet. To achieve biodiversity in your diet, simply eating a lot of fruits and vegetables is not enough. A biodiverse diet not only includes consuming at least 8 to 10 servings (½ cup per serving) per day, but also making sure there is as much diversity within food groups as possible.

### Avoid Foods That Contain Additives and Artificial Ingredients

Additives are placed in foods for a number of reasons: to lengthen shelf life; to make a food more appealing by enhancing color, texture, or taste; to facilitate food preparation; or to otherwise make the product more marketable.

Certain additives, like sugar, are derived from natural sources. Other additives, like aspartame (in NutraSweet and Equal), are made synthetically. Sweeteners derived from natural sources include sucralose, the compound used in Splenda. Sucralose is synthesized from sucrose (sugar) and appears to be inert metabolically, which would make it ideal for people with diabetes. However, sucralose might be stored in the body simply because this synthetic molecule is never found in nature and the body is not equipped to metabolize it. We would advise limiting the use of this additive/artificial sweetener. Although many additives are used in very small amounts, it has been estimated that the average American consumes about 5 pounds of additives per year. If you include sugar—the food-processing industry's most used additive—the number jumps to 135 pounds a year. Anyone whose diet is high in processed products clearly consumes a significant amount of additives and artificial ingredients.

At their best, additives and artificial ingredients simply add little or no nutritional value to a food product. At their worst, some additives could pose a threat to your health. The history of additive use includes a number of products that were once deemed safe but later were banned or allowed only if accompanied by warnings. The artificial

sweeteners cyclamate and saccharin are just two examples of such products. Other additives, like monosodium glutamate (MSG) and aspartame, are used without warnings per se, but packages of food that contain them are now marked in the United States with sometimes cryptic statements, such as “PHENYLKETONURICS: CONTAINS PHENYLALANINE,” which appears on packets of Equal, NutraSweet, and other products containing aspartame. These products may cause problems for some sensitive people. The warning is there to protect children born with PKU (phenylketonuria). This condition is identified at birth so those who have it know they have it. The long-term effects of most sugar-substitute additives, including sucralose, are unknown. A safer sugar substitute is an extract made from the herb *Stevia rebaudiana*, which is available in health food stores. Stevia is derived from the leaf of a plant and has recently become commercially available. It is a natural sweetener that does not affect blood sugar levels and yields a pleasant sweet taste. In 2009, the FDA granted stevia GRAS (Generally Recognized as Safe) status.

### Increase Your Consumption of Raw Produce

The most healthful fruits and vegetables are those that have been grown organically—without the use of insecticides, herbicides, artificial fertilizers, or growth-stimulating chemicals. Organic produce can be found in select health food stores, as well as in some supermarkets and greenmarkets and through food co-ops.

When choosing your produce, look for fruits and vegetables that are at the peak of ripeness. These contain more vitamins and enzymes than do foods that are underripe or overripe, or that have been stored for any length of time. The longer a food is kept in storage, the more nutrients it loses.

Once you get your organic produce home, running water and a vegetable brush are probably all that will be needed to get it ready for the table. If the produce is not organic, however, you will want to wash it more thoroughly to rid it of any chemical residues. Use a soft vegetable brush to scrub the foods, and then let them soak in water for ten minutes.

You can also clean produce with nontoxic rinsing preparations, which are available in reputable health food stores. If the products are waxed, peel them, because wax cannot be washed away. Remove as thin a layer of peel as possible.

Most fruits and vegetables should be eaten in their entirety, as all of the parts, including the skin, contain valuable nutrients. When eating citrus fruits, remove the rinds, but eat the white part inside the skin for its vitamin C and bioflavonoid content.

Although most people usually cook their vegetables before eating, both fruits and vegetables should be eaten raw if possible. All enzymes and most vitamins are extremely sensitive to heat, and are usually destroyed in the cooking process.

If fresh produce is unavailable, use frozen fruits and vegetables instead. Avoid highly processed food items be-

## Phytochemicals

For many years, researchers have recognized that diets high in fruits, vegetables, grains, and legumes appear to reduce the risk of a number of diseases, including cancer, heart disease, diabetes, and high blood pressure when compared with diets high in meat. More recently, it was discovered that the disease-preventing effects of these foods are partly due to antioxidants—specific vitamins, minerals, and enzymes that help prevent cancer and other disorders by protecting cells against damage from oxidation. Now, researchers have discovered that fruits, vegetables, grains, and legumes contain yet another group of health-promoting nutrients. Called *phytochemicals*, these substances appear to be powerful ammunition in the war against cancer and other disorders.

Phytochemicals are the biologically active substances in plants that are responsible for giving them color, flavor, and natural disease resistance. To understand how phytochemicals protect the body against cancer, it is necessary to understand that cancer formation is a multistep process. Phytochemicals seem to fight cancer by blocking one or more of the steps that lead to cancer.

For instance, cancer can begin when a carcinogenic molecule—from the food you eat or the air you breathe—invades a cell. But if sulforaphane, a phytochemical found in broccoli, also reaches the cell, it activates a group of enzymes that whisk the carcinogen out of the cell before it can cause any harm.

Other phytochemicals are known to prevent cancer in other ways. Flavonoids, found in citrus fruits and berries, keep cancer-causing hormones from latching on to cells in the first place. Genistein, found in soybeans, kills tumors by preventing the formation of the capillaries needed to nourish them. Indoles, found in cruciferous vegetables such as Brussels sprouts, cauliflower, and cabbage, increase immune activity and make it easier for the body to excrete toxins. Saponins, found in kidney beans, chickpeas, soybeans, and lentils, may prevent cancer cells from multiplying. P-coumaric acid and chlorogenic acid, found in tomatoes, interfere with certain chemical unions that can create carcinogens. The list of these protective substances

goes on and on. Tomatoes alone are believed to contain an estimated 10,000 different phytochemicals.

Although no long-term human studies have shown that specific phytochemicals stop cancer, research on phytochemicals supports the more than two hundred studies that link lowered cancer risk with a diet rich in grains, legumes, fruits, and vegetables. Moreover, animal and in vitro studies have demonstrated how some phytochemicals prevent carcinogens from promoting the growth of specific cancers. For instance, the phytochemical phenethyl isothiocyanate (PEITC), found in cabbage and turnips, has been shown to inhibit the growth of lung cancer in rats and mice. Among other things, PEITC protects the cells' DNA from a potent carcinogen found in tobacco smoke.

Researchers have been able to isolate some phytochemicals, and a number of companies are now selling concentrates that contain phytochemicals obtained from vegetables such as broccoli. These may be used as supplemental sources of some of these nutrients.

However, such pills should *not* be seen as replacements for fresh whole foods. Because several *thousand* phytochemicals are currently known to exist, and because new ones are being discovered all the time, no supplement can possibly contain all of the cancer-fighters found in a shopping basket full of fruits and vegetables.

Fortunately, it is easy to get a healthy dose of phytochemicals at every meal. Almost every grain, legume, fruit, and vegetable tested has been found to contain these substances. Moreover, unlike many vitamins, these substances do not appear to be destroyed by cooking or other processing. Genistein, the substance found in soybeans, for instance, is also found in soybean products such as tofu and miso soup. Similarly, the phytochemical PEITC, found in cabbage, remains intact even when the cabbage is made into coleslaw or sauerkraut. Of course, by eating much of your produce raw or only lightly cooked, you will be able to enjoy the benefits not just of phytochemicals, but of all the vitamins, minerals, and other nutrients that fresh whole foods have to offer.

cause they usually contain significant amounts of salt and sugar and other unhealthy additives. If raw produce does not agree with you, steam your vegetables lightly in a steamer, cooking pan, or wok just until slightly tender.

If fresh fruits and vegetables are not an option, it is still better to eat them than not—regardless of the form they come in. Many of the published studies on the health benefits of fruits and vegetables were based on consumption of any type (organic and nonorganic) and any state (fresh, frozen, canned, and juice).

### Avoid Overcooking Your Foods

As just discussed, cooking foods for all but brief periods of time can destroy many valuable nutrients. More alarming is that when foods are cooked to the point of browning or charring, the organic compounds they contain undergo changes in structure, producing carcinogens.

Barbecued meats seem to pose the worst health threat in this regard. When burning fat drips onto an open flame, polycyclic aromatic hydrocarbons (PAHs)—dangerous carcinogens—are formed. When amino acids and other chemicals found in muscle are exposed to high temperatures, other carcinogens, called heterocyclic aromatic amines (HAAs), are cre-

## Is Aspartame a Safe Sugar Substitute?

Due to America's obsession with dieting, the popularity of aspartame (found in Equal and NutraSweet, as well as many processed food products) has soared. Because it is about two hundred times sweeter than sugar, much smaller amounts of aspartame are needed to sweeten the taste of foods. This artificial sweetener pervades supermarket shelves. It is especially prevalent in diet foods, and can be found in a number of products, including instant breakfasts, breath mints, cereals, sugar-free chewing gum, cocoa mixes, coffee beverages, frozen desserts, gelatin desserts, juice beverages, laxatives, milk drinks, multivitamins, nonprescription pharmaceuticals, shake mixes, soft drinks, tabletop sweeteners, tea beverages, instant teas and coffees, topping mixes, wine coolers, and yogurt.

Upon digestion, aspartame breaks down into three components. The first two are the amino acids phenylalanine and aspartic acid and the third is methanol, or methyl alcohol.

Ever since it was introduced, aspartame has been the center of controversy. Supposedly, a significant number of people have reported suffering ill effects as a result of aspartame consumption. According to the 1990 book *Aspartame (NutraSweet): Is It Safe?* by H. J. Roberts, reactions included headaches, mood swings, changes in vision, nausea and diarrhea, sleep disorders, memory loss and confusion, and even convulsions. People with phenylketonuria (PKU) lack an enzyme needed to convert phenylalanine into tyrosine. Because of this, they accumulate phenylalanine, and at high levels it can be toxic to them. Consequently, these people almost certainly should not use aspartame. But how about the rest of us?

By now, the subject has become so emotional that it is difficult to separate fact from fancy. An entire cottage industry exists to educate people on the safety (or non-safety) of this one sweetener. Proponents claim that neither aspartame nor its components accumulate in the body and that

the chemical components are used in the body in exactly the same way as those derived from "natural" foods. The amounts of the chemicals are also quite small compared to those gained from other food sources. For instance, a serving of low-fat milk contains about six times more phenylalanine and thirteen times more aspartic acid than does the same quantity of diet soda sweetened with 100 percent aspartame. In the same vein, a serving of tomato juice has six times more methanol than an equivalent diet soda.

Other voices claim that the sale of aspartame must be stopped and the conspiracy between the manufacturer, the FDA, and an entire cast of players, some quite unlikely, needs to be exposed.

Actually, aspartame has been tested for more than thirty years in over two hundred studies, and so far all have concluded that it is a safe product, and can be used by almost everyone, including children and pregnant women. This is true not only in the United States, but also in France, Great Britain, and Europe as a whole.

In summary, earlier fears about safety centered on the components of aspartame being ingested in very high doses by laboratory animals. Some flaws in original studies were taken to be conspiratorial rather than simple mistakes. Subsequent research has shown that it just isn't possible for a normal human being to ingest enough aspartame to raise plasma concentrations of its metabolic constituents to toxic or dangerous levels.

Needless to say, however, there are sensitive people who have allergic reactions to many products. If you have experienced any type of reaction to aspartame, you should refrain from using foods that contain this additive. Better yet, avoid the controversy by avoiding all additives, and enjoy a diet rich in fruits and fresh juices. These foods are naturally sweet, free of artificial coloring and preservatives, and full of the nutrients needed for good health. An herbal sweetener called stevia is also available.

ated. In fact, many of the chemicals used to produce cancer in laboratory animals have been isolated from cooked proteins.

It is important to note, though, that cooked meats do not pose the only threat. Even browned or burned bread crusts contain a variety of carcinogenic substances.

The dangers posed by the practice of cooking foods at high temperatures or until browned or burned should not be dismissed. Although eating habits vary widely from person to person, it seems safe to assume that many people consume many grams of overcooked foods a day. By comparison, only half a gram of this same dangerous burned material is inhaled by someone who smokes two packs of cigarettes a day. Clearly, by eating produce raw or only lightly cooked, and by greatly limiting your consumption of meat, you will be doing much to decrease your risk of cancer and, possibly, other disorders.

### Use the Proper Cooking Utensils

Although raw foods have many advantages over cooked ones, nourishing soups and a variety of other dishes can be made healthfully. One of the ways to ensure wholesome cooked food is the careful selection of cookware.

When preparing foods, use only glass, stainless steel, or iron pots and pans. Do not use aluminum cookware or utensils. Foods cooked or stored in aluminum produce a substance that neutralizes the digestive juices, leading to acidosis and ulcers. Worse, the aluminum in the cookware can leach from the pot into the food. When the food is consumed, the aluminum is absorbed by the body, where it accumulates in the brain and nervous system tissues. Excessive amounts of these aluminum deposits have been implicated in Alzheimer's disease.

## Basic Nutritional Guide

A diet high in nutrients is the key to good health. Use the following table as a guide when deciding which types of food to include in your diet and which ones to avoid in order to maintain good health.

Type of Food	Foods to Avoid	Acceptable Foods
Beans	Canned pork and beans, canned beans with salt or preservatives, frozen beans.	All beans (especially soy) cooked without animal fat or salt.
Beverages	Alcoholic drinks, coffee, cocoa, pasteurized and/or sweetened juices and fruit drinks, sodas, tea (except herbal and green tea).	Herbal teas, fresh vegetable and fruit juices, grain beverages (often sold as coffee substitutes), mineral or distilled water.
Dairy products	All soft cheeses, all pasteurized or artificially colored cheese products, ice cream.	Raw goat cheese, nonfat cottage cheese, kefir, unsweetened yogurt, goat's milk, raw or skim milk, buttermilk.
Eggs	Fried or pickled.	Boiled or poached (limit of four weekly).
Fish	All fried fish, all shellfish, salted fish, anchovies, herring, fish canned in oil.	All freshwater whitefish, salmon, broiled or baked fish, water-packed tuna. (Limit tuna to two servings a week to avoid excessive mercury intake.)
Fruits	Canned, bottled, or frozen fruits with sweeteners added; oranges.	All fresh, frozen, stewed, or dried fruits without sweeteners (except oranges, which are acidic and highly allergenic), unsulfured fruits, home-canned fruits.
Grains	All white flour products, white rice, pasta, crackers, cold cereals, instant types of oatmeal and other hot cereals.	All whole grains and products containing whole grains: cereals, breads, muffins, whole-grain crackers, cream of wheat or rye cereal, buckwheat, millet, oats, brown rice, wild rice. (Limit yeast breads to 3 servings per week.)
Meats	Beef; all forms of pork; hot dogs; luncheon meats; smoked, pickled, and processed meats; corned beef; duck; goose; spare ribs; gravies; organ meats.	Skinless turkey and chicken, lamb. (Limit meat to three 3-oz. servings per week.)
Nuts	All salted or roasted nuts; peanuts (if suffering from a related disorder).	All fresh raw nuts (peanuts in moderation only).
Oils (fats)	All saturated fats, hydrogenated margarine, refined processed oils, shortenings, hardened oils.	All cold-pressed oils: corn, safflower, sesame, olive, flaxseed, soybean, sunflower, and canola oils; margarine made from these oils; eggless mayonnaise.
Seasonings	Black or white pepper, salt, hot red peppers, all types of vinegar except pure natural apple cider vinegar.	Garlic, onions, cayenne, Spike, all herbs, dried vegetables, apple cider vinegar, tamari, miso, seaweed, dulse.
Soups	Canned soups made with salt, preservatives, MSG, or fat stock; all creamed soups.	Homemade bean (salt- and fat-free), lentil, pea, vegetable, barley, brown rice, onion.
Sprouts and seeds	All seeds cooked in oil or salt.	All slightly cooked sprouts (except alfalfa, which should be raw and washed thoroughly), wheatgrass, all raw seeds.
Sweets	White, brown, or raw cane sugar, corn syrups, chocolate, sugar candy, fructose (except that in fresh whole fruit), all syrups (except pure maple syrup), all sugar substitutes, jams and jellies made with sugar.	Barley malt or rice syrup, small amounts of raw honey, pure maple syrup, stevia, unsulfured blackstrap molasses.
Vegetables	All canned or frozen with salt or additives.	All raw, fresh, frozen (no additives), or home-canned without salt (undercook vegetables slightly).

Other cookware to be avoided includes all pots and pans with nonstick coatings. Too often, the metals and other substances in the pots' finish flakes or leaches into the food. Ultimately, these chemicals end up in your body.

### Limit Your Use of Salt

Although some sodium is essential for survival, inadequate sodium intake is a rare problem. (Symptoms of salt deficiency include lightheadedness and muscles fatigue.) We need at least 1,000 to 1,500 milligrams of sodium a day to stay healthy. This is enough to accomplish all the vital functions that sodium performs in the body—helping maintain

normal fluid levels, healthy muscle function, and proper acidity (pH) of the blood. Excessive sodium intake can cause fluid to be retained in the tissues, which can lead to hypertension (high blood pressure) and can aggravate many medical disorders, including congestive heart failure, certain forms of kidney disease, and premenstrual syndrome (PMS).

One of the best ways to limit the sodium in your diet is to limit your consumption of processed and fast foods, which often contain excessively high amounts of sodium. Cooking at home is a perfect opportunity to control your salt intake. Last, if you can see it, avoid it—for example, in salty snacks such as pretzels and potato chips.

# Vitamins

## INTRODUCTION

Vitamins are essential to life. They contribute to good health by regulating the metabolism and assisting the biochemical processes that release energy from digested food. They are considered micronutrients because the body needs them in relatively small amounts compared with nutrients such as carbohydrates, proteins, fats, and water.

Enzymes are essential chemicals that are the foundation of human bodily functions. (See ENZYMES in Part One.) They are catalysts (activators) in the chemical reactions that are continually taking place within the body. As coenzymes, vitamins work with enzymes, thereby allowing all the activities that occur within the body to be carried out as they should be. Whole, fresh raw foods are a good source of enzymes.

Of the major vitamins, some are soluble in water and others in oil. Water-soluble vitamins must be taken into the body daily, as they cannot be stored and are excreted within four hours to one day. These include vitamin C and the B-complex vitamins. Oil-soluble vitamins can be stored for longer periods of time in the body's fatty tissue and the liver. These include vitamins A, D, E, and K. Both types of vitamin are needed by the body for proper functioning.

## SYNTHETIC VERSUS NATURAL

Make sure you are getting at least 100 percent of all essential vitamins from the foods you eat with a diet rich in fruits and vegetables. Once this has been accomplished, most people will need more from supplements to achieve optimal health. Vitamin supplements can be divided into two groups—synthetic and natural. Synthetic vitamins are produced in laboratories from isolated chemicals that mirror their counterparts found in nature. Natural vitamins are derived from food sources. Although there are no major chemical differences between a vitamin found in food and one created in a laboratory, synthetic supplements contain the isolated vitamins only, while natural supplements may contain other nutrients not yet discovered. This is because these vitamins are in their natural state. If you are deficient in a particular nutrient, the chemical source will work, but you will not get the benefits of the vitamin as found in whole foods. Supplements that are not labeled natural also may include coal tars, artificial coloring, preservatives, sugars, and starch, as well as other additives. You should beware of such harmful elements.

However, you should also note that a bottle of "natural"

vitamins might contain vitamins that have not been extracted from a natural food source. It is necessary to read labels carefully to make sure the products you buy contain nutrients from food sources, with none of the artificial additives mentioned above.

Studies have shown that protein-bonded vitamins, as found in natural whole food supplements, are absorbed, utilized, and retained in the tissues better than supplements that are not protein-bonded. Chemical-derived vitamins are not protein-bonded. Vitamins and minerals in food are bonded to proteins, lipids, carbohydrates, and bioflavonoids.

Dr. Abram Hoffer, one of the "founding fathers" of orthomolecular medicine (a school of medicine that emphasizes the role of nutrition in health), explains:

Components [of food] do not exist free in nature; nature does not lay down pure protein, pure fat, or pure carbohydrates. Their molecules are interlaced in very complex three-dimensional structures, which even now have not been fully described. Intermingled are the essential nutrients such as vitamins and minerals, again not free, but combined in complex molecules.

Using a natural form of vitamins and minerals in nutritional supplements is the objective of the protein-bonding process. Taking supplements with meals helps to assure a supply of other nutrients needed for better assimilation as well.

## WHAT'S ON THE SHELVES?

Over-the-counter vitamin supplements come in various forms, combinations, and amounts. They are available in tablet, capsule, gel-capsule, powder, sublingual (under the tongue), lozenge, and liquid forms. They can also be administered by injection.

In most cases, it is a matter of personal preference as to how you take them; however, due to slight variations in how rapidly the supplements are absorbed and assimilated into the body, we will sometimes recommend one form over another. These recommendations are given throughout the book.

Vitamin supplements are usually available as isolated vitamins or in combination with other nutrients. It is important to select your vitamins based upon what you really need. A program designed for health maintenance would be different from one designed to overcome a specific dis-

order. Some 59 percent of Americans are now taking supplements on a regular basis.

If you find one supplement that meets your needs, remember to take it daily. If it does not contain a large enough quantity of what you want, you may consider taking more than one. Just make sure that you are aware of the increased dosage of the other nutrients it may contain. If there is no single supplement that provides you with what you are looking for, consider taking a combination of different supplements. This book lists each supplement separately, so you will know what each does and the amount needed. But you may find a supplement that contains several needed nutrients in one tablet or capsule. In fact, a good multivitamin (and multimineral) should be a part of everyone's diet after he or she reaches a certain age, with additional supplements as necessary.

Because the potency of most vitamins may be decreased by sunlight, make sure that the container holding your vitamins is dark enough to shield its contents properly. Some people may be sensitive to plastic, and may need to purchase vitamins in glass containers. Vitamin supplements should be kept in a cool, dark place.

All vitamin supplements work best when taken in combination with food. Unless specified otherwise, oil-soluble vitamins should be taken before meals, and water-soluble ones should be taken after meals. (This applies when you are taking individual supplements only. Multivitamins have both water-soluble and oil-soluble elements.) If you are concerned about getting the full potency from your supplements, you may want to try using raw food-created vitamins made from a single-cell yeast, *Saccharomyces cerevisiae*. This yeast creates vitamins and minerals that are not isolated or synthesized, but that come from nutrient-dense whole foods. One of the best sources of raw food-created vitamins is Garden of Life.

## VITAMINS FROM A TO Z

### Vitamin A and the Carotenoids

Vitamin A prevents night blindness and other eye problems, as well as some skin disorders, such as acne. It enhances immunity, may help to heal gastrointestinal ulcers, and is needed for the maintenance and repair of epithelial tissue, of which the skin and mucous membranes are composed.

It is important in the formation of bones and teeth, aids in fat storage, and protects against colds, flu, and infections of the kidneys, bladder, lungs, and mucous membranes. Vitamin A acts as an antioxidant, helping to protect the cells against cancer and other diseases (see ANTIOXIDANTS in Part One) and is necessary for new cell growth. It guards against heart disease and stroke, and lowers cholesterol levels. People receiving radiation treatment for cervical cancer, prostate cancer, or colorectal cancer have benefited from taking oral vitamin A. Radiation-induced anal ulcers can be a problem with such treatment programs, and a

vitamin A megadose (100,000 international units daily) significantly reduced symptoms in 88 percent of people undergoing such regimens. This important vitamin also slows the aging process. The body cannot utilize protein without vitamin A. Vitamin A is a well-known wrinkle eliminator. Applied topically in the form of tretinoin (the active ingredient in Retin-A and Renova), vitamin A reduces fine lines in the skin and helps to fade age spots.

A deficiency of vitamin A can cause dry hair and/or skin, dryness of the conjunctiva and cornea, poor growth, and/or night blindness. Other possible results of vitamin A deficiency include abscesses in the ears; insomnia; fatigue; reproductive difficulties; sinusitis, pneumonia, and frequent colds and other respiratory infections; skin disorders, including acne; and weight loss.

The *carotenoids* are a class of compounds related to vitamin A. In some cases, they can act as precursors of vitamin A; some act as antioxidants or have other important functions.

The best-known subclass of the carotenoids is the carotenes, of which beta-carotene is the most widely known. Also included in this group are alpha-carotene, gamma-carotene, and lycopene. When food or supplements containing beta-carotene are consumed, the beta-carotene is converted into vitamin A in the liver. According to recent reports, beta-carotene appears to aid in cancer prevention by scavenging, or neutralizing, free radicals. One study reported in the *Journal of the National Cancer Institute*, published in May 2003, found that people who took beta-carotene supplements and who smoked and drank alcohol doubled their risk of precancerous colorectal tumors, while for those who also took the supplements but who didn't smoke or drink there was a 44 percent *decrease* in their risk. Other types of carotenoids that have been identified are the xanthophylls (including beta-cryptoxanthin, canthaxanthin, lutein, and zeaxanthin); the limonoids (including limonene); and the phytosterols (including perillyl alcohol). Evidence suggests that greater consumption of lutein reduces the risk of cataracts and age-related macular degeneration (AMD), and that taking lutein supplements can slow the progress of these disorders, although it does not appear to reverse them if they are already established. High lutein consumption has also been reported to decrease the incidence of prostate cancer.

Science has not yet discovered all of the carotenoids, although one source documents six hundred different carotenoids identified so far. Combinations of carotenoids have been shown to be more beneficial than individual carotenoids taken alone.

Taking large amounts of vitamin A, more than 100,000 international units daily, over long periods can be toxic to the body, mainly to the liver. Toxic levels of vitamin A are associated with abdominal pain, amenorrhea (cessation of menstruation), enlargement of the liver and/or spleen, gastrointestinal disturbances, hair loss, itching, joint pain, nausea and vomiting, water on the brain, elevated liver enzymes, and small cracks and scales on the lips and at the corners of the mouth. Excessive intake of vitamin A during

pregnancy has been linked to birth defects, including cleft palate and heart defects. It is better to take beta-carotene during pregnancy. If you have a particular disorder that calls for taking high doses of vitamin A, use an emulsified form, which puts less stress on the liver.

No overdose can occur with beta-carotene, although if you take too much, your skin may turn slightly yellow-orange in color. Beta-carotene does not have the same effect as vitamin A in the body and is not harmful in larger amounts unless your liver cannot convert beta-carotene into vitamin A. There is mixed evidence (mostly from studies done in Europe) as to whether too much vitamin A may increase the risk of osteoporosis. In the United States women usually don't have a problem with getting too much vitamin A because manufacturers mix beta-carotene with vitamin A. However, women who are worried about osteoporosis should consult a health care provider before taking vitamin A. It is important to take only *natural* beta-carotene or a natural carotenoid complex. Betatene is the trade name for a type of carotenoid complex extracted from sea algae. Different manufacturers use it as an ingredient in various products.

### Sources

Vitamin A can be obtained from animal livers, fish liver oils, and green and yellow fruits and vegetables. Foods that contain significant amounts include apricots, asparagus, beet greens, broccoli, cantaloupe, carrots, collards, dandelion greens, dulse (a red seaweed), fish liver and fish liver oil, garlic, kale, mustard greens, papayas, peaches, pumpkin, red peppers, spinach, spirulina, sweet potatoes, Swiss chard, turnip greens, watercress, and yellow squash. It is also present in the following herbs: alfalfa, borage leaves, burdock root, cayenne (capsicum), chickweed, eyebright, fennel seed, hops, kelp, lemongrass, mullein, nettle, oat straw, paprika, parsley, peppermint, plantain, raspberry leaf, red clover, rose hips, sage, uva ursi, violet leaves, watercress, and yellow dock. Animal sources of vitamin A are up to six times as strong as vegetable sources, but you should exercise caution if you choose to eat organ meats. A plant-based diet better promotes overall health.

### Comments

Antibiotics, laxatives, and some cholesterol-lowering drugs interfere with the absorption of vitamin A.

### Cautions

If you have liver disease, do not take a daily dose of over 10,000 international units of vitamin A in pill form, or any amount of cod liver oil. If you are pregnant, do not take more than 10,000 international units of vitamin A daily because of reported problems in fetal development. Children should not take more than 18,000 international units of vi-

tamin A on a daily basis for over one month. For most people, beta-carotene is the best source of vitamin A because it is converted by the liver into only the amount of vitamin A that the body actually needs. However, if you have diabetes or hypothyroidism, there is a good possibility your body cannot convert beta-carotene into vitamin A. Consuming large amounts of beta-carotene may therefore place unnecessary stress on your liver.

## Vitamin B Complex

The B vitamins help to maintain the health of the nerves, skin, eyes, hair, liver, and mouth, as well as healthy muscle tone in the gastrointestinal tract and proper brain function.

B-complex vitamins act as coenzymes, helping enzymes to react chemically with other substances, and are involved in energy production. They may be useful for alleviating depression or anxiety as well. Adequate intake of the B vitamins is very important for elderly people because these nutrients are not as well absorbed as we age. There have even been cases of people diagnosed with Alzheimer's disease whose problems were later found to be due to a deficiency of vitamin B<sub>12</sub> plus the B complex vitamins. The B vitamins should always be taken together, but up to two to three times more of one B vitamin than another can be taken for a period of time if needed for a particular disorder. There are spray and sublingual forms that are absorbed more easily, which are good choices for older adults and those with absorption problems.

Because the B vitamins work together, a deficiency in one often indicates a deficiency in another. Although the B vitamins are a team, they will be discussed individually.

### Vitamin B<sub>1</sub> (Thiamine)

Thiamine (thiamine hydrochloride) enhances circulation and assists in blood formation, carbohydrate metabolism, and in the production of hydrochloric acid, which is important for proper digestion. Thiamine also optimizes cognitive activity and brain function. It has a positive effect on energy, growth, normal appetite, and learning capacity, and is needed for proper muscle tone of the intestines, stomach, and heart. Thiamine also acts as an antioxidant, protecting the body from the degenerative effects of aging, alcohol consumption, and smoking.

Beriberi, a nervous system disease that is rare in developed nations, is caused by a deficiency of thiamine. Other symptoms that can result from thiamine deficiency include constipation, edema, enlarged liver, fatigue, forgetfulness, gastrointestinal disturbances, heart changes, irritability, labored breathing, loss of appetite, muscle atrophy, nervousness, numbness of the hands and feet, pain and sensitivity, poor coordination, tingling sensations, weak and sore muscles, general weakness, and severe weight loss.

Benfotiamine is a fat-soluble form of the water-soluble vitamin B<sub>1</sub>. Its use is reserved for cases such as alcoholic

peripheral neuropathy, a disorder involving decreased nerve functioning caused by damage from excessive drinking of alcohol. It is found naturally in small quantities in roasted, crushed garlic, as well as in onions, shallots, and leeks. This variant of the vitamin lasts longer in the body, yielding potentially therapeutic benefits that regular vitamin B<sub>1</sub> cannot achieve. Benfotiamine may be more effective than thiamine in controlling damage from diabetes because it is a better activator of the enzyme transketolase. This enzyme assists in keeping glucose-derived compounds out of healthy vascular (blood vessel) and nerve cells. The normal supplemental dose is 150 to 600 milligrams per day, taken under the guidance of a doctor or other qualified health care practitioner.

### Sources

The richest food sources of thiamine include brown rice, egg yolks, fish, legumes, liver, peanuts, peas, pork, poultry, rice bran, wheat germ, and whole grains. Other sources include asparagus, brewer's yeast, broccoli, Brussels sprouts, dulse, kelp, most nuts, oatmeal, plums, dried prunes, raisins, spirulina, and watercress. Herbs that contain thiamine include alfalfa, bladderwrack, burdock root, catnip, cayenne, chamomile, chickweed, eyebright, fennel seed, fenugreek, hops, nettle, oat straw, parsley, peppermint, raspberry leaf, red clover, rose hips, sage, yarrow, and yellow dock.

### Comments

Antibiotics, phenytoin (Dilantin, a drug used to prevent seizures), sulfa drugs, and oral contraceptives, as well as heavy alcohol or caffeine consumption, may decrease thiamine levels in the body. A high-carbohydrate diet increases the need for thiamine. Alcoholics are among those most often deficient in thiamine because the alcohol inhibits its storage. This is sometimes manifested as a disorder known as Wernicke-Korsakoff syndrome, which is characterized by memory problems, abnormal movements, confusion, drowsiness, and other symptoms.

### Vitamin B<sub>2</sub> (Riboflavin)

Riboflavin is necessary for red blood cell formation, antibody production, cell respiration, and growth. It alleviates eye fatigue and is important in the prevention and treatment of cataracts. It aids in the metabolism of carbohydrates, fats, and proteins. Together with vitamin A, it maintains and improves the mucous membranes in the digestive tract. Riboflavin also facilitates the use of oxygen by the tissues of the skin, nails, and hair; eliminates dandruff; and helps the absorption of iron and vitamin B<sub>6</sub> (pyridoxine).

Consumption of adequate amounts of riboflavin is important during pregnancy, because a lack of this vitamin can damage a developing fetus even if a woman shows no signs of deficiency. Riboflavin is needed for the metabolism of the amino acid tryptophan, which is converted into niacin

in the body. Carpal tunnel syndrome may benefit from a treatment program that includes riboflavin and vitamin B<sub>6</sub>.

Deficiency symptoms include cracks and sores at the corners of the mouth, eye disorders, inflammation of the mouth and tongue, and skin lesions, a group of symptoms collectively referred to as *ariboflavinosis*. Other possible deficiency symptoms include dermatitis, dizziness, hair loss, insomnia, light sensitivity, poor digestion, retarded growth, and slowed mental response.

### Sources

High levels of vitamin B<sub>2</sub> are found in the following foods: cheese, egg yolks, fish, legumes, meat, milk, poultry, spinach, whole grains, and yogurt. Other sources include asparagus, avocados, broccoli, Brussels sprouts, currants, dandelion greens, dulse, kelp, leafy green vegetables, mushrooms, molasses, nuts, and watercress. Herbs that contain vitamin B<sub>2</sub> include alfalfa, bladderwrack, burdock root, catnip, cayenne, chamomile, chickweed, eyebright, fennel seed, fenugreek, ginseng, hops, mullein, nettle, oat straw, parsley, peppermint, raspberry leaves, red clover, rose hips, sage, and yellow dock.

### Comments

Factors that increase the need for riboflavin include the use of oral contraceptives and strenuous exercise. This B vitamin is easily destroyed by light, antibiotics, and the consumption of alcohol. Taking too much riboflavin (over 50 milligrams daily) over a long period of time may lead to cataracts and retinal diseases. Taking high doses also may turn urine a deep yellow.

### Vitamin B<sub>3</sub> (Niacin, Nicotinic Acid, Niacinamide)

Vitamin B<sub>3</sub> is needed for proper circulation and healthy skin. It aids in the functioning of the nervous system; in the metabolism of carbohydrates, fats, and proteins; and in the production of hydrochloric acid for the digestive system. It is involved in the normal secretion of bile and stomach fluids, and in the synthesis of sex hormones. Niacin (nicotinic acid) lowers cholesterol and improves circulation. It is helpful for schizophrenia and other mental illnesses, and is also a memory-enhancer.

Pellagra is a disease caused by niacin deficiency. Other symptoms of niacin deficiency include canker sores, dementia, depression, diarrhea, dizziness, fatigue, halitosis, headaches, indigestion, insomnia, limb pains, loss of appetite, low blood sugar, muscular weakness, skin eruptions, and inflammation.

### Sources

Niacin and niacinamide are found in beef liver, brewer's yeast, broccoli, carrots, cheese, corn flour, dandelion greens,

dates, eggs, fish, milk, nuts, peanuts, pork, potatoes, rabbit, tomatoes, wheat germ, and whole wheat products. Herbs that contain niacin include alfalfa, burdock root, catnip, cayenne, chamomile, chickweed, eyebright, fennel seed, hops, licorice, mullein, nettle, oat straw, parsley, peppermint, raspberry leaf, red clover, rose hips, slippery elm, and yellow dock. A cup of coffee provides about 3 milligrams of niacin.

### Comments

A flush, usually harmless, may occur after you take a niacin supplement; you might develop a red rash on your skin and a tingling sensation may be experienced as well. Usually, these symptoms last only a few minutes.

There are two forms of this vitamin: niacin (or nicotinic acid) and niacinamide. In the form of niacinamide, it does not cause flushing. However, niacinamide does not have all the same properties of niacin. Specifically, it is not effective for lowering blood cholesterol.

Taking high doses of special, extended-release niacin for cholesterol control is a relatively recent phenomenon. The intent is to lower levels of low-density lipoproteins (LDL, or "bad," cholesterol), raise levels of high-density lipoproteins (HDL, or "good," cholesterol), and to reduce triglyceride levels. This type of niacin is *not* dietary niacin. A product called Niaspan, produced by Abbott Laboratories, is an extended-release type of niacin approved for cholesterol control.

### Cautions

Dietary niacin should *not* be substituted for Niaspan. Taking high doses of dietary niacin (more than 500 milligrams daily) can damage the liver. People who are pregnant or who suffer from diabetes, glaucoma, gout, liver disease, or peptic ulcers should use niacin supplements with caution. Niacin can elevate blood sugar levels.

### Vitamin B<sub>5</sub> (Pantothenic Acid)

Known as the antistress vitamin, pantothenic acid plays a role in the production of the adrenal hormones and the formation of antibodies, aids in vitamin utilization, and helps to convert fats, carbohydrates, and proteins into energy.

Pantothenic acid is required by all cells in the body and is concentrated in the organs. It is also involved in the production of neurotransmitters. This vitamin is an essential element of coenzyme A, a vital body chemical involved in many necessary metabolic functions. Pantothenic acid is also a stamina enhancer and prevents certain forms of anemia. It is needed for normal functioning of the gastrointestinal tract and may be helpful in treating depression and anxiety. A deficiency of pantothenic acid may cause fatigue, headache, nausea, and tingling in the hands. Pantothenic acid is also needed for proper functioning of the adrenal glands.

### Sources

The following foods contain pantothenic acid: avocados, beef, brewer's yeast, eggs, fresh vegetables, kidney, legumes, liver, lobster, mushrooms, nuts, pork, royal jelly, saltwater fish, torula yeast, whole rye flour, and whole wheat.

### Vitamin B<sub>6</sub> (Pyridoxine)

Pyridoxine is involved in more bodily functions than almost any other single nutrient. It affects both physical and mental health. It is beneficial if you suffer from water retention, and is necessary for the production of hydrochloric acid and the absorption of fats and protein. It also aids in maintaining sodium and potassium balance, and promotes red blood cell formation.

Pyridoxine is required by the nervous system and is needed for normal brain function and for the synthesis of the nucleic acids RNA and DNA, which contain the genetic instructions for the reproduction of all cells and for normal cellular growth. It activates many enzymes and aids in the absorption of vitamin B<sub>12</sub>, in immune system function, and in antibody production.

Vitamin B<sub>6</sub> plays a role in cancer immunity and aids in the prevention of arteriosclerosis. It inhibits the formation of a toxic chemical called homocysteine, which attacks the heart muscle and allows the deposition of cholesterol around the heart muscle. Pyridoxine acts as a mild diuretic, reducing the symptoms of premenstrual syndrome, and it may be useful in preventing calcium oxalate kidney stones as well. It is helpful in the treatment of allergies, arthritis, and asthma.

A deficiency of vitamin B<sub>6</sub> can result in anemia, convulsions, headaches, nausea, flaky skin, a sore tongue, and vomiting. Other possible signs of deficiency include acne, anorexia, arthritis, conjunctivitis, cracks or sores on the mouth and lips, depression, dizziness, fatigue, hyperirritability, impaired wound healing, inflammation of the mouth and gums, learning difficulties, impaired memory or memory loss, hair loss, hearing problems, numbness, oily facial skin, stunted growth, and tingling sensations. Carpal tunnel syndrome has been linked to a deficiency of vitamin B<sub>6</sub> as well.

### Sources

All foods contain some vitamin B<sub>6</sub>; however, the following foods have the highest amounts: brewer's yeast, carrots, chicken, eggs, fish, meat, peas, spinach, sunflower seeds, walnuts, and wheat germ. Other sources include avocado, bananas, beans, blackstrap molasses, broccoli, brown rice and other whole grains, cabbage, cantaloupe, corn, dulse (a red seaweed), plantains, potatoes, rice bran, soybeans, and tempeh. Herbs that contain vitamin B<sub>6</sub> include alfalfa, catnip, and oat straw.

## Comments

Antidepressants, estrogen therapy, and oral contraceptives may increase the need for vitamin B<sub>6</sub>. Diuretics and cortisone drugs block the absorption of this vitamin by the body.

Prolonged use of high doses of vitamin B<sub>6</sub> (over 1,000 milligrams per day) can be toxic, and may result in nerve damage and loss of coordination.

## Vitamin B<sub>12</sub> (Methylcobalamin)

Vitamin B<sub>12</sub> is the most chemically complex of all the vitamins and is the general name for a group of essential biological compounds known as cobalamins. The cobalamins are similar to hemoglobin in the blood except that instead of iron they contain cobalt. Vitamin B<sub>12</sub> comes in several forms. Not all forms are equally effective. The most effective form is *methylcobalamin*. However, the most common form is *cyanocobalamin*, because it is easier to manufacture and is therefore less expensive.

Unfortunately, the very common and inexpensive cyanocobalamin form is difficult for the body to absorb, and the small amount that is absorbed usually fails to find its way into the cells, where it can perform its intended tasks. The liver does, however, convert a small amount of cyanocobalamin into methylcobalamin, but much larger amounts than can be converted are needed to carry out the normal functions of vitamin B<sub>12</sub>. As a result, many people who take large doses of cyanocobalamin continue to be deficient in the vitamin. They often find themselves resorting to vitamin B<sub>12</sub> injections, which are available from a doctor by prescription only. Vitamin B<sub>12</sub> deficiency caused by malabsorption is most common in elderly people. A simple alternative is to take the methylcobalamin form in the first place, either swallowed in tablet form or sublingually. Those with severe digestive disorders may have no choice but to resort to vitamin B<sub>12</sub> injections. Injections usually are administered every two to three months.

Methylcobalamin is active in the growth and protection of the nervous system. Larger quantities are especially necessary to protect against neurological deterioration as we age. One Danish study found that daily supplementation with 6 micrograms per day (the DRI is 2.4 micrograms) appeared to be sufficient to correct deficiencies in women aged forty-one to seventy-five years.

Vitamin B<sub>12</sub>, in the methylcobalamin form, may help prevent Parkinson's disease and slow the progression in those who already have the disease by protecting against neural toxicity caused by excess L-dopa, a probable cause of the disease. The vitamin has been shown to reverse the symptoms of such rare neurological diseases as Bell's palsy (see page 682), and shows promise in the treatment of multiple sclerosis and other neurological diseases. Very

few substances are known to have any impact on regenerating damaged nerves in humans. However, a 1994 study in the *Journal of Neurological Science* suggested that the methylcobalamin form of vitamin B<sub>12</sub> could increase the synthesis of certain proteins that help regenerate nerves. The study showed that very high doses of methylcobalamin produced nerve regeneration in rats. No substantive human studies on nerve regeneration are known to date, but as new research is reported it will be included in future editions of this book.

Methylcobalamin is essential in converting homocysteine into methionine, which is used to build protein. As such, it plays an important role in protein synthesis necessary for cardiovascular function. It has been found that high levels of homocysteine that have gone unconverted may be toxic to the lining of the blood vessels and may increase clotting factors, which can result in the buildup of plaque and eventually lead to heart disease and stroke. As such, vitamin B<sub>12</sub> plays an important role in protein synthesis necessary for cardiovascular function.

Vitamin B<sub>12</sub> is needed to prevent anemia; it aids folic acid in regulating the formation of red blood cells, and helps in the utilization of iron. This vitamin is also required for proper digestion, absorption of foods, and the metabolism of carbohydrates and fats. It aids in cell formation and cellular longevity. In addition, vitamin B<sub>12</sub> prevents nerve damage, maintains fertility, and promotes normal growth and development by maintaining the fatty sheaths that cover and protect nerve endings. A study reported in the *American Journal of Obstetrics and Gynecology* in 2004 found that women who gave birth to children with spina bifida had vitamin B<sub>12</sub> levels that were 21 percent lower than those of mothers who had had healthy children. Vitamin B<sub>12</sub> is also linked to the production of acetylcholine, a neurotransmitter that assists memory and learning. Vitamin B<sub>12</sub> supplementation has been shown to enhance sleep patterns, allowing for more restful and refreshing sleep.

A vitamin B<sub>12</sub> deficiency can be caused by malabsorption, which is most common in older adults and in people with digestive disorders. Deficiency can cause abnormal gait, bone loss, chronic fatigue, constipation, depression, digestive disorders, dizziness, drowsiness, enlargement of the liver, eye disorders, hallucinations, headaches (including migraines), inflammation of the tongue, irritability, labored breathing, memory loss, moodiness, nervousness, neurological damage, palpitations, pernicious anemia, ringing in the ears, and spinal-cord degeneration.

Researchers caution that all patients with unexplained anemia and/or neurological symptoms, as well as patients at risk of developing low B<sub>12</sub> levels like the elderly and those with intestinal disorders, should have blood levels measured. In addition, those with cognitive impairment may want to be tested for low B<sub>12</sub> levels.

Strict vegetarians must remember that they require vitamin B<sub>12</sub> supplementation, as this vitamin is found almost

exclusively in animal tissues. Although people who follow a strictly vegetarian diet may not see any signs of the deficiency for some time—the body can store up to five years' worth of vitamin B<sub>12</sub>—signs eventually will develop. Those who have followed a vegetarian diet for a long time (more than five years) should have B<sub>12</sub> blood levels measured yearly.

### Sources

The largest amounts of vitamin B<sub>12</sub> are found in meats, brewer's yeast, clams, eggs, herring, kidney, liver, mackerel, milk and dairy products, and seafood. Vitamin B<sub>12</sub> is not found in many vegetables; it is available only from sea vegetables, such as dulse, kelp, kombu, bladderwrack, and nori, and soybeans and soy products. It is believed that bacteria present in the large intestine synthesize most B<sub>12</sub>. It is also present in the herbs alfalfa and hops.

### Comments

Antigout medications, anticoagulant drugs, and potassium supplements may block the absorption of vitamin B<sub>12</sub> from the digestive tract. Taking vitamin B<sub>12</sub> in sublingual tablets, which are dissolved under the tongue rather than swallowed, can be a good option for those who have difficulty absorbing this vitamin. *Intrinsic factor* is a protein produced in the gastrointestinal tract that is necessary for absorption of vitamin B<sub>12</sub>. People who lack intrinsic factor must use a sublingual form (or injections) for absorption. A blood test called the Schilling test can be used to determine the body's ability to absorb vitamin B<sub>12</sub>.

At this time there are still some health food stores that do not stock the methylcobalamin form of vitamin B<sub>12</sub>. It is expected that as research results become more widely known, the methylcobalamin form will become easier to find in your local health food store under various brand names.

### Biotin

Biotin aids in cell growth; in fatty acid production; in the metabolism of carbohydrates, fats, and proteins; and in the utilization of the other B-complex vitamins. Sufficient quantities are needed for healthy hair and skin. One hundred milligrams of biotin daily may prevent hair loss in some men. Biotin also promotes healthy sweat glands, nerve tissue, and bone marrow. In addition, it helps to relieve muscle pain.

In infants, a condition called *seborrheic dermatitis*, or cradle cap, which is characterized by a dry, scaly scalp, may occur as a result of biotin deficiency. In adults, deficiency of this B vitamin is rare because it can be produced in the intestines from foods such as those mentioned below. However, if a deficiency does occur, it can cause anemia, depression, hair loss, high blood sugar, inflammation or pallor of the skin and mucous membranes, insomnia, loss of appetite, muscular pain, nausea, and soreness of the tongue.

### Sources

Biotin is found in brewer's yeast, cooked egg yolks, meat, milk, poultry, saltwater fish, soybeans, and whole grains.

### Comments

Raw egg whites contain a protein called avidin, which combines with biotin in the intestinal tract and depletes the body of this needed nutrient. Fats and oils that have been subjected to heat or exposed to the air for any length of time inhibit biotin absorption. Antibiotics, sulfa drugs, and saccharin also threaten the availability of biotin.

### Choline

Choline is needed for the proper transmission of nerve impulses from the brain through the central nervous system, as well as for gallbladder regulation, liver function, and lecithin formation. It aids in hormone production and minimizes excess fat in the liver because it aids in fat and cholesterol metabolism. Without choline, brain function and memory are impaired. Choline is beneficial for disorders of the nervous system such as Parkinson's disease and tardive dyskinesia. A deficiency may result in fatty buildup in the liver, as well as in cardiac symptoms, gastric ulcers, high blood pressure, an inability to digest fats, kidney and liver impairment, and stunted growth.

Research in the last decade indicates that choline plays an important role in cardiovascular health, as well as in reproduction and fetal development. One study showed a need for choline for both prevention and treatment of arteriosclerosis and the metabolism of homocysteine. This is such an important nutrient that it recently was added to the list of essential compounds. People who have a high choline intake have the lowest levels of inflammation in the body, which reduces their risk of heart disease.

### Sources

The following foods contain significant amounts of choline: broccoli, oat bran, egg yolks, lecithin (about 13 percent choline by weight), legumes, liver, meat, milk, shrimp, soybeans, and whole-grain cereals. If you are managing your cholesterol levels, using one egg yolk for every two egg whites will help you get enough choline.

### Folate

Also known as folacin, folic acid, or pteroylglutamic acid (PGA), folate is considered a brain food, and is needed for energy production and the formation of red blood cells. It also strengthens immunity by aiding in the proper formation and functioning of white blood cells. Because it functions as a coenzyme in DNA and RNA synthesis, it is important for healthy cell division and replication. It is in-

volved in protein metabolism and has been used in the prevention and treatment of folic acid anemia. This nutrient may also help depression and anxiety, and may be effective in the treatment of uterine cervical dysplasia.

Folate may be the most important nutrient in regulating homocysteine levels. Homocysteine is an amino acid that is naturally formed in the body as the result of the breakdown of another amino acid, methionine. In recent years, high levels of homocysteine have been found to be associated with an increased risk of atherosclerosis (hardening of the arteries due to the accumulation of fatty plaques). Normally, homocysteine is converted to other, non-harmful amino acids in the body. In order for this conversion to take place as it should, the body needs an adequate supply of folate, as well as of vitamins B<sub>6</sub> and B<sub>12</sub>. Homocysteine levels in red blood cells have been shown to have an inverse relationship to levels of these three important B vitamins—that is, the lower the levels of these vitamins, the higher the level of homocysteine.

Folate is very important in pregnancy. It helps to regulate embryonic and fetal nerve cell formation, which is vital for normal development. Studies have shown that a daily intake of 400 micrograms of folate in early pregnancy may prevent the vast majority of neural tube defects, such as spina bifida and anencephaly. It may also help to prevent premature birth. To be effective, this regimen must begin *before* conception and continue for at least the first three months of pregnancy; if a woman waits until she knows she is pregnant, it may be too late, because critical events in fetal development occur during the first six weeks of pregnancy—before many women know that they have conceived. In the mid-1990s, the government required that enriched grain products be fortified with folic acid. This was an attempt to achieve an across-the-board reduction in neural-tube birth defects such as spina bifida. Since the program started, there has also been a decline in stroke-related deaths that appears to be related. Researchers attribute this decline to the reduction of serum homocysteine levels in the population as a whole. However, some researchers worry that the higher folic acid intake may mask B<sub>12</sub> deficiencies. If you are worried about low B<sub>12</sub> (see B<sub>12</sub>, above), consult your health care practitioner before taking folic acid supplements.

Many experts still recommend that every woman of childbearing age take a folate supplement daily as a matter of course. Folate works best when combined with vitamin B<sub>12</sub> and vitamin C. Another option is to simply take a good-quality multivitamin; most have at least 400 micrograms of folic acid and these other nutrients.

A sore, red tongue is one sign of folate deficiency. Other possible signs include anemia, apathy, digestive disturbances, fatigue, graying hair, growth impairment, insomnia, labored breathing, memory problems, paranoia, weakness, and birth defects in one's offspring. Folate deficiency may be caused by inadequate consumption of fresh fruits and vegetables; consumption of only cooked or microwaved vegetables (cooking destroys folate); and malabsorption problems.

## Sources

The following foods contain significant quantities of folate: asparagus, barley, beef, bran, brewer's yeast, brown rice, cheese, chicken, dates, green leafy vegetables, lamb, legumes, lentils, liver, milk, mushrooms, oranges, split peas, pork, root vegetables, salmon, tuna, wheat germ, whole grains, and whole wheat. Unlike most other nutrients, synthetic folic acid from a supplement is more bioavailable than folic acid from food. It is best to eat folate-rich foods and take a supplement, especially if you are a woman of childbearing age.

## Comments

Oral contraceptives may increase the need for folate. Alcohol also can act as an enemy to folate absorption.

## Cautions

Do not take high doses of folate for extended periods if you have a hormone-related cancer or seizure disorder.

## Inositol

Inositol is vital for hair growth. This vitamin has a calming effect and helps to reduce cholesterol levels. It helps prevent hardening of the arteries and is important in the formation of lecithin and the metabolism of fat and cholesterol. It also helps remove fats from the liver. Deficiency can lead to arteriosclerosis, constipation, hair loss, high blood cholesterol, irritability, mood swings, and skin eruptions. Research has also shown that high doses of inositol may help in the treatment of depression, obsessive-compulsive disorder, and anxiety disorders, without the side effects of prescription medications.

## Sources

Inositol is found in brewer's yeast, fruits, lecithin, legumes, meats, milk, unrefined molasses, raisins, vegetables, and whole grains.

## Comments

Consuming large amounts of caffeine may cause a shortage of inositol in the body.

## Para-Aminobenzoic Acid (PABA)

PABA is one of the basic constituents of folate and also helps in the assimilation of pantothenic acid. PABA can be converted into folate by intestinal bacteria. This antioxidant helps protect against sunburn by reducing the absorption of ultraviolet-B (UV-B) radiation. Consequently, it helps to prevent skin cancer. It also acts as a coenzyme in

the breakdown and utilization of protein; and assists in the formation of red blood cells.

PABA also aids in the maintenance of healthy intestinal flora. Supplementing the diet with PABA may restore gray hair to its original color if the graying was caused by stress or a nutritional deficiency. Other benefits of PABA include protection against secondhand smoke, ozone, and other air pollutants; reduced inflammation in arthritis; and enhanced flexibility.

A deficiency of PABA may lead to depression, fatigue, gastrointestinal disorders, graying of the hair, irritability, nervousness, and patchy areas of white skin.

### Sources

Foods that contain PABA include kidney, liver, molasses, mushrooms, spinach, and whole grains.

### Comments

Sulfa drugs may cause a deficiency of PABA.

### Vitamin C (Ascorbic Acid)

Vitamin C is an antioxidant that is required for at least three hundred metabolic functions in the body, including tissue growth and repair, adrenal gland function, and healthy gums. It also aids in the production of antistress hormones and interferon, an important immune system protein, and is needed for the metabolism of folic acid, tyrosine, and phenylalanine. Studies have shown that taking vitamin C can reduce symptoms of asthma. It protects against the harmful effects of pollution, helps to prevent cancer, protects against infection, and enhances immunity. Vitamin C increases the absorption of iron. It can combine with toxic substances, such as certain heavy metals, and render them harmless so that they can be eliminated from the body.

Most people know of vitamin C and its perceived ability to prevent the common cold. But over the years there has been conflicting data on vitamin C and its effect on colds. And the data remains conflicting. Recently, a group of researchers with the Cochrane Collaboration Reviews, the largest medical literature database, looked at the effect of vitamin C and its use in the treatment of the common cold in over 11,000 people. They found that for intakes of vitamin C greater than 200 milligrams, vitamin C reduced the duration and severity of common cold symptoms but not the number of colds someone gets in a year. However, in extreme physical stress as experienced by marathon runners and skiers, vitamin C reduced the common cold risk by half. Another group of scientists found that vitamin C (when individuals used 500 milligrams per day) reduced the frequency of the common cold but did not affect the duration or severity.

This vitamin also may reduce levels of low-density lipo-

proteins (LDL, the so-called “bad cholesterol”), while increasing levels of high-density lipoproteins (HDL, or “good cholesterol”), as well as lowering high blood pressure and helping to prevent atherosclerosis. Essential in the formation of collagen, vitamin C protects against abnormal blood clotting and bruising, may reduce the risk of cataracts, and promotes the healing of wounds and burns. It may even boost your love life by causing more of the hormone oxytocin to be released.

Vitamin C has been useful in managing *Helicobacter pylori* (commonly known as *H. pylori*). *H. pylori* is a bacteria that grows in the stomach and may result in pain, gas, and bloating. Using 1,000 milligrams of vitamin C, in combination with drugs to treat the condition, allowed for less of the drugs to be used, which resulted in a cost savings to the patients.

Vitamin C works synergistically with both vitamin E and beta-carotene—that is, when these vitamins work together, they have an effect even greater than the sum of their individual effects, and taking them together may counter potential adverse effects of taking these vitamins alone. Long-term users of vitamins E and C in combination seem to have higher cognitive abilities as they age, as reported by a 2003 study.

Vitamin E scavenges for dangerous free radicals in cell membranes, while vitamin C attacks free radicals in biological fluids. These vitamins reinforce and extend each other’s antioxidant activity.

Because the body cannot manufacture vitamin C, it must be obtained through the diet or in the form of supplements.

It was once thought that most of the vitamin C consumed in the diet was lost in the urine, although this idea is being challenged because initial studies apparently failed to account for the half-life, or consistent decreasing rate of elimination from the blood, of the vitamin in the original calculations.

If you require larger-than-normal amounts of vitamin C due to serious illness, such as cancer, it is more effective to take it intravenously, under the supervision of a physician, than it is to take high doses orally.

Scurvy is a disease caused by vitamin C deficiency. It is characterized by poor wound healing, soft and spongy bleeding gums, edema, extreme weakness, and “pinpoint” hemorrhages under the skin. Fortunately, this condition is rare in Western societies. More common are signs of lesser degrees of deficiency, including gums that bleed when brushed; increased susceptibility to infection, especially colds and bronchial infections; joint pains; lack of energy; poor digestion; prolonged wound healing time; a tendency to bruise easily; and tooth loss.

### Sources

Vitamin C is found in berries, citrus fruits, and green vegetables. Good sources include asparagus, avocados, beet greens, black currants, broccoli, Brussels sprouts, canta-

loupe, collards, dandelion greens, dulse, grapefruit, kale, lemons, mangos, mustard greens, onions, oranges, papayas, green peas, sweet peppers, persimmons, pineapple, radishes, rose hips, spinach, strawberries, Swiss chard, tomatoes, turnip greens, and watercress. Orange juice is an excellent source of vitamin C, but *only* if it is freshly squeezed or has been processed by methods that don't involve heating or pasteurization. While freshly squeezed juice is best, frozen juices are often processed by nonthermal methods and can be good sources of vitamin C. Some so-called fruit drinks have added vitamin C, and although they are not as good a choice as real fruit juices, they are preferable to carbonated beverages that are devoid of any nutrients.

Herbs that contain vitamin C include alfalfa, burdock root, cayenne, chickweed, eyebright, fennel seed, fenugreek, hops, kelp, peppermint, mullein, nettle, oat straw, paprika, parsley, pine needle, plantain, raspberry leaf, red clover, rose hips, skullcap, violet leaves, yarrow, and yellow dock.

### Comments

Alcohol, analgesics, antidepressants, anticoagulants, oral contraceptives, and steroids may reduce levels of vitamin C in the body. Smoking causes a serious depletion of vitamin C.

Diabetes medications such as chlorpropamide (Diabinese) and sulfa drugs may not be as effective if taken with vitamin C. Taking high doses of vitamin C may cause a false-negative reading in tests for blood in the stool. It is thought that for some people taking too much vitamin C may cause it to act as a pro-oxidant (creating damaging oxygen particles) rather than an antioxidant (negating the harmful effect of oxygen free radicals). For example, patients with kidney failure had increased oxidation of tissues by taking only 214 milligrams per day.

For maximum effectiveness, supplemental vitamin C should be taken in divided doses, twice daily. Esterified vitamin C (Ester-C) is an effective form of vitamin C. Recently, however, some investigators have found that Ester-C may be no more bioavailable than regular vitamin C (ascorbic acid). We will have to wait to see what is discovered in future studies. Ester-C is created by having the vitamin C react with a necessary mineral, such as calcium, magnesium, potassium, sodium, or zinc. This results in a form of the vitamin that is nonacidic and that contains vitamin C metabolites identical to those produced by the body. Esterified vitamin C enters the bloodstream and tissues four times faster than standard forms of vitamin C because it moves into the blood cells more efficiently and also stays in the body tissues longer. The levels of vitamin C in white blood cells achieved by taking esterified vitamin C are four times higher than those achieved with standard vitamin C. Further, only one-third as much is lost through excretion in the urine. A variety of manufacturers produce supplements containing Ester-C, either by itself or in combination with

other valuable nutrients, including the antioxidants Pycnogenol and proanthocyanidins, and the herbs echinacea and garlic.

### Cautions

If aspirin and standard vitamin C (ascorbic acid) are taken together in large doses, stomach irritation can occur, possibly leading to ulcers. If you take aspirin regularly, use an esterified form of vitamin C, and take it separately from the aspirin.

If you are pregnant, do not take more than 5,000 milligrams of vitamin C daily. A developing infant may become dependent on this supplement and develop scurvy when deprived of the accustomed megadoses after birth. If you have a bruise or sprained muscle, temporarily cut back on vitamin C to less than 90 milligrams daily. Larger amounts may combine with iron produced by the injuries to cause more damage.

Avoid using chewable vitamin C supplements, because these can damage tooth enamel.

### Vitamin D

Vitamin D, a fat-soluble vitamin that has properties of both a vitamin and a hormone, is required for the absorption and utilization of calcium and phosphorus. It is necessary for growth, and is especially important for the normal growth and development of bones and teeth in children. It protects against muscle weakness and is involved in regulation of the heartbeat. It is also important in the prevention and treatment of breast and colon cancer, osteoarthritis, osteoporosis, and hypocalcemia; enhances immunity; and is necessary for thyroid function and normal blood clotting.

There are several forms of vitamin D, including vitamin D<sub>2</sub> (ergocalciferol), which comes from food sources; vitamin D<sub>3</sub> (cholecalciferol), which is synthesized in the skin in response to exposure to the sun's ultraviolet rays; and a synthetic form identified as vitamin D<sub>5</sub>. Of the three, vitamin D<sub>3</sub> is considered the natural form of vitamin D and was thought to be the most active. Newer data shows that D<sub>2</sub> is as effective as D<sub>3</sub> in maintaining vitamin D levels in the blood.

The form of vitamin D that we get from food or supplements is not fully active. It requires conversion by the liver, and then by the kidneys, before it becomes fully active. This is why people with liver or kidney disorders are at a higher risk for osteoporosis. When the skin is exposed to the sun's ultraviolet rays, a cholesterol compound in the skin is transformed into a precursor of vitamin D. Exposing the face and arms to the sun for fifteen minutes three times a week is an effective way to ensure adequate amounts of vitamin D in the body.

Vitamin D has been the ignored vitamin until recently. Studies have shown that at least 40 percent of people have less-than-optimal levels of the vitamin in their blood. As

much as 70 to 80 percent of Hispanic-Americans and African-Americans may be deficient in vitamin D. Those with more coloring in the skin have a harder time absorbing vitamin D from sunlight. In addition, those who live above the 37th latitude obtain virtually no vitamin D from sunlight between November and March.

Not getting enough vitamin D in the diet or from direct sunlight has been linked to the development of several diseases including heart disease, osteoporosis, diabetes, and cancers such as breast and colon. As baby boomers age, the risk of osteoporosis increases. Taking more than 400 IU of vitamin D has been shown to reduce the risk of fractures by 20 percent in those over sixty-five years of age. But how much is needed to optimize health is still open for debate. Some have argued that it is necessary to consume very high amounts of vitamin D—in excess of the UL for safety—in order to maintain blood levels associated with reducing the risk of disease. Before the FDA considers increasing the UL for vitamin D, more research is needed to assure that there is no risk of toxicity at the upper levels. We do not recommend exceeding the UL for vitamin D until further research has been conducted.

### Sources

Fish liver oils, fatty saltwater fish (especially mackerel), dairy products, and eggs all contain vitamin D. It is also found in butter, cod liver oil, dandelion greens, egg yolks, halibut, liver, milk, shiitake and chanterelle mushrooms, oatmeal, oysters, salmon, sardines, sweet potatoes, tuna, and vegetable oils. Herbs that contain vitamin D include alfalfa, nettle, and parsley.

Vitamin D is also formed by the body in response to the action of sunlight on the skin. Of all the nutrients, this is one of a few that is difficult to reach the DRI from food alone and supplementation may be needed. It may make sense to take serial blood tests each year with a physical examination to see if you are getting enough vitamin D to maintain healthy levels.

### Comments

Intestinal disorders and liver and gallbladder malfunctions interfere with the absorption of vitamin D. Some cholesterol-lowering drugs, antacids, mineral oil, and steroid hormones such as cortisone also interfere with absorption.

Thiazide diuretics such as chlorothiazide (Diuril) and hydrochlorothiazide (Esidrix, HydroDIURIL, Oretic) disturb the body's calcium/vitamin D ratio. Taking excessive amounts of vitamin D (over 1,000 international units) daily may cause a decrease in bone mass.

### Cautions

Toxicity may result from taking excessive amounts of supplemental vitamin D.

## Vitamin E

Vitamin E is actually a family of eight antioxidant compounds. These consist of four tocopherols (alpha, beta, gamma, and delta) and four tocotrienols (also alpha through delta). The alpha-tocopherol form is the one found in the largest quantities in human blood and tissue. Small amounts of the gamma form are also found.

Alpha-tocopherol acts as an antioxidant in the human body. As an antioxidant, vitamin E prevents cell damage by inhibiting the oxidation of lipids (fats) and the formation of free radicals. It protects other fat-soluble vitamins from destruction by oxygen and aids in the utilization of vitamin A. It protects the low-density lipoproteins (LDL cholesterol) from oxidation as well. Oxidized LDL has been implicated in the development of cardiovascular disease. It is also known to inhibit blood platelet aggregation (clotting) and has other functions related to the activity of the immune system.

Vitamin E is essential for life, and Americans typically don't get enough of it from their diet. Only 8 percent of men and 2.4 percent of women consume the amount the government recommends. You at least need the DRI for vitamin E, and perhaps more. It is hard to get this nutrient from foods alone, so supplementation is recommended. We don't recommend taking unsafe doses; that is, doses in excess of the UL of safety. None of the dosages given in previous editions of this book seriously exceed the maximums (upper levels or ULs) published by the Office of Dietary Supplements of the National Institutes of Health. These upper limits were established based on the possibility of hemorrhage rather than any perceived problem with the vitamin itself.

The most common dietary form of vitamin E is the gamma-tocopherol form. However, this form is not taken up by the body in any quantity because the liver selectively incorporates alpha-tocopherol into blood lipoproteins for delivery to the tissues. About ten times more alpha-tocopherol than gamma-tocopherol is found in the blood. However, the gamma form may have some unique benefits in suppressing colon cancer, according to recent animal studies, making a sufficient amount of *dietary* vitamin E even more important to good health.

Vitamin E deficiency may result in damage to red blood cells and destruction of nerves. Signs of deficiency can include infertility (in both men and women), menstrual problems, neuromuscular impairment, shortened red blood cell life span, spontaneous abortion (miscarriage), and uterine degeneration. People with impaired balance and coordination and/or damage to the retina (pigmented retinopathy) may also be deficient. Individuals with severe malnutrition, genetic defects affecting a liver protein known as alpha-tocopherol transfer protein (alpha-TTP), or fat malabsorption problems such as those caused by cystic fibrosis, cholestatic liver disease, or Crohn's disease may have a vitamin E deficiency. True vitamin E deficiency is rare, but

## The Vitamin E Controversy

A common complaint among consumers of nutritional information is that researchers are always changing their minds about what is good for you. The problem is that two different studies using the same nutrient have the potential to produce contradictory data. This is because nutrients are consumed in varying amounts, making it almost impossible to determine the exact intake of a single compound. Moreover, the only way to completely isolate a nutrient for study would be to remove it entirely, and this would risk making the person ill. Vitamin E serves as a perfect example of these challenges and why there is often conflicting data among nutritional research studies. In 2004 a group of researchers reported that consuming vitamin E in supplement form in excess of 200 IUs per day actually increased the chances of dying. Previous studies, and these were numerous, had been fairly unanimous in their findings that 400 IUs of vitamin E

actually reduced the risk of heart disease and prostate cancer. How is it possible that researchers came up with such different conclusions about the same vitamin? First, in the 2004 study, participants were rarely given vitamin E on its own. Usually it was given with beta-carotene and vitamin C. Other studies have shown that beta-carotene increases the risk of death in smokers. So some of the increased risk of death attributed to vitamin E was likely related to smokers who took both nutrients. Second, the study included all forms of vitamin E. Sometimes vitamin E was given as alpha-tocopherol and sometimes as mixed tocopherols, and since each has distinct biological effects, they cannot be lumped together. Third, because most participants were over 60, and a majority had preexisting conditions, such as heart disease, the study's application to younger, healthy adults may be limited.

low intake (lower than required) is relatively common. One study showed that 27 to 41 percent of people studied had blood levels of alpha-tocopherol less than 20 micromoles per liter ( $\mu\text{moles/L}$ ), the level below which there appears to be an increased risk for cardiovascular disease. Low levels of vitamin E in the body have been linked to both bowel cancer and breast cancer.

The d-alpha-tocopherol form of vitamin E is the most potent, and is the one we recommend. Also, natural sources of vitamin E are better than synthetic vitamin E because natural vitamin E is more available for use by the body than the synthetic form. Synthetic vitamin E is only 67 percent as active as the natural form. Read labels closely. The natural form of vitamin E is listed as *d-alpha-tocopherol*, *rrr-alpha-tocopherol*, *d-alpha-tocopherol acetate* or *d-alpha-tocopherol succinate*. The synthetic form is listed as *dl-alpha-tocopherol* or *all-rac alpha-tocopherol* (watch out for the *l* after the *d*). The synthetic form costs only about half as much as the natural form, but it has significantly less activity, or potency. Some vitamin manufacturers have been known to mix 10 percent natural and 90 percent synthetic vitamin E, then label the product *natural*. Your responsibility is to check the label and make sure it says *100 percent potency* or *100 percent natural vitamin E*.

If you cannot absorb fat, there is a special water-soluble form of vitamin E available from various suppliers.

### Sources

Vitamin E is found in the following food sources: avocados, cold-pressed vegetable oils (olive, soybean, corn, canola, safflower, and sunflower), dark green leafy vegetables, legumes, nuts (almonds, hazelnuts, peanuts), seeds, and whole grains. Significant quantities of this vitamin are also found in brown rice, cornmeal, dulse, eggs, kelp, des-

iccated liver, milk, oatmeal, organ meats, soybeans, sweet potatoes, watercress, wheat, and wheat germ. Herbs that contain vitamin E include alfalfa, bladderwrack, dandelion, dong quai, flaxseed, nettle, oat straw, raspberry leaf, and rose hips.

### Comments

The body needs zinc in order to maintain the proper level of vitamin E in the blood. Vitamin E that has oxidized a free radical can be revitalized by vitamin C and enabled to battle additional free radicals, according to Lester Packer, Ph.D., noted researcher and professor of molecular and cell biology at the University of California–Berkeley. Adding vitamin E to fats and oils prevents them from becoming rancid. The oxidation of fats is a key factor in the formation of plaque adhering to blood vessel walls.

If you take both vitamin E and iron supplements, take them at different times of the day. Inorganic forms of iron (such as ferrous sulfate) destroy vitamin E. Organic iron (ferrous gluconate or ferrous fumarate) leaves vitamin E intact.

### Cautions

If you are taking an anticoagulant medication (blood-thinner), do not take more than 200 international units of vitamin E daily. If you suffer from diabetes, rheumatic heart disease, or an overactive thyroid, do not take more than the recommended dose. If you have high blood pressure, start with a small amount, such as 100 international units daily, and increase slowly to the desired amount. If you have retinitis pigmentosa that is *not* associated with vitamin E deficiency, do not take any supplemental vitamin E.

## Vitamin K

Vitamin K is needed for the production of prothrombin, which is necessary for blood clotting. It is also essential for bone formation and repair; it is necessary for the synthesis of osteocalcin, the protein in bone tissue on which calcium crystallizes. Consequently, it may help prevent osteoporosis. In addition, it may protect the vascular system by preventing calcification in the arteries. The liver is a very efficient extractor of vitamin K, which it uses to make clotting factors for the blood. Some investigators have argued that the current DRIs may be insufficient to meet the needs of other tissues in the body.

Vitamin K plays an important role in the intestines and aids in converting glucose into glycogen for storage in the liver, promoting healthy liver function. It may increase resistance to infection in children and help prevent cancers that target the inner linings of the organs. It aids in promoting longevity. A deficiency of this vitamin can cause abnormal and/or internal bleeding.

There are three forms of vitamin K. The first is vitamin K<sub>1</sub> (phylloquinone or phytonadione), which comes from plants and makes up your dietary vitamin K. The second is vitamin K<sub>2</sub>, a family of substances called menaquinones, which are made by intestinal bacteria and also found in butter, cow liver, chicken, egg yolks, fermented soybean products, and some cheeses. Third, there is vitamin K<sub>3</sub> (menadione), which is a synthetic, man-made substance.

### Sources

Vitamin K<sub>1</sub> is found in some foods, including asparagus, blackstrap molasses, broccoli, Brussels sprouts, cabbage, cauliflower, chicken, dark green leafy vegetables, egg yolks, leaf lettuce, liver, oatmeal, oats, rye, safflower oil, soybeans, wheat, and yogurt. Herbs that can supply vitamin K<sub>1</sub> include alfalfa, green tea, kelp, nettle, oat straw, and shepherd's purse. However, the majority of the body's supply of this vitamin is synthesized by the "friendly" bacteria normally present in the intestines, which comes as a result of consuming soluble fiber.

### Comments

Antibiotics increase the need for dietary or supplemental vitamin K. Because bacteria in the intestines synthesize vitamin K, taking antibiotics—which kill the bacteria—interferes with this process. Antibiotics also interfere with the absorption of vitamin K. Vitamin K deficiency can be caused by any of the following:

- A poor or restricted diet lacking in fiber.
- Crohn's disease, ulcerative colitis.
- Liver disease that interferes with vitamin K storage.
- The use of antibiotics, cholesterol-lowering drugs, mineral oil, aspirin, and/or blood-thinners.

Low levels of vitamin K are associated with insulin release and glucose regulation problems, and may lead to low bone density in women. Supplementing the diet with this vitamin enhances the bone-building process by attracting calcium to the bone. Supplemental vitamin K also reduces the amount of calcium in the urine and frees up more calcium to be used by the bone-building process.

### Cautions

Do not take large doses of synthetic vitamin K during the last few weeks of pregnancy. It can result in a toxic reaction in the newborn. If you are taking anticoagulant (blood-thinning) drugs, consult with your health care provider before taking any supplemental vitamin K, as it can interfere with the action of these medications. Megadoses of this vitamin can accumulate in the body and cause flushing and sweating.

### Bioflavonoids

Although bioflavonoids are not true vitamins in the strictest sense, they are sometimes referred to as vitamin P. Bioflavonoids are essential for the absorption of vitamin C, and the two should be taken together. There are many different bioflavonoids, including citrin, eriodictyol, flavones, hesperetin, hesperidin, quercetin, quercetrin, and rutin. The human body cannot produce bioflavonoids, so they must be supplied in the diet.

Bioflavonoids are used extensively in the treatment of athletic injuries because they relieve pain, bumps, and bruises. They also reduce pain located in the legs or across the back, and lessen symptoms associated with prolonged bleeding and low serum calcium. Bioflavonoids act synergistically with vitamin C to protect and preserve the structure of capillaries. In addition, bioflavonoids have an antibacterial effect and promote circulation, stimulate bile production, lower cholesterol levels, and treat and prevent cataracts. When taken with vitamin C, bioflavonoids also reduce the symptoms of oral herpes.

Quercetin, a bioflavonoid available in supplement form, may effectively treat and prevent asthma symptoms. Activated Quercetin from Source Naturals is a good source of quercetin. It also contains two other ingredients that increase its efficacy: bromelain, an enzyme from pineapple, and vitamin C, in the nonacidic form of magnesium ascorbate. Bromelain and quercetin are synergists, and should be taken in conjunction to enhance absorption.

### Sources

Peppers, buckwheat, black currants, and the white material just beneath the peel of citrus fruits contain bioflavonoids. Sources of bioflavonoids include apricots, blackberries, cherries, grapefruit, grapes, lemons, oranges, plums, and prunes. Herbs that contain bioflavonoids include chervil,

elderberries, hawthorn berry, rose hips, and shepherd's purse.

### Comments

Extremely high doses of bioflavonoids may cause diarrhea.

### Coenzyme Q<sub>10</sub>

Coenzyme Q<sub>10</sub> is a vitamin-like substance found in all parts of the body, the action of which resembles that of vitamin E. It may be an even more powerful antioxidant. It is also called ubiquinone. There are ten common substances designated coenzyme Qs, but coenzyme Q<sub>10</sub> is the only one found in human tissue. This substance plays a critical role in the production of energy in every cell of the body. It aids circulation, stimulates the immune system, increases tissue oxygenation, and has vital anti-aging effects. Deficiencies of coenzyme Q<sub>10</sub> have been linked to periodontal disease, diabetes, and muscular dystrophy.

Research has revealed that supplemental coenzyme Q<sub>10</sub> has the ability to counter histamine, and therefore is beneficial for people with allergies, asthma, or respiratory disease. Many people also use it when taking cholesterol-lowering drugs in the statin family to reduce leg cramps. Medical literature does not support this practice, but coenzyme Q<sub>10</sub> is not harmful and there is enough anecdotal information that it may relieve cramping, so it can't hurt to try it.

Coenzyme Q<sub>10</sub> is used by many health care professionals to treat anomalies of mental function, such as those associated with schizophrenia and Alzheimer's disease. It is also beneficial in fighting obesity, candidiasis, multiple sclerosis, and diabetes. Other conditions—such as heart disease, migraines, and Parkinson's disease—are related to a defect in the body's ability to turn food into energy, and coenzyme Q<sub>10</sub> may help.

Coenzyme Q<sub>10</sub> appears to be a giant step forward in the treatment and prevention of cardiovascular disease. A six-year study conducted by scientists at the University of Texas found that people being treated for congestive heart failure who took coenzyme Q<sub>10</sub> in addition to conventional therapy had a 75 percent chance of survival after three years, compared with a 25 percent survival rate for those using conventional therapy alone. In a similar study by the University of Texas and the Center for Adult Diseases in

Japan, coenzyme Q<sub>10</sub> was shown to be able to lower high blood pressure without medication or dietary changes.

In addition to its use in fighting cardiovascular disease, coenzyme Q<sub>10</sub> has been shown to be effective in reducing mortality in experimental animals afflicted with tumors and leukemia. Some doctors give their patients coenzyme Q<sub>10</sub> to reduce the side effects of cancer chemotherapy.

Coenzyme Q<sub>10</sub> is widely used in Japan. More than 12 million people in that country are reportedly taking it at the direction of their physicians for treatment of heart disease (it strengthens the heart muscle) and high blood pressure, and also to enhance the immune system. Research in Japan has shown that coenzyme Q<sub>10</sub> also protects the stomach lining and duodenum, and may help heal duodenal ulcers.

The amount of coenzyme Q<sub>10</sub> present in the body declines with age, so it should be supplemented in the diet, especially by people who are over the age of fifty. A chewable form containing 50 milligrams or more of this vital nutrient, available from FoodScience of Vermont, is an especially easy to assimilate supplement. Nature's Plus and Carlson Labs both make soft gel-capsules of coenzyme Q<sub>10</sub> in dosage levels up to 300 milligrams. Oil-based forms are best.

### Sources

Mackerel, salmon, and sardines contain the largest amounts of coenzyme Q<sub>10</sub>. It is also found in beef, peanuts, and spinach. People consume about 10 to 15 milligrams a day, mainly from meat and fish. Vegetarians should be aware that their intake may be less than optimal and should consider supplementation.

### Comments

Coenzyme Q<sub>10</sub> is oil soluble and is best absorbed when taken with oily or fatty foods, such as fish. Be cautious when purchasing coenzyme Q<sub>10</sub>. Not all products offer it in its purest form. Its natural color is dark bright yellow to orange, and it has very little taste in the powdered form. It should be kept away from heat and light. Pure coenzyme Q<sub>10</sub> is perishable and deteriorates in temperatures above 115°F. A liquid or oil form is preferable.

# Minerals

## INTRODUCTION

Every living cell on this planet depends on minerals for proper function and structure. Minerals are needed for the proper composition of body fluids, the formation of blood and bone, the maintenance of healthy nerve function, and the regulation of muscle tone, including that of the muscles of the cardiovascular system. Like vitamins, minerals function as coenzymes, enabling the body to perform its functions, including energy production, growth, and healing. Because all enzyme activities involve minerals, minerals are essential for the proper utilization of vitamins and other nutrients.

The human body, as with all of nature, must maintain its proper chemical balance. This balance depends on the levels of different minerals in the body and especially the ratios of certain mineral levels to one another. The level of each mineral in the body has an effect on every other one, so if one is out of balance, all mineral levels are affected. If not corrected, this can start a chain reaction of imbalances that leads to illness.

Minerals are naturally occurring elements found in the earth. Rock formations are made up of mineral salts. Rock and stone are gradually broken down into tiny fragments by erosion, a process that can take literally millions of years.

The resulting dust and sand accumulate, forming the basis of soil. The soil is teeming with microbes that utilize these tiny crystals of mineral salts, which are then passed from the soil to plants. Herbivorous animals eat the plants. We obtain these minerals by consuming plants or herbivorous animals.

Nutritionally, minerals belong to two groups: bulk minerals (also called macrominerals) and trace minerals (microminerals).

Bulk minerals include calcium, magnesium, sodium, potassium, and phosphorus. These are needed in larger amounts than trace minerals. Although only minute quantities of trace minerals are needed, they are nevertheless important for good health. Trace minerals include boron, chromium, copper, germanium, iodine, iron, manganese, molybdenum, selenium, silicon, sulfur, vanadium, and zinc.

Because minerals are stored primarily in the body's bone and muscle tissue, it is possible to develop mineral toxicity if extremely large quantities are consumed. Such situations are rare, however, because toxic levels of minerals generally accumulate only if massive amounts are ingested for a prolonged period of time.

## WHAT'S ON THE SHELVES

As with vitamins, it can be difficult, if not impossible, to obtain the amounts of minerals needed for optimum health through diet alone. Mineral supplements can help you to make sure you are getting all the minerals your body requires.

Minerals are often found in multivitamin formulas. Minerals also are sold as single supplements. These are available in tablet, capsule, powder, and liquid forms. Some are available in chelated form, which means that the minerals are bonded to protein molecules that transport them to the bloodstream and enhance their absorption. When mineral supplements are taken with a meal, they are usually automatically chelated in the stomach during digestion. There is some controversy over which mineral supplements are best, but we prefer the chelated preparations. Our experience with the various chelated formulas available has shown that, in general, arginate forms of minerals make the most effective supplements.

Once a mineral is absorbed, it must be carried by the blood to the cells and then transported across the cell membranes in a form that can be utilized by the cells. After minerals enter the body, they compete with one another for absorption. For example, too much zinc can deplete the body of copper; excessive calcium intake can affect magnesium absorption (and vice versa). Consequently, supplemental minerals should always be taken in balanced amounts. Otherwise, they will not be effective and may even be harmful. The absorption of minerals can also be affected by the use of fiber supplements. Fiber decreases the body's absorption of minerals. Therefore, supplemental fiber and minerals should be taken at different times.

## THE ABCs OF MINERALS

### Boron

Boron is needed in trace amounts for healthy bones and muscle growth because it assists in the production of natural steroid compounds within the body. It is also necessary for the metabolism of calcium, phosphorus, and magnesium.

Boron enhances brain function, promotes alertness, and plays a role in how the body utilizes energy from fats and sugars. Most people are not deficient in boron. However, elderly people usually benefit from taking a supplement of 2 to 3 milligrams daily because they have greater problems

with calcium absorption. Boron deficiency accentuates vitamin D deficiency.

Boron helps to prevent postmenopausal osteoporosis and build muscle. New research indicates that taking supplemental boron can shrink prostate tumor size, lower blood levels of prostate-specific antigen (PSA, a marker for prostate cancer), and may help prevent prostate cancer. Boron alleviates joint discomfort by reducing levels of both COX-2 and LOX enzymes (*see* ARTHRITIS in Part Two) and helps to preserve cognitive function. Studies have shown that in areas of the world where the level of boron in the soil is low there are a greater number of people suffering from arthritis. A study conducted by the U.S. Department of Agriculture indicated that within eight days of supplementing their daily diet with 3 milligrams of boron, a test group of postmenopausal women lost 40 percent less calcium, one-third less magnesium, and slightly less phosphorus through their urine than they had before beginning boron supplementation.

### Sources

Boron is found naturally in apples, carrots, grapes, dark green leafy vegetables, raw nuts, pears, and whole grains.

### Cautions

Do not take more than 3 to 6 milligrams of supplemental boron daily unless it is prescribed by a health care professional. Boron is toxic in high doses (15 milligrams or more daily for adults, less for children) but is not carcinogenic or mutagenic. Many supplements for bone health contain 3 milligrams of boron. If you are also using a multivitamin/multimineral supplement, be sure that your total intake through diet and supplements does not exceed 20 milligrams.

### Calcium

Calcium is vital for the formation of strong bones and teeth and for the maintenance of healthy gums. It is also important in the maintenance of a regular heartbeat and in the transmission of nerve impulses. Calcium lowers cholesterol levels and helps prevent cardiovascular disease. It is needed for muscular growth and contraction, and for the prevention of muscle cramps. It may increase the rate of bone growth and bone mineral density in children. Recently, calcium from dairy products or supplements has been shown to promote weight loss, especially in terms of fat loss. However, these findings are not universally accepted.

This important mineral is also essential in blood clotting and helps prevent cancer. It may lower blood pressure and prevent bone loss associated with osteoporosis as well. Calcium provides energy and participates in the protein structuring of RNA and DNA. It is also involved in the ac-

tivation of several enzymes, including lipase, which breaks down fats for utilization by the body. In addition, calcium maintains proper cell membrane permeability, aids in neuromuscular activity, helps to keep the skin healthy, and protects against the development of preeclampsia during pregnancy, the number-one cause of maternal death. If high blood pressure develops due to pregnancy, it can be reduced by calcium intake.

Calcium protects the bones and teeth from lead by inhibiting absorption of this toxic metal. If there is a calcium deficiency, lead can be absorbed by the body and deposited in the teeth and bones.

Calcium deficiency can lead to the following problems: aching joints, brittle nails, eczema, elevated blood cholesterol, heart palpitations, hypertension (high blood pressure), insomnia, muscle cramps, nervousness, numbness in the arms and/or legs, a pasty complexion, rheumatoid arthritis, rickets, and tooth decay. Deficiencies of calcium are also associated with cognitive impairment, convulsions, depression, delusions, and hyperactivity.

### Sources

Calcium is found in dairy foods, salmon (with bones), sardines, seafood, and dark green leafy vegetables. Other food sources include almonds, asparagus, blackstrap molasses, brewer's yeast, broccoli, buttermilk, cabbage, carob, cheese, collards, dandelion greens, dulse, figs, filberts, goat's milk, kale, kelp, milk, mustard greens, oats, prunes, sesame seeds, soybeans, tofu, turnip greens, watercress, whey, and yogurt.

Herbs that contain calcium include alfalfa, burdock root, cayenne, chamomile, chickweed, chicory, dandelion, eyebright, fennel seed, fenugreek, flaxseed, hops, kelp, lemongrass, mullein, nettle, oat straw, paprika, parsley, peppermint, plantain, raspberry leaves, red clover, rose hips, shepherd's purse, violet leaves, yarrow, and yellow dock. The amount of calcium in these herbs is so small, however, that they should not be considered as contributing to dietary intake.

### Comments

The amino acid lysine is needed for calcium absorption. Food sources of lysine include cheese, eggs, fish, lima beans, milk, potatoes, red meat, soy products, and brewer's yeast. Lysine is also available in supplement form.

Female athletes and menopausal women need greater amounts of calcium than other women because their estrogen levels are lower. Estrogen protects the skeletal system by promoting the deposition of calcium in bone.

Heavy exercising hinders calcium uptake, but moderate exercise promotes it. Insufficient vitamin D intake, or the ingestion of excessive amounts of phosphorus and magnesium, also hinders the uptake of calcium.

If you are taking medication for osteoporosis, a supplement containing vitamin D and calcium is required to help the medicine work properly. Other types of prescription medicines, such as steroids and anticonvulsants (antiseizure drugs), interfere with bone metabolism, and taking supplemental calcium will help with that.

If calcium is taken with iron, they bind together, preventing the optimal absorption of both minerals. It is therefore best to take calcium and iron at different times. Too much calcium can interfere with the absorption of zinc, and excess zinc can interfere with calcium absorption (especially if calcium intake is low). For most people, the best ratio between supplemental calcium and zinc is up to 2,500 milligrams of calcium with 50 milligrams of zinc daily. A hair analysis can determine the levels of these and other minerals in the body.

A diet that is high in protein, fat, and/or sugar affects calcium uptake. The average American diet of meats, refined grains, and soft drinks (which are high in phosphorus) leads to increased excretion of calcium. Consuming alcoholic beverages, coffee, junk foods, excess salt, and/or white flour also leads to the loss of calcium by the body. A diet based on foods such as vegetables, fruits, and whole grains, which contain significant amounts of calcium but lower amounts of phosphorus, is preferable.

Oxalic acid (found in almonds, beet greens, cashews, chard, cocoa, rhubarb, soybeans, and spinach) interferes with calcium absorption by binding with it in the intestines and producing insoluble salts that cannot be absorbed. The normal consumption of foods containing oxalic acid should not pose a problem, but overindulgence in these foods inhibits the absorption of calcium. Oxalic acid can also combine with calcium to form calcium-oxalate kidney stones. Studies have shown, however, that taking magnesium and potassium supplements can prevent the formation of this type of stone.

Calcium supplements are more effective when taken in smaller doses spread throughout the day and before bedtime. This mineral works *less* effectively when taken in a single megadose. Most experts agree that no more than 500 milligrams should be taken at one time, as this is the maximum amount the body can absorb in one dose. However, because calcium also promotes a sound sleep when taken at night, and because a high-fiber diet can interfere with calcium absorption, some recommend taking a single dose at bedtime. The National Academy of Sciences recommends an intake of at least 1,000 to 1,300 milligrams of calcium per day, particularly for those who have or are at risk of developing osteoporosis. Because the body is more likely to absorb a higher percentage of the calcium when taken in smaller doses, we recommend taking 1,500 to 2,000 milligrams in divided doses with food throughout the day.

Some vitamin companies use a compound called D<sub>1</sub>-calcium phosphate in their products. This form of calcium is insoluble and interferes with the absorption of the nutrients in a multinutrient supplement. Antacids such as Tums

are *not* recommended as a source of calcium. While they do contain calcium, if taken in quantities sufficient to serve as a source of this mineral, they could neutralize the stomach acid needed for calcium absorption. Additionally, a significant percentage (estimates range from 20 to 40 percent) of people over the age of sixty may have a condition called *atrophic gastritis*. This is a chronic inflammation of the stomach, and it reduces the ability to break down the calcium carbonate contained in Tums. People under sixty are more likely to have an overproduction of acid; in that case, calcium carbonate could neutralize some of the excess and reduce the associated symptoms of belching, gas, and bloating.

Since the amount of calcium required per day is large, some people find it difficult to swallow the pills. Chewable versions are available; these are ideal for children who do not meet calcium needs from dairy products. It is best to match the percentage Daily Value for calcium and vitamin D. For example, a good product would have 50 percent DV for calcium and vitamin D in a single unit. Then you can take two or more depending upon your need.

### Cautions

Calcium may interfere with the effects of verapamil (Calan, Isoptin, Verelan), a calcium channel blocker sometimes prescribed for heart problems and high blood pressure.

Calcium can also interfere with the effectiveness of tetracycline, thyroid hormone, certain anticonvulsants, and steroids. Consult your health care provider before taking supplemental calcium if you must take any of these drugs.

Phenobarbital and diuretics may cause a deficiency of calcium. Although several major studies have shown that added calcium in the diet does not appear to increase the risk for either a first or repeat attack of kidney stones, persons with a history of kidney stones or kidney disease should not take calcium supplements except on the advice of a physician. The maximum safe dosage of supplemental calcium is now placed at 2,500 milligrams per day.

Newer data has shown that calcium from dairy and supplements increases the risk of prostate cancer. Men in the United States who consumed more than 2½ servings a day of dairy products (about 600 milligrams) had a 32 percent increase in prostate cancer. Studies done in Europe found a relationship between dairy product consumption and the nonaggressive form of prostate cancer but not the aggressive form. The low-fat dairy products were more harmful than those with more fat or than calcium-containing foods that are not dairy products. Dairy products may also lead to an increased risk when used in conjunction with a high-protein diet.

### Chromium

Because it is involved in the metabolism of glucose, chromium (sometimes also called glucose tolerance factor or GTF) is needed for energy. It is also vital in the synthesis of

## Is Chromium Picolinate Safe?

An Australian study published in *Angewandte Chemie International Edition* in 2004 warned that trivalent chromium compounds like those used as supplements (chromium picolinate) can be converted into a carcinogenic form by

means of oxidation in the body. This flies in the face of a wealth of data in more than sixty other published studies that found such chromium compounds to be safe and nontoxic. At this point, there appears to be no cause for alarm.

cholesterol, fats, and proteins. This essential mineral maintains stable blood sugar levels through proper insulin utilization, and can be helpful both for people with diabetes and those with hypoglycemia. Studies have shown that low plasma chromium levels can be an indication of coronary artery disease. Additional chromium is needed during pregnancy because the developing fetus increases demand for this mineral. Chromium supplements can help an expectant mother maintain healthy blood sugar levels during pregnancy.

The average American diet is chromium deficient. Only one in ten Americans has an adequate amount of chromium in his or her diet. There are five main reasons for this: The form of chromium in many foods is not easily absorbed (only 0.4 to 2.5 percent of dietary chromium is absorbed); not enough foods containing chromium are consumed; much of the chromium content is lost during processing; many people do not like the foods that are the best sources of chromium; and high quantities of sugar in the diet cause a loss of chromium from the body. Researchers estimate that two out of every three Americans have glucose regulation issues including hypoglycemia, prehypoglycemia, or diabetes. The ability to maintain normal blood sugar levels is jeopardized by the lack of chromium in our soil and water supply and by a diet high in refined white sugar, flour, and junk foods. A number of human and animal studies have found that chromium supplements can improve insulin sensitivity and blood sugar control in the face of insulin resistance, elevated blood glucose levels, impaired glucose tolerance, and diabetes.

A deficiency of chromium can lead to anxiety, fatigue, glucose intolerance (particularly in people with diabetes), inadequate metabolism of amino acids, and an increased risk of arteriosclerosis. Excessive intake (the level depends upon individual tolerance) can lead to chromium toxicity, which has been associated with dermatitis, gastrointestinal ulcers, and kidney and liver impairment. No toxicities have been reported, and thus chromium does not have an Upper Limit of Safety (UL). (See the chart on page 11 for this book's recommended chromium intake.) As depicted in the movie *Erin Brockovich*, people can become ill from chromium, but it is important to note that this was a different form of the mineral. The form that is obtained through diet is called divalent and the one that is toxic is hexavalent.

Supplemental chromium is best absorbed by the body when it is taken in a form called *chromium picolinate* (chromium chelated with picolinate, a naturally occurring amino acid metabolite).

Picolinate enables chromium to readily enter into the body's cells, where the mineral can then help insulin do its job much more effectively.

Chromium picolinate has been used successfully to control blood cholesterol and blood glucose levels. The NIH funded a study to look at the benefits of chromium picolinate for patients with diabetes and heart disease. Preliminary data shows it lowers blood sugar and cholesterol. It also promotes the loss of fat and an increase in lean muscle tissue. Studies show it may increase longevity and help to fight osteoporosis. In addition, when combined with biotin, chromium picolinate reduces insulin resistance and reduces "bad" (LDL) cholesterol in patients with type 2 diabetes.

Chromium polynicotinate (chromium bonded to niacin) is an effective form of this mineral as well.

### Sources

Chromium is found in the following food sources: beef, beer, brewer's yeast, brown rice, cheese, turkey, fish, and whole grains. It may also be found in dried beans, blackstrap molasses, broccoli, calf liver, chicken, corn and corn oil, dairy products, dried liver, dulse, eggs, green beans, mushrooms, and potatoes. Herbs that contain chromium include catnip, licorice, nettle, oat straw, red clover, sarsaparilla, wild yam, and yarrow.

### Comments

Active, athletic individuals—people who engage in vigorous aerobic activities and consume higher amounts of carbohydrates than the general population—have higher chromium requirements than nonathletes. Chromium levels start to decrease as we age, starting in our early forties.

Some smaller studies have confirmed that added chromium in the diet can reduce total body fat and increase the percentage of muscle.

### Cautions

If you have insulin-dependent diabetes, you should not use chromium unless your health care practitioner prescribes it. Chromium supplements can make insulin function more effectively and, in effect, reduce insulin requirements. People

with diabetes therefore have to monitor their blood sugar levels very carefully when using chromium. Chromium requirements differ from person to person; consult your health care provider to determine the correct amount of this mineral for you.

Some people experience light-headedness or a slight skin rash when taking chromium. If you feel light-headed, stop taking the supplement and consult your health care provider. If you develop a rash, either try switching brands or discontinue use.

## Copper

Among its many functions, copper aids in the formation of bone, hemoglobin, and red blood cells, and works in balance with zinc and vitamin C to form elastin, an important skin protein. It is involved in the healing process, energy production, hair and skin coloring, and taste sensitivity.

This mineral is also needed for healthy nerves and joints. One of the early signs of copper deficiency is osteoporosis.

Copper is essential for the formation of collagen, one of the fundamental proteins making up bones, skin, and connective tissue. Other possible signs of copper deficiency include anemia, baldness, diarrhea, general weakness, impaired respiratory function, and skin sores. A lack of copper can also lead to increased blood fat levels. (See COPPER DEFICIENCY in Part Two.)

Excessive intake of copper can lead to toxicity, which has been associated with depression, irritability, nausea and vomiting, nervousness, and joint and muscle pain. Ingesting a quantity as small as 10 milligrams usually causes nausea. Sixty milligrams generally results in vomiting, and just 3.5 grams (3,500 milligrams) can be fatal. Children can be affected at much smaller dosage levels. (See COPPER TOXICITY in Part Two.)

## Sources

Besides its use in cookware and plumbing, copper is also widely distributed in foods. Food sources include almonds, avocados, barley, beans, beets, blackstrap molasses, broccoli, garlic, lentils, liver, mushrooms, nuts, oats, oranges, pecans, radishes, raisins, salmon, seafood, soybeans, and green leafy vegetables.

## Comments

The level of copper in the body is related to the levels of zinc and vitamin C. Copper levels are reduced if large amounts of zinc or vitamin C are consumed. If copper intake is too high, levels of vitamin C and zinc drop.

The consumption of high amounts of fructose (fruit sugar) can make a copper deficiency significantly worse. In a study conducted by the U.S. Department of Agriculture, people who obtained 20 percent of their daily calories from fructose showed decreased levels of red blood cell super-

oxide dismutase (SOD), a copper-dependent enzyme critical to antioxidant protection within the red blood cells.

## Cautions

Excessive copper in the body can promote destruction of eye tissue through oxidation. Persons with eye problems should be especially careful to balance their intake of copper with that of iron, zinc, and calcium. In one study, elderly individuals who consumed a high-fat diet, rich in saturated fat and trans fat, and had high copper intakes (greater than 1.6 milligrams per day), seemed to experience greater cognitive impairment compared to those who ate a diet low in these fats or a diet lower in copper (0.88 mg per day) with high amounts of these dietary fats. In this study, it was best to get copper from foods rather than supplements.

## Germanium

Germanium improves cellular oxygenation, but is not an essential nutrient. It helps to fight pain, keep the immune system functioning properly, and rid the body of toxins and poisons. Researchers have shown that consuming foods containing organic germanium is an effective way to increase tissue oxygenation, because, like hemoglobin, germanium acts as a carrier of oxygen to the cells. A Japanese scientist, Kazuhiko Asai, found that an intake of 100 to 300 milligrams of germanium per day improved many illnesses, including rheumatoid arthritis, food allergies, elevated cholesterol, candidiasis, chronic viral infections, cancer, and AIDS.

## Sources

Germanium is found in all organic material, of both plant and animal origin. The following foods contain the greatest concentrations of germanium: broccoli, celery, garlic, shiitake mushrooms, milk, onions, rhubarb, sauerkraut, tomato juice, and the herbs aloe vera, comfrey, ginseng, and suma.

## Comments

Germanium is best obtained through the diet.

## Cautions

Although it is rare, some individuals may have a toxic reaction to this mineral if they take it in excessive amounts. People have been known to develop kidney problems, and there have been some deaths associated with germanium. Speak to a health care professional before using it, particularly if you have kidney problems.

## Iodine

Needed only in trace amounts, iodine helps to metabolize excess fat and is important for physical and mental devel-

opment. It is also needed for a healthy thyroid gland and for the prevention of goiter, a grossly swollen gland rarely seen these days. Certain parts of the country have little or no iodine in the soil, and isolated agrarian cultural groups that refrained from using iodized salt and cattle feed were subject to this disorder. Iodine deficiency in children may result in mental retardation. In addition, iodine deficiency has been linked to breast cancer and is associated with fatigue, neonatal hypothyroidism, and weight gain.

Excessive iodine intake (sometimes as little as 750 micrograms daily) may inhibit the secretion of thyroid hormone and can produce a metallic taste and sores in the mouth, swollen salivary glands, diarrhea, and vomiting. If you have any problem with your thyroid, speak with your physician about iodine. In most cases, however, the small risk of chronic iodine excess is far outweighed by the hazards of a low-iodine diet. It is especially important for women of childbearing age and children to get adequate amounts of iodine.

### Sources

Foods that are high in iodine include dairy products (from cattle fed iodine-supplemented feed and salt licks), iodized salt, seafood, saltwater fish, and kelp. It may also be found in asparagus, dulse, garlic, lima beans, mushrooms, sea salt (which provides nature's own balance of minerals), sesame seeds, soybeans, spinach (*see* Comments, below), summer squash, Swiss chard, and turnip greens. Most fruits and vegetables grown near the coasts contain more iodine than those grown inland.

### Comments

Some foods block the uptake of iodine into the thyroid gland when eaten raw in large amounts. These include Brussels sprouts, cabbage, cauliflower, kale, peaches, pears, spinach, and turnips. If you have an underactive thyroid, you should limit your consumption of these foods.

### Iron

Perhaps the most important of iron's functions in the body is the production of hemoglobin and myoglobin (the form of hemoglobin found in muscle tissue), and the oxygenation of red blood cells. Iron is the mineral found in the largest amounts in the blood. It is essential for many enzymes, including catalase, and is important for growth. Iron is also required for a healthy immune system and for energy production.

Iron deficiency is most often caused by insufficient intake. However, it may result from intestinal bleeding, a diet high in phosphorus, poor digestion, long-term illness, ulcers, prolonged use of antacids, excessive coffee or tea consumption, and other causes. Menstruating women may become iron deficient, especially if they have heavy or pro-

longed periods and/or short menstrual cycles. In some cases, a deficiency of vitamin B<sub>6</sub> (pyridoxine) or vitamin B<sub>12</sub> can be the underlying cause of anemia. Strenuous exercise and heavy perspiration also deplete iron from the body. Strict vegetarians are susceptible to iron deficiency and should have regular blood tests to check iron levels.

Iron deficiency symptoms include anemia, brittle hair, difficulty swallowing, digestive disturbances, dizziness, fatigue, fragile bones, hair loss, inflammation of the tissues of the mouth, nails that are spoon-shaped or that have ridges running lengthwise, nervousness, obesity, pallor, and slowed mental reactions.

Because iron is stored in the body, excessive iron intake can also cause problems. Too much iron in the tissues and organs leads to the production of free radicals and increases the need for vitamin E. High levels of iron were once thought to be associated with heart disease and cancer. Newer data indicates that having high iron stores does not seem to predict who will get cancer but may predict who will get heart disease. However, ferritin, a protein in the body that binds to iron, was associated with an increased risk of cancer in women when the level was greater than 160 micrograms per liter.

The buildup of iron in the tissues has been associated with a rare disease known as hemochromatosis, a hereditary disorder of iron metabolism that is found mostly in men and postmenopausal women and that causes excessive absorption of iron from both foods and supplements, leading to bronze skin pigmentation, arthritis, cirrhosis of the liver, diabetes, and heart disorders.

### Sources

Iron is found in eggs, fish, liver, meat, poultry, green leafy vegetables, whole grains, and enriched breads and cereals. Other food sources with lesser amounts include almonds, avocados, beets, blackstrap molasses, brewer's yeast, dates, dulse, kelp, kidney and lima beans, lentils, millet, peaches, pears, dried prunes, pumpkins, raisins, rice and wheat bran, sesame seeds, soybeans, and watercress. Herbs that contain very small amounts of iron include alfalfa, burdock root, catnip, cayenne, chamomile, chickweed, chicory, dandelion, dong quai, eyebright, fennel seed, fenugreek, kelp, lemongrass, licorice, milk thistle seed, mullein, nettle, oat straw, paprika, parsley, peppermint, plantain, raspberry leaf, rose hips, sarsaparilla, shepherd's purse, uva ursi, and yellow dock. Foods are distinguished between heme iron (only from animal sources) and non-heme sources. The heme iron foods present iron in a form that is more readily absorbed into the body.

### Comments

Unless you are diagnosed as anemic, are menstruating, or are of childbearing age, you should not take iron supplements. If you take a multivitamin and mineral supplement,

choose a product that does not contain iron. Be sure to read labels. Some products contain iron below the DRI and should be avoided by everyone; the amount in these products is too low if you are anemic or require iron and too high if you don't need more. If you do need to take iron supplements, do not take them at the same time as vitamin E, and choose an organic form of iron such as ferrous gluconate or ferrous fumarate. Inorganic forms of iron, such as ferrous sulfate, can oxidize vitamin E. The RDA for iron is 8 milligrams per day for adult men, 12 milligrams a day for male children above age ten, and 18 milligrams per day for adult women and girls over eleven years of age (27 milligrams for pregnant women).

There must be sufficient hydrochloric acid (HCl) present in the stomach in order for iron to be absorbed. Copper, manganese, molybdenum, vitamin A, and the B-complex vitamins are also needed for complete iron absorption. Taking vitamin C can increase iron absorption by as much as 30 percent.

Taking calcium with meals can inhibit the absorption of iron from dietary sources. If you are iron deficient, take calcium supplements at bedtime or at other times when you are not consuming foods containing iron. Excessive amounts of zinc and vitamin E can also interfere with iron absorption. The utilization of iron may be impaired by rheumatoid arthritis and cancer. These diseases can result in anemia despite adequate amounts of iron stored in the liver, spleen, and bone marrow. Iron deficiency is more prevalent in people with candidiasis or chronic herpes infections.

### Cautions

Do not take iron supplements if you have an infection. Because bacteria require iron for growth, the body "hides" iron in the liver and other storage sites when an infection is present. Taking extra iron at such times encourages the proliferation of bacteria in the body. Iron may cause constipation.

### Magnesium

Magnesium is a vital catalyst in enzyme activity, especially the activity of those enzymes involved in energy production. It also assists in calcium and potassium uptake. A deficiency of magnesium interferes with the transmission of nerve and muscle impulses, causing irritability and nervousness. Supplementing the diet with magnesium can help prevent depression, dizziness, muscle weakness and twitching, and premenstrual syndrome (PMS), and also aids in maintaining the body's proper pH balance and normal body temperature.

Magnesium is necessary to prevent the calcification of soft tissue. This essential mineral protects the arterial linings from stress caused by sudden blood pressure changes, and plays a role in the formation of bone and in carbohydrate and mineral metabolism. With vitamin B<sub>6</sub> (pyridox-

ine), magnesium helps to reduce and dissolve calcium-phosphate kidney stones, and may prevent calcium-oxalate kidney stones. Research has shown that magnesium may help prevent cardiovascular disease, osteoporosis, and certain forms of cancer, and it may reduce cholesterol levels. It is effective in preventing premature labor and convulsions in pregnant women.

Studies have shown that taking magnesium supplements during pregnancy has a dramatic effect in reducing birth defects. A study reported by the *Journal of the American Medical Association* reported a 70 percent lower incidence of mental retardation in the children of mothers who had taken magnesium supplements during pregnancy. The incidence of cerebral palsy was 90 percent lower.

Possible manifestations of magnesium deficiency include confusion, insomnia, irritability, poor digestion, rapid heartbeat, seizures, and tantrums; often, a magnesium deficiency can be synonymous with diabetes. Magnesium deficiencies are at the root of many cardiovascular problems.

Magnesium deficiency may be a major cause of fatal cardiac arrhythmia, hypertension, and sudden cardiac arrest, as well as asthma, chronic fatigue and chronic pain syndromes, depression, insomnia, irritable bowel syndrome, and pulmonary disorders. Research has also shown that magnesium deficiency may contribute to the formation of kidney stones. To test for magnesium deficiency, a procedure called an intracellular (mononuclear cell) magnesium screen should be performed. This is a more sensitive test than the typical serum magnesium screen, and can detect a deficiency with more accuracy. Magnesium screening should be a routine test, as a low magnesium level makes nearly every disease worse. It is particularly important for individuals who have, or who are considered at risk for developing, cardiovascular disease. Muscle biopsies give a better picture of your magnesium status than blood tests do.

### Sources

Magnesium is found in most foods, especially dairy products, fish, meat, and seafood. Other rich food sources include apples, apricots, avocados, bananas, black-eyed peas, blackstrap molasses, brewer's yeast, brown rice, cantaloupe, dulce, figs, garlic, grapefruit, green leafy vegetables, kelp, lemons, lima beans, millet, nuts, peaches, salmon, sesame seeds, soybeans, tofu, torula yeast, watercress, wheat, and whole grains. Herbs that contain magnesium include alfalfa, bladderwrack, catnip, cayenne, chamomile, chickweed, dandelion, eyebright, fennel seed, fenugreek, hops, lemongrass, licorice, mullein, nettle, oat straw, paprika, parsley, peppermint, raspberry leaf, red clover, sage, shepherd's purse, yarrow, and yellow dock.

### Comments

The consumption of alcohol, the use of diuretics, diarrhea, the presence of fluoride, and high levels of zinc and vita-

min D all increase the body's need for magnesium. The consumption of large amounts of fats, cod liver oil, calcium, vitamin D, and protein decrease magnesium absorption. Fat-soluble vitamins also hinder the absorption of magnesium, as do foods high in oxalic acid, such as almonds, chard, cocoa, rhubarb, spinach, and tea.

## Manganese

Minute quantities of manganese are needed for protein and fat metabolism, healthy nerves, a healthy immune system, and blood sugar regulation. Manganese is used in energy production and is required for normal bone growth and for reproduction. In addition, it is used in the formation of cartilage and synovial (lubricating) fluid of the joints. It is also necessary for the synthesis of bone.

Manganese is essential for people with iron-deficiency anemia and is needed for the utilization of vitamin B<sub>1</sub> (thiamine) and vitamin E. Manganese works well with the B-complex vitamins to give an overall feeling of well-being. It aids in the formation of mother's milk and is a key element in the production of enzymes needed to oxidize fats and to metabolize purines, including the antioxidant enzyme superoxide dismutase (SOD).

A deficiency of manganese (which is extremely rare) may lead to atherosclerosis, confusion, convulsions, eye problems, hearing problems, heart disorders, high cholesterol levels, hypertension, irritability, memory loss, muscle contractions, pancreatic damage, profuse perspiration, rapid pulse, teeth grinding, tremors, and a tendency toward breast ailments.

## Sources

The largest quantities of manganese are found in avocados, nuts and seeds, seaweed, and whole grains. This mineral may also be found in blueberries, egg yolks, legumes, dried peas, pineapples, and green leafy vegetables. Herbs that contain manganese include alfalfa, burdock root, catnip, chamomile, chickweed, dandelion, eyebright, fennel seed, fenugreek, ginseng, hops, lemongrass, mullein, parsley, peppermint, raspberry, red clover, rose hips, wild yam, yarrow, and yellow dock.

## Molybdenum

This essential mineral is required in extremely small amounts for nitrogen metabolism. It aids in the final stages of the conversion of purines to uric acid. It promotes normal cell function, aids in the activation of certain enzymes, and is a component of the metabolic enzyme xanthine oxidase.

Molybdenum is found in the liver, bones, and kidneys. It supports bone growth and strengthening of the teeth. A low intake is associated with mouth and gum disorders and cancer. A molybdenum deficiency may cause impotence in older men. People whose diets are high in refined and processed foods are at risk for deficiency.

## Sources

This trace mineral is found in beans, beef liver, cereal grains, dark green leafy vegetables, legumes, and peas.

## Comments

Heat and moisture can change the action of supplemental molybdenum. A high intake of sulfur may decrease molybdenum levels. Excess amounts of molybdenum (more than 15 milligrams daily) may interfere with copper metabolism.

## Cautions

Do not take more than 15 milligrams of molybdenum daily. Higher doses may lead to the development of gout.

## Phosphorus

Phosphorus is needed for blood clotting, bone and tooth formation, cell growth, contraction of the heart muscle, normal heart rhythm, and kidney function. It also assists the body in the utilization of vitamins and the conversion of food to energy. A proper balance of magnesium, calcium, and phosphorus should be maintained at all times. If one of these minerals is present in either excessive or insufficient amounts, this will have adverse effects on the body.

Deficiencies of phosphorus are rare, but can lead to such symptoms as anxiety, bone pain, fatigue, irregular breathing, irritability, numbness, skin sensitivity, trembling, weakness, and weight changes.

## Sources

Phosphorus deficiency is rare because this mineral is found in most foods, especially processed cooked foods and carbonated soft drinks. Significant amounts of phosphorus are contained in asparagus; bran; brewer's yeast; corn; dairy products; eggs; fish; dried fruit; garlic; legumes; nuts; sesame, sunflower, and pumpkin seeds; meats; poultry; salmon; and whole grains.

## Comments

Excessive amounts of phosphorus interfere with calcium uptake. A diet high in processed cooked foods and junk food such as carbonated beverages is a common culprit. Vitamin D increases the effectiveness of phosphorus.

## Potassium

This mineral is important for a healthy nervous system and a regular heart rhythm. It helps prevent stroke, aids in proper muscle contraction, and works with sodium to control the body's water balance. Potassium is important for chemical reactions within the cells and aids in maintaining

stable blood pressure and in transmitting electrochemical impulses. A 1997 review of earlier studies showed that low potassium intake might be a significant factor in the development of high blood pressure. A high intake of potassium protects several body systems, including cardiovascular, kidney, and bone. The potassium in fruits and vegetables contains organic salts such as malate and citrate, which neutralize the acid urine that can cause kidney stones. Potassium also regulates the transfer of nutrients through cell membranes. This function of potassium has been shown to decrease with age, which may account for some of the circulatory damage, lethargy, and weakness experienced by older people. Together with magnesium, potassium can help prevent calcium-oxalate kidney stones.

In one study, healthy individuals with normal blood pressure experienced lower blood pressure from both potassium chloride and potassium citrate. The levels were still normal, but on the lower side of normal, which is desirable. The amount of potassium given in this study was the equivalent of what is found in five half-cup servings of fruits and vegetables. Anyone with high blood pressure would benefit from lowered blood pressure to reduce heart disease risk.

Signs of potassium deficiency include abnormally dry skin, acne, chills, cognitive impairment, constipation, depression, diarrhea, diminished reflex function, edema, nervousness, insatiable thirst, fluctuations in heartbeat, glucose intolerance, growth impairment, high cholesterol levels, insomnia, low blood pressure, muscular fatigue and weakness, nausea and vomiting, periodic headaches, proteinuria (protein in the urine), respiratory distress, and salt retention.

### Sources

Food sources of potassium include dairy foods, fish, fruit, legumes, meat, poultry, vegetables, and whole grains. High amounts are found in apricots, avocados, bananas, lima beans, blackstrap molasses, brewer's yeast, brown rice, dates, dulse, figs, dried fruit, garlic, nuts, potatoes, raisins, spinach, torula yeast, wheat bran, winter squash, yams, and yogurt. Herbs that contain potassium include catnip, hops, nettle, plantain, red clover, sage, and skullcap. In general, if it is grown in the ground—for example, fruits and vegetables—it is rich in potassium. In addition, these foods are very low in sodium. It is desirable to consume 2.5 to 3.5 grams of potassium per day from your diet.

### Comments

Kidney disorders, diarrhea, and the use of diuretics or laxatives all disrupt potassium levels. Tobacco and caffeine reduce potassium absorption. Using large amounts of licorice over long periods can deplete the body's potassium supply.

Potassium is needed for hormone secretion. The secretion of stress hormones causes a decrease in the potassium-

to-sodium ratio both inside and outside the cells. As a result, stress increases the body's potassium requirements.

Too much potassium from supplements could be harmful. Check with your health care professional before using potassium supplements.

### Selenium

Selenium's principal function is to inhibit the oxidation of lipids (fats) as a component of the enzyme glutathione peroxidase. It is a vital antioxidant, especially when combined with vitamin E. It protects the immune system by preventing the formation of free radicals that can damage the body. (See ANTIOXIDANTS in Part One.) It plays a vital role in regulating the effects of thyroid hormone on fat metabolism.

Selenium has also been found to function as a preventive against the formation of certain types of tumors. One study found that men who took 200 micrograms of selenium daily over a ten-year period had roughly half the risk of developing lung, prostate, and colorectal cancer as compared with men who did not.

Selenium and vitamin E act synergistically to aid in the production of antibodies and to help maintain a healthy heart and liver. This trace element is needed for pancreatic function and tissue elasticity. When combined with vitamin E and zinc, it may also provide relief from an enlarged prostate. Selenium supplementation has been found to protect the liver in people with alcoholic cirrhosis. Studies conducted at the University of Miami indicate that taking supplemental selenium may enhance the survival of people with AIDS by increasing both red and white blood cell counts. It has shown promise in the treatment of arthritis, cardiovascular disease, male infertility, cataracts, AIDS, and high blood pressure. For very sick patients in the intensive care unit, selenium appears to reduce mortality rates. In one study, the death rate was 14 percent lower in those getting a high dose of selenium (1,000 micrograms a day). Selenium is incorporated into over twenty-five proteins, called selenoproteins, that play pivotal roles in a number of bodily activities, from activating thyroid hormones to regenerating vitamin C.

Selenium deficiency has been linked to cancer and heart disease. It has also been associated with exhaustion, growth impairment, high cholesterol levels, infections, liver impairment, pancreatic insufficiency, and sterility. There is some thought that selenium deficiency might be linked to a host of viral outbreaks, from new strains of influenza to Ebola, wrought by the rapidly mutating virus's interaction with selenium-deficient hosts in places like Africa and China where there is little or no selenium in the soil.

Some have found selenium to be related to cognitive function. One study found that lower selenium content in fingernails was related to poorer cognitive function in a group of elderly Chinese. This finding supports the hypothesis that a lifelong low selenium level is associated with lower cognition.

## Sources

Selenium can be found in meat and grains, depending on the selenium content of the soil where the food is raised. Because New Zealand soils are low in selenium, cattle and sheep raised there have suffered a breakdown of muscle tissue, including the heart muscle. However, human intake of selenium there is adequate because of imported Australian wheat. The soil of much American farmland is low in selenium, resulting in selenium-deficient produce.

Selenium can be found in Brazil nuts (the only truly concentrated natural source), brewer's yeast, broccoli, brown rice, chicken, dairy products, dulse, garlic, kelp, liver, molasses, onions, salmon, seafood, torula yeast, tuna, vegetables, wheat germ, and whole grains. Herbs that contain selenium include alfalfa, burdock root, catnip, cayenne, chamomile, chickweed, fennel seed, fenugreek, garlic, ginseng, hawthorn berry, hops, lemongrass, milk thistle, nettle, oat straw, parsley, peppermint, raspberry leaf, rose hips, sarsaparilla, uva ursi, yarrow, and yellow dock.

## Comments

The typical dietary intake of selenium is 80 to 150 micrograms. Taking up to 200 micrograms per day is considered safe for most people. This is half the maximum allowable dose.

## Cautions

Symptoms of selenosis (excessively high selenium levels) can include arthritis, brittle nails, garlicky breath, gastrointestinal disorders, hair loss, irritability, liver and kidney impairment, a metallic taste in the mouth, pallor, skin eruptions, tooth loss, and yellowish skin. Unless your health care provider prescribes it, do *not* take more than 400 micrograms daily. One ounce of Brazil nuts can contain as much as 544 micrograms of selenium. If you take supplemental selenium, do not consume Brazil nuts. If you are pregnant, you should *not* take more than 40 micrograms of supplemental selenium daily, nor should you consume Brazil nuts.

## Silicon

Silicon is the second most abundant element on the planet (oxygen is the first). It is necessary for the formation of collagen for bones and connective tissue; for healthy nails, skin, and hair; and for calcium absorption in the early stages of bone formation. It is needed to maintain flexible arteries, and plays a major role in preventing cardiovascular disease. Silicon counteracts the effects of aluminum on the body and is important in the prevention of Alzheimer's disease and osteoporosis. It stimulates the immune system and inhibits the aging process in tissues. Silicon levels decrease with aging, so elderly people need larger amounts.

A seven-year study in French women showed that higher silicon intakes, primarily from drinking water, appeared to be protective against developing Alzheimer's disease.

## Sources

Foods that contain silicon include alfalfa, beets, brown rice, rice bran, rice hulls, whole and rolled oats, bell peppers, soybeans, leafy green vegetables, and whole grains.

## Comments

Silicon is most commonly found in the form of silica, a compound of silicon and oxygen also known as silicon dioxide (SiO<sub>2</sub>). One form of silicon, called silicic acid (actually, orthosilicic acid or OSA), appears to be extremely absorbable and useful as a silicon transport agent in the body. Two good sources of silicon are Body Essential Silica Gel from NatureWorks and Jarrosil from Jarrow Formulas. The minerals boron, calcium, magnesium, manganese, and potassium are needed for the efficient utilization of silicon.

## Sodium

Sodium is necessary for maintaining proper water balance and blood pH. It is also needed for stomach, nerve, and muscle function. Although sodium deficiency is rare—most people have adequate (if not excessive) levels of sodium in their bodies—it can occur. This condition is most likely to affect people who take diuretics for high blood pressure, especially if they simultaneously adhere to low-sodium diets.

Some experts estimate that as many as 20 percent of elderly people who take diuretics may be deficient in sodium. In some cases of disorders such as fibromyalgia, studies have shown that moderate amounts of sodium may be needed as well (natural sea salt is recommended). Symptoms of sodium deficiency can include abdominal cramps, anorexia, confusion, dehydration, depression, dizziness, fatigue, flatulence, hallucinations, headache, heart palpitations, an impaired sense of taste, lethargy, low blood pressure, memory impairment, muscular weakness, nausea and vomiting, poor coordination, recurrent infections, seizures, and weight loss. Excessive sodium intake can result in edema, high blood pressure, potassium deficiency, and liver and kidney disease.

## Sources

Virtually all foods contain some sodium.

## Comments

A proper balance of potassium and sodium is necessary for good health. Because most people consume too much so-

dium, they typically need more potassium as well. An imbalance between sodium and potassium can lead to heart disease. If you sweat excessively from exercise or heat, you will need to make sure to replace salt lost in perspiration through foods or beverages with added salt.

### Sulfur

An acid-forming mineral that is part of the chemical structure of the amino acids methionine, cysteine, taurine, and glutathione, sulfur disinfects the blood, helps the body to resist bacteria, and protects the protoplasm of cells. It aids in necessary oxidation reactions in the body, stimulates bile secretion, and protects against toxic substances. Because of its ability to protect against the harmful effects of radiation and pollution, sulfur slows the aging process. It is found in all body tissues, and is needed for the synthesis of collagen, a principal protein that gives the skin its structural integrity.

### Sources

Brussels sprouts, dried beans, cabbage, eggs, fish, garlic, kale, meats, onions, soybeans, turnips, and wheat germ contain sulfur, as do the amino acids cysteine, cystine, and methionine. Sulfur is also available in tablet and powder forms. Methylsufonylmethane (MSM) is a good form of sulfur.

### Comments

Moisture and heat may destroy or change the action of sulfur in the body. Sulfur is one of the key substances that makes garlic the "king of herbs."

### Vanadium

Vanadium is needed for cellular metabolism and for the formation of bones and teeth. It plays a role in growth and reproduction, and inhibits cholesterol synthesis. Vanadium has been shown to have the ability to improve insulin utilization, resulting in improved glucose tolerance. A vanadium deficiency may be linked to cardiovascular and kidney disease, impaired reproductive ability, and increased infant mortality. Vanadium is not easily absorbed. Athletes may require more of this trace mineral than nonathletes.

### Sources

Vanadium is found in dill, fish, olives, meat, radishes, snap beans, vegetable oils, and whole grains.

### Comments

There may be an interaction between vanadium and chromium. If you take supplemental chromium and vanadium,

take them at different times. Tobacco use decreases the uptake of vanadium.

### Zinc

This essential mineral is important in prostate gland function and the growth of the reproductive organs. Zinc may help prevent acne and regulate the activity of oil glands. It is required for protein synthesis and collagen formation, and promotes a healthy immune system and the healing of wounds. Zinc also enhances acuity of taste and smell. It protects the liver from chemical damage and is vital for bone formation. It is a constituent of insulin and many vital enzymes, including the antioxidant enzyme superoxide dismutase (SOD). It also helps to fight and prevent the formation of free radicals in other ways. A form of zinc called zinc monomethionine (zinc bound with the amino acid methionine), sold under the trademark OptiZinc, has been found to have antioxidant activity comparable to that of vitamin C, vitamin E, and beta-carotene. Zinc lozenges have been reported to be effective in relieving symptoms of the common cold and reducing the duration of colds.

Sufficient intake and absorption of zinc are needed to maintain the proper concentration of vitamin E in the blood. In addition, zinc increases the absorption of vitamin A. For optimum health, a proper 1-to-10 balance between copper and zinc levels should be maintained.

A deficiency of zinc may result in the loss of the senses of taste and smell. It can also cause fingernails to become thin, peel, and develop white spots. Other possible signs of zinc deficiency include acne, delayed sexual maturation, fatigue, growth impairment, hair loss, high cholesterol levels, impaired night vision, impotence, increased susceptibility to infection, infertility, memory impairment, a propensity to diabetes, prostate trouble, recurrent colds and flu, skin lesions, and slow wound healing.

### Sources

Zinc is found in the following food sources: brewer's yeast, dulce, egg yolks, fish, kelp, lamb, legumes, lima beans, liver, meats, mushrooms, oysters, pecans, poultry, pumpkin seeds, sardines, seafood, soy lecithin, soybeans, sunflower seeds, torula yeast, and whole grains. Herbs that contain zinc include alfalfa, burdock root, cayenne, chamomile, chickweed, dandelion, eyebright, fennel seed, hops, milk thistle, mullein, nettle, parsley, rose hips, sage, sarsaparilla, skullcap, and wild yam.

### Comments

Zinc levels may be lowered by diarrhea, kidney disease, cirrhosis of the liver, diabetes, or the consumption of fiber, which causes zinc to be excreted through the intestinal tract. A significant amount of zinc is lost through perspiration.

The consumption of hard water also can upset zinc levels. Compounds called phytates that are found in grains and legumes bind with zinc so that it cannot be absorbed.

If you take both zinc and iron supplements, take them at different times. If these two minerals are taken together, they interfere with each other's activity.

### **Cautions**

Do not take a total of more than 100 milligrams of zinc daily. While daily doses less than 100 milligrams enhance the immune response, doses of more than 100 milligrams can depress the immune system.

# Air

## INTRODUCTION

Air is what we breathe. It is made up almost entirely of nitrogen, oxygen, argon, carbon dioxide, some water vapor, and tiny amounts of inert gases such as krypton, neon, and helium. The part essential for life is oxygen, which makes up about 21 percent of the air. The nitrogen component is basically 78 percent and argon is less than 1 percent. The remaining gases are found in very small quantities, measured as parts per million.

Water vapor can exist in varying amounts (0 to 5 percent) in any given location, depending on the air temperature and other factors. Without getting too technical, it is enough to say that as the air temperature rises, its ability to hold water vapor increases.

Nonstandard components can include particulates, chemical vapors, methane, sulfur dioxide, oxides of nitrogen, ammonia, and carbon monoxide, among others. Levels of these compounds can vary from place to place, and are collectively called *air pollution*.

## AIR POLLUTION—WHAT IS IT?

Air pollution is basically contamination of the air caused by the discharge of harmful substances. It can cause immediate health problems, such as burning eyes and nose, an itchy irritated throat, and/or breathing difficulties. Over long periods, exposure to some of the chemicals and particulates found in polluted air can cause cancer, birth defects, brain and nerve damage, and injury to the lungs and breathing passages. Dust and particulates from smokestacks, and especially from diesel exhaust, are suspected of increasing the number of deaths from heart attacks by affecting the heart's ability to maintain its rhythm. The very young and the very old suffer the most from the effects of air pollution, but the duration of the exposure and the concentration of the chemical pollutants are important. Certain contaminants can, at high levels, cause severe injury or even death in short order.

Air pollution also causes damage to the environment and to the infrastructure. Trees, lakes, crops, and animals (both wild and domestic) are affected, as are buildings, bridges, monuments, and other man-made structures. Air pollution almost certainly has thinned the protective ozone layer above the earth, allowing dangerous radiation from the sun's rays to cause cancers, birth defects, and other injuries to humans throughout the world.

Smog is a type of large-scale air pollution caused by

chemical reactions in the air between different pollutants from vehicle exhaust and industrial sources. Smog can have a different specific cause depending on location, wind, and weather, but the effect is essentially the same. Smog becomes a real problem when a phenomenon known as *temperature inversion* occurs. That is, the air near the ground is cooler than the air above, which holds down the pollution so it can't disperse. Cities surrounded by mountains, such as Los Angeles, are particularly prone to this phenomenon. If the inversion happens in the winter, it traps mostly particulates and carbon monoxide. If it happens in the summer, expect smog.

Indoor air pollution, including secondhand smoke, is almost as big a problem as outdoor air pollution. In the United States, most people now spend between 80 and 90 percent of their time indoors. It sounds unbelievable until you actually do the math. We live in sealed buildings, our kids go to school in sealed buildings, and we commute in air-conditioned cars to work in sealed offices. It's no wonder that indoor pollution has such an effect on our health. And the effect may be even more serious in northern climates, where the weather keeps people indoors in the winter. Defective air-handling equipment, faulty air-conditioning and building design, poor maintenance of air-conditioning and heating systems, plus gas emissions from carpeting, paints, paneling, computers, copying machines, plastic furniture—all contribute to an ever-growing problem.

## THE MAJOR POLLUTANTS

There are thousands of potential air pollutants. Some of the major ones are as follows.

### Carbon Monoxide

Carbon monoxide (CO) is colorless, odorless, and poisonous. After it is inhaled, the carbon monoxide molecules enter the bloodstream via the lungs. They bind with the red blood cells, preventing them from picking up oxygen. Because the cells throughout the body are then starved of oxygen, serious problems result. Low concentrations cause dizziness, headaches, and fatigue. Exposure to high concentrations is usually fatal.

Carbon monoxide is created for the most part by automobile engines as a product of incomplete combustion, although even a wood-burning stove emits plenty of the gas. Home-testing kits are available to test the levels at home.

## Carbon Dioxide

Carbon dioxide (CO<sub>2</sub>) is a greenhouse gas that is normally found in the atmosphere. As we use oxygen, we generate carbon dioxide, which is exhaled with each breath. Luckily for us, plants that use photosynthesis need this carbon dioxide to live. They take it in, use it, and excrete oxygen. This has been a good relationship. At present, the concentration in the air is around 360 parts per million (ppm). This varies with location and season (it's a bit higher in the summer). This so-called "natural" concentration has been trending upward for the last 11,000 years, since the end of the last ice age. About the time the ice sheets began to retreat, the concentration of CO<sub>2</sub> in the air was around 200 ppm.

The oceans hold most of the CO<sub>2</sub> on the planet—at least fifty times more than is in the air and ten times more than in all the plant and soil sources. Circulation patterns, or megacurrents, transport the CO<sub>2</sub> up and down in the oceans—most of the CO<sub>2</sub> is held in deep, cold waters—and there is a constant interchange of CO<sub>2</sub> between the oceans and the atmosphere. As the oceans have warmed up, they are giving up their CO<sub>2</sub> to the air. By the late 1700s, the atmospheric CO<sub>2</sub> level was up to 280 ppm, by 1960 it was up to 315 ppm, and today it is approximately 390 ppm. Over the past fifty years, atmospheric CO<sub>2</sub> has been increasing by about 1 ppm per year, which is an indicator not only of the natural processes taking place but also the rapidly increasing burning of fossil fuels.

Why is this important? Because CO<sub>2</sub> is a greenhouse gas, the more of it there is in the atmosphere, the warmer the climate will become.

## Chlorofluorocarbons (CFCs)

These CFCs, used widely in industry and especially as a refrigerant in air-conditioning systems, are commonly known as *freon*. There are several commercial forms of freon; all are greenhouse gases. The latest form of freon being used extensively is designated R134. An older form, R12, was used as a solvent and in air conditioners through the 1990s (and is still used in some countries). When released into the atmosphere, all forms of freon eventually rise into the stratosphere. Through reaction with other atmospheric chemicals, freon has reduced the amount of ozone (O<sub>3</sub>). This ozone layer is a protective shield against harmful solar ultraviolet (UV) radiation. Increased skin cancers and other related problems caused by an increased level of UV radiation at the earth's surface have been the result.

In addition, the reduction in the ozone layer has lowered the temperature of the stratosphere, and the temperature differential between it and the troposphere (the layer closest to the ground) has caused an increase in both stratospheric and surface wind speeds, and has the potential for altering the climate.

In a vicious cycle, the lowered stratospheric temperature can further reduce the ozone layer because as the temperature drops, the amount of ozone naturally decreases.

## Hazardous Air Pollutants (HAPs)

This is a general class of chemicals that can cause serious health and environmental effects. Health effects can include cancer, birth defects, nervous system disorders, respiratory problems, and even death at high concentrations. There are literally thousands of these chemicals, and almost 200 of them have been positively identified as potential hazards. Most are produced in chemical plants for industrial use or as intermediate products used to manufacture other chemicals.

Examples of these chemicals are acrolein, formaldehyde, acetaldehyde, beryllium, and arsenic, among others. The greatest hazard still comes from diesel emissions.

## Lead

Lead is a highly toxic metal that produces a number of problems, especially neurological disorders in young children. Lead has been phased out of gasoline and consumer products, but there are still quantities of lead in the environment as lead paint and lead piping, and lead-contaminated dust and soil from years of lead emission is still a problem. Luckily, the number of children with elevated blood levels of lead has dropped significantly. More information on lead can be obtained from the National Lead Information Center (NLIC) at [www.epa.gov/lead/nlic.htm](http://www.epa.gov/lead/nlic.htm).

## Ozone (O<sub>3</sub>)

Ozone is beneficial only if it remains in the stratosphere, where a layer of it shields us from ultraviolet radiation. This form of oxygen, having three atoms rather than two, is toxic and can damage our health, the environment, trees, and crops. It is also corrosive to many materials. Normally, the health problems most experienced by ozone exposure include respiratory tract irritation, chest pain, coughing, increased susceptibility to lung infections, and an inability to catch one's breath. Ozone at ground level comes from the oxidation of organic compounds given up naturally by vegetation, auto emissions, electrical discharges (brush-type motors, generators, and lightning), and the burning of coal.

## Oxides of Nitrogen (NO<sub>x</sub>)

There are several significant oxides of nitrogen (the subscript *x* denotes any number of oxygen atoms) that affect air pollution. These nitrogen compounds react with many volatile organic compounds, both man-made and natural, to form what we call smog. Smog causes breathing difficulties, coughing, and general respiratory system distress.

One by-product is acid rain, which kills vegetation and sterilizes lakes. The burning of fossil fuels, either gasoline in automobiles or coal and oil in power plants, predominantly produces these oxides of nitrogen. As energy demands increase we can expect  $\text{NO}_x$  emissions to increase, and consequently more ozone and smog will be created.

### Particulate Matter

The term *particulate matter* refers to any type of solid material in the air in the form of dust, smoke, or vapor, which can remain suspended for a long time. Breathing in these microscopic particles is one of the major causes of lung damage and respiratory disease. Particles from diesel engines have been rated as the most hazardous pollutant in an entire arsenal of pollutants, simply on the basis of tonnage emitted. Nobody is exempt. People in urban areas are subjected to heavy traffic and industrial pollution. Farmers who don't have to contend with heavy traffic nevertheless work amid clouds of soil dust, chemical vapors, fertilizer, and flour and grain dust. Industrial processes, mining, road construction, and any number of other modern activities contribute to the problem. New evidence suggests that as many as 50,000 Americans may die each year from inhaling these microscopic specks. The World Health Organization has estimated that deaths worldwide could be as high as 2.8 million annually. People with existing respiratory problems are naturally more prone to feel the effects when air quality is bad.

Many others have been dying from sudden heart failure, which may be caused by abnormalities in the heart rhythm in response to changing demands. When the air is thick with dust and soot, the heart is less able to adjust its rhythm. These pollutants also reduce lung capacity, depending on the particulate level: the greater the particle density, the less the lung capacity. Smaller particles appear to be more hazardous than larger ones.

Particulates also pick up hitchhikers, such as toxic metals, acidic aerosols, and other particles of different chemical composition than themselves. Particles of dust from the sub-Saharan region of Africa have reached all the way into Arizona and Texas, causing asthma problems for people there and all throughout the Caribbean basin.

### Sulfur Dioxide ( $\text{SO}_2$ )

Sulfur dioxide is a pungent, toxic gas produced by the burning of coal, usually in power plants. More than 65 percent, or 13 million tons a year, comes from our electric utilities. This takes into account the large number of domestic power plants that have installed scrubbers. Worldwide, the problem is almost out of control. Coal-fired power plants in China and other areas of Asia are not even equipped with rudimentary stack scrubbers. A few other industrial processes, including some paper mills and smelters, also produce  $\text{SO}_2$  (from the odor, people generally know where they are). Like the oxides of nitrogen, sulfur dioxide is a major contributor to acid rain and smog. Corrosive acids (such as sulfurous acid and sulfuric acid) formed in the air can rain down to cause massive damage to wildlife, vegetation, streams, rivers, and lakes. Lung problems are caused by breathing sulfur dioxide, including permanent lung damage from long-term exposure (or exposure for shorter times at higher doses).

### Volatile Organic Compounds (VOCs)

There are many volatile organic compounds. Volatile chemicals form vapors easily at normal room temperature. Many of the VOCs we find in the air are natural, and are excreted as part of natural processes by vegetation. Others are not found in nature, and are escapees from a petrochemical plant (a source site) or somewhere downstream where the chemical is being utilized. An example is gasoline. Vapor can escape right at the refinery, during transfer to storage, during delivery to the distributor and gas station, or right at the pump when it is being pumped into the gas tank.

Other VOCs include benzene, one of the most prevalent chemicals known. Solvents such as toluene, xylene, and perchlorethylene are VOCs, as are a host of other products. VOCs are also released as combustion products, such as during the burning of coal, natural gas, oil, and even wood. Vehicle emissions are a major source of VOCs, as are vapors from industrial glues, solvents, paints, and many other consumer products.

# Water

## INTRODUCTION

Human beings can survive without food for thirty to forty days—about five weeks—but without water, life would end in three to five days. The average person's body is composed of approximately 70 percent water, although the water content varies considerably from person to person and even from one body part to another. The body's water supply is responsible for and involved in nearly every bodily process, including digestion, absorption, circulation, and excretion. Water is also the primary transporter of nutrients throughout the body and so is necessary for all building functions in the body. Water helps maintain normal body temperature and is essential for carrying waste material out of the body. Therefore, replacing the water that is continually being lost through sweating and elimination is very important.

A drop in the body's water content causes a decline in blood volume. The lowering of blood volume in turn triggers the hypothalamus, which is the brain's thirst center, to send out the demand for a drink. This causes a slight rise in the concentration of sodium in the blood. These changes quickly trigger a sensation of thirst. Unfortunately, people often consume only enough liquid to quench a dry or parched throat—not enough to cover all of their water loss.

As a result, they can become dehydrated. As we age, the sense of thirst becomes dulled. At the same time, we have a lower percentage of reserve body water than we had when we were younger. This is why it is important to drink water even when you do not feel thirsty. Drinking water can also help control overeating, as thirst is sometimes mistaken for hunger.

Quality water is beneficial for virtually all disorders known to humankind. Bowel and bladder problems, as well as headaches, can be reduced by drinking water. If not enough water is consumed, toxins can build up in the system, causing headaches. Water flushes out these toxins.

Anxiety attacks, food intolerances, "acid stomach" and heartburn, muscle pains, colitis pain, hot flashes, and many other discomforts and disorders can be eased quickly by drinking a full glass of water. Chronic fatigue syndrome (CFS) is another disorder that necessitates consuming plenty of quality water daily to flush out toxins and other substances that contribute to muscle aches and extreme fatigue.

Without adequate water, we would poison ourselves with our own metabolic wastes. The kidneys remove waste

products, such as uric acid, urea, and lactic acid, all of which must be dissolved in water. If there is not enough water available to remove these substances effectively, they may cause damage to the kidneys. Digestion and metabolism also rely on water for certain enzymatic and chemical reactions in the body. Water carries nutrients and oxygen to cells through the blood and is involved in the regulation of body temperature through perspiration. Water is especially important for people who have musculoskeletal problems such as arthritis, or who are athletic, as it lubricates the joints. Because lung tissue must be moist to facilitate oxygen intake and carbon dioxide excretion, water is essential for breathing. Approximately one pint of liquid is lost each day through exhaling. If you do not take in enough water to maintain fluid balance, every bodily function can be impaired. And the more active you are, the more water you must consume in order to keep your body's water level in balance.

Inadequate water consumption may contribute to excess body fat; poor muscle tone; digestive problems; poor functioning of many organs, including the brain; joint and muscle soreness; and, paradoxically, water retention. Consuming plenty of quality water can slow the aging process, and can prevent or improve arthritis, kidney stones, constipation, arteriosclerosis, obesity, glaucoma, cataracts, diabetes, hypoglycemia, and many other diseases. It is not expensive, and you should feel a difference quickly, but you must drink about ten full glasses of quality water (80 ounces) daily.

Obtaining quality water would seem to be an easy matter. However, due to the numerous types of classifications water is given, the average consumer can easily be confused about what is available. This section offers a guide to understanding what the most commonly used classifications of water mean and how these different kinds of water may help or harm the body.

## TAP WATER

Water that comes out of household taps or faucets is generally obtained either from surface water or from ground water. Surface water is water that has run off from ponds, creeks, streams, rivers, and lakes, and is collected in reservoirs. Ground water is water that has filtered through the ground to the water table and is extracted by means of a well. Approximately half of the tap water in the United States comes from lakes, rivers, or other surface sources. Underground aquifers and municipal wells provide 35

percent of tap water, and the remaining 15 percent comes from private wells.

## The Safety of Tap Water

Most people assume that when they turn on the kitchen tap, they are getting clean, safe, healthy drinking water. Unfortunately, this often is not the case. Regardless of the original source of tap water, it is vulnerable to a number of different types of impurities, and may be full of harmful chemicals and inorganic minerals that the body cannot use.

Some undesirable substances found in water—including radon, fluoride, and arsenic, as well as iron, lead, copper, and other heavy metals—can occur naturally. Other contaminants, such as fertilizers, asbestos, cyanides, herbicides, pesticides, and industrial chemicals, may leach into ground water through the soil, or into any tap water from plumbing pipes. Many of these chemicals have been linked to cancer and other disorders. Water can also contain biological contaminants, including viruses, bacteria, and parasites.

Still other substances—including chlorine, fluorides, carbon, lime, phosphates, soda ash, and aluminum sulfate—are intentionally added to public water supplies to kill bacteria, adjust pH, and eliminate cloudiness, among other things. Even if the levels of individual substances in water are well within “allowable” limits, the total of all contaminants present may still be harmful to your health. And private wells may not be regulated at all, except at the local level.

The greatest concerns about water quality today focus on chlorine, arsenic, atrazine and other compounds known as triazines, perchlorate, organophosphate pesticides, trihalomethanes, lead, herbicides such as acetochlor, and parasites. Chlorine has long been added to public water supplies to kill disease-causing bacteria. However, the levels of chlorine in drinking water today can be quite high, and some by-products of chlorine are known carcinogens. As a result, the U.S. Environmental Protection Agency (EPA) is considering steps to reduce the level of chlorine in drinking water, but is facing opposition from industry groups.

Pesticides pose a risk in any area where the tap water is extracted from an underground source. These chemicals are suspected of causing, or at least contributing to, an increased incidence of cancer, especially breast cancer. The pesticide problem is a particular concern in areas where agriculture is (or was) a major part of the economy. These chemicals are persistent. Residues from pesticides used decades ago may still be present in water coming out of the tap today, and may pose a risk to health.

Long considered a problem limited to poor, developing countries, the presence of bacteria and parasites in drinking water—especially a parasite called *cryptosporidium*—is becoming a serious problem in the United States. In April

1993, as many as 370,000 people in and around Milwaukee, Wisconsin, were stricken by the parasite *Cryptosporidium parvum* from the city’s water supply. Thousands suffered from severe diarrhea, and up to 100 deaths were attributed to the outbreak. These “unacceptable” levels of cryptosporidia, most likely from agricultural runoff, forced users of the public water system to boil their tap water before using it. The same organism has created controversy over the safety of the water in New York City; many people with weakened immune systems have charged that cryptosporidia in the city water have made them sick, even though local officials insist that the water is safe to drink. For people with HIV or AIDS, cryptosporidia can be lethal.

The chlorine added to water to kill bacteria is not effective at killing these parasites. Like cryptosporidiosis, giardiasis is caused by an intestinal parasite and can be contracted through drinking water. And like cryptosporidia, giardia resists the effects of chlorine (outbreaks have occurred in areas where the water is routinely chlorine-treated) and poses a more serious problem for people with diminished immune response. Indeed, because of increasing concern over the danger contaminated drinking water poses for people with compromised immune systems, the U.S. Centers for Disease Control and Prevention (CDC) and the EPA have issued suggestions that immune-compromised individuals boil tap water for at least one minute before use, use an appropriate filtration system, or buy quality bottled drinking water.

The biggest problem is that even when municipalities comply with EPA regulations, the regulations themselves are weak and have been written in such a way that it is relatively easy to comply. For instance, there is no safe level for arsenic in drinking water, per se, according to recent studies. The EPA sets its limits based on the risk of developing cancer as 1 in every 10,000 people. This still may represent too great a risk for some people. Average levels of arsenic in drinking water are around 5 parts per billion (ppb). In 2002, the EPA upgraded the standard for arsenic from 50 to 10 ppb (the lower the amount the better the standard). The National Academy of Sciences has found that even at 10 ppb, the lifetime risk of developing life-threatening cancer is 1 in 333. This is thirty times higher than the EPA’s own standard for what it says is acceptable risk. The good news about drinking city water is that the contaminants are published on the EPA website. With bottled water, you need to contact the manufacturer to get such information. The risk of getting sick may be lower with public water because more people become exposed and word gets out faster.

Whatever the source of your water, it is important to know some warning signs of bad water. Watch for cloudiness or murkiness in water. Chlorination can cause some cloudiness, but it usually clears if the water is left to stand, whereas bacterial or sedimentary cloudiness will remain. Foaming may be caused by bacterial contamination, by floating particles of sediment, or by soaps or detergents.

Bacteria can be destroyed by boiling water for at least five minutes, while sediment should settle out if you let the water stand for several hours. Strange smells or tastes in water that was previously fine could mean chemical contamination. However, many toxic hazards that work their way into water do not change its taste, smell, or appearance.

### Hard versus Soft Water

Hard water, found in various parts of the country, contains relatively high concentrations of the minerals calcium and magnesium. The presence of these minerals prevents soap from lathering and results in filmy sediment being deposited on hair, clothing, pipes, dishes, washtubs, and anything else that comes into regular contact with the water. It also affects the taste. Hard water can be annoying, and though some studies have shown that deaths from heart disease may be lower in areas where the drinking water is hard, we believe that the calcium found in hard water is not good for the heart, arteries, or bones. Hard water deposits its calcium and other minerals on the *outside* of these structures, while it is the calcium and magnesium found *within* these structures that are beneficial to the body.

Soft water can be naturally soft or it may be hard water that has been treated to remove the calcium and magnesium. Standard water-softening systems work by using pressure to pass the water through exchange media to exchange “hard” calcium and magnesium ions for “soft” sodium or potassium ions. Most use either sodium chloride or potassium chloride for this purpose. The primary benefit of softening is in improved cleaning properties for the water and less mineral buildup inside household pipes and equipment. One potentially serious problem with artificially softened water is that it is more likely than hard water to dissolve the lining of pipes. This poses an especially significant threat if pipes are made of lead. Another threat comes from certain plastic and galvanized pipes, which contain cadmium, a toxic heavy metal. These types of pipes are rarely used in construction today, but they may be present in older buildings that have not undergone extensive renovation. But leaching from pipes can be a problem with today’s copper pipes as well. Dangerous levels of copper, iron, zinc, and arsenic can leach into softened water from copper pipes. Another potential problem with artificially softened water is of concern to people with kidney failure. People with kidney failure must restrict their intake of potassium. Potassium-based water-softening systems can therefore pose a danger to such individuals.

### Fluoridation

For many years now, controversy has raged over whether fluoride should be added to drinking water. As early as 1961, as recorded in the Congressional Record, fluoride was exposed as a lethal poison in our nation’s water supply.

Proponents say that fluoride occurs naturally and helps develop and maintain strong bones and teeth. Opponents to fluoridation contend that when fluoridated water is consumed regularly, toxic levels of fluorine, the poisonous substance from which fluoride is derived, build up in the body, causing irreparable harm to the immune system. The Delaney Congressional Investigation Committee, the government body charged with monitoring additives and other substances in the food supply, has stated “fluoridation is mass medication without parallel in the history of medicine.” Meanwhile, no convincing scientific proof has ever been generated that fluoridated water makes for stronger bones and teeth. It is known, however, that chronic fluoride use can result in health problems, including osteoporosis and osteomalacia, and also damages teeth and leaves them mottled. But this only occurs with very high doses. Fluorine is never found in elemental form in nature because it is so reactive. Numerous compounds of fluorine can, however, exist. These are notoriously toxic compounds, so much so that they are used in rat poison and insecticides. The naturally occurring form of fluoride, calcium fluoride, is not toxic—but this form of fluoride is not used to fluoridate water. Sodium fluoride (NaF) is added to city water supplies in the proportion of about one part per million to help prevent tooth decay. Sodium fluoride (NaF), stannous fluoride (SnF<sub>2</sub>), and sodium monofluorophosphate (Na<sub>2</sub>PO<sub>3</sub>F) are also added to toothpaste, also to help prevent tooth decay.

Today, more than half the cities in the United States fluoridate their water supplies. In fact, in many states it is required. Although many ailments and disorders—including Down syndrome, mottled teeth, and cancer—have been linked to fluoridated water, fluoridation has become the standard rather than the exception.

Individuals have different levels of tolerance for toxins such as fluoride. In addition, many water sources have levels of fluoride higher than one part per million, the level generally recognized as safe and originally set as the acceptable limit by the EPA. After the EPA learned that water in many towns had natural fluoride levels much higher than this, the permissible fluoride limit was raised—quadrupled, in fact—to four parts per million. And this is in addition to fluoride encountered from other sources. Since so many local water supplies are fluoridated, there is a good chance that virtually any packaged food product made with water, such as soft drinks and reconstituted juices, contains fluoride. It is easy to see how many Americans may be ingesting excessive amounts of this potentially toxic substance.

If your tap water contains fluoride, and you wish to remove it, you can use a reverse osmosis, distillation, or activated alumina filtration system to eliminate almost all of the fluoride from your water.

## MTBE and Drinking Water

Since 1979, methyl tertiary-butyl ether (MTBE) has been added to gasoline to increase its oxygen content. It took the place of lead as an octane enhancer, and was supposed to reduce the problems of both smog and carbon monoxide in the atmosphere. The Clean Air Act of 1990 required the use of reformulated gasoline, or RFG, in certain parts of the country, with the goal of reducing air pollution in those areas. RFG accounts for some 30 percent of gasoline sold in the United States, and MTBE is now added to over 80 percent of RFG fuel.

According to a disturbing report aired on the CBS television program *60 Minutes* on January 16, 2000, this measure to improve air quality has, ironically, given Americans yet another reason to be concerned about the safety of their drinking water supply. MTBE has been seeping into all our water supplies, both surface and underground, at an alarming rate. It has been found in storm water in 592 samples collected in sixteen cities between 1991 and 1995. The primary sources of the MTBE that ends up in water systems are leaking gasoline tanks, and reservoirs, drinking water lakes, and rivers where gasoline-powered recreational watercraft are permitted. Less than one-tenth of a gallon (roughly 12 ounces) of MTBE is capable of contaminating 13 million gallons of drinking water. It is estimated that more than 1 million gallons of fuel are deposited, un-

burned, into the water supply each year as a result of recreational boating.

Few long-term studies have been done on this chemical, but what little research there is indicates that MTBE is a likely human carcinogen and immune-system depressant. Certainly, tests on rats have provided evidence that MTBE is a cancer-causing agent. To date, drinking water supplies in the states of California, New York, Maine, Pennsylvania, Connecticut, and Rhode Island have been closed down due to contamination by MTBE (boiling drinking water does not help purge it of this agent). MTBE-contaminated tap water can cause problems even if you do not drink it. This chemical can also be absorbed through the skin when showering and can be inhaled as a vapor in the air. Possible effects of inhaling MTBE include headaches, burning of the nose and throat, dizziness, nausea, asthma, and respiratory problems. The possible effects on wildlife have not yet been documented.

If you have a private well, your local health department may be able to tell you if MTBE has been found in your area. To get your water tested, call the EPA's Safe Drinking Water Hotline at 800-426-4791. The EPA still has not made a determination on the continued use of MTBE.

### Water Analysis

Not all drinking water contains significant amounts of toxic substances. Some places rate higher in water safety than others. In addition, not all cities and towns process their water supplies the same way. Some do nothing at all to their water. Others add chemicals to the water to kill bacteria. Still others filter their water. It is up to the individual to find out how local drinking water is treated and to determine how safe the water coming out of the tap is.

The EPA has defined pure water as "bacteriologically safe" water, and it recommends—but does not require—that tap water have a pH between 6.5 and 8.5. This allows for a great deal of leeway in what passes as acceptable water. If you are concerned about the safety of the water coming out of your tap, you can contact your local water officials or local health department, which may test your tap water free of charge. In some cases, you may have to contact your state's water supply or health department. Typically, however, these agencies test the water only for bacteria levels, not for toxic substances. Therefore, you might want to contact a commercial laboratory or local state university laboratory to test your water for its chemical content. If you find that your tap water is unacceptable either because of its taste or because of its toxic chemical content, you may choose to use one of the alternative water supplies described in this section.

The Water Quality Association (*see* Health and Medical Organizations in the Appendix) is prepared to answer questions about the various types of water and methods of water treatment. In addition, the EPA operates the toll-free Safe Drinking Water Hotline, which can help you to locate an office or laboratory in your area that does certified water testing. There are also a number of laboratories that will send a self-addressed container for you to fill and return by mail for testing. Results are usually available in two to three weeks.

To help you understand the results of water testing, you should obtain information on the EPA's Recommended Maximum Contaminant Levels. This and other water quality information is available from NSF International at [www.nsf.org](http://www.nsf.org) or 800-673-6275.

### Improving Tap Water

Tap water can be improved in several ways. Heating tap water to a rolling boil and keeping it there for three to five minutes will kill bacteria and parasites. However, most people find boiling their drinking water too impractical and time-consuming. In addition, this procedure has the effect of concentrating whatever lead is present in the water, and the water must then be refrigerated if it is to be used for drinking. The taste of chlorinated tap water can

be improved by keeping the water in an uncovered pitcher for several hours to allow the chlorine taste and odor to dissipate.

Water can also be aerated in a blender to remove chlorine and other chemicals. Nevertheless, neither of these last two methods will improve the quality of the water—only the taste.

Filtration is a means by which contaminants in water are removed, rendering the water cleaner and better tasting. There are many different ways in which water can be filtered.

Nature filters water as the water runs through streams and as it seeps down through the soil and rocks to the water table. As water passes through the earth or over the rocks in a stream, the bacteria in the water leach into the rocks and are replaced with minerals such as calcium and magnesium.

There are also man-made ways of filtering water. There are three basic types of filter available:

- Absorbent types, which use materials such as carbon to pick up impurities.
- Microfiltration systems, which run water through filters with tiny pores to catch and eliminate contaminants (the filter may be made of any of a number of different materials).
- Special media such as ion-exchange resins that are designed to remove heavy metals.

Filters are often arranged in series, so that the filtering media that are most effective for specific types of contaminants can be used. The primary advantages of filters are relatively low cost and ease of use.

Water filtration systems vary in effectiveness. Two types that are considered good are reverse osmosis and ceramic filtration systems. In reverse osmosis filtering, the water is forced through a semipermeable membrane, while charged particles and larger molecules are repelled. It is the best system for treating water that is brackish (high in salt), high in nitrates, and loaded with inorganic heavy metals such as iron and lead. However, no filter can remove absolutely all contaminants. Each pore of even the finest filter is large enough for some viruses to permeate. To remove parasites such as cryptosporidia, the EPA and CDC recommend purchasing a filter that has an NSF rating for parasite reduction *and* that has an absolute pore size of one micron or smaller (a micron is  $1310^{26}$  meter).

Other water treatment systems that remove various contaminants include distillers and ultraviolet treatment units. The latter are used to kill bacteria and viruses in water. Each treatment method has its advantages and disadvantages (see Home Water Treatment Methods, page 52). Costs can vary from under fifty dollars for faucet-mounted units to many thousands of dollars for whole-house reverse osmosis systems. Using a combination of methods can result in the best overall quality drinking water. Even

the quality and taste of distilled water can be improved by passing the water through a charcoal/carbon filter as a final step.

Before you purchase a water treatment unit, contact NSF International or the Water Quality Association. These non-profit testing and certification organizations verify manufacturers' claims and certify that the materials used are nontoxic and structurally sound. They conduct periodic unannounced audits of the products they certify to ensure that the products still comply with standards.

## BOTTLED WATER

Because of concerns over the safety and health effects of tap water, many people today are turning to bottled water. Bottled water is usually classified by its source (spring, spa, geyser, public water supply, etc.), by its mineral content (containing at least 250 parts per million of dissolved solids), and/or by the type of treatment it has undergone (deionized, steam-distilled, etc.). Because there is a lot of overlap, some water falls into more than one classification. In addition, most states have no rules governing appropriate labeling, so some bottled water claims may be misleading or incorrect. The biggest problem with bottled water is its threat to the environment from the improper disposal of the bottles. Only 20 percent of Americans recycle bottles. Americans drink 18 gallons of bottled water per capita. This equals 144 16-ounce bottles per person per year, which mostly goes to the garbage or incinerator. Incineration causes toxic by-products such as chloride gas and ash, containing heavy metals. Energy is needed to transport these empty bottles as well. If you use bottled water, buy it in bulk and transfer water to reusable containers.

While the EPA is charged with the regulation of public water supplies, it is the FDA that has responsibility for overseeing the quality and safety of bottled drinking water. Recently, there has been concern over the possible leaching of plastic particles into the water that comes in plastic bottles. Researchers from the Harvard School of Public Health found that people who drank from clear plastic polycarbonate bottles had an increase in bisphenol A (BPA) of 69 percent. BPA is used to make reusable hard plastic—such as those used in water cooler bottles—more durable. The harder the bottle, the more BPA in it. BPA is used in hundreds of everyday products. The health effects on adults are not well understood, though a recent large human study linked BPA concentrations in people's urine to an increased prevalence of diabetes, heart disease, and liver toxicity. For adults, most BPA is flushed from the body in a matter of hours. The real risk in terms of developing these diseases actually comes from what we eat and drink, not the BPA in the containers.

The FDA defined the terms used to describe bottled drinking waters in specific requirements in April 1997, making the choices for the consumer somewhat clearer than in the past. The FDA regulations for bottled water al-

## Home Water Treatment Methods

Treatment Type	Configurations	How It Works	What It Does
Activated Carbon	Faucet-Mounted Pour-Through Countertop Under Sink Whole House	Water is filtered through a carbon trap that absorbs the contaminants.	Reduces levels of chlorine, herbicides, lead, hydrogen sulfide, and VOCs (volatile organic compounds). Also improves color and reduces turbidity.
Carbon Filtration	Faucet-Mounted Under Sink or Counter	Water is passed through charcoal granules or a solid block of charcoal that captures contaminants. When carbon is used up or plugged, cartridge is replaced.	Reduces levels of chlorine, organic chemicals, and pesticides. Improves taste and odor.
Distillation	Countertop Freestanding Whole House	Raises water temperature to boiling, leaving contaminants behind. Pure condensate is collected.	Reduces levels of arsenic, cadmium, chromium, iron, lead, giardia cysts, nitrates, and sulfates. Reduces turbidity.
Reverse Osmosis	Countertop Under Sink Whole House	Forces pressurized water through a semipermeable membrane and sends improved water to a holding tank.	Reduces levels of arsenic, cadmium, iron, chlorine, lead, giardia cysts, nitrates, sulfates, and radium. Reduces color and turbidity.
Water Softener	Whole House	Replaces calcium and magnesium with sodium to "soften" the water.	Reduces levels of calcium, magnesium, iron, and radium.

low for the various terms that have been defined to be used with one another if bottled water meets more than one definition, so it is possible for some water labels to include a number of different terms.

All the terms that are legally necessary to describe bottled drinking water are discussed in the paragraphs that follow. Any term you find on a label that is *not* defined or included here is a marketing slogan added to entice the consumer to buy the product. It can mean anything that the manufacturer of the product says it means.

### Artesian Water

Artesian water, or artesian well water, is water drawn from a well where the water is brought to the surface by natural pressure or flow.

### Bottled Water

Bottled water, or bottled drinking water, is water that is intended for human consumption and that is sealed in bottles or other containers with no added ingredients except

for optional antimicrobial agents. These must be identified on the label. If bottled water comes from a community water system or from a municipal source, this information must appear on the label. About 25 percent of bottled waters now sold come from the same water supplies that flow into some areas' household taps.

### Deionized or Demineralized Water

When the electric charge of a molecule of water has been neutralized by the addition or removal of electrons, the resulting water is called *deionized* or *demineralized*. The deionization process removes nitrates and the minerals calcium and magnesium, in addition to the heavy metals cadmium, barium, lead, mercury, and some forms of radium.

### Ground Water

This is water that comes from underground, in the water table, that is under pressure equal to or greater than atmospheric pressure, and that does not come into contact with surface water. Ground water must be pumped mechanically for bottling.

## Mineral Water

Mineral water is water containing not less than 250 parts per million total dissolved solids (TDS), originating from a geologically and physically protected underground water source or spring that has been tapped at the spring opening or through a borehole. Mineral water is distinguished from other types of water by constant levels and relative proportions of minerals and trace elements at its source, allowing for seasonal variations. No minerals may be added to this water. If the TDS content of mineral water is below 500 parts per million, the water may be labeled *low mineral content*. If it is greater than 1,500 parts per million, the label *high mineral content* may be used.

Depending on where the source is, the minerals the water contains will vary. If you are suffering from a deficiency of certain minerals and are drinking mineral water for therapeutic reasons, you must be aware of which minerals are in the particular brand of water you drink. If you are drinking mineral water containing minerals that you do not lack, you could be doing yourself more harm than good.

Most mineral waters are carbonated. However, some sparkling waters, such as club soda, are called mineral waters because the manufacturer added bicarbonates, citrates, and sodium phosphates to filtered or distilled tap water.

## Natural Spring Water

The term *natural spring water* on a bottled water label doesn't tell you where the water came from, only that the mineral content of the water has not been altered. It may or may not have been filtered or otherwise treated. While the number of gallons of "natural spring water" flowing through watercoolers and from bottles has more than doubled in recent years, the meaning of these words on a label has been firmly defined only since the final changes in the FDA bottled drinking water regulations have been in place.

Spring water is water that comes from an underground formation from which water flows naturally to the surface of the earth. It must be collected at the spring or through a borehole tapping the underground formation that feeds the spring. To meet the definition of *spring*, there must be natural force bringing the water to the surface opening. The location of the spring must be identified on the label of any water labeled as spring water.

If you use a watercooler for bottled spring water, you should be sure to clean the cooler once a month to destroy bacteria. Run a 50-50 mixture of hydrogen peroxide and baking soda through the reservoir and spigots, then remove the residue by rinsing the cooler with four or more gallons of tap water.

## Sparkling Water

This is bottled water that contains the same amount of carbon dioxide that it had at emergence from the water source. It can be a healthful alternative to soda and alcoholic beverages, but if it is loaded with fructose and other sweeteners, it may be no better than soda pop. Read labels before you buy. Soda water, seltzer water, and tonic water are *not* considered bottled waters. They are regulated separately, may contain sugar and calories, and are considered soft drinks.

Understanding where the carbonation in sparkling water comes from isn't always easy. So-called naturally sparkling water must get its carbonation from the same source as the water. If water is labeled *carbonated natural water*, that means the carbonation came from a source other than the one that supplied the water. That doesn't mean the water is of poor quality. It can still be called natural because its mineral content is the same as when it came from the ground, even though it has been carbonated from a separate source. People suffering from intestinal disorders or ulcers should avoid drinking carbonated water because it may be irritating to the gastrointestinal tract.

## Steam-Distilled Water

Distillation involves vaporizing water by boiling it. The steam rises, leaving behind most of the bacteria, viruses, chemicals, minerals, and pollutants from the water. The steam is then moved into a condensing chamber, where it is cooled and condensed to become distilled water.

Once consumed, steam-distilled water leaches inorganic minerals rejected by the cells and tissues out of the body.

We believe that only steam-distilled or reverse-osmosis-filtered water should be consumed. This water should be used not only for drinking, but also for cooking, because foods such as pasta, rice, and beans can absorb chemicals found in unpurified water.

Flavor can be added to distilled water by adding 1 to 2 tablespoons of raw apple cider vinegar (obtained from a health food store) per gallon of distilled water. Vinegar is an excellent solvent and aids in digestion. Lemon juice is another good flavoring agent, and has cleansing properties as well. For added minerals, you can add mineral drops to steam-distilled water. Concentrace from Trace Minerals Research is a good product for this purpose. Add 1¼ teaspoons of mineral drops to every 5 gallons of water.

# Amino Acids

## INTRODUCTION

Amino acids are the chemical units, or “building blocks,” as they are popularly called, that make up proteins. They also are the end products of protein digestion, or *hydrolysis*.

Amino acids contain about 16 percent nitrogen. Chemically, this is what distinguishes them from the other two basic nutrients, sugars and fatty acids, which do not contain nitrogen.

To understand how vital amino acids are, you must understand how essential proteins are to life. It is protein that provides the structure for all living things. Every living organism, from the largest animal to the tiniest microbe, is composed of protein. In its various forms, protein participates in the vital chemical processes that sustain life.

Proteins are a necessary part of every living cell in the body. Next to water, protein makes up the greatest portion of our body weight. In the human body, protein substances make up the muscles, ligaments, tendons, organs, glands, nails, hair, and many vital body fluids, and are essential for the growth of bones. The enzymes and hormones that catalyze and regulate all bodily processes are proteins. Proteins help to regulate the body's water balance and maintain the proper internal pH. They assist in the exchange of nutrients between the intercellular fluids and the tissues, blood, and lymph. A deficiency of protein can upset the body's fluid balance, causing edema. Proteins form the structural basis of chromosomes, through which genetic information is passed from parents to offspring. The genetic “code” contained in each cell's DNA is actually information for how to make that cell's proteins.

Proteins are chains of amino acids linked together by what are called *peptide bonds*. Each individual type of protein is composed of a specific group of amino acids in a specific chemical arrangement. It is the particular amino acids present and the way in which they are linked together in sequence that gives the proteins that make up the various tissues their unique functions and characters. Each protein in the body is tailored for a specific need; proteins are not interchangeable.

The proteins that make up the human body are not obtained directly from the diet. Rather, dietary protein is broken down into its constituent amino acids, which the body then uses to build the specific proteins it needs. Thus, it is the amino acids rather than protein that are the essential nutrients.

In addition to those that combine to form the body's proteins, there are other amino acids that are important in

metabolic functions. Some, such as citrulline, glutathione, ornithine, and taurine, can be similar to (or by-products of) the protein-building amino acids. Some act as neurotransmitters or as precursors of neurotransmitters, the chemicals that carry information from one nerve cell to another. Certain amino acids are thus necessary for the brain to receive and send messages. Unlike many other substances, neurotransmitters are able to pass through the *blood-brain barrier*. This is a kind of defensive shield designed to protect the brain from toxins and foreign invaders that may be circulating in the bloodstream. The endothelial cells that make up the walls of the capillaries in the brain are much more tightly meshed together than are those of capillaries elsewhere in the body. This prevents many substances, especially water-based substances, from diffusing through the capillary walls into brain tissue. Because certain amino acids can pass through this barrier, they can be used by the brain to communicate with nerve cells elsewhere in the body.

Amino acids also enable vitamins and minerals to perform their jobs properly. Even if vitamins and minerals are absorbed and assimilated by the body, they cannot be effective unless the necessary amino acids are present. For example, low levels of the amino acid tyrosine may lead to iron deficiency. Deficiency and/or impaired metabolism of the amino acids methionine and taurine has been linked to allergies and autoimmune disorders. Many elderly people suffer from depression or neurological problems that may be associated with deficiencies of the amino acids tyrosine, tryptophan, phenylalanine, and histidine, and also of the *branched-chain amino acids*—valine, isoleucine, and leucine.

These are amino acids that can be used to provide energy directly to muscle tissue. High doses of branched-chain amino acids have been used in hospitals to treat people suffering from trauma and infection. Some people are born with an inability to metabolize the branched-chain amino acids. This potentially life-threatening condition, branched-chain ketoaciduria (often referred to as *maple syrup urine disease* because keto acids released into the urine cause it to smell like maple syrup), can result in neurological damage and necessitates a special diet, including a synthetic infant formula that does not contain leucine, isoleucine, or valine.

There are approximately twenty-eight commonly known amino acids that are combined in various ways to create the hundreds of different types of proteins present in all living things. In the human body, the liver produces about 80 percent of the amino acids needed. The remaining 20

percent must be obtained from the diet. These are called the *essential amino acids*. The essential amino acids that must enter the body through diet are histidine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, and valine. Although infants need to obtain histidine from their diet, most adult bodies can make enough. The *nonessential amino acids*, which can be manufactured in the body from other amino acids obtained from dietary sources, include alanine, arginine, asparagine, aspartic acid, citrulline, cysteine, cystine, gamma-aminobutyric acid, glutamic acid, glutamine, glycine, ornithine, proline, serine, taurine, and tyrosine.

The fact that they are termed *nonessential* does not mean that they are not necessary, only that they need not be obtained through the diet because the body can manufacture them as needed. Nonessential amino acids can indeed become essential under certain conditions. For instance, the nonessential amino acids cysteine and tyrosine are made from the essential amino acids methionine and phenylalanine. If methionine and phenylalanine are not available in sufficient quantities, cysteine and tyrosine then become essential in the diet. Also, in times of stress such as an illness, both arginine and glutamine are considered to be “conditionally essential.” Hospitalized patients have benefitted from amino acid supplements of each to enhance the functioning of their immune systems. Arginine is popular with body builders, who claim they feel a rush of blood flow, which helps them lift heavier weights.

The processes of assembling amino acids to make proteins, and of breaking down proteins into individual amino acids for the body's use, are continuous ones. When we need more enzyme proteins, the body produces more enzyme proteins; when we need more cells, the body produces more proteins for cells. These different types of proteins are produced as the need arises. Should the body become depleted of its reserves of any of the essential amino acids, it would not be able to produce the proteins that require those amino acids. An inadequate supply of even one essential amino acid can hinder the synthesis, and reduce body levels, of necessary proteins. This can result in negative nitrogen balance, an unhealthy condition in which the body excretes more nitrogen than it assimilates. Further, *all* of the essential amino acids must be present simultaneously in the diet in order for the other amino acids to be utilized—otherwise, the body remains in negative nitrogen balance. A lack of vital proteins in the body can cause problems ranging from indigestion to depression to stunted growth.

How could such a situation occur? More easily than you might think. Many factors can contribute to deficiencies of essential amino acids, even if you eat a well-balanced diet that contains enough protein. Impaired absorption, infection, trauma, stress, drug use, age, and imbalances of other nutrients can all affect the availability of essential amino acids in the body. Insufficient intake of vitamins and minerals, especially vitamin C, can interfere with the absorp-

tion of amino acids in the lower part of the small intestines. Vitamin B<sub>6</sub> is needed also, for the transport of amino acids in the body.

If your diet is not properly balanced—that is, if it fails to supply adequate amounts of the essential amino acids—sooner or later, this will become apparent as some type of physical disorder. When the brain senses the lack of any of the essential amino acids, it immediately sends a signal to the muscles to release some of their tissue. Human muscle is rich in essential amino acids, so it can support the vital organs like the liver and heart during times of poor intake. Sometimes in the case of cancer patients who are unable to eat, a massive muscle wasting called cachexia will occur. This condition can be reversed with food, but it takes a long time.

This does not mean, however, that eating a diet containing enormous amounts of protein is the answer. In fact, it is unhealthy to consume a diet that is deficient in protein or one that contains too much. Excess protein puts undue stress on the kidneys and the liver, which are faced with processing the waste products of protein metabolism. Nearly half of the amino acids in dietary protein are transformed into glucose by the liver and utilized to provide needed energy to the cells. This process results in a waste product, ammonia. Ammonia is toxic to the body, so the body protects itself by having the liver turn the ammonia into a much less toxic compound, urea, which is then carried through the bloodstream, filtered out by the kidneys, and excreted.

As long as protein intake is not too great and the liver is working properly, ammonia is neutralized almost as soon as it is produced, so it does no harm. However, if there is too much ammonia for the liver to cope with—as a result of too much protein consumption, poor digestion, and/or a defect in liver function—toxic levels may accumulate.

Strenuous exercise also tends to promote the accumulation of excess ammonia. This may put a person at risk for serious health problems, including encephalopathy (brain disease) or hepatic coma. Abnormally high levels of urea can also cause problems, including inflamed kidneys and back pain. (See NUTRITION, DIET, AND WELLNESS in Part One.)

It is possible to take supplements containing amino acids, both essential and nonessential. For certain disorders, taking supplements of specific amino acids can be very beneficial. When you take a specific amino acid or amino acid combination, it supports the metabolic pathway involved in your particular illness. Vegetarians, especially vegans, would be wise to take a formula containing all of the essential amino acids to ensure that their protein requirements are met.

## WHAT'S ON THE SHELVES

Supplemental amino acids are available in combination with various multivitamin formulas, as protein mixtures,

in a wide variety of food supplements, and in a number of amino acid formulas. They can be purchased as capsules, tablets, liquids, and powders. Most amino acid supplements are derived from animal protein, yeast protein, or vegetable protein. Crystalline free form amino acids are generally extracted from a variety of grain products. Brown rice bran is a prime source, although cold-pressed yeast and milk proteins are also used.

*Free form* means the amino acid is in its purest form. Free form amino acids need no digestion and are absorbed directly into the bloodstream. These white crystalline amino acids are stable at room temperature and decompose when heated to temperatures of 350°F to 660°F (180°C to 350°C). They are rapidly absorbed and do not come from potentially allergenic food sources. For best results, choose encapsulated powders or powder.

When choosing amino acid supplements, look for products that contain USP (U.S. Pharmacopeia) pharmaceutical-grade L-crystalline amino acids. A good company is Ajinomoto. It manufactures amino acids for intravenous use as well as orally for the public. Most of the amino acids (except for glycine) can appear in two forms, the chemical structure of one being the mirror image of the other. These are called the D- and L- forms—for example, D-cystine and L-cystine. The “D” stands for *dextro* (Latin for “right”) and the “L” for *levo* (Latin for “left”); these terms denote the direction of the rotation of the spiral that is the chemical structure of the molecule. Proteins in animal and plant tissue are made from the L- forms of amino acids (with the exception of phenylalanine, which is also used in the form of DL-phenylalanine, a mixture of the D- and L- forms). Thus, with respect to supplements of amino acids, products containing the L- forms of amino acids are considered to be more compatible with human biochemistry.

Each amino acid has specific functions in the body. The many functions and possible symptoms of deficiency of twenty-eight amino acids and related compounds are described below. When taking amino acids individually for healing purposes, take them on an empty stomach to avoid making them compete for absorption with the amino acids present in foods. When taking individual amino acids, it is best to take them in the morning or between meals, with small amounts of vitamin B<sub>6</sub> and vitamin C to enhance absorption.

When taking an amino acid complex that includes all of the essential amino acids, it is best to take it a half hour away from a meal, either before or after. If you are taking individual amino acids, it is wise also to take a full amino acid complex, including both essential and nonessential amino acids, at a different time. This is the best way to assure you have adequate amounts of all the necessary amino acids.

Be aware that individual amino acids should not be taken for long periods of time. A good rule to follow is to alternate the individual amino acids that fit your needs and back them up with an amino acid complex, taking the

supplements for two months and then discontinuing them for two months. Moderation is the key. Some amino acids have potentially toxic effects when taken in high doses (over 6,000 milligrams per day) and may cause neurological damage. These include aspartic acid, glutamic acid, homocysteine, serine, and tryptophan. Cysteine can be toxic if taken in amounts over 1,000 milligrams per day. Do not give supplemental amino acids to a child, or take doses of any amino acid in excess of the amount recommended unless specifically directed to do so by your health care provider.

Some recommended amino acid products include the following:

- A/G-Pro from Miller Pharmacal Group, a complete amino acid and mineral supplement.
- Anabolic Amino Balance and Muscle Octane from Anabol Naturals. Anabolic Amino Balance is a complex of twenty-three free form amino acids. Muscle Octane is a blend of free form branched-chain amino acids (L-leucine, L-valine, and L-isoleucine). Anabol Naturals also produces free form single amino acids.
- Super Daily Amino Blend from Carlson Laboratories, a complex containing twenty amino acids, both essential and nonessential.

## THE ABCs OF AMINO ACIDS

### Alanine

Alanine plays a major role in the transfer of nitrogen from peripheral tissue to the liver. It aids in the metabolism of glucose, a simple carbohydrate that the body uses for energy.

Alanine also guards against the buildup of toxic substances that are released in the muscle cells when muscle protein is broken down to meet energy needs quickly, such as happens with aerobic exercise. Epstein-Barr virus and chronic fatigue syndrome have been associated with excessive alanine levels and low levels of tyrosine and phenylalanine. One form of alanine, beta-alanine, is a constituent of pantothenic acid (vitamin B<sub>5</sub>) and coenzyme A, a vital catalyst in the body.

Research has found that for people with insulin-dependent diabetes, taking an oral dose of L-alanine can be more effective than a conventional bedtime snack in preventing nighttime hypoglycemia.

### Arginine

Arginine retards the growth of tumors and cancer by enhancing immune function. It increases the size and activity of the thymus gland, which manufactures T lymphocytes (T cells), crucial components of the immune system. Arginine may therefore benefit those suffering from AIDS and malignant diseases that suppress the immune system. It is also good for liver disorders such as cirrhosis of the liver and fatty liver; it

aids in liver detoxification by neutralizing ammonia. It may also reduce the effects of chronic alcohol toxicity.

Seminal fluid contains arginine. Studies suggest that sexual maturity may be delayed by arginine deficiency; conversely, arginine is useful in treating sterility in men. It is found in high concentrations in the skin and connective tissues, making it helpful for healing and repair of damaged tissue.

Arginine is important for muscle metabolism. It helps to maintain a proper nitrogen balance by acting as a vehicle for transportation and storage, and aiding in the excretion, of excess nitrogen. Studies have shown that it also reduces nitrogen losses in people who have undergone surgery, and improves the function of cells in lymphatic tissue. This amino acid aids in weight loss because it facilitates an increase in muscle mass and a reduction of body fat. It is also involved in a variety of enzymes and hormones. It aids in stimulating the pancreas to release insulin, is a component of the pituitary hormone vasopressin, and assists in the release of growth hormones. Because arginine is a component of collagen and aids in building new bone and tendon cells, it can be good for arthritis and connective tissue disorders.

Scar tissue that forms during wound healing is made up of collagen, which is rich in arginine. A variety of functions, including insulin production, glucose tolerance, and liver lipid metabolism, are impaired if the body is deficient in arginine.

This amino acid can be produced in the body; however, in newborn infants, production may not occur quickly enough to keep up with requirements. It is therefore deemed essential early in life. Foods high in arginine include carob, chocolate, coconut, dairy products, gelatin, meat, oats, peanuts, soybeans, walnuts, white flour, wheat, and wheat germ. Eating watermelon can increase plasma arginine levels because watermelon is rich in citrulline, which is a precursor to arginine. Some people who engage in strength-training activities might want to increase nitric oxide levels to increase blood flow and enhance performance. One study showed that taking 3 grams of arginine a day with a protein supplement slightly increased nitric oxide production and did not cause harm.

People with viral infections such as herpes should *not* take supplemental arginine, and should avoid foods rich in arginine and low in the amino acid lysine (see page 62), as this appears to promote the growth of certain viruses. Pregnant and lactating women should avoid L-arginine supplements. Persons with schizophrenia should avoid amounts over 30 milligrams daily. Long-term use, especially of high doses, is not recommended. One study found that several weeks of large doses might result in thickening and coarsening of the skin.

## Asparagine

Asparagine, created from another amino acid, aspartic acid, is needed to maintain balance in the central nervous

system; it prevents you from being either overly nervous or overly calm. As it is converted back into aspartic acid, asparagine releases energy that brain and nervous system cells use for metabolism. It promotes the process by which one amino acid is transformed into another in the liver.

## Aspartic Acid

Because aspartic acid increases stamina, it is good for fatigue and depression, and plays a vital role in metabolism. Chronic fatigue syndrome may result from low levels of aspartic acid, because this leads to lowered cellular energy. In proper balance, aspartic acid is beneficial for neural and brain disorders; it has been found in increased levels in persons with epilepsy and in decreased levels in people with some types of depression. It is good for athletes and helps to protect the liver by aiding in the removal of excess ammonia.

Aspartic acid combines with other amino acids to form molecules that absorb toxins and remove them from the bloodstream. It also helps to move certain minerals across the intestinal lining and into the blood and cells, aids cell function, and aids the function of RNA and DNA, which are the carriers of genetic information. It enhances the production of immunoglobulins and antibodies (immune system proteins). Plant protein, especially that found in sprouting seeds, contains an abundance of aspartic acid. The artificial sweetener aspartame is made from aspartic acid and phenylalanine, another amino acid.

## Carnitine

Carnitine is not an amino acid in the strictest sense (it is actually a substance related to the B vitamins). However, because it has a chemical structure similar to that of amino acids, it is usually considered together with them.

Unlike true amino acids, carnitine is not used for protein synthesis or as a neurotransmitter. Its main function in the body is to help transport long-chain fatty acids, which are burned within the cells, mainly in the mitochondria, to provide energy. This is a major source of energy for the muscles. Carnitine thus increases the use of fat as an energy source. This prevents fatty buildup, especially in the heart, liver, and skeletal muscles. Carnitine may be useful in treating chronic fatigue syndrome (CFS), because a disturbance in the function of the mitochondria (the site of energy production within the cells) may be a factor in fatigue. Studies have shown decreased carnitine levels in many people with CFS.

Carnitine reduces the health risks posed by poor fat metabolism associated with diabetes; inhibits alcohol-induced fatty liver; and lessens the risk of heart disorders.

Studies have shown that damage to the heart from cardiac surgery can be reduced by treatment with carnitine. According to *The American Journal of Cardiology*, one study showed that propionyl-L-carnitine, a carnitine derivative, helps to ease the severe pain of intermittent claudication, a

condition in which a blocked artery in the thigh decreases the supply of blood and oxygen to leg muscles, causing pain, especially with physical activity. Carnitine has the ability to lower blood triglyceride levels, aid in weight loss, improve the motility of sperm, and improve muscle strength in people with neuromuscular disorders. It may be useful in treating Alzheimer's disease. Conversely, carnitine deficiency may be a contributor to certain types of muscular dystrophy, and it has been shown that these disorders lead to losses of carnitine in the urine. People with such conditions need greater-than-normal amounts of carnitine. Carnitine has also been shown to reduce fatigue, which is common in many diseases. In studies, people with celiac disease (an autoimmune disorder of the small intestine) and people with cancer had more energy with carnitine supplementation.

Carnitine also enhances the effectiveness of the antioxidant vitamins E and C. It works with antioxidants to help slow the aging process by promoting the synthesis of carnitine acetyl-transferase, an enzyme in the mitochondria of brain cells that is vital for the production of cellular energy there. Supplemental carnitine has been shown to reduce damage to the bad cholesterol, LDL, in patients with type 2 diabetes. This shows that carnitine is effective at limiting the oxidative stress that is common in diabetes and many other conditions.

The body can manufacture carnitine if sufficient amounts of iron, vitamin B<sub>1</sub> (thiamine), vitamin B<sub>6</sub> (pyridoxine), and the amino acids lysine and methionine are available. The synthesis of carnitine also depends on the presence of adequate levels of vitamin C. Inadequate intake of any of these nutrients can result in a carnitine deficiency. Carnitine can also be obtained from food, primarily meats and other foods of animal origin.

Many cases of carnitine deficiency have been identified as partly genetic in origin, resulting from an inherited defect in carnitine synthesis. Possible symptoms of deficiency include confusion, heart pain, muscle weakness, and obesity.

Because of their generally greater muscle mass, men need more carnitine than do women. Vegetarians are more likely than nonvegetarians to be deficient in carnitine because it is not found in vegetable protein. Moreover, neither methionine nor lysine, two of the key constituents from which the body makes carnitine, are obtainable from vegetable sources in sufficient amounts. To ensure adequate production of carnitine, vegetarians should take supplements or should eat grains, such as cornmeal, that have been fortified with lysine.

Supplemental carnitine is available in different forms, including D-carnitine, L-carnitine, and DL-carnitine. DL-carnitine is not recommended, as it may cause toxicity.

Acetyl-L-carnitine (ALC), a carnitine derivative produced naturally in the body, is involved in carbohydrate and protein metabolism and in the transport of fats into the mitochondria. It increases levels of carnitine in tissues and even surpasses the metabolic potency of carnitine. ALC

has become one of the most studied compounds for its anti-aging effects, particularly with regard to degeneration of the brain and nervous system. Several major studies have shown that daily supplementation with ALC significantly slows the progression of Alzheimer's disease, resulting in less deterioration in memory, attention and language, and spatial abilities.

It also can be used to treat other cognitive disorders, as well as depression. ALC provides numerous other benefits to many of the body's systems. It helps to limit damage caused by oxygen starvation, enhance the immune system, protect against oxidative stress, stimulate the antioxidant activity of certain enzymes, protect membranes, slow cerebral aging, prevent nerve disease associated with diabetes and sciatica, modulate hormonal changes caused by physical stress, and increase the performance-enhancing benefits of branched-chain amino acids.

Total brain levels of ALC (and carnitine) decline with age. In most of the studies of ALC done with humans, subjects took 500 to 2,500 milligrams daily, in divided doses. No toxic or serious side effects have been reported.

### Carnosine

L-carnosine is a dipeptide composed of two bonded amino acids—alanine and histidine. It is found naturally in the body, particularly in brain tissue, the heart, skin, muscles, kidneys, and stomach. Carnosine levels in the body decline with age. This compound has the ability to help prevent glycosylation, the cross linking of proteins with sugars to form advanced glycosylation end products, or AGEs. This effect may be beneficial for combating diabetes, kidney failure, neuropathy, and aging in general.

To date, no serious side effects have been noted in trials. The normal oral dose is 100 to 500 milligrams daily (with occasional breaks). Avoid megadosing. This is the oral form, not the eyedrop form used in Russia for cataract treatment (that is N-alpha-acetylcarnosine).

### Citrulline

The body makes citrulline from another amino acid, ornithine. Citrulline promotes energy, stimulates the immune system, is metabolized to form L-arginine, and detoxifies ammonia, which damages living cells. Citrulline is found primarily in the liver. It is helpful in treating fatigue.

### Cysteine and Cystine

These two amino acids are closely related; each molecule of cystine consists of two molecules of cysteine joined together.

Cysteine is very unstable and is easily converted to L-cystine; however, each form is capable of converting into the other as needed. Both are sulfur-containing amino acids that aid in the formation of skin and are important in detoxification.

Cysteine is present in alpha-keratin, the chief protein constituent of the fingernails, toenails, skin, and hair. Cysteine aids in the production of collagen and promotes the proper elasticity and texture of the skin. It is also found in a variety of other proteins in the body, including several of the digestive enzymes.

Cysteine helps to detoxify harmful toxins and protect the body from radiation damage. It is one of the best free radical destroyers, and works best when taken with selenium and vitamin E. Cysteine is also a precursor to glutathione, a substance that detoxifies the liver by binding with potentially harmful substances there. It helps to protect the liver and brain from damage due to alcohol, drugs, and toxic compounds in cigarette smoke.

Since cysteine is more soluble than cystine, it is used more readily in the body and is usually best for treating most illnesses. This amino acid is formed from L-methionine in the body. Vitamin B<sub>6</sub>, vitamin B<sub>12</sub>, and folate are necessary for cysteine synthesis, which may not take place as it should in the presence of chronic disease. Therefore, people with chronic illnesses may need higher-than-normal doses of cysteine, as much as 1,000 milligrams three times daily for a month at a time.

Supplementation with L-cysteine is recommended in the treatment of rheumatoid arthritis, hardening of the arteries, and mutagenic disorders such as cancer. It promotes healing after surgery and severe burns, chelates heavy metals, and binds with soluble iron, aiding in iron absorption. This amino acid also promotes the burning of fat and the building of muscle. Because of its ability to break down mucus in the respiratory tract, L-cysteine is often beneficial in the treatment of bronchitis, emphysema, and tuberculosis. It promotes healing from respiratory disorders and plays an important role in the activity of white blood cells, which fight disease.

Cystine or the N-acetyl form of cysteine (N-acetylcysteine, or NAC) may be used in place of L-cysteine. NAC aids in preventing side effects from chemotherapy and radiation therapy. Because it increases glutathione levels in the lungs, kidneys, liver, and bone marrow, it has an antiaging effect on the body—reducing the accumulation of age spots, for example. NAC has been shown to be more effective at boosting glutathione levels than supplements of cystine or even of glutathione itself.

People who have diabetes should be cautious about taking supplemental cysteine because it is capable of inactivating insulin. Persons with cystinuria, a rare genetic condition that leads to the formation of cystine kidney stones, also should not take cysteine.

### Gamma-Aminobutyric Acid

Gamma-aminobutyric acid (GABA) is an amino acid that acts as a neurotransmitter in the central nervous system. It is essential for brain metabolism, aiding in proper brain function. GABA is formed in the body from another amino

acid, glutamic acid. Its function is to decrease neuron activity and inhibit nerve cells from overfiring. Together with niacinamide and inositol, it prevents anxiety- and stress-related messages from reaching the motor centers of the brain by occupying their receptor sites.

GABA can be taken to calm the body in much the same way as diazepam (Valium), chlordiazepoxide (Librium), and other tranquilizers, but without the fear of addiction. It has been used in the treatment of epilepsy and hypertension.

GABA is good for depressed sex drive because of its ability as a relaxant. It is also useful for enlarged prostate glands, probably because it plays a role in the mechanism regulating the release of sex hormones. GABA is effective in treating attention deficit disorder and may reduce cravings for alcohol. It is also thought to promote growth hormone secretion.

Too much GABA, however, can cause increased anxiety, shortness of breath, numbness around the mouth, and tingling in the extremities. Further, abnormal levels of GABA unbalance the brain's message-delivery system and may cause seizures.

### Glutamic Acid

Glutamic acid is an excitatory neurotransmitter that increases the firing of neurons in the central nervous system. It is a major excitatory neurotransmitter in the brain and spinal cord. It is converted into either glutamine or GABA.

This amino acid is important in the metabolism of sugars and fats, and aids in the transportation of potassium into the spinal fluid and across the blood-brain barrier. Although it does not pass the blood-brain barrier as readily as glutamine does, it is found at high levels in the blood and may infiltrate the brain in small amounts. The brain can use glutamic acid as fuel. Glutamic acid can detoxify ammonia by picking up nitrogen atoms, in the process creating another amino acid, glutamine. The conversion of glutamic acid into glutamine is the only means by which ammonia in the brain can be detoxified.

Glutamic acid helps to correct personality disorders and is useful in treating childhood behavioral disorders. It is used in the treatment of epilepsy, mental retardation, muscular dystrophy, ulcers, and hypoglycemic coma, a complication of insulin treatment for diabetes. It is a component of folate (folic acid), a B vitamin that helps the body break down amino acids. Because one of its salts is monosodium glutamate (MSG), glutamic acid should be avoided by anyone who is allergic to MSG.

### Glutamine

Glutamine is the most abundant free amino acid found in the muscles of the body. Because it can readily pass the blood-brain barrier, it is known as brain fuel. In the brain, glutamine is converted into glutamic acid—which is essen-

tial for cerebral function—and vice versa. It also increases the amount of GABA, which is needed to sustain proper brain function and mental activity. It assists in maintaining the proper acid/alkaline balance in the body, and is the basis of the building blocks for the synthesis of RNA and DNA. It promotes mental ability and the maintenance of a healthy digestive tract.

When an amino acid is broken down, nitrogen is released. The body needs nitrogen, but free nitrogen can form ammonia, which is especially toxic to brain tissues. The liver can convert nitrogen into urea, which is excreted in the urine, or nitrogen may attach itself to glutamic acid. This process forms glutamine. Glutamine is unique among the amino acids in that each molecule contains not one nitrogen atom but two. Thus, its creation helps to clear ammonia from the tissues, especially brain tissue, and it can transfer nitrogen from one place to another.

Glutamine is found in large amounts in the muscles and is readily available when needed for the synthesis of skeletal muscle proteins. Because this amino acid helps to build and maintain muscle, supplemental glutamine is useful for dieters and bodybuilders. More important, it helps to prevent the kind of muscle wasting that can accompany prolonged bed rest or diseases such as cancer and AIDS. This is because stress and injury (including surgical trauma) cause the muscles to release glutamine into the bloodstream. In addition, glutamine helps strengthen the lining of the intestinal tract, so that nutrients are more efficiently absorbed. This is important for wasting diseases such as cancer.

In fact, during times of stress, as much as one third of the glutamine present in the muscles may be released. As a result, stress and/or illness can lead to the loss of skeletal muscle. If enough glutamine is available, however, this can be prevented.

Supplemental L-glutamine can be helpful in the treatment of arthritis, autoimmune diseases, fibrosis, intestinal disorders, peptic ulcers, connective tissue diseases such as polymyositis and scleroderma, and tissue damage due to radiation treatment for cancer. L-glutamine can enhance mental functioning and has been used to treat a range of problems, including developmental disabilities, epilepsy, fatigue, impotence, depression, schizophrenia, and senility.

It preserves glutathione in the liver and protects that organ from the effects of acetaminophen overdose. It enhances antioxidant protection. L-glutamine decreases sugar cravings and the desire for alcohol, and is useful for recovering alcoholics.

Many plant and animal substances contain glutamine, but cooking easily destroys it. If eaten raw, spinach and parsley are good sources. Supplemental glutamine must be kept absolutely dry or the powder will degrade into ammonia and pyroglutamic acid. Glutamine should *not* be taken by persons with cirrhosis of the liver, kidney problems, Reye's syndrome, or any type of disorder that can result in an accumulation of ammonia in the blood. For such individuals, taking supplemental glutamine may only

cause further damage to the body. Be aware that although the names sound similar, glutamine, glutamic acid (also sometimes called glutamate), glutathione, gluten, and monosodium glutamate are all different substances.

## Glutathione

Like carnitine, glutathione is not technically one of the amino acids. It is a compound classified as a tripeptide, and the body produces it from the amino acids cysteine, glutamic acid, and glycine. Because of its close relationship to these amino acids, however, it is usually considered together with them.

Glutathione is a powerful antioxidant that is produced in the liver. The largest stores of glutathione are found in the liver, where it detoxifies harmful compounds so that they can be excreted through the bile. Some glutathione is released from the liver directly into the bloodstream, where it helps to maintain the integrity of red blood cells and protect white blood cells. Glutathione is also found in the lungs and the intestinal tract. It is needed for carbohydrate metabolism and appears to exert antiaging effects, aiding in the breakdown of oxidized fats that may contribute to atherosclerosis.

It can mitigate some of the damage caused by tobacco smoke because it modifies the harmful effects of aldehydes, chemicals present in cigarette smoke that damage cells and molecules, and it may protect the liver from alcohol-induced damage.

A deficiency of glutathione first affects the nervous system, causing such symptoms as lack of coordination, mental disorders, tremors, and difficulty maintaining balance. These problems are believed to be due to the development of lesions in the brain. A study sponsored in part by the National Cancer Institute found that people with HIV disease who had low glutathione levels had a lower survival rate over a three-year period than those whose glutathione levels were normal. As we age, glutathione levels decline, although it is not known whether this is because we use it more rapidly or produce less of it to begin with. Unfortunately, if not corrected, the lack of glutathione in turn accelerates the aging process.

Supplemental glutathione is expensive, and the effectiveness of oral formulas is questionable. To raise glutathione levels, it is better to supply the body with the raw materials it uses to make this compound: cysteine, glutamic acid, and glycine. The N-acetyl form of cysteine, N-acetylcysteine (NAC), is considered particularly effective for this purpose.

## Glycine

Glycine retards muscle degeneration by supplying additional creatine, a compound that is present in muscle tissue and is utilized in the construction of DNA and RNA. It improves glycogen storage, thus freeing up glucose for en-

ergy needs. It is essential for the synthesis of nucleic acids, bile acids, and other nonessential amino acids in the body.

Glycine is used in many gastric antacid agents. Because high concentrations of glycine are found in the skin and connective tissues, it is useful for repairing damaged tissues and promoting healing.

Glycine is necessary for central nervous system function and a healthy prostate. It functions as an inhibitory neurotransmitter and as such can help prevent epileptic seizures. It has been used in the treatment of manic (bipolar) depression, and can also be effective for hyperactivity.

Having too much of this amino acid in the body can cause fatigue, but having the proper amount produces more energy. If necessary, glycine can be converted into the amino acid serine in the body.

## Histidine

Histidine is an essential amino acid that is significant in the growth and repair of tissues. It is important for the maintenance of the myelin sheaths, which protect nerve cells, and is needed for the production of both red and white blood cells. Histidine also protects the body from radiation damage, helps lower blood pressure, aids in removing heavy metals from the system, and may help in the prevention of AIDS.

Histidine levels that are too high may lead to stress and even psychological disorders such as anxiety and schizophrenia; people with schizophrenia have been found to have high levels of histidine in their bodies. Inadequate levels of histidine may contribute to rheumatoid arthritis and may be associated with nerve deafness. Methionine has the ability to lower histidine levels.

Histamine, an important immune system chemical, is derived from histidine. Histamine aids in sexual arousal.

Because the availability of histidine influences histamine production, taking supplemental histidine—together with vitamins B<sub>3</sub> (niacin) and B<sub>6</sub> (pyridoxine), which are required for the transformation from histidine to histamine—may help improve sexual functioning and pleasure.

Because histamine also stimulates the secretion of gastric juices, histidine may be helpful for people with indigestion resulting from a lack of stomach acid.

Persons with manic (bipolar) depression should not take supplemental histidine unless a deficiency has been identified. Natural sources of histidine include rice, wheat, and rye.

## Homocysteine

Homocysteine is an amino acid that is produced in the body in the course of methionine metabolism. This amino acid has been the focus of increasing attention in recent years, because high levels of homocysteine in the blood are associated with an increased risk of cardiovascular disease.

Further, it is known that homocysteine has a toxic effect on cells lining the arteries, makes the blood more prone to clotting, and promotes the oxidation of low-density lipoproteins (LDL, the so-called “bad cholesterol”), which makes it more likely that cholesterol will be deposited as plaque in the blood vessels.

Like other amino acids, homocysteine does perform a necessary function in the body. It is then usually broken down quickly into the amino acid cysteine and other important compounds, including adenosine triphosphate (ATP, an important source of cellular energy) and Sadenosylmethionine (SAME). However, a genetic defect or, more commonly, deficiencies of vitamins B<sub>6</sub> and B<sub>12</sub> and folate (folic acid) can prevent homocysteine from converting rapidly enough. As a result, high levels of the amino acid accumulate in the body, damaging cell membranes and blood vessels, and increasing the risk of cardiovascular disease, particularly atherosclerosis. Vitamins B<sub>6</sub> and B<sub>12</sub> and folate work together to facilitate the breakdown of homocysteine, and thus help protect against heart disease.

## Isoleucine

Isoleucine, one of the essential amino acids, is needed for hemoglobin formation and also stabilizes and regulates blood sugar and energy levels. It is metabolized in muscle tissue. It is one of the three branched-chain amino acids. These amino acids are valuable for athletes because they enhance energy, increase endurance, and aid in the healing and repair of muscle tissue.

Isoleucine has been found to be deficient in people suffering from many different mental and physical disorders. A deficiency of isoleucine can lead to symptoms similar to those of hypoglycemia.

Food sources of isoleucine include almonds, cashews, chicken, chickpeas, eggs, fish, lentils, liver, meat, rye, most seeds, and soy protein. It is also available in supplemental form. Supplemental L-isoleucine should always be taken with a correct balance of the other two branched-chain amino acids, L-leucine and L-valine—approximately 2 milligrams of leucine for each milligram of valine and isoleucine. Combination supplements that provide all three of the branched-chain amino acids are available and may be more convenient to use.

## Leucine

Leucine is an essential amino acid and one of the branched-chain amino acids (the others are isoleucine and valine). These work together to protect muscle and act as fuel. Leucine plus other dietary proteins fosters muscle growth even without the other two branched-chain amino acids. They promote the healing of bones, skin, and muscle tissue, and are recommended for those recovering from surgery. Leucine also lowers elevated blood sugar levels and aids in increasing growth hormone production.

Natural sources of leucine include brown rice, beans, meat, nuts, soy flour, and whole wheat. Supplemental L-leucine must be taken in balance with L-isoleucine and L-valine (*see* Isoleucine in this section), and it should be taken in moderation, or symptoms of hypoglycemia may result. An excessively high intake of leucine may also contribute to pellagra, and may increase the amount of ammonia present in the body.

## Lysine

Lysine is an essential amino acid that is a necessary building block for all protein. It is needed for proper growth and bone development in children; it helps calcium absorption and maintains a proper nitrogen balance in adults. This amino acid aids in the production of antibodies, hormones, and enzymes, and helps in collagen formation and tissue repair. Because it helps to build muscle protein, it is good for those recovering from surgery and sports injuries. It also lowers high serum triglyceride levels.

Another very useful ability of this amino acid is its capacity for fighting cold sores and herpesviruses. Taking supplemental L-lysine, together with vitamin C with bioflavonoids, can effectively fight and/or prevent herpes outbreaks, especially if foods containing the amino acid arginine are avoided (*see* HERPESVIRUS INFECTION in Part Two). Supplemental L-lysine also may decrease acute alcohol intoxication.

Lysine is an essential amino acid, and so cannot be manufactured in the body. It is therefore vital that adequate amounts be included in the diet. Deficiencies can result in anemia, bloodshot eyes, enzyme disorders, hair loss, an inability to concentrate, irritability, lack of energy, poor appetite, reproductive disorders, retarded growth, and weight loss. Food sources of lysine include cheese, eggs, fish, lima beans, milk, potatoes, red meat, soy products, and yeast.

## Methionine

Methionine is an essential amino acid that assists in the breakdown of fats, thus helping to prevent a buildup of fat in the liver and arteries that might obstruct blood flow to the brain, heart, and kidneys. The synthesis of the amino acids cysteine and taurine may depend on the availability of methionine. This amino acid helps the digestive system; helps to detoxify harmful agents such as lead and other heavy metals; helps diminish muscle weakness, prevent brittle hair, and protect against radiation; and is beneficial for people with osteoporosis or chemical allergies. It is useful also in the treatment of rheumatic fever and toxemia of pregnancy.

Methionine is a powerful antioxidant. It is a good source of sulfur, which inactivates free radicals and helps to prevent skin and nail problems. It is also good for people with Gilbert's syndrome, an anomaly of liver function, and is required for the synthesis of nucleic acids, collagen, and

proteins found in every cell of the body. It is beneficial for women who take oral contraceptives because it promotes the excretion of estrogen. It reduces the level of histamine in the body, which can be useful for people with schizophrenia, whose histamine levels are typically higher than normal.

As levels of toxic substances in the body increase, the need for methionine increases. The body can convert methionine into the amino acid cysteine, a precursor of glutathione. Methionine thus protects glutathione; it helps to prevent glutathione depletion if the body is overloaded with toxins. Since glutathione is a key neutralizer of toxins in the liver, this protects the liver from the damaging effects of toxic compounds.

An essential amino acid, methionine is not synthesized in the body and so must be obtained from food sources or from dietary supplements. Good food sources of methionine include beans, eggs, fish, garlic, lentils, meat, onions, soybeans, seeds, and yogurt. Because the body uses methionine to derive a brain food called choline, it is wise to supplement the diet with choline or lecithin (which is high in choline) to ensure that the supply of methionine is not depleted.

## Ornithine

Ornithine helps to prompt the release of growth hormone, which promotes the metabolism of excess body fat. This effect is enhanced if ornithine is combined with arginine and carnitine. Ornithine is necessary for proper immune-system and liver function. This amino acid also detoxifies ammonia and aids in liver regeneration. High concentrations of ornithine are found in the skin and connective tissue, making it useful for promoting healing and repairing damaged tissues.

Ornithine is synthesized in the body from arginine, and in turn serves as the precursor of citrulline, proline, and glutamic acid. Children, pregnant women, nursing mothers, or anyone with a history of schizophrenia should not take supplemental L-ornithine, unless they are specifically directed to do so by a physician.

## Phenylalanine

Phenylalanine is an essential amino acid. Because it can cross the blood-brain barrier, it can have a direct effect on brain chemistry. Once in the body, phenylalanine can be converted into another amino acid, tyrosine, which in turn is used to synthesize two key neurotransmitters that promote alertness: dopamine and norepinephrine. Because of its relationship to the action of the central nervous system, this amino acid can elevate mood, decrease pain, aid in memory and learning, and suppress the appetite. It can be used to treat arthritis, depression, menstrual cramps, migraines, obesity, Parkinson's disease, and schizophrenia.

Phenylalanine is available in three different forms, des-

ignated L-, D-, and DL-. The L- form is the most common type and is the form in which phenylalanine is incorporated into the body's proteins. The D- form acts as a painkiller. The DL- form is a combination of the D- and the L-. Like the D- form, it is effective for controlling pain, especially the pain of arthritis; like the L- form, it functions as a building block for proteins, increases mental alertness, suppresses the appetite, and helps people with Parkinson's disease. It has been used to alleviate the symptoms of premenstrual syndrome (PMS) and various types of chronic pain.

Supplemental phenylalanine, as well as products containing aspartame (an artificial sweetener made from phenylalanine and another amino acid, aspartic acid), should *not* be taken by pregnant women or by people who suffer from anxiety attacks, diabetes, high blood pressure, phenylketonuria (PKU), or preexisting pigmented melanoma, a type of skin cancer.

### Proline

Proline improves skin texture by aiding in the production of collagen and reducing the loss of collagen through the aging process. It is needed to repair tissue after a major sunburn or severe burn. It also helps in the healing of cartilage and the strengthening of joints, tendons, and heart muscle. It works with vitamin C to promote healthy connective tissue.

Proline is obtained primarily from meat sources, dairy products, and eggs.

### Serine

Serine is needed for the proper metabolism of fats and fatty acids, the growth of muscle, and the maintenance of a healthy immune system. It is a component of brain proteins and the protective myelin sheaths that cover nerve fibers. It is important in RNA and DNA function, cell membrane formation, and creatine synthesis. It also aids in the production of immunoglobulins and antibodies. However, too-high serine levels in the body may have adverse effects on the immune system.

Serine can be made from glycine in the body, but this process requires the presence of sufficient amounts of vitamins B<sub>3</sub> and B<sub>6</sub> and folic acid. Food sources of serine include meat and soy foods, as well as many foods that often cause allergic reactions, such as dairy products, wheat gluten, and peanuts. It is included as a natural moisturizing agent in many cosmetics and skin-care preparations.

### Taurine

High concentrations of taurine are found in the heart muscle, white blood cells, skeletal muscle, and central nervous system. It is a building block of all the other amino acids as well as a key component of bile, which is needed for the digestion of fats, the absorption of fat-soluble vitamins,

and the control of serum cholesterol levels. Taurine can be useful for people with atherosclerosis, edema, heart disorders, hypertension, or hypoglycemia. It is vital for the proper utilization of sodium, potassium, calcium, and magnesium, and it has been shown to play a particular role in sparing the loss of potassium from the heart muscle. This helps to prevent the development of potentially dangerous cardiac arrhythmias.

Taurine has a protective effect on the brain, particularly if the brain is dehydrated. It is used to treat anxiety, epilepsy, hyperactivity, poor brain function, and seizures.

Taurine is found in concentrations up to four times greater in the brains of children than in those of adults. It may be that a deficiency of taurine in the developing brain is involved in seizures. Zinc deficiency also is commonly found in people with epilepsy, and this may play a part in the deficiency of taurine. Taurine is also associated with zinc in maintaining eye function; a deficiency of both may impair vision. Taurine supplementation may benefit children with Down syndrome and muscular dystrophy. This amino acid is also used in some clinics for breast cancer treatment.

Excessive losses of taurine through the urine can be caused by many metabolic disorders. Cardiac arrhythmias, disorders of platelet formation, intestinal problems, an overgrowth of candida, physical or emotional stress, a zinc deficiency, and excessive consumption of alcohol are all associated with high urinary losses of taurine. Excessive alcohol consumption also causes the body to lose its ability to utilize taurine properly. Taurine supplementation may reduce symptoms of alcohol withdrawal. Diabetes increases the body's requirements for taurine; conversely, supplementation with taurine and cystine may decrease the need for insulin.

Taurine is found in eggs, fish, meat, and milk, but not in vegetable proteins. It can be synthesized from cysteine in the liver and from methionine elsewhere in the body, as long as sufficient quantities of vitamin B<sub>6</sub> are present. For vegetarians, synthesis by the body is crucial. For individuals with genetic or metabolic disorders that prevent the synthesis of taurine, taurine supplementation is required.

### Threonine

Threonine is an essential amino acid that helps to maintain the proper protein balance in the body. It is important for the formation of collagen, elastin, and tooth enamel, and aids liver and lipotropic function when combined with aspartic acid and methionine. A precursor of the amino acids glycine and serine, threonine is present in the heart, central nervous system, and skeletal muscle, and helps to prevent fatty buildup in the liver. It enhances the immune system by aiding in the production of antibodies, and may be helpful in treating some types of depression.

Because the threonine content of grains is low, vegetarians are more likely than others to have deficiencies.

## Tryptophan

Tryptophan is an essential amino acid that is necessary for the production of vitamin B<sub>3</sub> (niacin). It is used by the brain to produce serotonin, a necessary neurotransmitter that transfers nerve impulses from one cell to another and is responsible for normal sleep. Consequently, tryptophan helps to combat depression and insomnia and to stabilize moods. But it is most commonly used to treat sleep problems.

Tryptophan helps to control hyperactivity in children, alleviates stress, is good for the heart, aids in weight control by reducing appetite, and enhances the release of growth hormone. It is good for migraine headaches and may reduce some of the effects of nicotine. Sufficient amounts of vitamins B<sub>6</sub> (pyridoxine) and C, folate, and magnesium are necessary for the formation of tryptophan, which, in turn, is required for the formation of serotonin. A study reported in the *Archives of General Psychiatry* found that women with a history of bulimia nervosa, an eating disorder, experienced relapses after they took an amino acid mixture lacking tryptophan. Researchers believe that insufficient tryptophan altered brain serotonin levels and, consequently, the transmission of nerve impulses. A lack of tryptophan and magnesium may contribute to coronary artery spasms.

The best dietary sources of tryptophan include brown rice, cottage cheese, meat, peanuts, and soy protein. In November 1989, the U.S. Centers for Disease Control (CDC) reported evidence linking L-tryptophan supplements to a blood disorder called eosinophilia-myalgia syndrome (EMS). Several hundred cases of this illness—which is characterized by an elevated white blood cell count and can also cause such symptoms as fatigue, muscular pain, respiratory ailments, edema, and rash—were reported. After the CDC established an association between the blood disorder and products containing L-tryptophan in New Mexico, the U.S. Food and Drug Administration (FDA) first warned consumers to stop taking L-tryptophan supplements, then recalled all products in which L-tryptophan was the sole or a major component. According to the FDA, at least thirty-eight deaths could be attributed to the tryptophan supplements.

Subsequent research showed that it was contaminants in the supplements, *not* the tryptophan, that was probably responsible for the problem. In 2005, tryptophan supplements were sold again in the United States after the FDA carefully reviewed the new source of tryptophan and deemed it acceptable.

## Tyrosine

Tyrosine is important to overall metabolism. It is a precursor of adrenaline and the neurotransmitters norepinephrine and dopamine, which regulate mood and stimulate metabolism and the nervous system. Tyrosine acts as a

mood elevator; a lack of adequate amounts of tyrosine leads to a deficiency of norepinephrine in the brain, which in turn can result in depression. It also acts as a mild antioxidant, suppresses the appetite, and helps to reduce body fat. It aids in the production of melanin (the pigment responsible for skin and hair color) and in the functions of the adrenal, thyroid, and pituitary glands. It is also involved in the metabolism of the amino acid phenylalanine.

Tyrosine attaches to iodine atoms to form active thyroid hormones. Not surprisingly, low plasma levels of tyrosine have been associated with hypothyroidism. Symptoms of tyrosine deficiency can also include low blood pressure, low body temperature (such as cold hands and feet), and restless leg syndrome.

Supplemental L-tyrosine has been used for stress reduction, and research suggests it may be helpful against chronic fatigue and narcolepsy. It has been used to help individuals suffering from anxiety, depression, low sex drive, allergies, and headaches, as well as persons undergoing withdrawal from drugs. It may also help people with Parkinson's disease.

Natural sources of tyrosine include almonds, avocados, bananas, dairy products, lima beans, pumpkin seeds, and sesame seeds. Tyrosine can also be produced from phenylalanine in the body. Supplements of L-tyrosine should be taken at bedtime or with a high-carbohydrate meal so that it does not have to compete for absorption with other amino acids.

Persons taking monoamine oxidase (MAO) inhibitors, commonly prescribed for depression, must strictly limit their intake of foods containing tyrosine and should *not* take any supplements containing L-tyrosine, as it may lead to a sudden and dangerous rise in blood pressure. Anyone who takes prescription medication for depression should discuss necessary dietary restrictions with his or her physician.

## Valine

Valine, an essential amino acid, has a stimulant effect. It is needed for muscle metabolism, tissue repair, and the maintenance of a proper nitrogen balance in the body. Valine is found in high concentrations in muscle tissue. It is one of the branched-chain amino acids, which means that it can be used as an energy source by muscle tissue. It may be helpful in treating liver and gallbladder disease, and it is good for correcting the type of severe amino acid deficiencies that can be caused by drug addiction. An excessively high level of valine may lead to such symptoms as a crawling sensation in the skin and even hallucinations.

Dietary sources of valine include dairy products, grains, meat, mushrooms, peanuts, and soy protein. Supplemental L-valine should always be taken in balance with the other branched-chain amino acids, L-isoleucine and L-leucine (*see* Isoleucine in this section).

# Antioxidants

## INTRODUCTION

Antioxidants are natural compounds that help protect the body from harmful free radicals. These are atoms or groups of atoms that can cause damage to cells, impairing the immune system and leading to infections and various degenerative diseases such as heart disease and cancer. Antioxidants therefore play a beneficial role in the prevention of disease. Free radical damage is thought by scientists to be the basis for the aging process as well. (See Free Radicals on page 67.)

There are a number of known free radicals that occur in the body, the most common of which are oxygen-derived free radicals, such as superoxide radicals and hydroxyl radicals, hypochlorite radicals, hydrogen peroxide, various lipid peroxides, and nitric oxide. They may be formed by exposure to radiation, including exposure to the sun's rays; exposure to toxic chemicals such as those found in cigarette smoke, polluted air, and industrial and household chemicals; and various metabolic processes, such as the process of breaking down stored fat molecules for use as an energy source.

Free radicals are normally kept in check by the action of *free radical scavengers* that occur naturally in the body. These scavengers neutralize the free radicals. Certain enzymes serve this vital function. Four important enzymes that neutralize free radicals are superoxide dismutase (SOD), methionine reductase, catalase, and glutathione peroxidase.

The body makes these as a matter of course. There are also a number of phytochemicals and nutrients that act as antioxidants, including vitamin A, beta-carotene and other carotenoids, flavonoids, vitamins C and E, and the mineral selenium. Researchers have recently found that eggplant contains high levels of chlorogenic acid, which has proven to be a highly effective antioxidant. Another antioxidant is the hormone melatonin, which is a powerful free radical neutralizer. Certain herbs have antioxidant properties as well.

Although many antioxidants can be obtained from food sources such as sprouted grains and fresh fruits and vegetables, it is difficult to get enough of them from these sources to hold back the free radicals constantly being generated in our polluted environment. We can minimize free radical damage by taking supplements of key nutrients. A high intake of antioxidant nutrients appears to be especially protective against cancer.

Antioxidants work synergistically in giving protection against free radical damage, so it is better to take smaller

doses of several different antioxidants than a large amount of only one. For example, while beta-carotene by itself is an excellent antioxidant, a mix of natural carotenoids provides more health benefits than beta-carotene alone. There are many good combination formulas available that make it easy to take multiple antioxidants every day. Similarly, taking antioxidants together, for example beta-carotene with vitamin E and vitamin C, appears to be more effective than taking any one alone.

Some of the major antioxidants are described in the sections that follow.

## THE ANTIOXIDANTS

### Alpha-Lipoic Acid

Alpha-lipoic acid (ALA) is a powerful antioxidant—both on its own and as a “recycler” of vitamin E and vitamin C. It can restore the antioxidant properties of these vitamins after they have neutralized free radicals. ALA also stimulates the body's production of glutathione and aids in the absorption of coenzyme Q<sub>10</sub>, both important antioxidants. Because ALA is soluble in both water and fat, it can move into all parts of cells to deactivate free radicals.

Supplemental ALA has been used for almost three decades in Europe to treat peripheral nerve degeneration and to help control blood sugar levels in people with diabetes. It also helps to detoxify the liver of metal pollutants, block cataract formation, protect nerve tissues against oxidative stress, and reduce blood cholesterol levels. It can be used with carnitine to provide an antiaging effect. ALA is known also as a metabolic antioxidant, because without it, cells cannot use sugar to produce energy. The body does not produce large amounts of ALA, but because it is found naturally in only a few foods, including spinach, broccoli, potatoes, brewer's yeast, and organ meats, supplementation may be necessary.

### Bilberry

The herb bilberry (*Vaccinium myrtillus*), a European relative of the American blueberry, contains natural antioxidants that keep capillary walls strong and flexible. They also help to maintain the flexibility of the walls of red blood cells and allow them to pass through the capillaries more freely. Everyone knows that vitamins C and E are good sources of antioxidants, but bilberry, which contains anthocyanidins phytochemicals, also acts as an antioxidant. It also helps to lower blood pressure, inhibit clot formation, and enhance

blood supply to the nervous system. Studies indicate that anthocyanidins can provide up to fifty times the antioxidant protection of vitamin E and ten times the protection of vitamin C. In addition, this herb protects the eyes and may enhance vision; supports and strengthens collagen structures; inhibits the growth of bacteria; acts as an anti-inflammatory; and has antiaging and anticarcinogenic effects. One study that looked at the effects of bilberry on night vision found that vision was not improved with the amounts that are typically sold. Tests have shown that the compound glucoquinine, found in bilberry leaves, helps to lower blood sugar levels.

### Burdock

The herb burdock (*Arctium lappa*) was tested by researchers at the Chia Nan College of Pharmacy and Science in Taiwan for its antioxidant properties. They found that burdock is a powerful antioxidant, capable of scavenging hydrogen peroxide and superoxide radicals. It also showed a marked scavenging effect against hydroxyl radicals. The study showed also that burdock and vitamin E quench more free radicals when used in combination. Burdock also might protect against cancer by helping to control cell mutation.

### Carotenoids

See under Vitamin A and the Carotenoids.

### Coenzyme Q<sub>10</sub>

Coenzyme Q<sub>10</sub> is an antioxidant that is structurally similar to vitamin E. It plays a crucial role in the generation of cellular energy, is a significant immunologic stimulant, increases circulation, has antiaging effects, and is beneficial for the cardiovascular system. Also known as *ubiquinone* (from *quinone*, a type of coenzyme, and *ubiquitous*, because it exists everywhere in the body), coenzyme Q<sub>10</sub> is found in highest concentrations in the heart, followed by the liver, kidney, spleen, and pancreas. Within the mitochondria, the cells' energy-production centers, coenzyme Q<sub>10</sub> helps to metabolize fats and carbohydrates. It also helps to maintain the flexibility of cell membranes.

Various research reports suggest that coenzyme Q<sub>10</sub> also may be beneficial in treating cancer, AIDS, muscular dystrophy, allergies, gastric ulcers, myopathy, Parkinson's disease, and deafness.

Natural sources of coenzyme Q<sub>10</sub> include meats, peanuts, sardines, and spinach. (See Natural Food Supplements later in Part One for more on coenzyme Q<sub>10</sub>.)

### Curcumin (Turmeric)

Found in the spice turmeric, the phytochemical curcumin has antioxidant properties that prevent the formation of

and neutralize existing free radicals. It stops precancerous changes within DNA and interferes with enzymes necessary for cancer progression. Curcumin stops the oxidation of cholesterol, thus protecting against the formation of plaque in the arteries. In a study of chronic smokers, those who took curcumin excreted a substantially lower level of mutagens (substances that induce cells to mutate) in their urine, a reflection of how well the body is dealing with these cancer-causing substances. Curcumin has been shown to be of benefit to some patients with advanced pancreatic cancer. It may also calm an overactive immune system in patients with ulcerative colitis, reducing inflammation, redness, and soreness. In one study, curcumin helped keep patients with ulcerative colitis from experiencing intestinal flare-ups. But it does not seem to be effective for other inflammatory conditions such as psoriasis. Curcumin also blocks toxic compounds from reaching or reacting with body tissues, and may prevent cataracts.

Curcumin should not be taken by anyone who has biliary tract obstruction or is taking anticoagulants, as curcumin stimulates bile secretion and acts as a blood-thinner.

### Flavonoids

Flavonoids are especially potent antioxidants and metal chelators. They are the largest category of plant compounds called polyphenols. They are chemical compounds that plants produce to protect themselves from parasites, bacteria, and cell injury. More than 4,000 chemically unique flavonoids are known; they occur in fruits, vegetables, spices, seeds, nuts, flowers, and bark. Wine (particularly red wine), apples, blueberries, bilberries, onions, soy products, and tea are some of the best food sources of flavonoids. Certain flavonoids in fruits and vegetables have much greater antioxidant activity than vitamins C and E or beta-carotene. In fact, flavonoids protect the antioxidant vitamins from oxidative damage.

Numerous medicinal herbs contain therapeutic amounts of flavonoids; they often are a major component of an herb's medicinal activity, which include helping prevent heart disease and cancer, and reducing the incidence of neurodegenerative diseases.

Natural sources of the flavonoids include almonds, apples, broccoli, citrus fruits, tea, tomatoes, onions, soybeans, and red wine. In the United States, the greatest intake of flavonoids comes from citrus fruits, tea, and wine.

### Garlic

This versatile healing herb also has antioxidant properties. The sulfhydryl (sulfur and hydrogen) compounds in garlic are potent chelators of toxic heavy metals, binding with them so that they can be excreted. These same compounds are effective protectants against oxidation and free radicals.

Garlic aids in the detoxification of peroxides such as hydrogen peroxide and helps to prevent fats from being oxi-

## Free Radicals

A free radical is an atom or group of atoms that contains at least one unpaired electron. Electrons are negatively charged particles that usually occur in pairs, forming a chemically stable arrangement. If an electron is unpaired, another atom or molecule can easily bond with it, causing a chemical reaction. Because they join so readily with other compounds, free radicals can effect dramatic changes in the body, and they can cause a lot of oxidative damage. Each free radical may exist for only a tiny fraction of a second, but the damage it leaves behind can be irreversible, particularly damage to heart muscle cells, nerve cells, and certain immune system sensor cells.

Free radicals are normally present in the body in small numbers. Oxygen-charged particles are created in the body as we breathe. Diets rich in antioxidants can more than neutralize these particles. Dietary supplements rich in antioxidants act in the same way. Biochemical processes naturally lead to the formation of free radicals, and under normal circumstances the body can keep them in check. Indeed, not all free radicals are bad. Free radicals produced by the immune system destroy viruses and bacteria. Other free radicals are involved in producing vital hormones and activating enzymes that are needed for life. We need free radicals to produce energy and various substances that the body requires. If there is excessive free radical formation, however, damage to cells and tissues can occur. The formation of a large number of free radicals stimulates the formation of more free radicals, leading to even more damage.

Many different factors can lead to an excess of free radicals. Exposure to radiation, whether from the sun or small amounts from medical x-rays, activates the formation of free radicals, as does exposure to environmental pollutants such as tobacco smoke and automobile exhaust. Diet also

can contribute to the formation of free radicals. When the body obtains nutrients through the diet, it utilizes oxygen and these nutrients to create energy. In this oxidation process, oxygen molecules containing unpaired electrons are released. These oxygen free radicals can cause damage to the body if produced in extremely large amounts. Being overweight or consuming a diet that is high in fat can increase free radical activity because oxidation occurs more readily in fat molecules than it does in carbohydrate or protein molecules. Cooking fats at high temperatures, particularly frying foods in oil, can produce large numbers of free radicals.

The presence of a dangerous number of free radicals can alter the way in which the cells code genetic material.

Changes in protein structure can occur as a result of errors in protein synthesis. The body's immune system may then see this altered protein as a foreign substance and try to destroy it. The formation of mutated proteins can eventually damage the immune system and lead to leukemia and other types of cancer, as well as to many other diseases.

In addition to damaging genetic material, free radicals can destroy the protective cell membranes. Calcium levels in the body may be upset as well. Over time, the body produces more free radicals than it does scavengers. The resulting imbalance contributes to the aging process.

Substances known as antioxidants neutralize free radicals by binding to their free electrons. Antioxidants available in supplement form include the enzymes superoxide dismutase and glutathione peroxidase; vitamin A, beta-carotene, and vitamins C and E; the minerals selenium and zinc; and the hormone melatonin. By destroying free radicals, antioxidants help to detoxify and protect the body.

dized and deposited in tissues and arteries. Garlic also contains antioxidant nutrients such as vitamins A and C and selenium.

Studies on aged garlic extract (AGE) have shown that the aging process substantially boosts garlic's antioxidant potential. AGE protects against DNA damage, keeps blood vessels healthy, and guards against radiation and sunlight damage. According to researcher and nutritionist Robert I-San Lin, Ph.D., aged garlic extract can prevent liver damage caused by carbon tetrachloride, a common indoor pollutant and free radical generator. Overall, aged garlic supplements provide a greater concentration of garlic's beneficial compounds. It is particularly helpful to reduce oxidation associated with aging. If you're worried about "garlic breath" putting a strain on your social life, choose an odorless and tasteless form such as Kyolic aged garlic extract from Wakunaga of America. Aged garlic extract reduces blood cholesterol levels, thus lowering the risk of heart attack; provides protection from heart disease by pre-

venting clots that can lead to heart attacks and strokes; and helps lower high blood pressure. Timed-released garlic has been shown to reduce blood cholesterol levels, and to lower fasting blood sugar levels in patients with type 2 diabetes.

### Ginkgo Biloba

Ginkgo biloba is an herb with powerful antioxidant effects in the brain, retina, and cardiovascular system. It is well known for its ability to enhance circulation, and a study reported in the *Journal of the American Medical Association* showed that it has a measurable effect on dementia in people with Alzheimer's disease and people recovering from strokes. Other studies indicate that it can improve both long- and short-term memory and enhance concentration.

Ginkgo biloba has also been used to treat hearing problems, impotence, and macular degeneration.

Anyone who takes prescription anticoagulant (blood-thinning) medication or who uses over-the-counter pain-

killers regularly should consult a health care provider before using ginkgo biloba, as the combination may result in internal bleeding.

## Glutathione

Glutathione is a protein that is produced in the liver from the amino acids cysteine, glutamic acid, and glycine. It is a powerful antioxidant that inhibits the formation of, and protects against cellular damage from, free radicals. It helps to defend the body against damage from cigarette smoking, exposure to radiation, cancer chemotherapy, and toxins such as alcohol. As a detoxifier of heavy metals and drugs, it aids in the treatment of blood and liver disorders.

Glutathione protects cells in several ways. It neutralizes oxygen molecules before they can harm cells. Together with selenium, it forms the enzyme glutathione peroxidase, which neutralizes hydrogen peroxide. It is also a component of another antioxidant enzyme, glutathione-S-transferase, which is a broad-spectrum liver-detoxifying enzyme.

Glutathione protects not only individual cells but also the tissues of the arteries, brain, heart, immune cells, kidneys, lenses of the eyes, liver, lungs, and skin against oxidant damage. It plays a role in preventing cancer, especially liver cancer, and may actually target carcinogens, make them water-soluble, and then help escort them from the body. It may also have an antiaging effect. The rate at which we age is directly correlated with reduced concentrations of glutathione in cellular fluids; as we grow older, glutathione levels drop, resulting in a decreased ability to deactivate free radicals.

Glutathione can be taken in supplement form. The production of glutathione by the body can be boosted by taking supplemental dehydroepiandrosterone (DHEA), a hormone; N-acetylcysteine or L-cysteine; and L-methionine. Studies suggest that this may be a better way of raising glutathione levels than taking glutathione itself, but check with your health care professional if you have any hormonal problems.

## Grape Seed Extract

See under Oligomeric Proanthocyanidins in this section.

## Green Tea

Tea is the most commonly consumed beverage around the world after water. Green tea contains compounds known as polyphenols, including phytochemicals that have antioxidant, antibacterial, antiviral, and health-enhancing properties. Tests on epigallocatechin gallate (EGCG), a particular type of polyphenol in green tea, have shown that it is able to penetrate the body's cells and shield DNA from hydrogen peroxide, a potent free radical. Epidemiological studies have shown that green tea protects against cancer, lowers cholesterol levels, and reduces the clotting tendency of the

blood. Because green tea boosts immune function and acts as an antiviral and anti-inflammatory agent, it may help prevent cancer. In one study, it was shown to prevent symptoms associated with colds and flu, and even reduced the number of these illnesses. It also shows promise as a weight-loss aid that can promote the burning of fat and help to regulate blood sugar and insulin levels. Instead of drinking green tea, a supplement containing known quantities of it can produce weight loss—especially as fat—and lower blood pressure and “bad” (LDL) cholesterol.

Green tea is simply the dried leaves of the tea plant. All green teas are from the species *Camellia sinensis*, but depending on the locale where they are grown and on the processing they can be quite different. Chinese teas are predominant, and comprise about 90 percent of what is sold. There are numerous regional Chinese teas, the best known being *lung ching* (dragon well).

Other teas from Japan are equally good. Japanese green teas are of two basic types, *sencha* or *gyokuro*. Sencha is grown in the full sun, while gyokuro is shaded a few weeks before it is harvested. While there are many brands, the basic difference is that gyokuro makes a sweeter, darker green tea than sencha, which is somewhat grassy in flavor. It also costs over twice as much. Gyokuro is the source of the special handmade powdered tea used in the traditional tea ceremony.

Green tea is not fermented and has more polyphenols than black tea. Black tea undergoes natural fermentation, which converts tannins, astringent phytochemicals, into more complex compounds. This fermentation process destroys some of black tea's polyphenols, and it was once thought that it was thus rendered less effective as an antioxidant. Tests have shown, however, that both green and black teas contain about the same amount of antioxidant polyphenols, but that there are different combinations of antioxidants between black and green teas depending on the method of processing. Black tea lowers blood sugar and raises insulin levels after a meal. The polyphenolic content of black tea is thought to stimulate the pancreas to release insulin.

Green tea does contain caffeine (15 to 25 milligrams per 3/4 cup), but it is less than in similar amounts of coffee (80 to 115 milligrams per 3/4 cup) or caffeinated carbonated beverages (38 to 46 milligrams per can). Those who have heart problems or sensitivity to caffeine, or are pregnant may want to limit their intake of caffeine. Green tea contains vitamin K, which can make anticoagulant medication less effective. Consult your health provider if you are using them.

## Methionine

A unique amino acid, methionine neutralizes hydroxyl radicals, one of the most dangerous types of free radicals. Most often a by-product of reactions between heavy metals and less toxic free radicals, hydroxyl radicals can be formed also during strenuous exercise or exposure to high levels of radiation, and can damage any type of body tissue.

## N-Acetylcysteine (NAC)

The sulfur-containing amino acid cysteine is needed to produce the free radical fighter glutathione and to help maintain it at adequate levels in the cells. N-acetylcysteine (NAC) is a more stable form of cysteine that can be taken in supplement form.

NAC is used by the liver and the lymphocytes to detoxify chemicals and other poisons. It is a powerful detoxifier of alcohol, tobacco smoke, and environmental pollutants, all of which are immune suppressors. Taking supplemental NAC can boost the levels of protective enzymes in the body, thus slowing some of the cellular damage that is characteristic of aging. NAC supplementation may also decrease both the frequency and duration of infectious diseases. It has been used in the management of AIDS and chronic bronchitis.

People with diabetes should not take supplemental NAC without first consulting a health care provider, as it can interfere with the effectiveness of insulin.

## Nicotinamide Adenine Dinucleotide (NADH)

Also known as coenzyme 1, nicotinamide adenine dinucleotide with high-energy hydrogen, or NADH, is the “spark” that ignites energy production in the body’s cells.

NADH’s high antioxidant capacity derives from its ability to reduce levels of substances. NADH plays a central role in DNA repair and maintenance, and in the cellular immune defense system. Studies report that NADH also can inhibit the auto-oxidation of the neurotransmitter dopamine, which causes the release of toxic chemicals that may damage sensitive parts of the brain.

## Oligomeric Proanthocyanidins

Oligomeric proanthocyanidins (OPCs) are naturally occurring substances present in a variety of food and botanical sources. They are unique phytochemicals known as flavonoids that have powerful antioxidant capabilities. OPCs are highly water soluble, so the body is able to absorb them rapidly. Clinical tests suggest that OPCs may be as much as fifty times more potent than vitamin E and twenty times more potent than vitamin C in terms of bioavailable antioxidant activity. What’s more, OPCs work with the antioxidant glutathione to recycle and restore oxidized vitamin C, thus increasing the vitamin’s effectiveness. Because they are able to cross the blood-brain barrier, OPCs can protect the brain and spinal nerves against free radical damage. In addition to their antioxidant activity, OPCs protect the liver from damage caused by toxic doses of acetaminophen, a nonprescription pain reliever; they strengthen and repair connective tissue, including that of the cardiovascular system; and they support the immune system and slow aging. They also moderate allergic and inflammatory responses by reducing histamine production.

OPCs are found throughout plant life; however, the two main sources are pine bark extract (Pycnogenol), produced from a French coastal pine tree, and grape seed extract, made from the seeds of the wine grape (*Vitis vinifera*). Pycnogenol was the first source of OPCs discovered, and the process for extracting it was patented in the 1950s. Pycnogenol is a trademarked name for pine bark extract, not a generic term for OPCs from other sources.

## Pycnogenol

See under Oligomeric Proanthocyanidins above.

## Selenium

Selenium is an essential trace mineral that functions as an antioxidant in partnership with vitamin E to protect tissues and cell membranes. Among other things, it increases antioxidant enzyme levels in cells. Selenium is also an integral component of the antioxidant enzyme glutathione peroxidase (each molecule of this enzyme contains four atoms of selenium). Glutathione peroxidase targets harmful hydrogen peroxide in the body and converts it into water. It is a particularly important guardian of blood cells and of the heart, liver, and lungs.

Numerous plants contain selenium, including garlic, asparagus, and grains, but the levels depend on soil content, which varies from one geographic region to another.

Use caution when taking supplemental selenium. A maximum safe dose is 400 micrograms (mcg) daily. Amounts higher than 1,000 micrograms (1 milligram) daily may be toxic.

The best natural sources of selenium include Brazil nuts (over 500 micrograms per ounce!), brown rice, seafood, eggs, tuna, and buckwheat.

## Silymarin

Extracted from the seeds of the herb milk thistle, silymarin has been used for centuries to treat liver disease. The active ingredients in milk thistle are several types of flavonoids (powerful antioxidants), known collectively as silymarin.

Silymarin guards the liver from oxidative damage. It also protects the liver from toxins, drugs, and the effects of alcohol, and promotes the growth of new liver cells. In addition, silymarin increases levels of glutathione, superoxide dismutase, and catalase, potent antioxidant enzymes that protect the liver. It also has been shown to reduce insulin resistance, which may help patients with diabetes. In one study, patients with diabetes who received silymarin experienced blood glucose control and better blood tests related to liver function.

## Superoxide Dismutase

Superoxide dismutase (SOD) is an enzyme. SOD revitalizes cells and reduces the rate of cell destruction. It neutral-

izes the most common, and possibly the most dangerous, free radicals—superoxide radicals. Superoxide radicals instigate the breakdown of synovial fluid, the lubricant for the body's joints. This leads to friction and, ultimately, inflammation.

SOD works synergistically with the enzyme catalase, which is abundant throughout the body. Catalase removes hydrogen peroxide by-products created by SOD reactions.

SOD also aids in the body's utilization of zinc, copper, and manganese. Its levels tend to decline with age, while free radical production increases. Its potential as an antiaging treatment is currently being explored.

Chemically speaking, there are two forms of this enzyme. The copper/zinc form (known as Cu/Zn SOD) exerts its antioxidant properties in the cytoplasm of cells. This is the watery fluid that surrounds all the other cellular components. Metabolic activity that takes place in the cytoplasm results in the production of free radicals, and Cu/Zn neutralizes them. The manganese form (Mn SOD) is active in the mitochondria, structures within cells where energy is produced. The production of cellular energy also leads to the creation of free radicals.

SOD occurs naturally in barley grass, broccoli, Brussels sprouts, cabbage, wheatgrass, and most green plants. It is also available in supplement form. SOD supplements in pill form must be enteric coated—that is, coated with a protective substance that allows the pill to pass intact through the stomach acid into the small intestines to be absorbed. Cell Guard from Biotec Food Corporation and KAL SOD-3 from Nutraceutical International Corporation are good sources of SOD.

### Vitamin A and the Carotenoids

A class of phytochemicals, carotenoids are fat-soluble pigments found in yellow, red, green, and orange vegetables and fruits. They are a potent family of antioxidants that include alpha-carotene, beta-carotene, lycopene, lutein, and zeaxanthin. Of the more than five hundred carotenoids found in nature, about fifty can be converted into vitamin A in the body.

Carotenoids quench singlet oxygen, which is not, chemically speaking, a free radical, but is nevertheless highly reactive and can damage body molecules. Carotenoids also act as anticancer agents, decrease the risk of cataracts and age-related macular degeneration, and inhibit heart disease.

Studies have shown that carotenoids found in tomato juice (lycopene), carrots (alpha- and beta-carotene), and spinach (lutein) may help to protect against cancer by reducing oxidative and other damage to DNA. Together, the antioxidants alpha-lipoic acid, coenzyme Q<sub>10</sub>, vitamin C, and vitamin E help conserve carotenoids in tissues. Another carotenoid, astaxanthin, when taken as a supplement, was shown to be well-absorbed and tended to reduce dam-

age to fat particles floating in the blood. This means that astaxanthin may be a beneficial supplement to reduce the risk of heart disease.

The body converts beta-carotene into vitamin A as needed. Any leftover beta-carotene then acts as an antioxidant, breaking free radical chain reactions and preventing the oxidation of cholesterol. It reduces the oxidation of DNA and disables reactive oxygen species molecules generated by exposure to sunlight and air pollution, preventing damage to eyes, lungs, and skin.

A recent laboratory study found that taking very high doses of supplemental beta-carotene alone (50,000 international units or more daily) may interfere with the normal control of cell division. It is best to take a carotenoid complex containing a variety of carotenoids.

Natural sources of vitamin A include liver, whole milk, whole eggs, cheddar cheese, and beta-carotene foods. Natural sources of the carotenoids in general include sweet potatoes, carrots, spinach, corn, sweet peppers, spirulina, and kale.

### Vitamin C

Vitamin C is a very powerful antioxidant that also recharges other antioxidants, such as vitamin E, to keep them potent. Its water solubility makes it an efficient free radical scavenger in body fluids. Some studies have shown that vitamin C is the first line of antioxidant defense in plasma against many different kinds of free radicals. The cells of the brain and spinal cord, which frequently incur free radical damage, can be protected by significant amounts of vitamin C. This vitamin also guards against atherosclerosis by preventing damage to artery walls. Vitamin C acts as a more potent free radical scavenger in the presence of the phytochemical hesperidin.

Natural sources of vitamin C include citrus fruits, papaya, Brussels sprouts, broccoli, and strawberries.

### Vitamin E

Vitamin E is a powerful antioxidant that prevents the oxidation of lipids (fats). Fat oxidation has been implicated in the process that leads to atherosclerosis. Vitamin E is fat soluble and, since cell membranes are composed of lipids, it effectively prevents the cells' protective coatings from becoming rancid as a result of the assault of free radicals.

Vitamin E also improves oxygen utilization, enhances immune response, plays a role in the prevention of cataracts caused by free radical damage, and may reduce the risk of coronary artery disease.

The natural form of vitamin E (d-alpha-tocopherol) is superior to the synthetic version (dl-alpha-tocopherol).

New evidence suggests that zinc is needed to maintain normal blood concentrations of vitamin E. Selenium enhances vitamin E uptake.

For information regarding dosage and safety of vitamin E supplements, consult the Vitamins section in Part One of this book. Natural sources of vitamin E include nuts, soybeans, spinach, sunflower seeds, asparagus, and sweet potatoes.

### Zinc

Zinc's main antioxidant function is in the prevention of fat oxidation. In addition, it is a constituent of the antioxidant enzyme superoxide dismutase (SOD). Zinc is also needed for proper maintenance of vitamin E levels in the blood and aids in the absorption of vitamin A.

# Enzymes

## INTRODUCTION

The late Dr. Edward Howell, a physician and pioneer in enzyme research, called enzymes the “sparks of life.” These energized protein molecules play a necessary role in virtually all of the biochemical activities that go on in the body.

They are essential for digesting food, for stimulating the brain, for providing cellular energy, and for repairing all tissues, organs, and cells. Life as we know it could not exist without the action of enzymes, even in the presence of sufficient amounts of vitamins, minerals, water, and other nutrients.

In their primary role, enzymes are catalysts—substances that accelerate and precipitate the hundreds of thousands of biochemical reactions in the body that control life’s processes. If it were not for the catalytic action of enzymes, most of these reactions would take place far too slowly to sustain life. Enzymes are not consumed in the reactions they facilitate.

Each enzyme has a specific function in the body that no other enzyme can fulfill. The chemical shape of each enzyme is specialized so that it can initiate a reaction only in a certain substance, or in a group of closely related substances, and not in others. The substance on which an enzyme acts is called the *substrate*. Because there must be a different enzyme for every substrate, the body must produce a great number of different enzymes.

## THE FUNCTIONS OF ENZYMES

Enzymes assist in practically all bodily functions. Digestive enzymes break down food particles for energy. This chemical reaction is called *hydrolysis*, and it involves using water to break the chemical bonds to turn food into energy. The stored energy is later converted by other enzymes for use by the body as required. Iron is concentrated in the blood by the action of enzymes; other enzymes in the blood help the blood to coagulate in order to stop bleeding. Urinary enzymes catalyze the conversion of uric acid into urea. Respiratory enzymes aid in eliminating carbon dioxide from the lungs. Enzymes assist the kidneys, liver, lungs, colon, and skin in removing wastes and toxins from the body. Enzymes also utilize the nutrients ingested by the body to construct new muscle tissue, nerve cells, bone, skin, and glandular tissue. One enzyme can take dietary phosphorus and convert it into bone. Enzymes prompt the oxidation of glucose, which creates energy for the cells. Enzymes also protect the blood from dangerous waste mate-

rials by converting these substances to forms that are easily eliminated by the body. Indeed, the functions of enzymes are so many and so diverse that it would be impossible to name them all.

Enzymes are often divided into two groups: digestive enzymes and metabolic enzymes. Digestive enzymes are secreted along the gastrointestinal tract and break down foods, enabling the nutrients to be absorbed into the bloodstream for use in various bodily functions. If you don’t make enough digestive enzymes, you will experience any or all of the following symptoms: bloating, gas, indigestion, diarrhea, and pain. Of the macronutrients—carbohydrate, protein, and fat—people have the most trouble digesting fat, followed by protein and carbohydrate. Those who are lactose intolerant lack the enzymes needed to break down milk sugar. When choosing an enzyme supplement, make sure that it addresses your specific digestion needs. There are three main categories of digestive enzymes: amylase, protease, and lipase.

- *Amylase*, found in saliva and in the pancreatic and intestinal juices, breaks down carbohydrates. It begins to act as soon as you start chewing (this is why it is important to chew your food well). Different types of amylase break down specific types of sugars. For example, lactase breaks down lactose (milk sugar), maltase breaks down maltose (malt sugar), and sucrase breaks down sucrose (cane and beet sugar).
- *Protease*, found in the stomach juices and also in the pancreatic and intestinal juices, helps to digest protein.
- *Lipase*, found in the stomach and pancreatic juices, and also present in fats in foods, aids in fat digestion.

Another component of the digestive process is hydrochloric acid. While not technically an enzyme itself, it interacts with digestive enzymes as they perform their functions.

Metabolic enzymes are enzymes that catalyze the various chemical reactions within the cells, such as energy production and detoxification. Metabolic enzymes govern the activities of all the body’s organs, tissues, and cells. They are the workers that build the body from proteins, carbohydrates, and fats. Metabolic enzymes are found doing their specific work in the blood, organs, and tissues. Each body tissue has its own specific set of metabolic enzymes.

Two particularly important metabolic enzymes are superoxide dismutase (SOD) and its partner, catalase. SOD is an antioxidant that protects the cells by attacking a com-

mon free radical, superoxide. (See Superoxide Dismutase under ANTIOXIDANTS in Part One.) Catalase breaks down hydrogen peroxide, a metabolic waste product, and liberates oxygen for the body to use.

The body uses most of its enzyme-producing potential to produce about two dozen enzymes. These control the breakdown and utilization of proteins, fats, and carbohydrates to create the hundreds of metabolic enzymes necessary to maintain the rest of the tissues and organs in their functions.

## FOOD ENZYMES

While the body manufactures a supply of enzymes, it also can, and should, obtain enzymes from food. In fact, the body's ability to manufacture enzymes is being seriously taxed by our diet of processed and highly cooked food. Unfortunately, enzymes are extremely sensitive to heat. Low to moderate heat (118°F or above) destroys most enzymes in food. To obtain enzymes from the diet, some people find benefit from eating raw foods. Eating raw foods or, alternatively, taking enzyme supplements, helps prevent depletion of the body's own enzymes and thus reduces the stress on the body. Since enzymes are made from protein, it is essential to consume adequate amounts of protein in the diet.

Who should take enzyme supplements? Anyone who has a malabsorption problem, a yeast infection (candidiasis), or is over age sixty and whose digestive process seems to be stalling out, resulting in unpleasant symptoms. Ingredients should include pancreatin, lipase, amylase, and protease. This combination ensures digestion and absorption of amino acids, fat-soluble nutrients, and carbohydrates. Bromelain, derived from pineapple stems, along with papain, derived from the papaya fruit, also are welcome. Specific problems can be addressed by the addition of specific enzymes. For instance, people who have trouble with dairy sugars should consider lactase; people who can't digest legumes might try legumase. Hydrochloric acid supplements also might be necessary in the form of betaine hydrochloride taken as capsules at the start of each meal.

Enzymes can be found naturally in many different foods, from both plant and animal sources. Avocados, papayas, pineapples, bananas, and mangos are all high in enzymes. Sprouts are the richest source. Unripe papaya and pineapple are excellent sources of enzymes. The enzymes extracted from papaya and pineapple—papain and bromelain, respectively—are proteolytic enzymes, which break down proteins. Many fat-containing foods also supply lipase, which breaks down fats. In fact, fat in food exposed only to pancreatic lipase (the lipase produced by the body) in the intestines is not as well digested as fat that is first worked on in the stomach by food lipase. Pancreatic lipase digests fat in a highly alkaline environment (the intestines), whereas lipase found in food fats works in a more acidic environment (the stomach). The optimal extraction of nu-

trients from fats depends on the work of different fat-digesting enzymes in successive stages.

Hydrochloric acid (HCl) comes in several different forms, including lysine HCl and betaine HCl. Betaine HCl is derived from sugar beets. When new, HCl capsules and tablets are almost white in color, but sometimes they can turn a deep purple color when they age. Supplemental HCl is not sold in powder or liquid form because contact with the teeth can damage tooth enamel. HCl has a sulfurlike odor.

Superoxide dismutase occurs naturally in a variety of food sources, including alfalfa, barley grass, broccoli, Brussels sprouts, cabbage, wheatgrass, and most dark green plants.

As powerful as they are, enzymes cannot act alone. They require adequate amounts of other substances, known as coenzymes, to be fully active. Among the most important coenzymes are the B-complex vitamins, vitamin C, vitamin E, and zinc.

## COMMERCIALY AVAILABLE ENZYMES

The majority of commercially available enzymes are digestive enzymes extracted from various sources. Enzymes are not manufactured synthetically. Most commercial enzyme products are made from animal enzymes, such as pancreatin and pepsin, which help in the digestion of food once it has reached the lower stomach and the intestinal tract. Some companies make their supplements from enzymes extracted from aspergillus, a type of fungus. Be sure to read labels. Those from animals are usually more concentrated than those grown from this fungus.

These enzymes begin their predigestive work in the upper stomach. All of these products are used primarily to aid the digestion of foods and absorption of nutrients, especially protein. If proteins are not completely digested, undigested protein particles may make their way into the bloodstream through the intestinal wall with other nutrients. This phenomenon is known as *leaky gut syndrome*, and it can result in allergic reactions that may be more or less severe, depending upon the strength of the immune system. This is one reason why the proper digestion of proteins is so important.

Any enzyme that acts on protein and prepares it for absorption is called a proteolytic enzyme. Proteolytic enzymes available in supplement form include pepsin, trypsin, rennin, pancreatin, chymotrypsin, bromelain, and papain. In addition to aiding digestion, proteolytic enzymes have been shown to be beneficial as anti-inflammatory agents. Pancreatin, derived from secretions of animal pancreas, is a focus of cancer research, because people with cancer are often deficient in this enzyme. Pancreatin is used in the treatment of digestive problems, viral infections, and sports injuries, as well as pancreatic insufficiency, food allergies, cystic fibrosis, autoimmune disorders, and other chronic illnesses.

Also available in supplement form are the antioxidant enzymes superoxide dismutase (SOD) and catalase.

The following table lists some common enzymes and their substrates (the substance acted upon).

Enzyme	Substrate
Amylase	Carbohydrates
Bromelain	Proteins
Cellulase	Fiber
Chymopapain	Proteins
Diastase	Carbohydrates
Glucoamylase	Carbohydrates
Hemicellulase	Carbohydrates
Hyaluronidase	Proteins, adhesions, fibrin
Invertase	Carbohydrates
Lactase	Lactose (milk sugar)
Lipase	Fats
Maltase	Carbohydrates
Pancreatin	Proteins, fats, carbohydrates
Papain	Proteins, fats, carbohydrates
Pectinase	Carbohydrates
Pepsin	Proteins
Phytase	Carbohydrates
Plasmin	Proteins
Protease	Proteins
Rennin	Proteins
Trypsin	Proteins

If you decide to supplement, keep in mind that the way you respond to an enzyme may vary depending on the manufacturer. The good thing about digestive enzymes is that they work right away, so if you find you are not digesting a certain food—even after you have taken the enzyme—try another brand. Enzyme supplements may not be for everyone. During pregnancy, it is a rule to be careful with supplements in general. Nursing mothers also should be careful about supplements, to avoid affecting their milk. People who have hemophilia or who take anticoagulants (blood-thinners) should consult their health care providers before taking large amounts of enzymes. Anyone contemplating surgery where there is a high risk of bleeding should ask his or her physician for advice before taking any supplement.

**WHAT'S ON THE SHELVES**

Enzymes are available over the counter in tablet, capsule, powder, and liquid forms. They may be sold in combination with each other or as separate items. Some enzyme products also contain garlic to aid digestion.

For maximum benefit, any digestive enzyme supplement you choose should contain all of the major enzyme groups—amylase, protease, and lipase. Digestive enzymes should be taken with meals. You can make your own di-

gestive enzymes by drying papaya seeds, placing them in a pepper grinder, and sprinkling them on your foods. These have a peppery taste.

If you take supplemental superoxide dismutase (SOD), make sure to choose a product that is enteric coated—that is, coated with a protective substance that allows the SOD to pass intact through the stomach acid to be absorbed in the small intestine. Do not crush or chew these pills. All forms of enzymes should be kept in a reasonably cool place to ensure potency because they are susceptible to moisture.

Research has shown that as we grow older, the body's ability to produce enzymes decreases. At the same time, malabsorption of nutrients, tissue breakdown, and chronic health conditions increase. Taking supplemental enzymes can help to ensure that you continue to get the full nutritional value from your foods. We believe that enzyme supplementation is vital for elderly persons. In addition, most patients with cystic fibrosis require enzyme supplements. This disease affects the pancreas and renders it unable to make adequate amounts of all digestive enzymes. Be sure to check with your health care provider to determine what product is right for you.

The following are a few recommended enzyme complex products:

- AbsorbAid from Nature's Sources is made from plant enzymes and includes lipase, amylase, and protease from bromelain, as well as cellulase and lactase. It has been shown to significantly improve the absorption of nutrients, especially essential fatty acids and zinc.
- Acid-Ease from Enzymatic Therapy is a digestive aid from natural plant sources that includes amylase, lipase, and cellulase, as well as the soothing herbs marshmallow root and slippery elm.
- All Complete Enzymes from TriMedica, Inc., is a blend of plant enzymes that provide a full range of essential enzymes, plus coenzymes for added effectiveness. It is designed to adapt to various body temperatures and pH levels without losing potency. Ingredients include amylase, lipase, bromelain, papain, protease, cellulase, acidophilus, bifidus, and trace minerals.
- Bio-Gestin from Biotec Foods (a division of AgriGenic Food Corporation) is freeze-dried mature green papaya containing papain and chymopapain. The naturally sweet taste of the papaya makes these especially good capsules to open and sprinkle over food before eating.
- Digestive Aid #34 Food Enzymes from Carlson Laboratories contains pancreatin and ox bile, with enough capability in each tablet to digest 34 grams of protein, 120 grams of carbohydrate, and 21 grams of fat. Ox bile is a beneficial supplement for people with gallbladder disorders.
- Essential Enzymes from Source Naturals is a full-spectrum digestive enzyme supplement containing pro-

- tease (acid stable), lipase, amylase, cellulase, and lactase. The powder in the capsules has very little taste of its own, and the contents may be added to food that is not hot (over 110°F) by sprinkling over food (this is a good option for vegetarians who want to avoid gelatin capsules). This supplement is designed to work in both the acidic environment of the stomach and the more alkaline environment of the intestines.
- Digest Support from Natrol is a multienzyme formula containing all three classes of digestive enzymes (proteolytic, amolytic, and lipolytic), including protease 1 and 2, amylase, cellulase, lipase, maltase, and sucrase. It also contains A-galactosidase, an enzyme that acts on galactose, a breakdown product of lactose (milk sugar), and fights gas.
  - Inf-Zyme Forte from American Biologics is a combination of enzymes and antioxidants for people requiring supplemental digestive enzymes to aid in the breakdown of proteins, fats, and carbohydrates. It may also be helpful for chronic or acute inflammation. Its ingredients include amylase, bromelain, catalase, chymotrypsin, L-cysteine, lipase, pancreatin, papain, rutin, superoxide dismutase, trypsin, and zinc. If taken as a digestive aid, the recommended dosage is 1 to 3 tablets following each meal; if you use it for other purposes, such as illness, inflammation, and/or injury, take 3 to 6 tablets one hour before each meal or between meals. Inf-Zyme Forte may be taken by persons on sodium-restricted diets.
  - Mega-Zyme from Enzymatic Therapy is an extra-strength pancreatic and digestive enzyme tablet. Each tablet contains protease, amylase, lipase, trypsin, papain, bromelain, and lysozyme.
  - MegaZymes from MegaFood is a vegetarian enzyme and herbal formula made from plant-based enzymes, including amylase, cellulase, glucoamylase, invertase, lactase, lipase, and protease, blended with the tonic herbs caraway, gentian, and ginger, plus acidophilus to support healthy intestinal flora.
  - Metazyme from Metagenics is a plant-derived enzyme supplement that contains protease, amylase, lipase, and cellulase.
  - Multi-Zyme from FoodScience of Vermont is an enteric-coated tablet containing pepsin, bromelain, ox bile, pancreas extract, papain, proteases, amylase, lipases, cellulase, and hydrochloric acid (HCl). HCl is another component of the digestive process that works with enzymes to break down foods.
  - Vegetarian Enzyme Complex from Futurebiotics contains protease, amylase, cellulase, lipase, papain, and bromelain.
- Other sources for quality enzyme supplements include the National Enzyme Company and Miller Pharmacal Group. Miller Pharmacal products, available through health care professionals only, include:
- Milco-zyme, a two-part enzyme supplement with glutamic acid HCl, betaine HCl, papain, pepsin, and an enteric-coated side of the same tablet with pancreatin, lipase, amylase, and bromelain.
  - Carozyme, which contains betaine HCl, trypsin, chymotrypsin, bromelain, pancreatin, mannitol, thymus extract, lipase, amylase, and papain.
  - Proteolytic Enzymes, made with enteric-coated trypsin and chymotrypsin.
  - Karbozyme (not to be confused with the sound-alike product above), which contains pancreatin, sodium bicarbonate, and potassium bicarbonate.
  - MM-Zyme, which contains pancreatic lipase, bromelain, amylase, raw pancreas extract, papain, trypsin, chymotrypsin, and selenium.
- Finally, while not technically an enzyme product, Bio-perine 10 from Nature's Plus also enhances the digestion and absorption of nutrients. It contains an extract of black pepper (*Piper nigrum*), and when taken with food or with vitamin, mineral, or herbal supplements, it may help food to digest and accelerates the distribution of nutrients throughout the body. However, not all vitamin, mineral, and herbal supplements have been tested in clinical studies.

# Natural Food Supplements

## INTRODUCTION

Natural food supplements include a wide variety of products. Almost all health food stores carry them, and a number of drugstores, supermarkets, and mass market/club stores stock them on their shelves as well. In general, natural food supplements are composed of, derived from, or by-products of foods that provide health benefits. In some cases, health benefit claims made by manufacturers are based upon a supplement's use in traditional healing; in other cases, they are based on modern scientific research. Today, label claims are regulated by the FDA and FTC to be true, not misleading, and based on science.

Food supplements can be high in certain nutrients, contain active ingredients that aid digestive or metabolic processes, or provide a combination of nutrients and active ingredients. It is important to point out that some unscrupulous manufacturers make false promises. It is therefore vital to be an informed consumer.

Many natural food supplements have been known to work for years; these products are medically endorsed only when they are "discovered" by researchers deemed acceptable by these groups. Such recent discoveries include garlic, aloe vera, fiber, and fish oils—substances that have been used for centuries in many parts of the world. In a review by the head of the American Botanical Council, Mark Blumenthal, several herbs have not only been used a long time but have also stood up to rigorous scientific testing. He makes an argument for the strong science behind St. John's wort to help with depression, garlic to help people with heart disease, ginseng to improve sexual function in males, and echinacea to boost immunity.

## WHAT'S ON THE SHELVES

Food supplements come in many shapes and forms—tablets, capsules, powders, liquids, jellies, creams, biscuits, wafers, granules, and more. Product packaging depends entirely on the nature of the food supplement's composition.

The potency of these products varies. Because they are made up of perishable foods, food derivatives, or food by-products, their potency may be affected by the length of time they sit on a shelf or by the temperature at which they are kept. If you don't understand how a product is to be used, ask questions or read the available literature on the particular supplement. All products sold today need to have a "sell-by" date on the label. If there isn't one, contact the manufacturer and tell them the code on your box.

If you have never used a natural food supplement, you may be uncomfortable about buying and using one for the first time. This is normal. Keep in mind that once you become familiar with its use and benefits, you won't give the idea of using it a second thought.

In this section, we describe some of the types of food supplements that are recommended for use in dealing with the various disorders discussed in Part Two of this book.

### Acidophilus

See *Lactobacillus Acidophilus* in this section.

### Adenosine Triphosphate (ATP)

Adenosine triphosphate (ATP) is a compound that serves as the immediate source of energy for the body's cells, notably muscle cells. It increases energy and stamina, builds muscular density, increases muscular strength, buffers lactic-acid buildup (the reason for sore, achy muscles after physical activity), delays fatigue, and preserves muscle fibers. ATP is produced naturally in the body from adenine, a nitrogen-containing compound; ribose, a type of sugar; and phosphate units, each containing one phosphorus atom and four oxygen atoms.

### Alfalfa

One of the most mineral-rich foods known, alfalfa has roots that grow as much as 130 feet into the earth. Alfalfa is available in liquid extract form and is good to use while fasting because of its chlorophyll and nutrient content. It contains digestive-aiding enzymes, amino acids, and carbohydrates. It also contains calcium, magnesium, phosphorus, potassium, plus virtually all known vitamins. The minerals are in a balanced form, which promotes absorption. These minerals are alkaline, but have a neutralizing effect on the intestinal tract.

If you need a mineral supplement, alfalfa is a good choice. It has helped many arthritis sufferers. Alfalfa, wheatgrass, barley, and spirulina, all of which contain chlorophyll, have been found to aid in the healing of intestinal ulcers, gastritis, liver disorders, eczema, hemorrhoids, asthma, high blood pressure, anemia, constipation, body and breath odor, bleeding gums, infections, burns, athlete's foot, and cancer.

## Aloe Vera

This plant is known for its healing effect and is used in many cosmetic and hair care products. There are over two hundred different species of aloe that grow in dry regions around the world.

Aloe vera is commonly known as a skin healer, moisturizer, and softener. It is dramatically effective on burns of all types, and is also good for cuts, insect stings, bruises, acne and blemishes, poison ivy, welts, skin ulcers, and eczema.

Taken internally, 98 or 99 percent pure aloe vera juice is known to aid in the healing of stomach disorders, ulcers, constipation, hemorrhoids, rectal itching, colitis, and all colon problems.

Aloe vera can also be helpful against infections, varicose veins, skin cancer, and arthritis, and is used in the management of AIDS.

We have had excellent results using colon cleansers containing psyllium husks in combination with aloe vera juice. We have found this combination to be good for food allergy and colon disorder sufferers. Psyllium keeps the folds and pockets in the colon free of toxic material that gathers there. The aloe vera not only has a healing effect, but if constipation or diarrhea is present, it will return the stools to normal.

It takes a few weeks to cleanse the colon, but regular, periodic use will keep the colon clean. As with any substance, it is possible to develop intolerance to aloe vera juice and/or psyllium husks, so this treatment should not be used on an ongoing basis.

## Barley Grass

Barley grass contains small amounts of calcium, iron, all the essential amino acids, chlorophyll, flavonoids, vitamin B<sub>12</sub>, vitamin C, and many minerals, plus enzymes. This food heals stomach, duodenal, and colon disorders as well as pancreatitis, and is an effective anti-inflammatory.

## Bee By-products

See Bee Pollen, Bee Propolis, Honey, and Royal Jelly, all in this section.

## Bee Pollen

Bee pollen is a powderlike material that is produced by the anthers of flowering plants and gathered by bees. It is composed of 10 to 15 percent protein and also contains B-complex vitamins, vitamin C, essential fatty acids, enzymes, carotene, calcium, copper, iron, magnesium, potassium, manganese, sodium, plant sterols, and simple sugars.

Like other bee products, bee pollen has an antimicrobial effect. In addition, it is useful for combating fatigue, depression, cancer, and colon disorders. It is also helpful for people with allergies because it strengthens the immune system.

It is best to obtain bee pollen from a local source, as this

increases its antiallergenic properties. Fresh bee pollen should not cling together or form clumps, and it should be sold in a tightly sealed container. Some people (an estimated 0.05 percent of the population) may be allergic to bee pollen. It is best to try taking a small amount at first and watch for a developing rash, wheezing, discomfort, or any other signs of a reaction. If such symptoms occur, discontinue taking bee pollen.

## Bee Propolis

Bee propolis is a resinous substance collected from various plants by bees. Bees use propolis, together with beeswax, in the construction of hives. As a supplement, it is an excellent aid against bacterial infections. Bee propolis is believed to stimulate phagocytosis, the process by which some white blood cells destroy bacteria.

Propolis is beneficial as a salve for abrasions and bruises because of its antibacterial effect. Good results have been reported on the use of propolis against inflammation of the mucous membranes of the mouth and throat, dry cough and throat, halitosis, tonsillitis, ulcers, and acne, and for the stimulation of the immune system.

Be sure that any bee products you use smell and taste fresh. All bee products should be in tightly sealed containers. It is best to purchase these products from a manufacturer who specializes in bee products. If you are using bee products for allergies, it is best to obtain products that are produced within a ten-mile radius of your home. This way, you get a minute dose of pollen to desensitize you to the local pollen in the area.

## Beta-1,3-Glucan

Beta-1,3-glucan is a polysaccharide (a complex type of carbohydrate molecule) with immune-stimulating properties. Specifically, it stimulates the activity of macrophages (immune cells that destroy cellular debris), microorganisms, and abnormal cells by surrounding and digesting them.

Beta-1,3-D-glucan is a supplemental form of beta-1,3-glucan made from the cell walls of baker's yeast. Despite its origin, it does not contain any yeast proteins. It is useful for treating many bacterial, viral, and fungal diseases. It can also kill tumor cells and increase bone marrow production.

Because of its ability to protect the immune system, beta-1,3-D-glucan may protect against the effects of aging. Studies done as early as the 1970s have found that it can reduce the size of cancerous tumors in rats. Further investigation has shown beta-1,3-D-glucan to be a potent agent for healing sores and ulcers in women who have undergone mastectomies.

## Bifidobacterium Bifidum

*Bifidobacterium bifidum* aids in the synthesis of the B vitamins by creating healthy intestinal flora. *B. bifidum* is the

predominant healthy organism in the intestinal flora and establishes a healthy environment for the manufacture of the B-complex vitamins and vitamin K.

When you take antibiotics, the “friendly” bacteria in your digestive tract are destroyed along with the harmful bacteria. Supplementing your diet with *B. bifidum* helps you maintain healthy intestinal flora and helps strengthen the intestinal wall. Unhealthy flora can result in the liberation of abnormally high levels of ammonia as protein-containing foods are digested. This irritates the intestinal membranes. In addition, the ammonia is absorbed into the bloodstream and must be detoxified by the liver, or it will cause nausea, a decrease in appetite, vomiting, and other toxic reactions. By promoting the proper digestion of foods, the friendly bacteria also aid in preventing digestive disorders such as constipation and gas, as well as food allergies. If digestion is poor, the activity of intestinal bacteria on undigested food may lead to excessive production of the body chemical histamine, which triggers allergic symptoms.

Yeast infections of the vaginal tract respond very favorably to douching with *B. bifidum* preparations. These microorganisms destroy the pathogenic organisms. When used as an enema, *B. bifidum* also helps establish a healthy intestinal environment. It improves bowel function by aiding peristalsis, and results in the production of a softer, smoother stool. Harmful bacteria are kept in check, and toxic wastes that have accumulated in the intestines are destroyed and/or eliminated from the body.

*B. bifidum* may be useful in the treatment of cirrhosis of the liver and chronic hepatitis; by improving digestion, it reduces the strain on the liver. Many people who do not respond to *L. acidophilus* react positively to *B. bifidum*. Many experts consider *B. bifidum* to be preferable to *L. acidophilus* for children and for adults with liver disorders. This product needs to be taken every day or the body will go back to its usual state of bacteria growth.

### Bifidus

See Bifidobacterium Bifidum above.

### Bovine Cartilage

Cleaned, dried, and powdered bovine cartilage is a supplement that helps to accelerate wound healing and reduce inflammation. Like shark cartilage, it has been shown to be helpful for psoriasis, all types of arthritis, and ulcerative colitis. Bovine Cartilage from FoodScience of Vermont is a good source made from hormone-free, organically raised cattle.

### Brewer's Yeast

See Yeast in this section.

### Cellulose

See under Fiber in this section.

### Cerasomal-cis-9-cetylmyristoleate

This is a modified version of a medium-chain fatty acid, cetylmyristoleate, which is found in nuts, vegetables, and animal tissue. It appears to be a very promising development in arthritis research. Studies in laboratory rats have shown it to have anti-inflammatory effects, and early clinical studies in people suggest it may be beneficial for many with osteoarthritis, rheumatoid arthritis, and psoriatic arthritis, as well as psoriasis. It is believed to work by normalizing the functioning of the immune system and reducing the production of pro-inflammatory prostaglandins.

### Chlorella

Chlorella is a tiny, single-celled water-grown alga containing a nucleus and an enormous amount of readily available chlorophyll. It also contains protein (approximately 58 percent), carbohydrates, all of the B vitamins, vitamins C and E, amino acids, and rare trace minerals. In fact, it is virtually a complete food. It contains more vitamin B<sub>12</sub> than liver, plus a considerable amount of beta-carotene. It has a strong cell wall, however, which makes it difficult to gain access to its nutrients. Consequently, it requires factory processing to be effective.

Chlorella is one of the few edible species of water-grown algae. The chlorophyll in chlorella can help speed the cleansing of the bloodstream. Chlorella is very high in RNA and DNA, and has been found to protect against the effects of ultraviolet radiation. Studies show that chlorella is an excellent source of protein, especially for people who cannot or who choose not to eat meat. It is available from Sun Chlorella USA. (See Manufacturer and Distribution Information in the Appendix for further information.)

### Chlorophyll

See under Chlorella and “Green Drinks” in this section.

### Chondroitin Sulfate

Chondroitin sulfate is an important element in the creation of cartilage. Cartilage is the tough yet flexible connective tissue found in the joints, where it acts as a cushion, and in other parts of the body, such as the tip of the nose and the outer ear.

Chemically, chondroitins belong to a group of substances classified as *glycosaminoglycans* (also referred to as *muco-polysaccharides*), which are complex types of carbohydrate molecules. Glycosaminoglycans in turn attach to proteins such as collagen and elastin, forming even more complex substances designated *proteoglycans*, which are a vital com-

ponent of cartilage tissue. Chondroitin sulfate attracts water to the proteoglycans and holds it there, which is important for maintaining healthy joint cartilage. It can also protect existing cartilage from premature degeneration by blocking certain enzymes that destroy cartilage and prevent nutrients from being transported to the cartilage for repair. In one study of patients with osteoarthritis of the knee who used chondroitin, the diseased progressed more slowly and they had less pain compared to a group that was not treated. It was more effective in patients with mild knee pain than in those with severe pain.

Taking supplemental chondroitin sulfate, usually derived from powdered shark cartilage or cow trachea cartilage, has been shown to be helpful in the treatment of osteoarthritis. Many times it is used in conjunction with glucosamine for even more effective therapy. The supplements are usually taken together in pill form. Neither chondroitin sulfate nor glucosamine has shown any toxic effects, but there are potential side effects for certain people. The Arthritis Foundation recommends exercising caution in taking these supplements for treatment of osteoarthritis. Let your physician know you are taking these supplements, and discuss any allergies or potential reactions. Use caution in taking chondroitin sulfate if you are taking anticoagulants (blood-thinners) or daily aspirin, as it is chemically similar to the blood-thinner heparin. Pregnant women should not take these supplements, as there has not been sufficient study regarding their safety and potential side effects during pregnancy.

Twinlab manufactures a few good products containing chondroitin sulfate. Glucosamine Chondroitin Sulfate from Only Natural, Inc. is a good combination source of glucosamine and chondroitin sulfate.

## Citrin

Citrin is a trademarked name for a standardized herbal extract from the fruit of the *Garcinia cambogia* plant (Indian berry). It inhibits the synthesis of fatty acids in the liver, promotes the burning of body fat as fuel, and suppresses the appetite. Its main usefulness is in treating obesity; it may also aid in preventing or slowing atherosclerosis and heart disease. It does not affect the nervous system or have any known side effects. Citrin is found in a number of products sold by various manufacturers. Recent studies suggest that Garcitrin, a similar extract made from *Garcinia cambogia*, may be more effective for weight loss than Citrin.

## Coenzyme A

Coenzyme A, a substance manufactured by body cells from pantothenic acid (vitamin B<sub>5</sub>), is at the center of the whole metabolic process. It performs a vital role in the process by which the cells generate energy from glucose. Indeed, it helps produce around 90 percent of the energy the body needs to function. Coenzyme A also begins the metabolism

of fatty acids. A lack of sufficient coenzyme A can result in stiff, sore muscles and a decrease in energy. Taken as a supplement, coenzyme A increases energy, supports the manufacture of substances critical for the brain and adrenal glands, helps with the manufacture of connective tissue, and supports the immune system. Studies suggest that coenzyme A may be as, if not more, beneficial than coenzyme Q<sub>10</sub>.

## Coenzyme Q<sub>10</sub>

Coenzyme Q<sub>10</sub> is present in the mitochondria of all the cells in the body. It is vital because it carries into the cells the energy-laden protons and electrons that are used to produce adenosine triphosphate (ATP), the immediate source of cellular energy. (See Adenosine Triphosphate [ATP] earlier in this section.) This is a constant process because the body can store only a small quantity of ATP at any one time. It is believed that as many as 75 percent of people over fifty may be deficient in coenzyme Q<sub>10</sub>. A lack of sufficient coenzyme Q<sub>10</sub> can lead to cardiovascular disease. Without enough of it, the heart cannot circulate the blood effectively. Coenzyme Q<sub>10</sub> has varied applications, including migraine prevention, improving energy levels, lowering blood pressure, and the management of chronic cardiac failure. It has *not* been shown to help with glucose management, prevent oxidation of bad cholesterol, enhance blood flow from the heart, or inhibit periodontal disease. In Japan, coenzyme Q<sub>10</sub> has been approved for use in treating congestive heart failure. (See ANTIOXIDANTS earlier in this chapter for a discussion of coenzyme Q<sub>10</sub> as an antioxidant.)

## Colostrum

Colostrum is a thin, yellowish fluid secreted by the mammary glands of mammalian mothers in the first days after giving birth, before the production of true milk begins. It contains high levels of protein and growth factors, as well as immune factors that help to protect the newborn against infection. Taken as a supplement, colostrum can boost the immune system by enhancing the ability of the thymus gland to create T cells and also can help the body to burn fat and build lean muscle. It may also accelerate the healing of injuries, increase vitality and stamina, and have an anti-aging effect.

Supplemental colostrum usually contains bovine (cow) colostrum. Good sources include Colostrum Plus from Symbiotics and Colostrum Prime Life from Jarrow Formulas.

## Corn Germ

Using a process that isolates the embryo of the corn plant, which contains the most usable nutrients, corn germ is made. Corn germ has a longer shelf life than wheat germ

and is higher in some nutrients, especially zinc. Corn germ contains ten times the amount of zinc found in wheat germ.

You can use corn germ to bread chicken or fish. It is also good when added to cereals and used as a topping.

## Creatine

Creatine (creatine monohydrate) is a compound produced by metabolic processes in the body. When muscles are in use, the compound adenosine triphosphate (ATP) is broken down into two other compounds—adenosine diphosphate (ADP) and inorganic phosphate. This process produces the body's cellular energy, which, among other things, powers the muscles. Each such burst of energy is very fleeting.

However, with the addition of creatine, ADP can be transformed back to ATP, the source of cellular energy. Taken as a supplement, creatine can increase both endurance and strength, making possible extended workout time. Longer workouts in turn can result in a real increase in lean muscle mass, and do not simply puff up the muscle with water.

Creatine is particularly popular with athletes. The use of creatine for muscle-depleting illnesses and the natural wasting of muscles that comes with age is also being studied. In one study, elderly men and women had improved upper body grip strength and lower body muscle endurance after using creatine. They were less fatigued in general and experienced no side effects from the supplement.

Creatine should be used in combination with a balanced, nutritionally complete diet. Vegetarians do not get enough dietary creatine—since it comes exclusively from animal-based foods—and may need supplementation, especially if they exercise. Those who eat animal-based foods consume about 2 grams a day. You should not take it with fruit juices, as this combination results in the production of creatinine, which is difficult for the kidneys to process. Never exceed the recommended dose. Smaller doses (about 2.5 grams) rather than 5 or more grams seemed to be just as effective in growing new muscles during a workout.

## Dehydroepiandrosterone (DHEA)

Dehydroepiandrosterone (DHEA) is a hormone that is produced primarily by the adrenal glands and is found naturally in the human body. It is an important base from which other key substances, including the hormones testosterone, progesterone, and corticosterone, can be derived, either directly or indirectly. The amount of DHEA produced by the body declines with age, particularly after age forty. Research indicates that taking DHEA supplements may help to prevent cancer, arterial disease, multiple sclerosis, and Alzheimer's disease; may be beneficial in the treatment of lupus and osteoporosis; may enhance the activity of the immune system; and may help to improve memory.

Caution should be exercised when taking this supplement. Some physicians believe that taking high doses of DHEA suppresses the body's natural ability to synthesize this hormone. Further, laboratory studies have shown that high doses can lead to liver damage. If you take supplemental DHEA, it is important also to take supplements of the antioxidant vitamins C and E and the antioxidant mineral selenium to prevent oxidative damage to the liver. Possible side effects of taking DHEA include excess growth of facial hair in women. This can often be avoided by starting with a dose of 10 milligrams daily. 7-Keto DHEA is a derivative of DHEA that is not converted into estrogen or testosterone, which is good for women concerned about breast cancer and for men concerned about prostate cancer. 7-Keto DHEA is a good and safer alternative to DHEA and has the same benefits.

## Desiccated Liver

Desiccated liver is concentrated dried liver that is put into powdered or tablet form. This form of liver contains vitamins A, D, and C; the B-complex vitamins; and the minerals calcium, copper, phosphorus, and iron. Desiccated liver is good for people with anemia, and aids in building healthy red blood cells. It is known to increase energy, aid in liver disorders, and help relieve stress in the body. Use only a product made from liver derived from beef that is raised organically.

## Dimethylglycine (DMG)

Dimethylglycine (DMG) is a derivative of glycine, the simplest of the amino acids. It acts as a building block for many important substances, including the amino acid methionine, choline, a number of important hormones and neurotransmitters, and DNA.

Low levels of DMG are present in meats, seeds, and grains. It is a safe, nontoxic food substance that does not build up in the body. No deficiency symptoms are associated with a lack of DMG in the diet, but taking supplemental DMG can have a wide range of beneficial effects, including helping the body maintain high energy levels and boosting mental acuity. DMG has been found to enhance the immune system and to reduce elevated blood cholesterol and triglyceride levels. It improves oxygen utilization by the body, helps to normalize blood pressure and blood glucose levels, and improves the functioning of many important organs. It may also be useful for controlling epileptic seizures. Some people have used DMG as a substitute for pangamic acid, a supplement that is no longer available in the United States but that is widely used in Russia to treat heart disease, liver disease, alcohol and drug addiction, and other problems. DMG is thought to increase pangamic acid levels in the body. Aangamik DMG from FoodScience of Vermont is a good source of supplemental DMG.

## Dimethylsulfoxide (DMSO)

Dimethylsulfoxide (DMSO) is a by-product of wood processing for papermaking. It is a somewhat oily liquid that looks like mineral oil and has a slightly garlicky odor. Because it is an excellent solvent, it is widely used as a degreaser, paint thinner, and antifreeze. However, it also has remarkable therapeutic properties, especially for the healing of injuries. Applying DMSO on sprained ankles, pulled muscles, dislocated joints, and even at the site of simple fractures can virtually eliminate the pain. It also promotes immune system activity.

DMSO is absorbed through the skin and enters the bloodstream by osmosis through capillary walls. It is then distributed through the circulatory system and ultimately is excreted through the urine. Because of the properties of DMSO, it will take any contaminants on the skin or in the product directly into the bloodstream. For this reason, only pure DMSO from a health food source can be used. The use of hardware store DMSO could cause serious health problems. DMSO has been used successfully in the treatment of brain and spinal cord damage, arthritis, Down syndrome, sciatica and other back problems, keloids, acne, burns, musculoskeletal problems, sports injuries, cancer, sinusitis, headaches, skin ulcers, herpes, and cataracts. The use of DMSO may result in a garlicky body odor. This is temporary and is not a cause for concern.

## Essential Fatty Acids (EFAs)

Fatty acids are the basic building blocks of which fats and oils are composed. Contrary to popular myth, the body does need some of the right kind of fat. The fatty acids that are necessary for health and that cannot be made by the body are called *essential fatty acids* (EFAs). EFAs must be supplied through the diet.

EFAs have desirable effects on many disorders. They improve the skin and hair, reduce blood pressure, aid in the prevention of arthritis, lower cholesterol and triglyceride levels, and reduce the risk of blood clot formation. They are beneficial for candidiasis, cardiovascular disease, eczema, and psoriasis. Found in high concentrations in the brain, EFAs aid in the transmission of nerve impulses, and are needed for the normal development and functioning of the brain. A deficiency of EFAs can lead to an impaired ability to learn and recall information. Infant formulas now contain ARA and DHA, essential fats for infants, which may promote better learning.

Every living cell in the body needs EFAs. They are essential for rebuilding and producing new cells. They are also used by the body for the production of prostaglandins, hormonelike substances that act as chemical messengers and regulators of various body processes.

There are two basic categories of EFAs, designated *omega-3* and *omega-6*, based on their chemical structures. Omega-3 EFAs, including alpha-linolenic and eicosapen-

taenoic acid (EPA), are found in fresh deepwater fish, fish oil, and certain vegetable oils, among them canola oil, flaxseed oil, and walnut oil. Omega-6 EFAs, which include linoleic and gamma-linolenic acids, are found primarily in raw nuts, seeds, and legumes, and in unsaturated vegetable oils, such as borage oil, grape seed oil, primrose oil, sesame oil, and soybean oil. A recent study reported in the British medical journal *Lancet* has shown that omega-3 fatty acids, which create a more stable arterial plaque, are better for your heart than the omega-6 variety. We recommend that you try to increase your consumption of omega-3s at the expense of the omega-6s. In order to supply EFAs, these oils must be consumed in pure liquid or supplement form and must not be subjected to heat, either in processing or cooking. Heat destroys EFAs. Worse, it results in the creation of dangerous free radicals. (See ANTIOXIDANTS in Part One.) If oils are hydrogenated (processed to make the oil more solid, as is commonly done in the production of margarine), the linoleic acid is converted into trans-fatty acids, which are not beneficial to the body.

The daily requirement for EFAs is satisfied by an amount equivalent to 10 to 20 percent of total fat intake. The most essential of the EFAs is linoleic acid.

A number of sources of EFAs are recommended in this book, among them fish oils, flaxseeds and flaxseed oil, and primrose oil. If you are taking any of these oils, you need to cut back on linoleic-rich oils such as corn, sunflower, and cottonseed oil to avoid getting too much of the omega-6 fats.

### Emu Oil

Emu oil is an excellent source of linoleic acid, linolenic acid, and oleic acid. Linolenic acid has anti-inflammatory properties. It can be used topically for the relief of rashes, hemorrhoids, poison ivy, insect bites, arthritis, joint aches, and muscle strains, and it has been known to stop the pain of burns. It can also be used as a facial moisturizer to reduce wrinkles and lines. Thunder Ridge Emu is a good source for emu oil.

### Fish Oil

Fish oil is a good source of omega-3 EFAs. Salmon, herring, tuna (limit to 1 serving per week), and sardines are good sources of fish oil because they have a higher fat content and provide more omega-3 factors than other fishes.

For instance, 4 ounces of salmon contains 1,000 to 4,600 milligrams of omega-3 fatty acids, while 4 ounces of cod (a low-fat fish) contains only about 300 milligrams. Menhaden, another type of fish, supplies most of the oil used in dietary supplements because it is rich in omega-3s.

Carlson Laboratories markets a good Norwegian salmon oil that we recommend. Cod liver oil from Norway is the

most commonly used fish oil and is milder tasting than other varieties. Author Dale Alexander claims it is excellent for arthritis. He has marketed an oil containing 13,800 international units of vitamin A and 1,380 international units of vitamin D per tablespoon. However, we do not recommend that you rely on cod liver oil as a source of the EFAs. You would have to overdose on vitamins A and D to obtain the amount of fatty acids you need.

People with diabetes have been cautioned not to take fish oil supplements because fish oil may slightly raise blood cholesterol levels. However, the benefit of such oils in reducing triglyceride levels outweighs this risk. People with diabetes should check with their health care provider, but they should consume fish anyway for its EFAs.

### Flaxseeds and Flaxseed Oil

Flaxseeds are rich in omega-3 EFAs, magnesium, potassium, and fiber. The omega-3s in plant-based foods are not in a bioactive form, which means the body has to process them before it can use them. In contrast, omega-3s from fish are ready for the body to use. Most experts agree that the body uses only 10 percent or less of omega-3s from plant-based foods. Both seeds and oils are also a good source of the B vitamins, protein, and zinc. They are low in saturated fats and calories, and contain no cholesterol. The nutty taste of ground flaxseeds is pleasant, and they can be mixed with water or any fruit or vegetable juice. They can also be added to salads, soups, yogurt, cereals, baked goods, or fresh juices. You can grind these tiny seeds in a coffee grinder.

If you prefer not to eat the seeds, you can use flaxseed oil as an alternative. Like the seeds from which it is extracted, organic cold-pressed flaxseed oil is rich in EFAs. Several studies have shown that it can reduce the pain, inflammation, and swelling of arthritis. It has been found to lower blood cholesterol and triglyceride levels, and to help reduce the hardening effects of cholesterol on cell membranes.

### Grape Seed Oil

Of the many natural sources of EFAs, grape seed oil is among the highest in linoleic acid and among the lowest in saturated fats. Grape seed oil is rich in omega-6 oils, which are essential, but usually we get more than enough omega-6s in our diet, so use it sparingly. It contains no cholesterol and no sodium. It has a light, nutty taste that brings out the flavor in many foods. Unlike most other oils, it can be heated to temperatures as high as 485°F without producing dangerous and possibly carcinogenic free radicals. These features make it good for use in cooking. Buy only grape seed oil that is cold-pressed and contains no preservatives.

### Primrose Oil

Primrose oil (also known as evening primrose oil) contains 9 to 10 percent gamma-linolenic acid (GLA). It is an anti-inflammatory fatty acid and may help reduce the likelihood of developing cancer, diabetes, heart disease, and Alzheimer's disease. It relieves pain and inflammation; enhances the release of sex hormones, including estrogen and testosterone; aids in lowering cholesterol levels; and is beneficial for cirrhosis of the liver.

Many women have found that primrose oil supplements relieve unpleasant menopausal symptoms such as hot flashes. Because it promotes the production of estrogen, women suffering from breast cancer that is diagnosed as estrogen-receptor positive (estrogen-related) should avoid or limit their intake of primrose oil. Black currant seed oil is a good substitute.

### Evening Primrose Oil

See Primrose Oil above.

### Fiber

Found in many foods, fiber helps to lower blood cholesterol levels and stabilize blood sugar levels. It helps prevent colon cancer, constipation, hemorrhoids, obesity, and many other disorders. Fiber is also good for removing certain toxic metals from the body. Because the refining process has removed much of the natural fiber from our foods, the typical American diet is lacking in fiber.

There are seven basic classifications of fiber: bran, cellulose, gum, hemicellulose, lignin, mucilages, and pectin. Each form has its own function. It is best to rotate among several different supplemental fiber sources. Start with small amounts and gradually increase your intake until your stools are the proper consistency. Also, be aware that while today's average diet is lacking in fiber, consuming excessive amounts may decrease the absorption of zinc, iron, and calcium. Always take supplemental fiber separately from other medications or supplements. Otherwise, it can lessen their strength and effectiveness.

In addition to using a fiber supplement, you should make sure to get fiber through your diet. Make sure your diet contains these high-fiber foods:

- Whole-grain cereals and flours.
- Brown rice.
- Agar agar (made from the algae species *gelidium*; also called dai choy goh).
- All kinds of bran.
- Fresh fruit.
- Dried prunes.
- Nuts.

- Seeds (especially flaxseeds)
- Beans.
- Lentils.
- Peas.
- Fresh, raw vegetables.

Eat several of these foods daily. When eating organic produce, leave the skin on apples and potatoes. Coat chicken in corn bran or oats for baking. Add extra bran to cereals and breads. Unsalted, unbuttered popcorn is also excellent for added fiber.

### *Bran, Gums, and Mucilages*

Both gums and mucilages help to regulate blood glucose levels, aid in lowering cholesterol, and help in the removal of toxins. They are found in oatmeal, oat bran, sesame seeds, and dried beans. Gums and mucilages are soluble fibers that foster the growth of healthy bacteria, which in turn discourage the growth of harmful ones. If you are taking any probiotics, for example, bifidobacteria, it is best to take it with one of these fibers.

One of the following should be part of your daily dietary plan:

- *Fennel seed.* Fennel is an herb that is helpful for digestive purposes. The seeds of this plant help to rid the intestinal tract of mucus and aid in relieving flatulence.
- *Glucomannan.* Derived from the tuber of the amorphophallis plant, it picks up and removes fat from the colon wall. This substance is good for diabetes, as it has been recognized for normalizing blood sugar and is good for people with hypoglycemia. Glucomannan expands to sixty times its own weight, thereby helping to curb the appetite. Taking 2 to 3 capsules with a large glass of water thirty minutes before meals is helpful for reducing allergic reactions and some symptoms associated with high and low blood sugar disorders. Always be sure to drink a large glass of water when taking glucomannan in capsule or pill form, as capsules can lodge in the throat and expand there, causing breathing problems. Glucomannan is tasteless and odorless, and can be added to foods to help normalize blood sugar.
- *Guar gum.* Extracted from the seeds of the guar plant, guar gum is good for the treatment of diabetes and for curbing the appetite. It also has the ability to reduce the levels of cholesterol, triglycerides, and low-density lipoproteins in the blood, and binds with toxic substances and carries them out of the body. Guar gum tablets must be chewed thoroughly or sucked gradually, not swallowed whole, and should be taken with lots of water, because guar gum has a tendency to ball up in the throat when mixed with saliva. It should not be used by individuals who have difficulty swallowing or who have

had gastrointestinal surgery. Some persons with colon disorders may have trouble using guar gum.

- *Oat bran and rice bran.* Bran is the broken coat of the seed of cereal grain that has been separated from the flour or meal by sifting or bolting. It helps to lower cholesterol.
- *Psyllium seed.* Psyllium is a grain grown in India that is utilized for its fiber content. A good intestinal cleanser and stool softener, it is one of the most popular fibers used. It thickens very quickly when mixed with liquid, and must be consumed immediately. Some doctors recommend Metamucil, which contains psyllium hydrophilic mucilloid, as a laxative and fiber supplement. However, we prefer less processing and all-natural products.

### *Cellulose*

Cellulose is an indigestible carbohydrate (or insoluble fiber) found in the outer layer of vegetables and fruits. It is good for hemorrhoids, varicose veins, colitis, and constipation, and for the removal of cancer-causing substances from the colon wall.

It is found in apples, beets, Brazil nuts, broccoli, carrots, celery, green beans, lima beans, pears, peas, and whole grains.

### *Hemicellulose*

Hemicellulose is an indigestible complex carbohydrate that absorbs water. It is good for promoting weight loss, relieving constipation, preventing colon cancer, and controlling carcinogens in the intestinal tract. Hemicellulose is found in apples, bananas, beans, beets, cabbage, corn, green leafy vegetables, pears, peppers, and whole-grain cereals.

### *Lignin*

This form of fiber is good for lowering cholesterol levels. It helps to prevent the formation of gallstones by binding with bile acids and removing cholesterol before stones can form. It is beneficial for persons with diabetes or colon cancer. Those who eat a lot of dietary lignins have been shown to have better cognitive function compared to those who eat a low-lignin diet.

Lignins are found in all plants but especially in alfalfa, berries, Brazil nuts, broccoli, carrots, green beans, peaches, peas, potatoes, seed oils, strawberries, tomatoes, and whole grains.

### *Pectin*

Because it slows the absorption of food after meals, pectin is good for people with diabetes. It also removes unwanted metals and toxins, reduces the side effects of radiation therapy, helps lower cholesterol, and reduces the risk of heart

disease and gallstones. Pectin is found in apples, bananas, beets, cabbage, carrots, citrus fruits, dried peas, and okra.

### Combination Fiber Supplements

There are many products available that combine two or more different types of fiber, or that combine fiber with other ingredients. Be sure you buy one that has both soluble and insoluble fiber. Two products of this kind that we recommend are:

- Colon Care Plus from Aerobic Life Industries. This formula contains psyllium and oat bran, and provides approximately 3 grams of soluble fiber and 4 grams of insoluble fiber per serving.
- Ultimate Cleanse from Nature's Secret. This formula combines gums with cellulose, hemicellulose, pectin, and lignin, plus herbs that support and cleanse the blood and internal organs.

### Fish Oil

See under Essential Fatty Acids in this section.

### 5-Hydroxy L-Tryptophan (5-HTP)

5-HTP is a substance that is created naturally in the body from the amino acid tryptophan, and that in turn is used by the body to produce serotonin, an important neurotransmitter. Supplemental 5-HTP is derived from the seeds of the griffonia plant (*Griffonia simplicifolia*), which is native to western Africa. It can be used to aid in weight loss, insomnia, and depression.

5-HTP should be used together with a high-carbohydrate food or liquid such as orange juice, and as part of a comprehensive nutritional program. It may not benefit everyone who takes it. If you regularly take large doses of 5-HTP (more than 300 milligrams daily), you should undergo blood testing for eosinophil (a type of white blood cell) levels every three months. HTP.Calm from Natural Balance is a good source of 5-HTP. You should avoid this supplement if you are taking antidepressants.

### Flaxseeds and Flaxseed Oil

See under Essential Fatty Acids in this section.

### Garlic

Garlic is one of the most valuable foods on this planet. It has been used since biblical times and is mentioned in the literature of the ancient Hebrews, Greeks, Babylonians, Romans, and Egyptians. The builders of the pyramids supposedly ate garlic daily for endurance and strength.

Garlic lowers blood pressure through the actions of one of its components, methyl-allyl-trisulfide, which dilates blood

vessels. It thins the blood by inhibiting platelet aggregation, which reduces the risk of blood clots and aids in preventing heart attacks. It also lowers serum cholesterol levels and aids in digestion. Garlic is useful for many diseases and illnesses, including cancer. It is a potent immune system stimulant and a natural antibiotic. It should be consumed daily. It can be eaten fresh, taken in supplement form, or used to prepare garlic oil.

Garlic contains an amino acid derivative, alliin. When garlic is consumed, the enzyme alliinase, which converts alliin to allicin, is released. Allicin has an antibiotic effect; it exerts an antibacterial effect estimated to be equivalent to 1 percent of that of penicillin. Because of its antibiotic properties, garlic was used to treat wounds and infections and to prevent gangrene during World War I.

Garlic is also effective against fungal infections, including athlete's foot, systemic candidiasis, and yeast vaginitis. There is some evidence that it may also destroy certain viruses, such as those associated with fever blisters, genital herpes, a form of the common cold, smallpox, and a type of influenza.

Garlic oil is good for the heart and colon, and is effective in the treatment of arthritis, candidiasis, and circulation problems. To make garlic oil, add peeled whole garlic cloves to a quart of olive or canola oil. Experiment to find the number of cloves that gives the degree of flavor you like. Be sure to wash your hands thoroughly and rinse the garlic after peeling and before placing it in the oil. The peel may contain mold and bacteria that can contaminate the oil.

Keep garlic oil refrigerated. This mixture will keep for up to a month before you need to replace it with fresh oil. Garlic oil can be used for sautéing, in salad dressings, and in a variety of other ways. If you find the odor too strong after you eat garlic, chew some sprigs of parsley or mint, or caraway or fennel seeds.

An alternative to fresh garlic is Kyolic from Wakunaga of America. Kyolic is an odorless, "sociable" garlic product, and is available in tablet, capsule, and oil extract forms.

### Ginkgo Biloba

The ornamental tree *Ginkgo biloba* originated in China thousands of years ago, and now grows in temperate climates throughout the world. The extract of its fan-shaped leaves is one of the world's most popular herbal products. It has been reported in scientific journals to enhance blood circulation and to increase the supply of oxygen to the heart, brain, and all bodily parts. This makes it useful for improving memory and relieving muscle pains. It also acts as an antioxidant, has antiaging effects, reduces blood pressure, inhibits blood clotting, and is helpful for tinnitus, vertigo, hearing loss, impotence, and Raynaud's disease.

Ginkgo biloba is widely known as the "smart herb" of our time. It has even been said to slow the early progression of Alzheimer's disease in some individuals. In one

study of the very old (over eighty-five years of age), ginkgo biloba was shown to slow the progression of dementia and memory decline. There also was no increased risk of bleeding, as had been reported in earlier studies.

## Ginseng

Ginseng is used throughout the Far East as a general tonic to combat weakness and give extra energy. There are a number of different varieties of ginseng:

- *Eleutherococcus senticosus* (Siberian ginseng),
- *Panax quinquefolium* (American ginseng),
- *Panax ginseng* (Chinese or Korean ginseng), and
- *Panax japonicum* (Japanese ginseng).

*Panax ginseng* is the most widely used species. Early Native Americans were familiar with ginseng. They called it *gisens* and used it for stomach and bronchial disorders, asthma, and neck pain. Russian scientists claim that the ginseng root stimulates both physical and mental activity, improves endocrine gland function, and has a positive effect on the sex glands. It has been shown to help men regain sexual function. Ginseng is beneficial for fatigue because it spares glycogen (the form of glucose stored in the liver and muscle cells) by increasing the use of fatty acids as an energy source. It is used to enhance athletic performance, to rejuvenate, to increase longevity, and to detoxify and normalize the entire system. Many studies have shown ginseng to be effective at improving energy levels, endurance, and alertness. Cancer patients who used ginseng reported a better quality of life, especially related to mood and socialization.

In lower doses, ginseng seems to raise blood pressure, while higher amounts appear to reduce blood pressure. Research suggests that high doses of ginseng may be helpful for inflammatory diseases such as rheumatoid arthritis, without the side effects of steroids, and may also protect against the harmful effects of radiation. Ginseng is beneficial for people with diabetes because it decreases the level of the hormone cortisol in the blood (cortisol interferes with the function of insulin). Normal individuals who were tested with one of several specially prepared ginseng formulas experienced less blood sugar response after a meal, but the level was not low enough to be harmful. Other parts of the ginseng plant used in this study had no effect on blood sugar levels. A portion of the ginseng rootlet referred to as Rg1 seemed to be the most important regulator of blood sugar response to foods. Nevertheless, people with hypoglycemia should avoid using large amounts of ginseng.

The root is sold in many forms: as a whole root or root pieces, which are either untreated or blanched; as a powder or powdered extract; as a liquid extract or concentrate; in granules for instant tea; as a tincture; in an oil base; and in tablets and capsules. These products should not contain

sugar or added color, and should be pure ginseng. Many supplement manufacturers add ginseng to combination products, but these often contain such low amounts that they may not be effective.

We advise following the Russian approach to using ginseng: Take it for fifteen to twenty days, followed by a rest period of two weeks. Avoid long-term usage of high doses. Ginseng should not be used by people with high blood pressure, or during pregnancy or lactation.

## Glucomannan

*See under* Fiber in this section.

## Glucosamine

This is one of a number of substances classified as an *amino sugar*. Unlike other forms of sugar in the body, amino sugars are components of carbohydrates that are incorporated into the structure of body tissues, rather than being used as a source of energy. Glucosamine is thus involved in the formation of the nails, tendons, skin, eyes, bones, ligaments, and heart valves. It also plays a role in the mucous secretions of the digestive, respiratory, and urinary tracts.

Glucosamine is made in the body from the simple carbohydrate glucose and the amino acid glutamine. It is found in high concentrations in joint structures. It is also available as a supplement, in the form of glucosamine sulfate, which helps to combat both the causes and symptoms of osteoarthritis. Glucosamine has been studied in nearly 200 clinical trials. Although not all the participants in these studies responded to the supplements, most did. For patients with osteoarthritis of the knee, glucosamine was more effective than taking nothing, and reduced the likelihood of needing a knee replacement. Glucosamine was also shown to help with acute injuries such as one would get from exercise. Athletes with recent knee injuries healed faster in terms of knee flexion and extension when using glucosamine compared to a group who took nothing.

It can also slightly reduce the destruction of cartilage and depression caused by taking nonsteroidal anti-inflammatory drugs (NSAIDs), which are commonly prescribed for people with arthritis. Glucosamine may be taken in conjunction with chondroitin sulfate for an even greater effect on osteoarthritis (*see* Chondroitin Sulfate in this section).

In addition to having benefits for people with osteoarthritis, supplemental glucosamine can be helpful for asthma, bursitis, candidiasis, food allergies, osteoporosis, respiratory allergies, tendinitis, vaginitis, and various skin problems. The product GS-500 from Enzymatic Therapy is a good source of glucosamine. GlucosaMend from Source Naturals and Glucosamine Plus from FoodScience of Vermont are other recommended products. A related compound is N-acetylglucosamine (NAG), available as N-A-G from Source Naturals.

## Grape Seed Oil

See under Essential Fatty Acids in this section.

## “Green Drinks”

“Green drinks” are natural food formulas made from plants that are good detoxifiers and blood cleansers, as well as sources of chlorophyll, minerals, enzymes, and other important nutrients. Greens help neutralize acid buildup in the blood. Eating a Western diet, which is high in meat, dairy, and grains, produces an excess of hydrogen ions in the blood, making it acidic. An adequate intake of fruits and vegetables can counteract this effect, but few of us consume enough of these foods. The green drinks leave an alkaline residue upon digestion, just like fruits and vegetables. This neutralizes the acid from the other foods. Generally, green drinks are sold in powdered form to be mixed just before use. Many different companies market green drink formulas. We recommend buying organic green drinks. In addition, those that provide the greatest number of different plants offer a broader range of antioxidant protection. The following are some recommended products:

- BarleyLife from AIM International. This product contains a combination of barley juice and kelp.
- Earthsource Greens & More from Solgar. This formula combines four organically grown grasses (alfalfa, barley, kamut, and wheat), Hawaiian blue-green spirulina, and Chinese chlorella with three potent immune-stimulating mushrooms (maitake, reishi, and shiitake), plus powdered broccoli, carrots, and red beets, which supply phytonutrients. Its fruit flavor comes from fresh fruit powders.
- Green Magma from Green Foods Corporation. Green Magma is a pure, natural juice of young barley leaves that are organically grown in Japan and are pesticide-free. Brown rice is added to supply vitamins B<sub>1</sub> (thiamine) and B<sub>3</sub> (niacin) and linoleic acid. Green Magma contains thousands of enzymes, which play an important role in the metabolism of the body (see ENZYMES in Part One), plus a high concentration of superoxide dismutase (SOD). The powdered product may be added to juice or quality water.
- Kyo-Green from Wakunaga of America. This is a combination of barley, wheatgrass, kelp, and the green algae chlorella. The barley and wheatgrass are organically grown. It is a highly concentrated natural source of chlorophyll, amino acids, vitamins and minerals, carotene, and enzymes. Chlorella is a rich natural source of vitamin A, and kelp supplies iodine and other valuable minerals. (See Chlorella and Kelp in this section.)
- ProGreens from NutriCology (Allergy Research Group). ProGreens includes organic alfalfa, barley, oat, and wheat-

grass juice powders; natural fiber; wheat sprouts; blue-green algae; sea algae; fructooligosaccharides (FOS); lecithin; standardized bioflavonoid extracts; along with royal jelly and bee pollen; beet and spinach extracts; acerola juice powder; natural vitamin E; and the herbs astragalus, echinacea, licorice, Siberian ginseng, and suma.

## Green Papaya

Green (unripe) papaya is an excellent source of vitamins, minerals, and enzymes. Ounce for ounce, it contains more vitamin A than carrots and more vitamin C than oranges, as well as abundant B vitamins and vitamin E. The complex of enzymes it contains helps to digest proteins, carbohydrates, and fats.

Green papaya can be eaten fresh or taken in supplement form. Papain is the most abundant, most active enzyme in both the fresh fruit and the powdered supplement form. Papain possesses very powerful digestive action.

## Guar Gum

See under Fiber in this section.

## Hemicellulose

See under Fiber in this section.

## Honey

Bees produce honey by mixing nectar, which is a sweet substance secreted by flowers, with bee enzymes. Honey is a highly concentrated source of many essential nutrients, including large amounts of carbohydrates (sugars), some minerals, B-complex vitamins, and vitamins C, D, and E.

Honey is used to promote energy and healing. It has been shown to be an effective treatment for relieving symptoms of coughing from an upper respiratory tract infection in people two to eighteen years of age. The FDA and leading medical groups have called the effectiveness of most cold and flu preparations into question. Honey offers a natural and effective alternative. It is a natural antiseptic and makes a good salve for burns and wounds. Honey is also used for sweetening foods and beverages. It varies somewhat in color and taste depending on the origin of the flower and nectar, but in general it is approximately twice as sweet as sugar, so not as much is needed for sweetening purposes.

People who have diabetes or hypoglycemia should be careful when consuming honey and its by-products. These substances affect blood sugar levels in the same way that refined sugars do. Tupelo honey contains more fructose than other types of honey and it is absorbed at a slower rate, so some people with hypoglycemia can use this type sparingly without ill effects.

Buy only unfiltered, unheated, unprocessed honey, and

*never* give honey to an infant under one year of age. In its natural form, honey can contain spores of the bacteria that cause botulism. This poses no problem for adults and older children, but in infants and those with compromised immune systems, the spores can colonize the digestive tract and produce the deadly botulin toxin there. Honey is safe for babies after age one.

### Inosine

Inosine occurs naturally in the human body. It is involved in the rebuilding of adenosine triphosphate (ATP; see page 76, and stimulates the production of a compound designated 2,3-disphosphoglycerate (2,3-DPG), which is needed in the transportation of oxygen to muscle cells for the production of energy. Weight and endurance trainers have found supplemental inosine to be beneficial; it is believed to increase muscle development and blood circulation. It also enhances immune function.

If you have kidney problems or gout, you should not take inosine because it can increase the production of uric acid. For best results, use the dosage recommended by the manufacturer for your body size, and take it forty-five to sixty minutes prior to exercising.

### Inositol Hexaphosphate (IP<sub>6</sub>)

Inositol hexaphosphate (IP<sub>6</sub>, also known as phytic acid) is a compound consisting of the B vitamin inositol plus six phosphate groups. Found naturally in many foods, including wheat, rice, and legumes, it is a powerful antioxidant that has many positive effects on the body. Laboratory studies suggest it may fight cancer, prevent and treat heart disease, prevent kidney stones and liver disease, and also reduce cholesterol levels and prevent the inappropriate formation of blood clots, a major cause of heart attacks. IP<sub>6</sub> inhibits the activity of free radicals in the body, which slows the type of abnormal cell division associated with cancer and tumor growth. It works best very early in the development of malignant tumors, before the malignancy can even be recognized by the immune system. The cells are then normalized and begin to grow in the usual manner again.

IP<sub>6</sub> contains a substance designated beta-1,3-D-glucan, which helps to maintain a strong immune system in people undergoing chemotherapy and radiation. IP<sub>6</sub> protects the heart by preventing the formation of blood clots in blood vessels and reducing the levels of cholesterol and triglycerides (fats) in the bloodstream. It protects the liver by preventing fatty deposits from accumulating there. Studies have shown that a diet high in IP<sub>6</sub> is associated with a lower incidence of cancer of the breast, colon, and prostate.

Significant amounts of IP<sub>6</sub> are found in foods such as beans, brown rice, whole-kernel corn, sesame seeds, wheat bran, cornbread, grape juice, raisins, and mulberries. It can also be taken in supplement form. Some studies have shown that IP<sub>6</sub> may interfere with the body's absorption of

minerals, so supplements should not be taken within one hour of meals. IP<sub>6</sub> from Jarrow Formulas and Cell Forté with IP-6 and Inositol from Enzymatic Therapy are recommended sources of IP<sub>6</sub>.

### Kelp

Kelp is a type of seaweed that can be eaten raw, but it is usually dried, granulated, or ground into powder. It is also available in a liquid form that can be added to drinking water. Granulated or powdered kelp can be used as a condiment and for flavoring, as a salt substitute. If you find the taste unappealing, you can purchase it in tablet form.

Kelp is a rich source of vitamins, especially the B vitamins, as well as of many valuable minerals and trace elements. It is reported to be very beneficial to brain tissue, the membranes surrounding the brain, the sensory nerves, and the spinal cord, as well as the nails and blood vessels. It has been used in the treatment of thyroid problems because of its iodine content, and is useful for other conditions as varied as hair loss, obesity, and ulcers. It protects against the effects of radiation and softens stools. Kelp is recommended as a daily dietary supplement, especially for people with mineral deficiencies.

### Kombucha Tea

The kombucha, or Manchurian, "mushroom" has reputedly been used in Asian countries and in Russia for centuries. The kombucha itself is not eaten. Rather, a tea is made by fermenting it for about a week in a mixture of water, sugar, and green or black tea, with apple cider vinegar or a bit of previously made tea added. Kept in this mixture, the kombucha reproduces, and the daughter mushrooms can then be used to produce more tea.

Although commonly referred to as a mushroom, the kombucha is actually a combination of a number of different elements, including lichen, bacteria, and yeast. Kombucha tea contains a variety of different nutrients and other health-promoting substances. It is a natural energy booster and detoxifier that may also help slow or reverse the aging process.

Because of the way in which it has traditionally been propagated (one at a time, by individual users), kombucha may be difficult to find. Many people who have them received a daughter mushroom as a gift from a friend, although there are some herbal companies that sell both the mushrooms and the bottled tea commercially.

### Lactobacillus Acidophilus

*Lactobacillus acidophilus* is a type of "friendly" bacteria that assists in the digestion of proteins, a process in which lactic acid, hydrogen peroxide, enzymes, B vitamins, and antibiotic substances that inhibit pathogenic organisms are produced. Acidophilus has antifungal properties, helps to

reduce blood cholesterol levels, aids digestion, and enhances the absorption of nutrients.

The flora in the healthy colon should consist of at least 85 percent lactobacilli and 15 percent coliform bacteria. However, the typical colon bacteria count today is the reverse. This can result in gas, bloating, intestinal and systemic toxicity, constipation, and malabsorption of nutrients, and is conducive to an overgrowth of candida. Taking an acidophilus supplement helps to combat all of these problems by returning the intestinal flora to a healthier balance. In addition, acidophilus may help to detoxify harmful substances. Between 5 and 30 percent of those who take antibiotics develop antibiotic-associated diarrhea, and *Lactobacillus acidophilus* may prevent it.

There are many good acidophilus supplements available. Acidophilus products come in tablet, capsule, and powdered forms. We recommend using the powdered form. Natren, Inc., markets quality products that contain very high numbers of organisms. Other good nondairy acidophilus supplements include Primadophilus from Nature's Way, Probiotic All-Flora from New Chapter, and Flora from DaVinci Labs.

Acidophilus can die at high temperatures. Whatever product you choose, keep it in a cool, dry place—refrigerate but do not freeze it. Take acidophilus on an empty stomach in the morning and one hour before each meal. If you are taking antibiotics, do not take the antibiotics and acidophilus simultaneously.

### Lactoferrin

Lactoferrin is a protein that occurs naturally in human bile, tears, mucus, saliva, and milk. Because it binds with free iron in the body, it plays an important role in regulating iron levels (and, in turn, growth) and aids in preventing and fighting infection by depriving disease-causing organisms of the iron they need to grow and multiply. It also plays a role in the functioning of lymphocytes, a type of white blood cell important for immunity. Taken in supplement form, it may boost immune function and help in combating both infectious and inflammatory conditions. It may also benefit intestinal health.

### Lecithin

Lecithin is a type of lipid that is needed by every living cell in the human body. Cell membranes, which regulate the passage of nutrients into and out of the cells, are largely composed of lecithin. The protective sheaths surrounding the brain are composed of lecithin, and the muscles and nerve cells also contain this essential fatty substance.

Lecithin consists mostly of the B vitamin choline, and also contains linoleic acid and inositol. Although lecithin is a lipid, it is partly soluble in water and thus acts as an emulsifying agent. This is why many processed foods contain lecithin.

This nutrient helps to prevent arteriosclerosis, protects against cardiovascular disease, improves brain function, and aids in the absorption of thiamine by the liver and vitamin A by the intestine. It is also known to promote energy and is needed to help repair damage to the liver caused by alcoholism. Lecithin enables fats, such as cholesterol and other lipids, to be dispersed in water and removed from the body. The vital organs and arteries are thus protected from fatty buildup.

Lecithin would be a wise addition to anyone's diet. It is especially valuable for older adults. Anyone who is taking niacin for high serum cholesterol and triglycerides should also include lecithin in his or her program. Two tablespoons of lecithin granules can be sprinkled on cereals and soups or added to juices or breads. Lecithin also comes in capsule form. Taking one 1,200-milligram capsule before each meal helps in the digestion of fats and the absorption of fat-soluble vitamins. More recently, a mixture of lecithin and soy stanols has been shown to be an effective cholesterol-lowering supplement. It can reduce the amount of cholesterol absorbed from the diet, thereby reducing both total cholesterol and LDL (bad cholesterol).

Most lecithin is derived from soybeans, but recently egg lecithin has become popular. This type of lecithin is extracted from the yolks of fresh eggs. Egg lecithin may hold promise for those suffering from AIDS, herpes, chronic fatigue syndrome, and immune disorders associated with aging. Studies have shown that it works better for people with these disorders than soy lecithin does. Other sources of lecithin include brewer's yeast, grains, legumes, fish, and wheat germ.

### Lignin

See under Fiber in this section.

### Maitake

Maitake (*Grifola frondosa*) is a mushroom that has a long history of use in traditional Chinese and Japanese herbology and cooking. It grows wild in Japan, as well as in some wooded areas in eastern North America. Because maitake is difficult to cultivate, however, only relatively recently have the mushrooms become widely available.

Maitake is considered an adaptogen, which means that it helps the body adapt to stress and normalizes bodily functions. Its healing properties are thought to be related to its high content of a polysaccharide called beta-1,6-glucan, which is considered very powerful. In laboratory studies, this substance has been shown to prevent carcinogenesis, inhibit the growth of cancerous tumors, kill HIV, and enhance the activity of key immune cells known as T-helper cells or CD4 cells. Maitake may also be useful for diabetes, chronic fatigue syndrome, chronic hepatitis, obesity, and high blood pressure.

Maitake can be eaten in food or taken as a supplement.

Buy organically grown dried mushrooms (when using them in cooking, soak them in water or broth for half an hour first), or purchase maitake in capsule, extract, or tea form. Some of the capsule supplements contain a small amount of vitamin C, which enhances the effectiveness of the active ingredient in maitake by aiding in its absorption.

## Melatonin

The hormone melatonin is naturally produced by the pineal gland, a cone-shaped structure in the brain. The body's pattern of melatonin production is similar to that of the other "antiaging" hormones, human growth hormone (HGH) and dehydroepiandrosterone (DHEA). Throughout early life, melatonin is produced in abundance. It was thought for some time that the production of melatonin begins to drop at puberty, and then continues to decline steadily as we age. This may not be true, according to research done at the Harvard Medical School. Researchers say that older people who were on aspirin therapy might have skewed the results because taking aspirin reduces melatonin levels in the body.

Research has demonstrated that melatonin may have several profound long-term effects on the body. As one of the most powerful antioxidants ever discovered—with a greater range of effectiveness than vitamin C, vitamin E, or beta-carotene—melatonin helps prevent harmful oxidation reactions from occurring. In this way, melatonin may prevent the changes that lead to hypertension and heart attack, and may reduce the risk of certain kinds of cancer. Melatonin also has been found to stimulate the immune system; have a major role in the production of estrogen, testosterone, and possibly other hormones, helping to prevent cancers involving the reproductive system; and slow the growth of existing malignancies. Recent studies suggest that if melatonin is taken in the mornings, tumor growth may be stimulated, but if it is taken in the evenings, tumor growth tends to be slowed. In addition, as melatonin is secreted cyclically, in response to the fall of darkness at the end of each day, the hormone helps our bodies keep in sync with the rhythms of day and night. Thus, melatonin helps regulate sleep.

Research on melatonin continues, and with it, knowledge is increasing about the functions of melatonin in the body and the effects of melatonin supplementation. Melatonin is the internal sleep facilitator in humans. Both human research studies and anecdotal evidence indicate that melatonin supplements can be an effective and side effect-free sleep aid both for adults suffering from insomnia and for children with autism, epilepsy, Down syndrome, cerebral palsy, and other problems that can cause sleep disorders. There is evidence that supplemental melatonin can induce sleep by reducing restlessness before sleep, and correct sleep patterns during sleep so you feel rested upon awakening. Sleeping disorders increase with age, and melatonin has been shown to help. Subjects over fifty-five

years of age who used 2 milligrams of time-released melatonin had better quality of sleep and felt more alert in the morning. It has been shown to be effective in those who suffer from minor sleep disorders when used on a regular basis, and episodically for jet lag or shift workers. In addition, in a rare condition resulting in nocturnal hypertension, patients using melatonin experienced a reduction in blood pressure while they slept. For patients with mild cognitive impairment, melatonin allowed for better performance on several tests that assess cognitive function. Mental acuity was thought to improve because the patients slept better and felt refreshed in the morning.

Animal and other laboratory research indicates that melatonin supplementation may help prevent age-related disorders, and perhaps extend life. Melatonin can be taken to ease PMS symptoms; stimulate the immune system; prevent memory loss, arteriosclerosis, and stroke; and treat cancer and Alzheimer's disease.

Although no toxic levels of melatonin have been found, it is a powerful hormone, and some researchers feel that certain people probably should not use this supplement until further information is available. Included in this category are pregnant and nursing women; people with severe allergies or autoimmune diseases; people with immune system cancers, such as lymphoma and leukemia; and healthy children, who already produce sufficient amounts of the hormone. Because high doses of melatonin have been found to act as a contraceptive, women who wish to become pregnant also might want to avoid taking this supplement.

Melatonin should be taken two hours or less before bedtime. This schedule is designed to release the added hormone at the same time that natural production peaks. A sustained-release form is best if you frequently awaken after several hours' sleep; a sublingual form is best if you are very ill or suffer from malabsorption. When you awaken after melatonin-assisted sleep, you should feel refreshed—not tired or groggy. If you do experience grogginess, you should reduce the dosage. (To learn how you can maintain or increase your melatonin levels through daily routines, see *Maintaining Your Melatonin Level Naturally* on page 90.) For information on other antiaging hormones, see *DHEA THERAPY* and *GROWTH HORMONE THERAPY* in Part Three.

## Methylsulfonylmethane (MSM)

Methylsulfonylmethane (MSM, also known as dimethylsulfone) is a naturally occurring organic sulfur compound found in plant and animal tissues that is essential for optimum health. It is a derivative of dimethylsulfoxide (DMSO), which has remarkable therapeutic properties, especially for the healing of injuries. It can also help to detoxify the body on a cellular level. MSM helps to nourish the hair, skin, and nails; relieve pain and inflammation; reduce allergy problems; and promote gastrointestinal health. It has also been found to aid immune function, and there have

## Maintaining Your Melatonin Level Naturally

As darkness falls at the end of each day, melatonin production rises. In the morning, when daylight hits the retina, neural impulses cause production of the hormone to slow. Clearly, light and darkness are the primary factors that set the rhythms of melatonin production. However, they are not the only factors involved. In fact, it has been found that a variety of regular daily routines can strengthen the rhythm of melatonin production. Here are a few simple ways in which you can help your body maintain high levels of this important hormone:

- Eat regular meals. The rhythm of melatonin production is strengthened by regular daily routines. Keep your mealtimes as regular as possible to keep your body in sync with the rhythms of the day.
- Keep your diet light at night. When melatonin production begins after nightfall, the digestive process is slowed.

Thus, any heavy foods eaten close to bedtime may lead to digestive problems, which can make it difficult to sleep. To get the sleep you need, eat small, light meals in the late evening.

- Avoid stimulants. Stimulants such as coffee, tea, and caffeine-containing medications and soft drinks can interfere with melatonin production by interfering with your sleep. As much as possible, eliminate these stimulants from your diet and lifestyle. Or, at the very least, allow at least four to five hours between the time you consume them and bedtime.
- Avoid exercising late at night. Vigorous activity delays melatonin secretion. If you exercise in the morning, you will reinforce healthful sleeping habits that lead to regular melatonin production. For best results, do your morning exercise outdoors, in the morning light.

been reports of benefits to patients with heartburn, arthritis, lung problems, migraines, and muscle pain. MSM is present naturally in foods such as fresh fish, meat, plants, fruit, and milk. However, it can be eliminated by even moderate processing, including drying or heating.

Most North Americans today eat considerable amounts of processed food, and MSM is normally either not present at all or present only in very small amounts in the typical diet. Most people therefore would probably benefit from supplementation.

Research suggests that we require a constant supply of MSM for optimum good health, as sulfur is one of the essential minerals. Commonly recommended dosage levels are about 2,000 milligrams (2 grams) per day taken in divided doses, with the morning and evening meals, but it is best to start out at 1,000 milligrams (1 gram) per day to avoid a too-rapid rate of detoxification. Higher doses (3,000 milligrams twice a day) were shown to be safe and effective at helping patients with osteoarthritis perform daily activities and feel better in general. The positive effects in this study occurred in eighty-four days. However, benefits could become evident in as few as two to twenty-one days, and can be enhanced by vitamin C supplementation. In addition, when MSM was combined with sternum collagen II, pain and soreness decreased in a group of patients with osteoarthritis. MSM is found in a variety of products from the following companies: Aerobic Life Industries, Allergy Research Group, Bluebonnet, Country Life, Jarrow, and Natrol.

### Mucilage

See under Fiber in this section.

### Nicotinamide Adenine Dinucleotide (NADH)

NADH is a form of vitamin B<sub>3</sub> (niacin) that is essential for the production of various neurotransmitters and cellular energy. NADH, which is also known as coenzyme 1, also acts as an antioxidant (see under ANTIOXIDANTS in Part One).

As we age, natural levels of NADH decline, which can lead to reduced levels of both energy and significant brain chemicals. Taking supplemental NADH can result in improvements in the biochemistry of energy production, especially in the brain and nervous systems. NADH shows promise as a therapy for Parkinson's disease because it results in an increase in brain levels of the neurotransmitter dopamine, which is deficient in people with this disorder.

People with Alzheimer's disease may be helped by this supplement as well. Some people suffering from chronic fatigue syndrome (CFS) have shown significant improvement with NADH therapy.

### Oat Bran

See under Fiber in this section.

### Octacosanol

Octacosanol is a naturally derived wheat germ oil concentrate. Although it would be possible to extract octacosanol from whole wheat, 10 pounds of wheat would be needed to obtain just 1,000 micrograms of octacosanol. Wheat germ has long been known for its many benefits. Today, extracts of wheat germ weighing only 2 milligrams offer remarkable benefits as well.

Octacosanol has been clinically proven to increase oxygen utilization during exercise and improve glycogen stores

in muscle tissue. As a result, it increases physical endurance, improves reaction time, reduces high-altitude stress, and aids in tissue oxygenation. This substance can greatly benefit those who experience muscle pain after exercise or have a lowered endurance level. It is good for muscular dystrophies and other neuromuscular disorders as well. It also reduces blood cholesterol levels.

### Olive Leaf Extract

Olive leaf extract is an herbal supplement that has been shown to be effective against virtually all the viruses and bacteria on which it has been tested. Laboratory studies suggest that olive leaf extract interferes with viral infection becoming established and/or spreading, either by rendering viruses incapable of infecting cells or by preventing them from reproducing. It has been shown to help protect against infection by such viruses as human immunodeficiency virus (HIV), herpesviruses, and influenza viruses. It is useful for such disorders as pneumonia, sore throat, sinusitis, and skin diseases such as chronic infections and rashes, as well as for fungal and bacterial infections. Olivir from DaVinci Laboratories is a good source of olive leaf extract that has been tested in clinical trials.

### Pectin

See under Fiber in this section.

### Perilla

Perilla (*Perilla frutescens*) is an Asian plant that is a member of the mint family. It has been prescribed by Asian herbalists for the relief of cough and lung ailments, and for certain types of food poisoning, as well as to prevent the flu and restore energy balance. It may aid in increasing learning ability and is also used as a culinary herb.

Perilla comes in several forms, including seed oil. This is an unsaturated oil that contains linolenic, linoleic, and oleic acids. Perilla oil is available in capsule form. Studies suggest that it may be an effective and safe source of essential omega-3 fatty acids.

### Phosphatidyl Choline

Phosphatidyl choline (PC) is a component of lecithin. (See Lecithin in this section.) Taken as a supplement, it helps to break down fats and can be helpful in preventing atherosclerosis (hardening of the arteries due to fatty plaques in the blood vessels), heart disease, gallstones, and liver problems. It has also shown substantial benefits for people with neurological disorders, memory loss, and depression.

PC is known to be safe and effective; however, people with bipolar mood disorder should not take large amounts.

### Phosphatidyl Serine

Phosphatidyl serine (PS) is a substance classified as a phospholipid (a phosphorus-containing lipid) that is needed by every cell in the body, and is especially abundant in nerve cells. PS is the most important of the phospholipids and is crucial for the maintenance of healthy cell membranes. Although the brain normally produces enough PS, production dwindles as we age, which can result in deficiency.

Supplemental PS, which is compounded from soybean oil in products sold in the United States, has been said to reduce symptoms of depression and Alzheimer's disease, and to enhance memory and learning abilities. Some of the earlier studies on this product focused on PS from cow brains, which is no longer sold in the United States. That was a different product chemically from the soy-based product sold today and results may not be the same. Some people have experienced nausea as a result of taking PS; however, taking it with food can help to avoid this. No danger has been reported with long-term use of the soy-based supplement. Its safety for pregnant women has not been determined.

### Primrose Oil

See under Essential Fatty Acids in this section.

### Probiotics

Probiotics are beneficial bacteria normally present in the digestive tract. They are vital for proper digestion and also perform a number of other useful functions, such as preventing the overgrowth of yeast and other pathogens, and synthesizing vitamin K. The probiotics most often used as supplements are acidophilus and bifidobacteria. (See *Lactobacillus acidophilus* and/or *Bifidobacterium bifidum* in this section.)

Cultured, or fermented, foods also contain various types and amounts of beneficial bacteria. These foods include buttermilk, cheese, kefir, miso, sauerkraut, tempeh, umeboshi, and yogurt.

### Progesterone Cream

Progesterone is a hormone that is produced primarily by the ovaries and also by the adrenal glands. It works in partnership with estrogen to regulate menstrual cycles and is important for the maintenance of pregnancy. In addition to its role in the female reproductive system, it has a number of other important effects: it stimulates the activity of bone-building cells called osteoblasts; exerts an antidepressant and calming effect in the brain; helps to regulate blood sugar levels; and plays a role in maintaining the myelin sheaths that protect nerve cells. It can be used by the body to produce other hormones, including DHEA, estrogen,

testosterone, and cortisol, as needed. A deficiency of progesterone, on the other hand, can exacerbate symptoms of premenstrual syndrome (PMS) and menopausal discomfort, and may increase the risk of osteoporosis. Progesterone deficiency becomes increasingly common in women as they approach menopause, and can start as early as age thirty-five. Symptoms can include night sweats, hot flashes, depression, and premenstrual discomfort.

Supplemental progesterone is available in cream form. The hormone is absorbed through the skin after the cream is applied, and it passes directly into the bloodstream for transport to sites where progesterone is needed. As these are biologically active substances, consult your health care professional before using them.

### Propolis

See Bee Propolis in this section.

### Psyllium Seed

See under Fiber in this section.

### Red Yeast Rice

Red yeast rice is a food product created by fermenting rice with a strain of red yeast (*Monascus purpureus* Went yeast). It is also sometimes referred to as *Monascus* rice or, in Chinese, *Hung-chu* or *Hong-Qu*. It has long been used in China and Japan as a food and as a remedy for digestive ailments and poor circulation. More recently, red yeast rice extract, taken in supplement form, has been found both to reduce overall blood cholesterol levels and to improve the ratio of HDL ("good cholesterol") to LDL ("bad cholesterol"). A study conducted by the University of California—Los Angeles, School of Medicine found that people who took red yeast rice and maintained a low-fat diet reduced their overall cholesterol levels by an average of 40 points over a period of twelve weeks. The extract contains a number of cholesterol-lowering compounds known as *statins*. One of these is lovastatin, a substance also sold as a prescription drug under the brand name Mevacor. Lovastatin acts to lower cholesterol by inhibiting the action of an enzyme designated HMG-CoA reductase, which in turn limits the rate at which the body produces cholesterol. Studies have shown statins to lower cholesterol levels and reduce the risk of heart attack. Unlike prescription products, red yeast rice extract has shown no serious adverse side effects in clinical trials. Smaller amounts of lovastatin from a plant as opposed to drugs are required to be effective. This is because it is thought that the natural compounds in the plant work synergistically with the active ingredient. Merck, which sells Mevacor, asked the FDA to ban red yeast rice extract. The FDA considered Merck's request, but decided to allow companies to continue to sell it. However, the FDA did mandate that there cannot be any mention of lowering

cholesterol levels or reducing heart disease risk. Check with your health care professional before using red yeast rice.

### Reishi

See Shiitake and Reishi in this section.

### Rice Bran

See under Fiber in this section.

### Royal Jelly

Royal jelly is a thick, milky substance that is secreted from the pharyngeal glands of a special group of young nurse bees between their sixth and twelfth days of life. When honey and pollen are combined and refined within the young nurse bee, royal jelly is naturally created. This substance contains all of the B-complex vitamins, including a high concentration of pantothenic acid (vitamin B<sub>5</sub>) and vitamin B<sub>6</sub> (pyridoxine), and is the only natural source of pure acetylcholine. Royal jelly also contains minerals, enzymes, hormones, eighteen amino acids, antibacterial and antibiotic components, and vitamins A, C, D, and E. It is useful for bronchial asthma, liver disease, pancreatitis, insomnia, stomach ulcers, kidney disease, bone fractures, and skin disorders, and it strengthens the immune system. This product must be combined with honey to preserve its potency. Royal jelly spoils easily. Keep it refrigerated and make sure it is tightly sealed when purchased.

### S-Adenosylmethionine (S-AdoMet)

S-adenosylmethionine (S-AdoMet) is a derivative of the amino acid methionine that is formed in the body when methionine combines with adenosine triphosphate (ATP), the major source of cellular energy. Taken as a supplement, S-AdoMet has a variety of positive effects:

- It is an effective antidepressant.
- It is beneficial for disorders of the joints and connective tissue, including arthritis and fibromyalgia.
- It promotes the health of the liver.
- It may lower levels of homocysteine, an amino acid that is associated with cardiovascular disease.
- It may help to slow the aging process.

S-AdoMet works closely with folic acid, choline, and vitamins B<sub>6</sub> and B<sub>12</sub>. It is one of a class of substances called *methyl donors*. As the name implies, methyl donors are compounds that "donate" units called methyl groups, which contain hydrogen and carbon atoms, to other substances. This process is called *methylation*, and it is one way in which the body protects itself from damage on the cellular level.

Among other things, methyl donors help to protect against such serious disorders as cancer, heart disease, neurological disorders, and many age-related problems, and facilitate the manufacture of DNA and brain neurotransmitters. SAME increases catechol-O-methyltransferase (COMT) enzyme activity, which has been shown to somewhat lessen aggressive symptoms in schizophrenia. In addition, brain waves of elderly patients with depression responded favorably with SAME at different doses. The effect was observed at one hour and lasted up to six. In patients with AIDS, depressive symptoms were improved with SAME, and the change was noted after one week of treatment. SAME has also been shown to be effective when coupled with drugs classified as selective serotonin reuptake inhibitors (SSRIs). If you are taking medications for depression, check with your health care provider before using SAME.

Taking supplemental SAME may also increase natural levels of glutathione, an antioxidant; phosphatidyl choline, which aids in the metabolism of fats; and the hormone melatonin. A small number of people have experienced minor nausea, gastrointestinal disturbances, and headaches as a result of taking high doses, but otherwise no notable side effects have been reported. Although SAME is considered very safe, anyone with bipolar mood disorder should consult a physician before taking this supplement. Do not give to a child under twelve. SAME should always be taken on an empty stomach. Be sure what you purchase is SAME because there have been some knockoffs. It is rather costly.

### Sea Cucumber

Sea cucumbers, also known as *bêche de mer* and *tre pang*, are not actually cucumbers, but are marine animals related to starfishes and sea urchins. They have been used in China for thousands of years as a treatment for arthritis. Modern research has confirmed they are beneficial for musculoskeletal inflammatory diseases, especially rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis, a rheumatic disease that affects the spine.

Researchers believe that sea cucumbers improve the balance of prostaglandins, which regulate the inflammatory process. They also contain substances known as chondroitins, which are often lacking in people with arthritis and connective tissue disorders (see Chondroitin Sulfate in this section). In addition, sea cucumbers provide vitamins A, B<sub>1</sub> (thiamine), B<sub>2</sub> (riboflavin), B<sub>3</sub> (niacin), and C, as well as the minerals calcium, iron, magnesium, and zinc.

### Sea Mussel

The green-lipped mussel (*Perna canaliculus*) is a species of edible shellfish. These mussels contain numerous amino acids, the building blocks of body proteins, in addition to enzymes and essential trace elements. The minerals they

contain are present in a balance similar to that in blood plasma, and these minerals are naturally chelated by the amino acids, making for better assimilation into the body.

Sea mussel aids in the functioning of the cardiovascular system, the lymphatic system, the endocrine system, the eyes, connective tissues, and mucous membranes. They help to reduce inflammation and relieve the pain and stiffness of arthritis. They also promote the healing of wounds and burns.

### Shark Cartilage

The tough, elastic material that makes up the skeleton of the shark is dried and pulverized (finely powdered) to make this food supplement. Shark cartilage contains a number of active components, the most important of which is a type of protein that acts as an angiogenesis inhibitor—that is, it supposedly acts to suppress the development of new blood vessels. This would make it valuable in fighting a number of disorders. Many cancerous tumors, for instance, are able to grow only because they induce the body to develop new networks of blood vessels to supply them with nutrients.

Shark cartilage is said to suppress this process, so that tumors are deprived of their source of nourishment and, often, begin to shrink. Many patients with advanced stages of cancer of the breast, colon, prostate, and others have sought shark cartilage as a means to avoid disease progression. To date, however, studies show that shark cartilage has no impact on disease progression, and many patients had adverse side effects from using the product.

There are certain eye disorders, such as diabetic retinopathy and macular degeneration, that are characterized by the growth of new blood vessels within the eye; because they grow in inappropriate places, the presence of these blood vessels can lead to blindness. Such diseases also may respond well to shark cartilage. Other conditions for which shark cartilage is useful include arthritis, psoriasis, and regional enteritis (inflammation of the lining of the bowels). In addition to angiogenesis-inhibiting protein, shark cartilage contains calcium (approximately 16 percent) and phosphorus (approximately 8 percent), which are absorbed as nutrients, and mucopolysaccharides that act to stimulate the immune system.

Shark cartilage is available in powder and capsule forms. Exercise caution when buying shark cartilage, as the purity and correct processing of the product are vital to its effectiveness. Not all shark cartilage products contain only 100 percent pure shark cartilage, so read labels carefully.

Pure shark cartilage is white in color. If you are taking large quantities of shark cartilage, it may be wise to increase your supplementation of certain minerals, especially magnesium and potassium, to maintain a proper mineral balance in the body. Shark cartilage should *not* be taken by pregnant women or children, or by persons who have recently undergone surgery or suffered a heart attack.

## Shiitake and Reishi

Shiitake and reishi are Japanese mushrooms with a delicate texture, strong stems, and well-defined undersides. They are attractive and have impressive health-promoting properties.

Shiitake (*Lentinus edodes*) contain a polysaccharide, lentinan, that strengthens the immune system by increasing T cell function. Shiitake mushrooms contain eighteen amino acids, seven of which are essential amino acids. They are rich in B vitamins, especially vitamins B<sub>1</sub> (thiamine), B<sub>2</sub> (riboflavin), and B<sub>3</sub> (niacin). When sun-dried, they contain high amounts of vitamin D. Their effectiveness in treating cancer has been reported in a joint study by the Medical Department of Koibe University and Nippon Kinoko Institute in Japan. These mushrooms are considered delicacies and are entirely edible.

Reishi (*Ganoderma lucidum*) have been popular for at least two thousand years in the Far East. They were rated number one on ancient Chinese lists of superior medicines, and were believed to give eternal youth and longevity.

Today, both shiitake and reishi mushrooms are used to treat a variety of disorders and to promote vitality. They are used to prevent high blood pressure and heart disease, to control and lower cholesterol, to build resistance to disease, and to treat fatigue and viral infections. They are also known to have anti-tumor properties valuable in treating cancer.

The mushrooms are available fresh or dried for use in foods (soak dried mushrooms in warm water or broth for thirty minutes before using), as well as in supplements in capsule, pill, and extract form.

## Spirulina

Spirulina is a microalgae that thrives in hot, sunny climates and in alkaline waters around the world, and produces twenty times as much protein as soybeans growing on an equal-sized area of land. It contains concentrations of nutrients unlike any other single grain, herb, or plant. Among its valuable components are gamma-linolenic acid (GLA), linoleic and arachidonic acids, vitamin B<sub>12</sub> (needed, especially by vegetarians, for healthy red blood cells), iron, a high level of protein (60 to 70 percent), essential amino acids, and the nucleic acids RNA and DNA, along with chlorophyll, and phycocyanin, a blue pigment that is found only in blue-green algae and that has increased the survival rate of mice with liver cancer in laboratory experiments. Spirulina has been clinically tested and has shown a variety of effects. Those with the common cold experienced less sneezing and congestion. Others showed lowered cholesterol levels and blood pressure. Finally, those who used spirulina as part of their regular diet had reduced post-exercise muscle soreness that may have allowed them to have longer workout sessions.

Spirulina is a naturally digestible food that aids in pro-

tecting the immune system, in cholesterol reduction, and in mineral absorption. Because it supplies nutrients needed to help cleanse and heal, while also curbing the appetite, it is beneficial for people who are fasting. A person with hypoglycemia may benefit from using this food supplement between meals because its high protein content helps stabilize blood sugar levels.

## Torula Yeast

See Yeast in this section.

## Wheat Germ

Wheat germ is the embryo of the wheat berry. It is a good source of vitamin E; most of the B vitamins; the minerals calcium, magnesium, and phosphorus; and several trace elements.

One problem with wheat germ is that it spoils easily. If you purchase wheat germ separately from the flour, make sure the product is fresh. It should be either vacuum packed or refrigerated, with a packing date or a label stating the date by which the product should be used. Toasted wheat germ has a longer shelf life, but the raw product is better because it is unprocessed. Wheat germ oil capsules are also available.

## Wheatgrass

Wheatgrass is a rich nutritional food that was popularized by the late Dr. Ann Wigmore, an educator and founder of the Hippocrates Health Institute in Boston. Wheatgrass contains a great variety of vitamins, minerals, and trace elements. According to Dr. Wigmore, 1 pound of fresh wheatgrass is equal in nutritional value to nearly 25 pounds of the choicest vegetables.

Dr. Wigmore reported that wheatgrass therapy, along with "living foods," helped to eliminate cancerous growths and helped many other disorders, including mental health problems. The molecular structure of chlorophyll resembles that of hemoglobin, the oxygen-carrying protein of red blood cells, and this may be the reason for the effectiveness of wheatgrass. The key difference between the two is that the metallic atom in the middle of each molecule of human hemoglobin is iron, while the metallic atom at the center of a molecule of chlorophyll is magnesium. In experiments on anemic animals, blood counts returned to normal after four to five days of receiving chlorophyll.

## Whey Protein

Whey is a normal by-product of cheesemaking; it is the liquid that is left when the solids in milk come together and are pressed into solid form. Filtering and purifying produces whey protein, then the water is removed to produce

a powder that, while high in quality protein, is free of fat and lactose (milk sugar).

This supplement helps to build lean body mass by increasing the body's production of muscle protein. A 30-gram serving of whey protein contains nearly all of the essential amino acids necessary each day. For this reason, it is popular among athletes and bodybuilders, and may also help to protect against muscle wasting in people with such diseases as AIDS and cancer. In addition to its effect on muscles, it appears to inhibit the proliferation of cancer cells, protect against free radical damage, and enhance immune function. Compared to soy protein, whey seems more effective at promoting weight loss. Some recommended whey protein supplements include Biochem Whey Pro from Country Life, Enhanced Life Extension Whey Protein from Life Extension, Molkosan from A. Vogel/Bioforce, and Whey to Go from Solgar.

## Yeast

Yeast are single-celled organisms that can multiply at extremely rapid rates, doubling in number in two hours. Yeast is rich in many basic nutrients, such as the B vitamins (except for vitamin B<sub>12</sub>), sixteen amino acids, and at least fourteen different minerals. The protein content of yeast is responsible for 52 percent of its weight. Yeast is also high in phosphorus.

There are various media on which yeast may be grown. Brewer's yeast, also known as nutritional yeast, is grown on hops, a bitter herb that is also used as an ingredient in beer. Torula yeast is grown on blackstrap molasses or wood pulp. A liquid yeast product from Switzerland called Bio-Strath, distributed by A. Vogel/Bioforce USA, is derived from herbs, honey, and malt. It is a natural product that we highly recommend.

Live baker's yeast should be avoided. Live yeast cells actually deplete the body of B vitamins and other nutrients. In nutritional yeast, these live cells are destroyed, leaving the beneficial nutrients behind.

Yeast may be consumed in juice or water, and is a good energy booster between meals. It can also be added to the diet to aid in treating certain disorders. It helps in sugar metabolism and is good for eczema, heart disorders, gout, nervousness, and fatigue. By enhancing the immune system, yeast is useful for people undergoing radiation therapy or chemotherapy for cancer. Yeast also seems to increase mental and physical efficiency.

## Specialty Supplements

In addition to the substances discussed above, there are many natural food supplements designed for specific circumstances.

There are too many of these products for us to discuss all of them here, but some that we feel are to be highly recommended are the following:

- Allergy Relief formulas from bioAllers. These are eight homeopathic formulas designed to relieve allergies by combining homeopathic remedies with specific allergens to help strengthen resistance to those allergens. Formulas include Animal Hair/Dander; Grain/Dairy; Grass Pollen; Mold/Yeast/Dust; Pollen/Hayfever; Sinus & Allergy Nasal Spray; and Tree Pollen.
- Herbal Actives Artichoke from Nature's Plus. This supplement contains artichoke extract standardized to a minimum of 2.5 to 5 percent caffeoylquinic acids, and also contains sesquiterpene lactones and the highly active flavonoids scolymoside, inulin, and taraxasterol. It is designed to support the liver and circulatory system and assists in cholesterol output reduction and conversion of cholesterol into bile acids.
- Betatene. This is a dietary supplement of mixed carotenoids, including alpha- and beta-carotene, lutein, lycopene, zeaxanthin, and cryptoxanthin. It is intended to help maintain a healthy and strong immune system.
- Bone Maximizer from Metabolic Response Modifiers. This is a combination supplement that contains microcrystalline hydroxyapatite concentrate (MCHC). MCHC is a source of bone proteins and highly absorbable calcium. Other ingredients include glucosamine, pregnenolone, vitamin D, magnesium, methylsulfonylmethane (MSM, a source of bioavailable sulfur), and other nutrients vital for bone health.
- Bone Support with Ostivone from Twinlab. This is a combination supplement designed to help maintain healthy bones. Ingredients include ipriflavone, calcium, vitamin D, magnesium, boron, and purified soy phytoestrogen extracts.
- Cardiaforce from A. Vogel/Bioforce USA. This hawthorn berry extract promotes healthy cardiovascular function, circulation, and heart muscle strength. It is a liquid supplement that is meant to be added to water and taken three times a day, before meals. It has no known interactions with other medications, and should be taken over a period of several months, with periodic short interruptions.
- Cold, flu, and allergy season formulas from ZAND. This is a line of products designed to support health through the various allergy seasons of the year. Individual formulas include Insure Herbal, an echinacea and goldenseal formula; Decongest Herbal, a natural decongestant formula; Herbal-Mist throat spray; and Allergy Season Formula, which contains bromelain, nettle extract, quercetin, and vitamin B<sub>5</sub> (pantothenic acid). These formulas can be used individually or on a rotating basis.
- Diamond Mind from Diamond-Herpanacine Associates. This product combines a number of herbal extracts and nutrients, including ginkgo biloba, gotu kola, ginseng, garlic, phosphatidyl serine, and phosphatidyl choline,

- in a supplement intended to support and improve memory, concentration, and mental energy and alertness.
- **Diamond Trim** from Diamond-Herpanacine Associates. This is a supplement program intended to promote weight loss by helping control appetite, reduce food cravings, increase the burning of calories, and reduce the absorption of fats. It also contains minerals to replenish those often lost through dieting. Ingredients include fiber, digestive enzymes, the herbs St. John's wort and griffonia, the minerals calcium and potassium, and a trace mineral complex.
  - **Noni** from Earth's Bounty. Noni (*Morinda citrifolia*) is a small tree that grows in Hawaii and other tropical regions. The fruit of this plant has a long history of use for a wide variety of problems, including joint problems, pain, inflammation, digestive problems, and cardiovascular disorders. Its active compounds include phytochemicals, designated anthraquinones, enzymes, and alkaloids.
  - **Echinaforce** from Bioforce, USA. This is a liquid echinacea supplement that promotes natural disease resistance during the winter season and helps to maintain a healthy immune system.
  - **Fibroplex** from Metagenics. This supplement contains vitamins B<sub>1</sub> (thiamine) and B<sub>6</sub> (pyridoxine), magnesium, manganese, and malic acid. It is designed to provide nutritional support for the nerves and muscles.
  - **GastroSoothe** from Enzymatic Therapy. GastroSoothe is a natural antacid that contains calcium carbonate, deglycyrrhizinated licorice extract (DGL), and the amino acid glycine for the relief of indigestion and heartburn.
  - **Herbal Mood Boost** from Country Life. This supplement contains a complex of herbs and nutrients known for their positive effects on mood and anxiety, including St. John's wort, 5-hydroxytryptophan (5-HTP), Siberian ginseng, kava kava, and passionflower.
  - **Hyper-C Serum** from Jason Natural Cosmetics. This is an oil-based moisturizing formula that contains vitamin C, an antioxidant, to protect the skin from free radical damage. It also reduces the appearance of existing fine lines and wrinkles, evens out skin tones, and makes the skin softer and smoother in texture.
  - **HyperiCalm** from Enzymatic Therapy. This supplement contains St. John's wort extract standardized to provide 0.3 percent hypericin. It is designed to support mental and nervous system function (see St. John's Wort under Herbs and Their Uses in HERBS in Part One).
  - **Instant Enerjetz** from Superior Source (Continental Vitamin Company). This is a convenient, easy-to-take form of vitamin B<sub>12</sub> that is placed on or under the tongue (not swallowed). Vitamin B<sub>12</sub> is needed to prevent anemia and maintain a healthy nervous system, and it boosts energy and combats fatigue (see VITAMINS in Part One).
  - **Jerusalem artichoke tablets.** Jerusalem artichoke whole tuber flour (JAF) tablets are a good source of fructooligosaccharides (FOS), which support the growth of healthy intestinal flora.
  - **Kyolic Neuro Logic** from Wakunaga of America. This supplement contains aged garlic extract, ginkgo biloba extract, lecithin, acetyl-L-carnitine, and phosphatidyl serine in a formula designed to improve memory and mental activity.
  - **Miracle 2000** from Century Systems, Inc., is a combination supplement that contains twenty-seven vitamins and minerals, eighteen herbs, eight amino acids, and numerous ionic trace minerals.
  - **Nature's Answer** line of herbal extracts designed for children. They are made using alcohol, like standard extracts, but the alcohol is then removed and replaced with glycerin, which is a preservative and a natural sweetener. Formulas include Bubble B-Gone, a combination colic remedy containing catnip, chamomile, fennel, and lemon balm; KidCatnip; KidChamomile; E-KID-nacea, an echinacea extract; E-KID-nacea Plus, which contains echinacea and goldenseal; and KID-B-Well, an immune-system tonic containing astragalus, burdock, and dandelion.
  - **Quick Cleanse Program** from ZAND (Nutraceuticals International Corp.). This is a program utilizing three separate supplements: Cleansing Fiber formula, a fiber supplement containing psyllium seed and husk, plus bentonite and kaolin; Cleansing Laxative formula, with cascara sagrada (an herbal stimulant laxative) and kaolin; and Thistle Cleanse formula, a milk thistle supplement. This combination of formulas is designed to cleanse the intestinal tract, eliminate toxins, and support liver function.
  - **Remifemin** from Enzymatic Therapy. Remifemin is a standardized extract of black cohosh that has been used in Europe for over forty years for the treatment of menopausal symptoms. (see Black Cohosh under Herbs and Their Uses in HERBS in Part One). This supplement does not affect hormone levels.
  - **Soy-Licious** from Country Life. This dietary supplement is a high-protein soy-based drink mix with added genistein and daidzein (soy isoflavones), essential vitamins and minerals, antioxidants, and adaptogenic herbs (adaptogens are herbs that help the body adapt to and cope with the effects of stress).
  - **Sub-Adrene** from American Biologics. This is a highly concentrated whole adrenal-cortical extract of bovine origin. Designed for sublingual administration, it has a peppermint taste and supplies a balance of natural steroids.
  - **Ultra Juice Green** from Nature's Plus (Natural Organics). This is a supplement based on marine algae and

containing a total of twenty different green foods in tablet form. It contains a wide range of vitamins, minerals, and phytonutrients.

- VitaSerum from ABRA, Inc. This is a skin care product designed to protect against free radicals, stimulate cell renewal, and reduce the visible signs of aging. It contains vitamin C from acerola berries; herbal extracts of elder flower, green tea, grape seed, and horsetail; citrus and cranberry bioflavonoids; hyaluronic acid; zinc sulfate; and essential oils of lavender, rose geranium, and sweet lavender.
- Vita Synergy for Men from The Synergy Company. This is a combination nutritional supplement that contains a

balanced blend of all major vitamins and minerals, trace elements, and a variety of herbal extracts used to support men's health.

- Wellness Formula from Source Naturals. This supplement is designed to support optimal health in cold weather. Its ingredients include vitamins A and C, beta-carotene, and bioflavonoids; the immune-boosting mineral zinc; bee propolis; and the herbs angelica, astragalus, boneset, cayenne, echinacea, garlic, goldenseal, hawthorn berry, horehound, mullein, pau d'arco, and Siberian ginseng.

# Herbs

## INTRODUCTION

The medicinal benefits of herbs have been known for centuries. Records of Native American, Roman, Egyptian, Persian, and Hebrew medical practices show that herbs were used extensively to treat practically every known illness.

Many herbs contain powerful ingredients that, if used correctly, can help heal the body. The pharmaceutical industry was originally based upon the ability to isolate these ingredients and make them available in a purer form. Herbalists, however, contend that nature provides other ingredients in the same herbs to balance the more powerful ingredients.

These other components, though they may be less potent, may help to act as buffers, synergists, or counterbalances working in harmony with the more powerful ingredients. Therefore, when you use herbs in their complete form, your body's healing process utilizes a balance of ingredients provided by nature.

In the United States, herbal remedies were used widely until the early 1900s, when what was to become the modern pharmaceutical industry began isolating individual active compounds and producing drugs based on them. American medicine became almost exclusively committed to a medical system some practitioners call *allopathy*, which seeks to treat illness by producing a condition in the body that does not allow the disease to live or thrive. Over the years, most Americans have become conditioned to rely on synthetic, commercial drugs for relief.

Today, however, scientists are taking a second look at herbal remedies. Particularly in the past twenty years, a growing body of research (much of it done in Europe) has pointed to the therapeutic potential of numerous herbs. And big pharmaceutical companies are always on the lookout for plants to help with a variety of diseases. But a lot of work remains to be done; less than 1 percent of the estimated plant species on earth have been investigated for possible medicinal uses. In 1978, the German Commission E monographs were created, which describe the safety and effectiveness of herbs. This is still considered the most authoritative modern work on the subject.

Today's renewed interest in herbs reflects increasing concern about the side effects of powerful synthetic drugs, as well as the desire of many people to take charge of their own health, rather than merely submitting themselves to a sometimes-impersonal health care system. We are also rediscovering the healthful benefits of tasty herbs for cooking and aromatic herbs for enhancing and helping to balance mental, spiritual, and physical health.

Nature's pharmacy is an abundant one. Many herbs are rich in compounds that have a beneficial effect on certain tissues and organs, and, therefore, can be used as medicines to treat, cure, or prevent disease. Herbal remedies can help nourish your immune system, stimulate the regeneration of damaged liver tissue, build the strength of the adrenal glands, counter the adverse side effects of chemotherapy, balance the endocrine system, stimulate milk production, and improve night vision, among other things.

Generally, medicinal herbs fall into two basic categories: *tonic* and *stimulating*.

Tonics help cells, tissues, and organs to maintain tone, or balance, throughout the body. Some tonics activate and invigorate bodily processes or parts. Other tonics supply important nutrients that cells, tissues, and organs need to function properly. Tonics ordinarily are taken regularly for three to nine months at a time to gently strengthen and improve overall health and/or certain organ functions.

Stimulating herbs have much stronger actions and are used to treat particular ailments. They should be taken in smaller doses than tonic herbs, and for shorter periods of time.

Just because an herb had an historical use doesn't necessarily mean it will work for your condition. There may be some trial and error with different herbs and herbal blends before you get satisfactory results. Today, some herbs have undergone processing to produce a standardized extract that targets specific conditions. Extracts are a good place to start if you have one of the targeted conditions because they have a known amount of the active compound, which is not the case with the herb itself.

## PHYTOMEDICINALS: THE HEALING POWER OF HERBS

Ancient cultures had no idea why herbs worked—they simply knew that certain plants produced certain desired results.

Only in the last hundred years or so have chemists and pharmacists been isolating and purifying the beneficial chemical compounds in plants to produce reliable pharmaceutical drugs. About 25 percent of the prescription medicines sold today are (or were originally) derived from plants. For example:

- Morphine and codeine come from the opium poppy.
- Aspirin originated from willow bark.
- Digitalis, a heart muscle strengthener, is derived from the foxglove plant.

- Paclitaxel (Taxol), used in cancer chemotherapy, comes from the Pacific yew tree.

*Phytomedicine*, a recently coined term, refers to an herbal medicine that is a whole-plant preparation, rather than a single isolated chemical compound. (The prefix *phyto* comes from the Greek word *phyton*, meaning “plant.”) The herbal preparation derived from a whole plant or plant part is considered the active entity, even though it may actually contain hundreds of individual active components. Phytomedicines are standardized, however—that is, they contain set percentages of specified active components—and their therapeutic values are backed by pharmacological and clinical studies and experience.

Phytomedicines are widely recognized in Europe, where they are categorized as plant-derived drugs. In Germany, for example, phytomedicines are considered “ethical drugs,” and physicians prescribe them and pharmacists dispense them. In the United States, phytomedicines are sold as over-the-counter dietary supplements in health food stores and in some pharmacies. A few mainstream doctors, however, have begun prescribing herbal remedies along with standard drugs. Some health insurance companies cover the cost of herbal medicines when they are prescribed by health care professionals. The National Center for Complementary and Alternative Medicine (NCCAM), part of the National Institutes of Health, is funding research on herbal remedies (for more information, go to [www.nccam.nih.gov](http://www.nccam.nih.gov)). According to Dr. David Eisenberg at Harvard Medical School, more than 18 percent of the U.S. population, or 38 million adults, use herbal supplements.

Although herbal supplements are not subject to the same standards as are prescription and over-the-counter drugs, they are regulated by the FDA. In fact, in July 2008 the FDA applied a new set of regulations to supplements called Good Manufacturing Practices (GMP). These rules ensure that all supplements are manufactured in a uniform way and that what appears on the label is what is in the product.

## OTHER HERBAL HEALING SYSTEMS

The World Health Organization estimates that 80 percent of the earth’s population today depends on plants to treat common ailments. Herbalism is an essential part of Ayurvedic (Indian), traditional Asian, Native American, and naturopathic medicines. Many homeopathic remedies are derived from plants as well. Homeopathic remedies are regulated by the FDA, but are subject to slightly different rules than dietary supplements. This biggest difference is that unlike supplements, they can carry disease claims on the label. This means labels for homeopathic remedies used historically for cancer patients, for example, can say “helps prevent recurrence of cancer.” Other supplements may not make such claims.

Oriental herbs are a recent addition to the American

herb scene, with the influx of several popular Chinese herbs. The Chinese are today’s foremost herbalists, drawing on thousands of years of experience in compounding and processing roots and herbs. In the Asian tradition, herbs are used to bring the whole body into balance and harmony. They are taken daily as a preventive measure, rather than as a treatment once illness has occurred. In the Orient, medicinal herbs often find their way into foods as seasoning and ingredients. Indeed, according to the late Chinese writer and scholar Lin Yutang, the Chinese view medicine and food as the same thing, believing that what is good for the body is medicine and at the same time is also food. Some of the Chinese herbs most readily found in U.S. herb and natural food stores include astragalus, Chinese ginseng, ginkgo biloba, gotu kola, licorice root, dong quai, ginger, and schizandra.

Every Native American nation has its own herbal medicine tradition based on the plants growing in the geographic area where it lives. Common among all Native American cultures is the spirituality attached to the gathering and use of herbs, and many peoples use the same herbs both medicinally and ceremonially. For the Navajos, for example, herbalism is a complex and specialized religion, in which the Navajo healer serves as both doctor and priest. Before plants are collected, prayers and offerings are made to the earth and the plant spirit. Herbs used in healing ceremonies are not thrown away, but are reverently placed back into the earth. Much like the Asian approach, Native American herbalism aims to achieve balance within the total person. Medicinal and ceremonial herbs commonly used by Native American cultures include American ginseng, yarrow, black cohosh, boneset, echinacea, goldenseal, nettles, juniper, wild buckwheat, and dogwood.

As they have for centuries, indigenous rainforest tribes around the world rely on the forests for virtually all their medicines. They too have incorporated herbs into their religions and everyday lives. Researchers estimate that the world’s rainforests contain literally thousands of potentially useful medicinal plants. Rainforests exist on every continent, though most research attention is currently directed at the rainforests of South America, particularly in the Amazon, and of the South Pacific Islands. Out of this rich storehouse of natural remedies, only a handful are now commonly found in health food stores, among them pau d’arco, boldo, cat’s claw, kava, yerba maté, suma, yohimbe (not recommended), guarana, and passionflower. More and more rainforest remedies are becoming available.

## USING MEDICINAL HERBS

Commercial herbal preparations are available in several different forms, including bulk herbs, medicinal herb blends, teas, oils, tinctures, fluid extracts, and tablets or capsules. Following are some of the ways in which herbal remedies can be used.

## Essential Oils

Essential oils are highly concentrated extracts—typically obtained either by steam distillation or cold pressing—from the flowers, leaves, roots, berries, stems, seeds, gums, needles, bark, or resins of numerous plants. They contain natural hormones, vitamins, antibiotics, and antiseptics. Essential oils typically come from anise, thyme, ginger, and chamomile. Some of these oils, and especially chamomile, appear to inhibit herpes simplex virus in a petri dish.

Known also as *volatile oils* because they evaporate easily in air, essential oils are soluble in vegetable oil, partially soluble in alcohol, and not soluble in water. Because they are so concentrated, they are likely to irritate mucous membranes and the stomach lining if taken internally. It is therefore best to use essential oils externally only, such as in poultices, inhalants, or bathwater, or on the skin (a few drops). The therapeutic properties of essential oils can help to remedy ailments ranging from insomnia to respiratory disorders to impotence to arthritis.

## Extracts

An extract is a concentrate that results when crude herb is mixed with a suitable solvent, such as alcohol and/or water. Of the different herbal forms, extracts are generally the most effective because their active ingredients are more highly concentrated, and they can be standardized to a guaranteed potency. Extracts also have longer shelf lives than other herbal preparations. Fresh herbal extracts retain almost all of the original plant's benefits.

Alcohol-free extracts are available. When administered sublingually (drops are placed under the tongue), herbal extracts can be absorbed by the body quickly. This is an especially effective way for older adults and people with absorption problems to use herbs.

## Plasters, Compresses, and Poultices

These are ways of applying herbal remedies directly to the skin. Plasters and compresses are cotton bandages soaked in infusions or decoctions and wrapped around the affected area or held on with pressure. Compresses are also warm. Poultices are made by moistening herbs, placing them on the skin, and holding them there with a bandage. Moistened and warmed herbal tea bags also help soothe and heal. Try using chamomile tea bags to relieve the itching and inflammation of insect bites and eczema.

## Powders

Powders are dried herbs ground to a fine consistency. You can sprinkle them over food, stir them into a liquid such as juice or water for tonics, or add them to soup stocks. You also can take them in capsule or tablet form.

## Salves, Ointments, and Creams

These preparations combine a medicinal herb with an oily base for external use. Creams are light and slightly oily, to blend with the skin's secretions and allow the active ingredients to penetrate the skin. The heavier and oilier salves and ointments apply protective remedies to the skin surface.

## Syrups

Syrups are used to improve the taste of bitter herbal formulas and to administer soothing cough or throat medicines. Herbs often taken in syrup form include wild cherry, marshmallow root, and licorice.

## Teas, Infusions, and Decoctions

People have been consuming herbal teas for as long as they have known how to heat water—since well before recorded history. Unlike green, black, and oolong teas, herbal teas can be made from virtually any plant, and from any part of the plant, including the roots, flowers, seeds, berries, or bark. There are some herbs, such as echinacea, ginkgo leaf, saw palmetto, and milk thistle, that are not effective at healing when taken in tea form because their active components are not water soluble, and the concentration needed for medicinal potency is so high it can be obtained only from an extract, pill, or capsule.

Different herbal teas, which sometimes contain thousands of beneficial active compounds, have their own distinctive healing uses. The late botanical expert Varro Tyler, Ph.D., formerly professor emeritus of pharmacognosy (the study of natural drug properties) at Purdue University, taught that herbal teas are very good for relieving mild to moderate ailments such as upset stomach, sore throat, coughs, stuffy nose, and insomnia.

Many herbal teas are available in tea bag form. They can also be prepared from the raw herb. To make an herbal tea, gently crumble leaves and flowers and break roots and bark into pieces (cutting the herbs causes the essential oils to dissipate) and place them in a ceramic or glass container. Cover the herb parts with boiling water (do not bring the herbs themselves to a boil), and allow them to steep. Most herbs should be steeped for four to six minutes, although some herbal teas, such as chamomile, need to be steeped for fifteen to twenty minutes in a covered container in order to deliver their full therapeutic effect. Other herbs, such as ginseng roots, can be boiled. Astragalus can be lightly simmered for several hours. In fact, in Asia, ginseng root, astragalus, dong quai, and other herbs are added to chicken broth to make a tonic soup that is both food and medicine.

*Infusion* is simply another term for tea. This is the easiest way to take herbal remedies. To make an infusion, you simply boil water and add leaves, stems, flowers, or powdered herbs—plant material whose active ingredients dis-

solve readily in hot water—then steep, strain, and drink the mixture as a tea.

A decoction is a tea made from thicker plant parts, such as bark, roots, seeds, or berries. These also contain lignin, a substance that is difficult to dissolve in water. Thus, decoctions require a more vigorous extraction method than infusions.

### Tinctures

Plant components that are either insoluble or only partially soluble in water can be extracted with solvents such as alcohol or glycerol. The herb is soaked in the solvent for a period of time, then pressed to render the tincture. Tinctures can preserve extracted ingredients for twelve months or more.

### Vinegars

Herbal vinegars can serve as both medicines and salad dressings. To make an herbal vinegar, add the herb or herbs of your choice to raw apple cider vinegar, balsamic vinegar, rice vinegar, or malt vinegar. Allow the herbs to steep for four days (agitate the container daily), strain, and then press through a straining cloth and bottle in a dark glass container.

### Wines

Steeping herbs in wine is a novel and pleasant way to use them medicinally. Wine does not keep as long as the stronger alcohols, so refrigeration is a good idea.

## TIPS AND PRECAUTIONS

However they are used, most herbs act gently and subtly. They do not produce the kind of dramatic, immediate results we expect from prescription drugs. Basically, herbs are balancers that work with the body to help it heal and regulate itself. They work better together than they do singly because the effect of one herb is usually supported and reinforced when combined with others.

While most herbs aren't likely to be harmful, keep in mind that "natural" isn't a synonym for "safe." Like synthetic drugs, herbal preparations may be toxic, cause allergic reactions, or affect your response to other medications.

Common sense, care, and forethought are needed when using herbs for either food or medicine. Here are some essential guidelines for herbal self-care:

- Use herbal self-care for minor ailments only, not for serious or life-threatening conditions.
- Use only recommended amounts for recommended periods of time.

- Use the correct herb. Buy your herbal remedies from a reputable company. If you collect or grow herbs on your own, be absolutely positive in your identification.
- Use the correct part of the plant. For instance, don't substitute roots for leaves. When buying fresh herbs, check to be sure which part of the herb is required for a remedy—the whole herb, flowers, fruit, leaves, stems, or roots.
- When using an herbal remedy for the first time, start with a small amount to test for possible allergic reactions.
- Don't take certain herbs if you are pregnant or planning to become pregnant.
- Don't take herbal remedies if you are nursing a baby.
- Don't give medicinal amounts of herbs to children without first consulting with your health care practitioner.

### Buying Herbal Remedies

When choosing herbal remedies, it is important to select quality products from a reliable source. How do you know whether a manufacturer or supplier is reliable? Start by making a phone call to the manufacturer. Ask how long the company has been in business, if they are following the GMP guidelines from the FDA, and how they determine the identity and potency of the herbs they sell. Membership in trade groups such as the American Herbal Products Association ([www.ahpa.org](http://www.ahpa.org)), while not a stamp of approval, does indicate the company's recognition of industry standards. The American Botanical Council provides regular updates on new science related to herbs ([www.herbalgram.org](http://www.herbalgram.org)). We recommend purchasing herbs sold by reputable companies that have been in the herb business for at least ten years. A number of manufacturers and distributors specializing in herbal products, including herbal combinations for management of certain disorders, are listed under Manufacturer and Distributor Information in the Appendix.

If you wish to buy organically grown herbs, look for the "certified organic" label on the product. More than half of U.S. states have certification programs for organic farms and products. Federal standards are now implemented through a nationwide certification system under the USDA National Organic Program. More information on the regulations governing these producers can be found at [www.ams.usda.gov/nop](http://www.ams.usda.gov/nop).

Finally, look for herbal products that are standardized to contain a specific percentage of active ingredients extracted from the specific herb part known to be effective.

## HERBS AND THEIR USES

The following table describes some of the most commonly used medicinal herbs, including which parts of each herb are used, its chemical and nutrient content, and its various uses.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Acerola ( <i>Malpighia glabra</i> )	Fruit.	Phytochemicals: Beta-carotene. Nutrients: Calcium, iron, magnesium, phosphorus, potassium, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , and C.	Has antioxidant, antifungal, and astringent properties. Helps to support the liver and hydrate the skin. Useful for diarrhea and fever.	A rainforest herb similar to the cherry. One of the richest natural sources of vitamin C; found in numerous multivitamin supplements.
Alfalfa ( <i>Medicago sativa</i> )	Flowers, leaves, petals, sprouted seeds.	Phytochemicals: Alpha-carotene, beta- carotene, beta-sitosterol, chlorophyll, coumarin, cryptoxanthin, daidzein, fumaric acid, genistein, limonene, lutein, saponin, stigmasterol, zeaxanthin. Nutrients: Calcium, copper, folate, iron, magnesium, manganese, phosphorus, potassium, silicon, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , C, D, E, and K.	Alkalizes and detoxifies the body. Acts as a diuretic, anti-inflammatory, and antifungal. Lowers cholesterol, balances blood sugar and hormones, and promotes pituitary gland function. Good for anemia, arthritis, ulcers, bleeding- related disorders, and disorders of the bones and joints, digestive system, and skin.	Must be used in fresh, raw form to provide all nutrients. Sprouts are especially effective (be sure to rinse them thoroughly before use to remove mold and bacteria).
Aloe ( <i>Aloe vera</i> )	Pulp from insides of succulent leaves.	Phytochemicals: Acemannan, beta- carotene, beta-sitosterol, campesterol, cinnamic acid, coumarin, lignins, p-coumaric acid, saponins. Nutrients: Amino acids, calcium, folate, iron, magnesium, phosphorus, potassium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , C, and E.	Acts as an astringent, emollient, antifungal, antibacterial, and antiviral. Applied topically, heals mouth sores and stimulates cell regeneration. Ingested, helps to lower cholesterol, reduces inflammation resulting from radiation therapy, increases blood vessel generation in lower extremities of people with poor circulation, soothes stomach irritation, aids healing, and acts as a laxative. May be good for patients with AIDS and for skin. It supports a healthy digestive system probably by increasing short-chain fatty acid production from the friendly bacteria in the colon.	Allergic reactions, though rare, may occur in susceptible persons. Before using, apply a small amount behind the ear or on the underarm. If stinging or rash occurs, do not use.  <i>Caution:</i> Should not be taken internally during pregnancy.
Anise ( <i>Pimpinella anisum</i> )	Seeds, seed oil.	Phytochemicals: Alpha-pinene, apigenin, bergapten, caffeic acid, chlorogenic acid, eugenol, limonene, linalool, myristicin, rutin, scopoletin, squalene, stigmasterol, umbelliferone. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , C, and E.	Aids digestion, clears mucus from air passages, combats infection, and promotes milk production in nursing mothers. Good for indigestion and for respiratory infections such as sinusitis. Also helpful for menopausal symptoms.	Used in many popular products as a fragrance and flavoring.
Annatto ( <i>Bixa orellana</i> )	Leaves, roots, seeds.	Phytochemicals: Beta-carotene, bixin, cyanidin, ellagic acid, salicylic acid, saponin, tannins. Nutrients: Amino acids, calcium, iron, phosphorus, vitamins B <sub>2</sub> , B <sub>3</sub> , and C.	Has diuretic, antioxidant, antibacterial, anti-inflammatory, and expectorant properties. Helps to protect the liver and kidneys. May reduce blood sugar levels. Useful for indigestion, fever, coughs, skin problems, and weight loss.	A rainforest herb used in skin care products as an emollient, and as an orange-yellow food coloring.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Ashwagandha ( <i>Withania somnifera</i> )	Roots.	Phytochemicals: Alkaloids, beta-sitosterol, chlorogenic acid, scopoletin, withaferin. Nutrients: Amino acids, choline.	Rejuvenates and energizes the nervous system. Helps prevent stress-related disorders and stress-related depletion of vitamin C and cortisol. Increases physical endurance and improves sexual function. Has anti-inflammatory and antiaging effects. In laboratory studies, has modulated and stimulated immune function.	An Ayurvedic herb also known as Indian ginseng and winter cherry. An important herb in Ayurvedic medicine.
Astragalus ( <i>Astragalus membranaceus</i> )	Roots.	Phytochemicals: Betaine, beta-sitosterol, formononetin, isoliquiritigenin. Nutrients: Calcium, choline, copper, essential fatty acids, iron, magnesium, manganese, potassium, zinc.	Acts as a tonic to protect the immune system. Aids adrenal gland function and digestion. Increases metabolism, produces spontaneous sweating, promotes healing, and provides energy to combat fatigue and prolonged stress. Increases stamina. Good for colds, flu, and immune deficiency-related problems, including AIDS, cancer, and tumors. Effective for chronic lung weakness.	Also called huang qi. <i>Caution:</i> Do not use if fever is present.
Barberry ( <i>Berberis vulgaris</i> )	Bark, berries, roots.	Phytochemicals: Berbamine, berberine, beta-carotene, caffeic acid, kaempferol, lutein, quercetin, sinapic acid, zeaxanthin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Decreases heart rate, slows breathing, reduces bronchial constriction. Kills bacteria on the skin and stimulates intestinal movement.	<i>Caution:</i> Should not be used during pregnancy.
Bayberry ( <i>Myrica cerifera</i> )	Root bark.	Phytochemicals: Beta-carotene, gallic acid, myristic acid, phenol. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a decongestant and astringent. Aids circulation, reduces fever. Helps stop bleeding. Good for circulatory disorders, fever, hypothyroidism, and ulcers. Also good for the eyes and the immune system.	The wax of the berries is used to make fragrant candles. <i>Caution:</i> Should not be used at high dosages or for prolonged periods. May temporarily irritate sensitive stomachs.
Bilberry ( <i>Vaccinium myrtillus</i> )	Entire plant.	Phytochemicals: Anthocyanosides, beta-carotene, caffeic acid, caryophyllene, catechin, chlorogenic acid, ferulic acid, gallic acid, hyperoside, lutein, quercetin, quercitrin, ursolic acid, vanillic acid. Nutrients: Calcium, inositol, magnesium, manganese, phosphorus, potassium, selenium, silicon, sulfur, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as an antioxidant, diuretic, and urinary tract antiseptic. Keeps blood vessels flexible, allowing increased blood flow. Helps control insulin levels and strengthen connective tissue. Supports and strengthens collagen structures, inhibits the growth of bacteria, and has antiaging and anticarcinogenic effects. Useful for hypoglycemia, inflammation, stress, anxiety, night blindness, and cataracts. May help halt or prevent macular degeneration.	Also known as European blueberry. Related to the American blueberry. <i>Caution:</i> Interferes with iron absorption when taken internally. Should not be used by people with diabetes except under the supervision of a knowledgeable health professional.
Birch ( <i>Betula alba</i> )	Bark, leaves, sap.	Phytochemicals: Betulin, betulinic acid, hyperoside, luteolin and quercetin glycosides, methyl salicylate.	Acts as a diuretic, anti-inflammatory, and pain reliever. Good for joint pain and urinary tract infections. Applied topically, good for boils and sores.	Betulinic acid in birch bark has been found to kill cancer cells.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Black cohosh ( <i>Cimicifuga racemosa</i> )	Rhizomes, roots.	Phytochemicals: Beta-carotene, cimicifugin, formononetin, gallic acid, phytosterols, salicylic acid, tannic acid, tannin. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Lowers blood pressure and cholesterol levels. Reduces mucus production. Helps cardiovascular and circulatory disorders. Induces labor and aids in childbirth (many herbalists recommend taking small amounts two weeks before expected delivery). Relieves menopausal symptoms, menstrual cramps with back pain, morning sickness, and pain. Helpful for poisonous snake bites. Good for arthritis.	Also known as black snakeroot.  <i>Caution:</i> Do not use during pregnancy or in the presence of chronic disease. There have been reports of liver problems associated with the use of this herb in certain individuals. Some products contain Asian <i>Actaea</i> and not black cohosh. Buy from a reputable company.
Black walnut ( <i>Juglans nigra</i> )	Husks, inner bark, leaves, nuts.	Phytochemicals: Beta-carotene, ellagic acid, juglone, myricetin, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Aids digestion and acts as a laxative. Helps heal mouth and throat sores. Cleanses the body of some types of parasites. Good for bruising, fungal infection, herpes, poison ivy, and warts. May help lower blood pressure and cholesterol levels.	When boiled, the hulls produce a dye that is used to color wool.
Blessed thistle ( <i>Cnicus benedictus</i> )	Flowers, leaves, stems.	Phytochemicals: Beta-carotene, beta-sitosterol, cnicin, ferulic acid, kaempferol, luteolin, oleanolic acid, stigmasterol. Nutrients: Calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Stimulates the appetite and stomach secretions. Heals the liver. Lessens inflammation, improves circulation, cleanses the blood, and strengthens the heart. May act as brain food. Good for female disorders and increases milk flow in nursing mothers.	Also called St. Benedict thistle, holy thistle.  <i>Caution:</i> Should be handled with care to avoid toxic skin effects.
Blue cohosh ( <i>Caulophyllum thalictroides</i> )	Roots.	Phytochemicals: Anagryne, beta-carotene, caulophylline, caulophyllosaponin, caulosaponin, hederagenin, phytosterols, saponin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Eases muscle spasms and stimulates uterine contractions for childbirth. Useful for memory problems, menstrual disorders, and nervous disorders.	<i>Caution:</i> Should not be used during the first two trimesters of pregnancy.
Boldo ( <i>Peumus boldus</i> )	Leaves.	Phytochemicals: Alpha-pinene, ascaridole, benzaldehyde, beta-pinene, boldin, boldine, camphor, coumarin, eugenol, farnesol, kaempferol, limonene, linalool, 1,8-cineole. Nutrients: Choline.	Acts as a diuretic, laxative, antibiotic, liver tonic, and anti-inflammatory. Aids in the excretion of uric acid and stimulates digestion.	Used by indigenous peoples of Chile and Peru for liver ailments and gallstones.
Boneset ( <i>Eupatorium perfoliatum</i> )	Flower petals, leaves.	Phytochemicals: Astragaloside, gallic acid, eupoliatin, eupoliatorin, eupatorin, euperfolin, euperfolitin, gallic acid, hyperoside, kaempferol, quercetin, rutin, tannic acid.	Acts as a decongestant, laxative, anti-inflammatory, and diuretic. Loosens phlegm, reduces fever, increases perspiration, calms the body. Useful for colds, flu, bronchitis, and fever-induced aches and pains.	Also called white snakeroot.  <i>Caution:</i> Do not use on a daily basis for more than one week as long-term use can lead to toxicity.
Borage ( <i>Borago officinalis</i> )	Leaves, seeds.	Phytochemicals: Beta-carotene, rosmarinic acid, silicic acid, tannin. Nutrients: Calcium, choline, essential fatty acids, iron, magnesium, phosphorus, potassium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as an adrenal tonic and gland balancer. Contains valuable minerals and essential fatty acids needed for proper cardiovascular function and healthy skin and nails.	The flowers of the borage plant are edible.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Boswellia ( <i>Boswellia serrata</i> )	Gum resin.	Phytochemicals: Borneol, boswellic acids, carvone, caryophyllene, farnesol, geraniol, limonene.	Acts as an anti-inflammatory, antiarthritic, antifungal, and antibacterial. Used topically for pain relief. Lowers cholesterol, protects the liver. Useful for arthritis, gout, low back pain, myositis, and fibromyalgia. Helps repair blood vessels damaged by inflammation. Traditionally used as a remedy for obesity, diarrhea, dysentery, pulmonary diseases, ringworm, and boils.	An Ayurvedic herb also known as Indian frankincense. An important herb in Ayurvedic medicine.
Buchu ( <i>Barosma betulina</i> )	Leaves.	Phytochemicals: Alpha-pinene, alpha-terpinene, barosma-camphor, diosphenol, hesperidin, limonene, menthone, pulegone, quercetin, quercetrin, rutin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , and B <sub>3</sub> .	Lessens inflammation of the colon, gums, mucous membranes, prostate, sinuses, and vagina. Acts as a diuretic. Helps control bladder and kidney problems, diabetes, digestive disorders, fluid retention, and prostate disorders. A specific for bladder infections.	Do not boil buchu leaves.
Burdock ( <i>Arctium lappa</i> )	Plant, roots, seeds.	Phytochemicals: Acetic acid, arctigenin, arctiin, beta-carotene, butyric acid, caffeic acid, chlorogenic acid, costic acid, inulin, isovaleric acid, lauric acid, lignin, myristic acid, propionic acid, sitosterol, stigmaterol. Nutrients: Amino acids, calcium, chromium, copper, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as an antioxidant. May help to protect against cancer by helping control cell mutation. Aids elimination of excess fluid, uric acid, and toxins. Has antibacterial and antifungal properties. Purifies the blood, restores liver and gallbladder function, and stimulates the digestive and immune systems. Helps skin disorders such as boils and carbuncles, and relieves gout and menopausal symptoms. Burdock root used as a hair rinse promotes scalp and hair health.	Also called bardana, beggar's buttons, clotbur, gobo, lappa, and thorny burr.  <i>Caution:</i> Interferes with iron absorption when taken internally. Should not be used by pregnant or breast-feeding women, people with diabetes, or those with heart or cardiovascular conditions.
Butcher's broom ( <i>Ruscus aculeatus</i> )	Plant, roots, seeds.	Phytochemicals: Beta-carotene, chrysophanic acid, glycolic acid, neoruscogenin, rutin, saponin. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Reduces inflammation. Useful for carpal tunnel syndrome, circulatory disorders, edema, Ménière's disease, obesity, Raynaud's phenomenon, thrombophlebitis, varicose veins, and vertigo. Also good for the bladder and kidneys.	More effective if taken with vitamin C.
Calendula ( <i>Calendula officinalis</i> )	Flower petals.	Phytochemicals: Alpha-amyrin, beta-amyrin, beta-sitosterol, caffeic acid, campesterol, caryophyllene, chlorogenic acid, faradiol, galactose, gentisic acid, kaempferol, lutein, lycopene, malic acid, myristic acid, oleanolic acid, p-coumaric acid, phytofluene, quercetin, rutin, salicylic acid, saponin, stigmaterol, syringic acid, taraxasterol vanillic acid, zeta-carotene. Nutrients: Calcium, coenzyme Q <sub>10</sub> , vitamins C and E.	Reduces inflammation and is soothing to the skin. Helps regulate the menstrual cycle and lower fever. Useful for skin disorders, such as rashes and sunburn, as well as for neuritis and toothache. Good for diaper rash and other skin problems in small children.	Also called pot marigold. Usually nonirritating when used externally.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Cascara sagrada ( <i>Frangula purshiana</i> )	Bark.	Phytochemicals: Aloe-emodin, anthraquinones, barbaloin, beta-carotene, casanthranol, chrysophanic acid, chrysophanol, frangulin, malic acid, myristic acid. Nutrients: Calcium, iron, linoleic acid, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a colon cleanser and laxative. Effective for colon disorders, constipation, and parasitic infestation.	Tastes very bitter taken as a tea.
Catnip ( <i>Nepeta cataria</i> )	Leaves.	Phytochemicals: Alpha-humulene, beta-elemene, camphor, carvacrol, caryophyllene, citral, citronellal, geraniol, myrcene, nepetalactone, piperitone, pulegone, rosmarinic acid, thymol. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc.	Lowers fever (catnip tea enemas reduce fever quickly). Dispels gas and aids digestion and sleep; relieves stress; stimulates the appetite. Good for anxiety, colds and flu, inflammation, pain, and stress.	Can be given to children.
Cat's claw ( <i>Uncaria tomentosa</i> )	Inner bark, roots.	Phytochemicals: Alloisopteropodine, allopteropodine, isomitraphylline, isopteropodine, mitraphylline, oleanolic acid, pteropodine, rhynchophylline, ursolic acid.	Acts as an antioxidant and anti-inflammatory. It may help with the management of arthritis. Stimulates the immune system. Cleanses the intestinal tract and enhances the action of white blood cells. Good for intestinal problems and viral infections. May help people with AIDS symptoms, arthritis, cancer, tumors, or ulcers.	Also called uña de gato. According to USDA research, cat's claw seeds contain an enzyme instrumental in converting saturated fats to unsaturated fats. <i>Caution:</i> Do not use during pregnancy.
Cayenne ( <i>Capsicum frutescens</i> or <i>C. annuum</i> )	Berries.	Phytochemicals: Alpha-carotene, beta-carotene, beta-ionone, caffeic acid, campesterol, capsaicin, carvone, caryophyllene, chlorogenic acid, citric acid, cryptoxanthin, hesperidin, kaempferol, limonene, lutein, myristic acid, 1,8-cineole, p-coumaric acid, quercetin, scopoletin, stigmaterol, zeaxanthin. Nutrients: Amino acids, calcium, essential fatty acids, folate, iron, magnesium, phosphorus, potassium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , C, and E.	Aids digestion, improves circulation, weight loss, and stops bleeding from ulcers. Acts as a catalyst for other herbs. Good for the heart, kidneys, lungs, pancreas, spleen, and stomach. Useful for arthritis and rheumatism. Helps to ward off colds, sinus infections, and sore throats. Good for pain when applied topically. Used with lobelia for nerves.	Also called capsicum, hot pepper, red pepper. <i>Caution:</i> Avoid contact with the eyes.
Cedar ( <i>Cedrus libani</i> )	Leaves, tops.	Phytochemicals: Borneol, quinic acid.	Acts as an antiviral, antifungal, expectorant, lymphatic cleanser, and urinary antiseptic. Stimulates the immune system. Increases venous blood flow. Can be used externally for warts.	

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Celery ( <i>Apium graveolens</i> )	Plant, roots, seeds.	Phytochemicals: Alpha-pinene, apigenin, bergapten, beta-carotene, caffeic acid, carvone, chlorogenic acid, coumarin, eugenol, ferulic acid, isoquercitrin, limonene, linalool, luteolin, mannitol, myristic acid, myristicin, p-coumaric acid, rutin, scopoletin, shikimic acid, thymol. Nutrients: Amino acids, boron, calcium, choline, essential fatty acids, folate, inositol, iron, magnesium, manganese, phosphorus, potassium, selenium, sulfur, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , C, E, and K.	Reduces blood pressure, relieves muscle spasms, and improves appetite. Good for arthritis, gout, and kidney problems. Acts as a diuretic, antioxidant, and sedative.	<i>Caution:</i> Do not use large amounts. Do not eat the seeds if you are pregnant.
Chamomile ( <i>Matricaria recutita</i> or <i>M. chamomilla</i> )	Flowers, plant.	Phytochemicals: Alpha-bisabolol, apigenin, azulene, borneol, caffeic acid, chlorogenic acid, farnesol, gentisic acid, geraniol, hyperoside, kaempferol, luteolin, p-coumaric acid, perillyl alcohol, quercetin, rutin, salicylic acid, sinapic acid, tannin, umbelliferone. Nutrients: Choline, vitamins B <sub>1</sub> , B <sub>3</sub> , and C.	Reduces inflammation, stimulates the appetite, and aids digestion and sleep. Acts as a diuretic and nerve tonic. Helpful for colitis, diverticulosis, fever, headaches, and pain. Good for menstrual cramps. A traditional remedy for stress and anxiety, indigestion, and insomnia. Useful as a mouthwash for minor mouth and gum infections.	Also called German chamomile, wild chamomile. Roman chamomile ( <i>Chamaemelum nobile</i> ) is also available, but is less common. <i>Caution:</i> Do not use it if allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients taking these drugs should avoid it.
Chanca piedra ( <i>Phyllanthus niruri</i> )	Entire plant.	Phytochemicals: Limonene, lupeol, methyl salicylate, quercetin, quercitrin, rutin, saponins.	Fights inflammation and bacterial and viral infection. Acts as a diuretic. Useful for kidney stones, gallstones, colds, flu, digestion, asthma, bronchitis, diarrhea, pain relief, fever, sexually transmitted diseases, and muscle spasms.	A rainforest herb whose name means "stone crusher." Also known as seed-on-the-leaf.
Chaste tree ( <i>Vitex agnus-castus</i> )	Fruit, leaf.	Phytochemicals: Alpha-pinene, alpha-terpineol, chrysoptenol, flavonoids, limonene, linalool, myrcene, 1,8-cineole, pinene, progesterone, testosterone.	Has a calming and soothing effect. Relieves muscle cramps. Regulates and normalizes hormone levels and menstrual cycles. Good for symptoms of PMS and menopause.	Also called chasteberry, vitex. <i>Caution:</i> Should not be used during pregnancy. Should not be given to children.
Chickweed ( <i>Stellaria media</i> )	Leaves, stems.	Phytochemicals: Beta-carotene, genistein, rutin. Nutrients: Calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, sulfur, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , C, and E.	Relieves nasal congestion. May lower blood lipids. Useful for bronchitis, circulatory problems, colds, coughs, skin diseases, and warts (applied topically). A good source of vitamin C and other nutrients.	Also called starweed.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Chuchuhuasi ( <i>Maytenus krukoviti</i> )	Bark, root, leaves.	Phytochemicals: Anthocyanidins, catechin, maytensine, nocotinyll, sesquiterpenes, triterpenes, tannins.	Fights inflammation and stimulates the immune system. Supports the adrenal system and balances and regulates menstrual cycles. Good for arthritis, rheumatism, back pain, muscle spasms, fever, skin tumors, bronchitis, diarrhea.	Also called chucchu huashu, chuchuasi, chuchasha, chuchuhuasha. Peruvian Amazon native name means “trembling back” for its value as an antiarthritic drug. This rainforest herb also used traditionally to stimulate sexual desire and give energy.
Cinnamon ( <i>Cinnamomum verum</i> )	Bark, plant.	Phytochemicals: Alpha-pinene, benzaldehyde, beta-carotene, beta-pinene, borneol, camphor, caryophyllene, cinnamaldehyde, coumarin, cuminaldehyde, eugenol, farnesol, geraniol, limonene, linalool, mannitol, mucilage, 1,8-cineole, phellandrene, tannin, terpinolene, vanillin. Nutrients: Calcium, chromium, copper, iodine, iron, manganese, phosphorus, potassium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Relieves diarrhea and nausea; counteracts congestion; aids peripheral circulation. Warms the body and enhances digestion, especially the metabolism of fats. Also fights fungal infection. Useful for diabetes, weight loss, yeast infection, and uterine hemorrhaging.	<i>Cinnamon cassia</i> is used for diabetes management but with varying degrees of success.  <i>Caution:</i> Should not be used in large amounts during pregnancy.
Clove ( <i>Syzygium aromaticum</i> )	Flower buds, essential oil.	Phytochemicals: Beta-carotene, beta-pinene, beta-sitosterol, campesterol, carvone, caryophyllene, chavicol, cinnamaldehyde, ellagic acid, eugenol, gallic acid, kaempferol, linalool, methyleugenol, methylsalicylate, mucilage, oleanolic acid, stigmaterol, tannin, vanillin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , and C.	Has antiseptic and antiparasitic properties, and acts as a digestive aid. Essential oil is applied topically for relief of toothache and mouth pain.	<i>Caution:</i> Clove oil is very strong and can cause irritation if used in its pure form. Diluting the oil in olive oil or distilled water is recommended. Essential oil should not be taken internally except under the careful supervision of a health care professional.
Comfrey ( <i>Symphytum officinale</i> )	Leaves, roots.	Phytochemicals: Allantoin, beta-carotene, caffeic acid, chlorogenic acid, rosmarinic acid, sitosterol, stigmaterol. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Speeds healing of wounds and many skin conditions. Beneficial for bedsores, bites and stings, bruises, inflamed bunions, dermatitis, dry skin, bleeding hemorrhoids, leg ulcers, nosebleeds, psoriasis, scabies, skin rashes, and sunburn.	Also called knitbone.  <i>Caution:</i> Recommended for external use only.
Corn silk ( <i>Zea mays</i> )	Styles, stigmas (“tassels”).	Phytochemicals: Benzaldehyde, beta-carotene, betaine, beta-sitosterol, caffeic acid, campesterol, carvacrol, caryophyllene, dioxycinnamic acid, geraniol, glycolic acid, limonene, 1,8-cineole, saponin, thymol, vitexin. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, vitamins B <sub>1</sub> , B <sub>3</sub> , and C.	Acts as a diuretic. Aids the bladder, kidney, and small intestine. Lessens the incidence of bed-wetting when taken several hours before bedtime. Good for carpal tunnel syndrome, edema, obesity, premenstrual syndrome, and prostate disorders. Used in combination with other “kidney herbs,” opens the urinary tract and removes mucus from the urine.	

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Cramp bark ( <i>Viburnum opulus</i> )	Bark, root.	Phytochemicals: Esculetin, scopoletin, valerianic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc.	Relieves muscle spasms and pain. Good for menstrual cramps. Useful for lower back and leg spasms.	Also called guelder rose. Closely related to black haw, which has the same medicinal properties.  <i>Caution:</i> Should be avoided during pregnancy.
Cranberry ( <i>Vaccinium macrocarpon</i> )	Fruit.	Phytochemicals: Alpha-terpineol, anthocyanosides, benzaldehyde, benzoic acid, beta-carotene, chlorogenic acid, ellagic acid, eugenol, ferulic acid, lutein, malic acid, quercetin. Nutrients: Calcium, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, sulfur, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , C, and E.	Acidifies the urine and prevents bacteria from adhering to bladder cells. Good for the kidneys, bladder, and skin. Has anticancer properties. Helpful for infections of the urinary tract. Shown to improve memory in older people (sixty years and older).	A good source of vitamin C. Cranberry juice cocktail products that contain sugar should be <i>avoided</i> .
Damiana ( <i>Turnera diffusa</i> )	Leaves.	Phytochemicals: Alpha-pinene, beta-carotene, beta-pinene, beta-sitosterol, 1,8-cineole, tannins, thymol. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Stimulates muscular contractions of the intestinal tract and delivery of oxygen to the genital area. Used as an energy tonic and aphrodisiac, and to remedy sexual and hormonal problems. A “sexuality tonic” for women.	<i>Caution:</i> Interferes with iron absorption when taken internally.
Dandelion ( <i>Taraxacum officinale</i> )	Flowers, leaves, roots, tops.	Phytochemicals: Beta-carotene, beta-sitosterol, caffeic acid, cryptoxanthin, lutein, mannitol, p-coumaric acid, saponin, stigmasterol. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a diuretic. Cleanses the blood and liver, and increases bile production. Reduces serum cholesterol and uric acid levels. Improves functioning of the kidneys, pancreas, spleen, and stomach. Relieves menopausal symptoms. Useful for abscesses, anemia, boils, breast tumors, cirrhosis of the liver, constipation, fluid retention, hepatitis, jaundice, and rheumatism. Believed to help prevent age spots and breast cancer.	Leaves can be boiled and eaten like spinach (young leaves can be used in salads).  <i>Caution:</i> Should not be combined with prescription diuretics. Not recommended for people with gallstones or biliary tract obstruction.
Devil's claw ( <i>Harpagophytum procumbens</i> )	Rhizome.	Phytochemicals: Chlorogenic acid, cinnamic acid, harpagide, harpagoside, kaempferol, luteolin, oleanolic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc.	Relieves pain and reduces inflammation. Acts as a diuretic, sedative, and digestive stimulant. Good for back pain, arthritis, rheumatism, diabetes, allergies, liver, gallbladder and kidney disorders, arteriosclerosis, lumbago, gout, and menopausal symptoms. For backache, taking devil's claw allowed for a reduction in the use of rescue medications (i.e., pharmaceuticals for pain). When used by patients with arthritis there was less need for other medications. Migraine sufferers had a decreased number of headaches after one month.	Also called grapple plant, wood spider.  <i>Caution:</i> Should not be used during pregnancy. Based on twenty studies, 3 percent of people reported side effects. Of that number, there were only a few cases—usually concerning gastrointestinal problems—that were severe enough to stop the use of the herb.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Dong quai ( <i>Angelica sinensis</i> )	Roots.	Phytochemicals: Alpha-pinene, bergapten, beta-carotene, beta-sitosterol, carvacrol, falcariol, ferulic acid, ligustilide, myristic acid, p-cymene, scopoletin, umbelliferone, vanillic acid. Nutrients: Calcium, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>5</sub> , and C.	Acts as a mild sedative, laxative, diuretic, antispasmodic, and pain reliever. Improves the blood. Strengthens the reproductive system. Assists the body in using hormones. Used to treat female problems such as hot flashes and other menopausal symptoms, premenstrual syndrome, and vaginal dryness.	Also known as Chinese angelica. <i>Caution:</i> Should not be used during pregnancy. Should not be used by people who have diabetes or are light-sensitive. Dong quai enhances the action of the blood-thinner warfarin, so the two should not be used together.
Echinacea ( <i>Echinacea species</i> )	Leaves, roots.	Phytochemicals: Alpha-pinene, apigenin, arabinogalactan, beta-carotene, beta-sitosterol, betaine, borneol, caffeic acid, caryophyllene, chlorogenic acid, cichoric acid, cynarin, echinacoside, ferulic acid, kaempferol, luteolin, quercetin, rutin, stigmasterol, vanillin, verbascoside. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Fights inflammation and bacterial and viral infection. Stimulates certain white blood cells. Good for the immune system and the lymphatic system. Useful for allergies, colic, colds, flu, and other infectious illnesses. Results summarized from 234 studies showed that echinacea extracts were effective in preventing symptoms of the common cold compared to a placebo.	For internal use, a freeze-dried form or alcohol-free extract is recommended. <i>Caution:</i> Do not take for longer than three weeks. Should not be used by people who are allergic to ragweed.
Elder ( <i>Sambucus nigra</i> )	Flowers, fruit, inner bark, leaves, roots.	Phytochemicals: Alpha-amyrin, astragalin, beta-carotene, beta-sitosterol, betulin, caffeic acid, campesterol, chlorogenic acid, cycloartenol, ferulic acid, isoquercitrin, kaempferol, lupeol, malic acid, myristic acid, oleanolic acid, p-coumaric acid, pectin, quercetin, rutin, shikimic acid, stigmasterol, ursolic acid. Nutrients: Calcium, essential fatty acids, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Combats free radicals and inflammation. Relieves coughs and congestion. Builds the blood, cleanses the system, eases constipation. Enhances immune system function. Increases perspiration, lowers fever, soothes the respiratory tract, and stimulates circulation. Effective against flu viruses. The flowers are used to soothe skin irritations.	Also called black elder, black elderberry, European elder. <i>Caution:</i> Should not be used during pregnancy. The stems of this plant should be <i>avoided</i> . They contain cyanide, and can be very toxic.
Ephedra ( <i>Ephedra sinica</i> )	Stems.	Phytochemicals: Beta-carotene, d-norpseudoephedrine, ellagic acid, ephedrine, gallic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.		On February 6, 2004, the U.S. Food and Drug Administration (FDA) issued a final rule prohibiting the sale of dietary supplements containing ephedrine alkaloids (ephedra) because such supplements present an unreasonable risk of illness or injury. The ban was challenged in court in 2005, but it was ultimately upheld by a federal appellate court in 2006 and the U.S. Supreme Court refused to hear the case. As a result the FDA ban is still in effect in the U.S.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Eucalyptus ( <i>Eucalyptus globulus</i> )	Bark, essential oil, leaves.	Phytochemicals: Alpha-pinene, beta-pinene, caffeic acid, carvone, chlorogenic acid, ellagic acid, ferulic acid, gallic acid, gentisic acid, hyperoside, 1,8-cineole, p-cymene, protocatechuic acid, quercetin, quercitrin, rutin.	Acts as a decongestant and mild antiseptic. Reduces swelling by helping to increase blood flow. Relaxes tired and sore muscles. Good for colds, coughs, and other respiratory disorders. Inhaling vapor from a few drops of the oil helps to break up mucus.	Recommended for external use only. Should not be used on broken skin or open cuts or wounds.
Eyebright ( <i>Euphrasia officinalis</i> )	Entire plant, except the root.	Phytochemicals: Beta-carotene, caffeic acid, ferulic acid, tannins. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Prevents secretion of fluids and relieves discomfort from eyestrain or minor irritation. Used as an eyewash. Good for allergies, itchy and/or watery eyes, and runny nose. Combats hay fever.	
False unicorn root ( <i>Chamaelirium luteum</i> )	Roots.	Phytochemicals: Chamaelirin, helonin, saponins.	Balances sex hormones. Helps treat infertility, menstrual irregularities and pain, premenstrual syndrome, and prostrate disorders. May help prevent miscarriage.	Also called helonias.
Fennel ( <i>Foeniculum vulgare</i> )	Fruit, roots, leaves, stems.	Phytochemicals: Alpha-pinene, benzoic acid, bergapten, beta-carotene, beta-phellandrene, beta-sitosterol, caffeic acid, camphor, cinnamic acid, cynarin, ferulic acid, fumaric acid, isopimpinellin, isoquercitrin, kaempferol, limonene, linalool, myristicin, 1,8-cineole, p-coumaric acid, pectin, protocatechuic acid, psoralen, quercetin, rutin, scopoletin, sinapic acid, stigmasterol, umbelliferone, vanillic acid, vanillin, xanthotoxin. Nutrients: Amino acids, calcium, choline, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , C, and E.	Used as an appetite suppressant and as an eyewash. Promotes the functioning of the kidneys, liver, and spleen, and also clears the lungs. Relieves abdominal pain, colon disorders, gas, and gastrointestinal tract spasms. Useful for acid stomach. Good after chemotherapy and/or radiation treatments for cancer.	The powdered plant can be used as a flea repellent.
Fenugreek ( <i>Trigonella foenum- graecum</i> )	Seeds.	Phytochemicals: Beta-carotene, beta-sitosterol, coumarin, diosgenin, kaempferol, luteolin, p-coumaric acid, quercetin, rutin, saponin, trigonelline, vitexin. Nutrients: Amino acids, calcium, essential fatty acids, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a laxative, lubricates the intestines, and reduces fever. Helps lower cholesterol and blood sugar levels. Helps asthma and sinus problems by reducing mucus. Good for the eyes and for inflammation and lung disorders.	Oil of fenugreek has a maplelike flavor.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Feverfew ( <i>Chrysanthemum parthenium</i> )	Bark, dried flowers, leaves.	Phytochemicals: Beta-carotene, parthenolide, santamarin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Combats inflammation and muscle spasms. Increases fluidity of lung and bronchial tube mucus, promotes menses, stimulates the appetite, and stimulates uterine contractions. Relieves nausea and vomiting. Good for arthritis, colitis, fever, headaches, mild and transient migraines, menstrual problems, muscle tension, and pain.	Chewing the leaves is a folk remedy, but this may cause mouth sores. Also called featherfew, featherfoil.  <i>Caution:</i> Do not use when pregnant or nursing. People who take prescription blood-thinning medications or who regularly take over-the-counter painkillers should consult a health care provider before using feverfew, as the combination can result in internal bleeding.
Flax ( <i>Linum usitatissimum</i> )	Seeds, seed oil.	Phytochemicals: Apigenin, beta-carotene, beta-sitosterol, campesterol, chlorogenic acid, cycloartenol, lecithin, luteolin, myristic acid, squalene, stigmasterol, vitexin. Nutrients: Amino acids, calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, sulfur, vanadium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , and E.	Promotes strong bones, nails, and teeth, as well as healthy skin. Useful for colon problems, female disorders, and inflammation.	The seeds are an excellent addition to a diet that is low in fiber. Flaxseed has the highest concentration of the phytoestrogen lignans of any other food. The lignans are removed during conversion to oil, so seeds are the only true source.
Garlic ( <i>Allium sativa</i> )	Bulb.	Phytochemicals: Allicin, beta-carotene, beta-sitosterol, caffeic acid, chlorogenic acid, diallyl-disulfide, ferulic acid, geraniol, kaempferol, linalool, oleanolic acid, p-coumaric acid, phloroglucinol, phytic acid, quercetin, rutin, s-allyl-cysteine, saponin, sinapic acid, stigmasterol. Nutrients: Calcium, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Detoxifies the body and protects against infection by enhancing immune function. Lowers blood pressure and improves circulation. Lowers blood lipid levels. Helps stabilize blood sugar levels. Aids in the treatment of arteriosclerosis, arthritis, asthma, cancer, circulatory problems, colds and flu, digestive problems, heart disorders, insomnia, liver disease, sinusitis, ulcers, and yeast infections. May prevent ulcers by inhibiting growth of <i>Helicobacter pylori</i> , the ulcer-causing bacterium. Good for virtually any disease or infection.	Garlic contains many sulfur compounds, which give it its healing properties. Odorless garlic supplements are available. Aged garlic extract (such as Kyolic) is good.  <i>Caution:</i> Not recommended for people who take anticoagulants, as garlic has blood-thinning actions.
Gentian ( <i>Gentiana lutea</i> )	Leaves, roots.	Phytochemicals: Caffeic acid, carvacrol, gentiopicrin, limonene, linalool, mangiferin, sinapic acid, swertamarin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Aids digestion, stimulates appetite, and boosts circulation. Kills plasmodia (organisms that cause malaria) and worms. Good for circulatory problems and pancreatitis.	

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Ginger ( <i>Zingiber officinale</i> )	Rhizomes, roots.	Phytochemicals: Alpha-pinene, beta-carotene, beta-ionone, beta-sitosterol, caffeic acid, camphor, capsaicin, caryophyllene, chlorogenic acid, citral, curcumin, farnesol, ferulic acid, geraniol, gingerols, lecithin, 1,8-cineole, zingerone. Nutrients: Amino acids, calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>6</sub> , and C. Ground ginger also contains vitamin A.	Fights inflammation, cleanses the colon, reduces spasms and cramps, and stimulates circulation. A strong antioxidant and effective antimicrobial agent for sores and wounds. Protects the liver and stomach. Useful for bowel disorders, circulatory problems, arthritis, fever, headache, hot flashes, indigestion, morning sickness, motion sickness, muscle pain, nausea, and vomiting.	Can cause stomach distress if taken in large quantities.  <i>Caution:</i> Not recommended for people who take anticoagulants or have gallstones. Not recommended for extended use during pregnancy.
Ginkgo ( <i>Ginkgo biloba</i> )	Leaves, seed.	Phytochemicals: Amentoflavone, apigenin, beta-carotene, bilobalide, ginkgetin, isorhamnetin, kaempferol, luteolin, myristic acid, p-coumaric acid, procyanidin, quercetin, shikimic acid, stigmaterol, tannin, thymol. Nutrients: Amino acids, calcium, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , and C.	Improves brain functioning by increasing cerebral and peripheral circulation and tissue oxygenation. Has antioxidant properties. May slow the progression of Alzheimer's disease, and may relieve leg cramps by improving circulation. Beneficial for asthma, dementia, depression, eczema, headaches, heart and kidney disorders, memory loss, and tinnitus (ringing in the ears). Shows promise as a treatment for vascular-related impotence.	Can take at least two weeks to see results.  <i>Caution:</i> Should not be used by people who have bleeding disorders, or who are scheduled for surgery or a dental procedure.
Ginseng ( <i>Panax quinquefolius</i> ) [American ginseng], ( <i>P. ginseng</i> ) [Chinese or Korean ginseng]	Roots.	Phytochemicals: Beta-sitosterol, campesterols, caryophyllene, cinnamic acid, escin ( <i>P. quinquefolius</i> ), ferulic acid, fumaric acid, ginsenosides, kaempferol, oleanolic acid, panaxic acid, panaxin, saponin, stigmaterol, vanillic acid. Nutrients: Calcium, choline, fiber, folate, iron, magnesium, manganese, phosphorus, potassium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , and C.	Strengthens the adrenal and reproductive glands. Enhances immune function, promotes lung functioning, and stimulates the appetite. Useful for bronchitis, circulatory problems, diabetes, infertility, lack of energy, and stress; to ease withdrawal from cocaine; and to protect against the effects of radiation exposure. In a laboratory study, enhanced breast-cancer-cell suppression in combination with standard treatment. Used by athletes for overall body strengthening. May help improve drug- or alcohol-induced liver dysfunction in older adults.	Siberian ginseng ( <i>Eleutherococcus senticosus</i> ) belongs to a different botanical family than American and Korean ginseng, but its properties are similar, and all are commonly referred to simply as ginseng.  <i>Caution:</i> Should not be used by people who have high blood pressure, are pregnant, or are nursing.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Goldenseal ( <i>Hydrastis canadensis</i> )	Rhizomes, roots.	Phytochemicals: Berberine, beta-carotene, canadine, chlorogenic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Fights infection and inflammation. Cleanses the body. Increases the effectiveness of insulin and strengthens the immune system, colon, liver, pancreas, spleen, and lymphatic and respiratory systems. Improves digestion, regulates menses, decreases uterine bleeding, and stimulates the central nervous system. Good for allergies, ulcers, and disorders affecting the bladder, prostate, stomach, and vagina. Used at the first sign of possible symptoms, can stop a cold, flu, or sore throat from developing.	Alternating with echinacea or other herbs is recommended. Alcohol-free extract is the best form.  <i>Caution:</i> Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.
Gotu kola ( <i>Centella asiatica</i> )	Nuts, roots, seeds.	Phytochemicals: Beta-carotene, beta-sitosterol, campesterol, camphor, kaempferol, saponin, stigmasterol. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Helps eliminate excess fluids, decreases fatigue and depression, increases sex drive, shrinks tissues, and stimulates the central nervous system. May neutralize blood acids and lower body temperature. Promotes wound healing, and is good for varicose veins and for heart and liver function. Useful for cardiovascular and circulatory disorders, fatigue, connective tissue disorders, kidney stones, poor appetite, and sleep disorders.	May cause dermatitis if applied topically.
Gravel root ( <i>Eupatorium purpureum</i> )	Flowers, root.	Phytochemicals: Euparin, eupatorin, resin.	Acts as a diuretic and urinary tract tonic. Combats prostate disorders, kidney stones, and problems related to fluid retention.	Also called joe-pye weed, queen-of-the meadow.
Green tea ( <i>Camellia sinensis</i> )	Leaves.	Phytochemicals: Apigenin, astragalín, benzaldehyde, beta-carotene, beta-ionone, beta-sitosterol, caffeic acid, caffeine, carvacrol, catechins, chlorogenic acid, cinnamic acid, cryptoxanthin, epicatechin, epigallocatechin, eugenol, farnesol, gallic acid, geraniol, hyperoside, indole, isoquercitrin, kaempferol, lutein, lycopene, myrcene, myricetin, myristic acid, naringenin, polyphenols, procyanidins, quercetin, quercitrin, rutin, salicylic acid, tannic acid, thymol, vitexin, zeaxanthin. Nutrients: Amino acids, calcium, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , and C.	Acts as an antioxidant and helps to protect against cancer. Lowers cholesterol levels, reduces the clotting tendency of the blood, stimulates the immune system, fights tooth decay, helps regulate blood sugar and insulin levels, combats mental fatigue, and may delay the onset of atherosclerosis. Good for asthma. Studies show promise as a weight-loss aid, but the green tea must not be decaffeinated. May help prevent enlarged prostate.	To get green tea's antioxidant benefits, drink it without milk (milk may bind with the beneficial compounds, making them unavailable to the body).  <i>Caution:</i> Contains a small amount of caffeine. Should not be used in large quantities by pregnant women or nursing mothers. Persons with anxiety disorder or irregular heartbeat should limit their intake to no more than 2 cups daily.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Guarana ( <i>Paullinia cupana</i> )	Seeds.	Phytochemicals: Adenine, caffeine, D-catechin, saponin, tannins, theobromine, theophylline.	Acts as a general tonic, stimulant, and intestinal cleanser. Increases mental alertness as well as speed and accuracy when reading. Improves stamina and endurance. Reduces fatigue. Useful for headaches, urinary tract irritation, diarrhea. Also shown to improve mood.	Also called Brazilian cocoa, uabano.  <i>Caution:</i> Due to guarana's caffeine content, taking more than 600 mg a day is not recommended. Not recommended for people with high blood pressure or heart conditions.
Hawthorn ( <i>Crataegus laevigata</i> )	Flowers, fruit, leaves.	Phytochemicals: Acetylcholine, adenine, adenosine, anthocyanidins, beta-carotene, beta-sitosterol, caffeic acid, catechin, chlorogenic acid, epicatechin, esculin, hyperoside, pectin, quercitrin, rutin, ursolic acid, vitexin. Nutrients: Amino acids, calcium, choline, chromium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Dilates the coronary blood vessels, lowers blood pressure and cholesterol levels, and restores heart muscle. Decreases fat deposit levels. Increases intracellular vitamin C levels. Useful for anemia, cardiovascular and circulatory disorders, high cholesterol, and lowered immunity. Patients with diabetes who were already using blood pressure medicine experienced a greater drop in blood pressure with hawthorn.	<i>Caution:</i> Do not use if you take medication for heart disease.
Hops ( <i>Humulus lupulus</i> )	Flowers, fruit, leaves.	Phytochemicals: Alpha-pinene, alpha-terpineol, beta-carotene, beta-eudesmol, beta-sitosterol, caffeic acid, campesterol, catechin, chlorogenic acid, citral, eugenol, ferulic acid, limonene, p-cymene, piperidine, procyanidins, quercetin, tannins. Nutrients: Amino acids, calcium, chromium, magnesium, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>3</sub> , and C.	Relieves anxiety. Stimulates the appetite. Useful for cardiovascular disorders, hyperactivity, insomnia, nervousness, pain, restlessness, shock, stress, toothaches, and ulcers.	Placed inside a pillowcase, aids sleep.  <i>Caution:</i> Should not be used by people who take antidepressants.
Horehound ( <i>Marrubium vulgare</i> )	Flowers, leaves.	Phytochemicals: Alpha-pinene, apigenin, beta-sitosterol, caffeic acid, gallic acid, limonene, luteolin, pectin, tannic acid, tannins, ursolic acid. Nutrients: B-complex vitamins, iron, potassium, vitamins A, C, and E.	Decreases thickness and increases fluidity of mucus in the bronchial tubes and lungs. Boosts the immune system. Useful for indigestion, loss of appetite, bloating, and hay fever, sinusitis, and other respiratory disorders.	<i>Caution:</i> Large doses may cause irregular heart rhythms.
Horse chestnut ( <i>Aesculus hippocastanum</i> )	Bark, leaves, oil, seeds.	Phytochemicals: Allantoin, citric acid, epicatechin, escin, esculetin, esculin, fraxetin, fraxin, isoquercitrin, kaempferol, leucocyanidin, myricetin, quercetin, quercitrin, rutin, saponin, scopoletin, tannin.	Protects against vascular damage, makes capillary walls less porous, shields against UV radiation damage. Good for varicose veins, reducing excess tissue fluids, and easing nighttime muscle spasms in the legs. For chronic venous insufficiency, horse chestnut was effective at reducing leg pain and allowed for less blood to pool in the lower limbs. Used topically, reduces pain and swelling, and prevents bruising.	
Hydrangea ( <i>Hydrangea arborescens</i> )	Rhizomes, roots.	Phytochemicals: Kaempferol, quercetin, rutin, saponin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc.	Stimulates the kidneys and acts as a diuretic. Good for bladder infection, kidney disease, obesity, and prostate disorders. Combined with gravel root, good for kidney stones.	<i>Caution:</i> The leaves of this plant should <i>not</i> be consumed. They contain cyanide and can be toxic.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Hyssop ( <i>Hyssopus officinalis</i> )	Flowers, leaves, shoots.	Phytochemicals: Alpha-pinene, benzaldehyde, beta-ionone, beta-sitosterol, borneol, caffeic acid, camphor, carvacrol, eugenol, ferulic acid, geraniol, hesperidin, limonene, linalool, marrubiin, oleanolic acid, 1,8-cineole, rosmarinic acid, thymol, ursolic acid. Nutrients: Choline.	Promotes expulsion of mucus from the respiratory tract, relieves congestion, regulates blood pressure, and dispels gas. Used externally, helpful for wound healing. Good for circulatory problems, epilepsy, fever, gout, and weight problems. Poultices made from fresh green hyssop help heal cuts.	<i>Caution:</i> Should not be used during pregnancy.
Irish moss ( <i>Chondrus crispus</i> )	Entire plant.	Phytochemicals: Beta-carotene. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as an expectorant and aids in the formation of stools. Good for bronchitis and many intestinal disorders. Also used in skin lotions and in hair rinses for dry hair.	
Jaborandi ( <i>Pilocarpus jaborandi</i> )	Leaves.	Phytochemicals: Alpha-pinene, limonene, myrcene, pilocarpine.	Fights inflammation and acts as a diuretic. Helps stimulate milk production and flow in nursing mothers. Beneficial for fever, colds and flu, bronchitis, colon disorders, and edema. Topically, useful for baldness and for promoting circulation in the capillaries.	A rainforest herb whose active compound, pilocarpine, has been used for over 120 years to relieve intraocular pressure in glaucoma.
Jatoba ( <i>Hymenaea courbaril</i> )	Bark, leaves, fruit.	Phytochemicals: Beta-sitosterol, caryophyllene, delta-cadinene, epicatechin.	Fights inflammation, free radicals, and bacterial and fungal infection. Increases energy. Beneficial for asthma, bronchitis, bursitis, bladder infection, candida and other fungal infections, arthritis, and prostatitis.	A rainforest herb with a wide range of traditional uses.
Juniper ( <i>Juniperus communis</i> )	Fruit.	Phytochemicals: Alpha-pinene, beta-carotene, beta-pinene, betulin, borneol, camphor, caryophyllene, catechin, farnesol, epicatechin, glycolic acid, limonene, linalool, menthol, rutin, tannins, umbelliferone. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a diuretic, anti-inflammatory, and decongestant. Helps regulate blood sugar levels. Helpful in treatment of asthma, bladder infection, fluid retention, gout, obesity, and prostate disorders.	<i>Caution:</i> May interfere with absorption of iron and other minerals when taken internally. Should not be used during pregnancy. Should not be used by persons with kidney disease.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Kava kava ( <i>Piper methysticum</i> )	Roots.	Phytochemicals: Cinnamic acid, kavalactones (including kawain, dihydrokawain, methysticin, dihydromethysticin, and yangonin).	Induces physical and mental relaxation. Acts as a diuretic, genitourinary antiseptic, and gastrointestinal tonic. Relieves muscle spasms and eases pain. Helpful for anxiety and anxiety disorders, insomnia, stress-related disorders, menopausal symptoms, and urinary tract infections. It has been shown to be an analgesic and an anticonvulsive, and protects the nervous system. Usually begins working within two hours, but multiple (about three times a day) dosing is needed to maintain blood levels.	Also called kava.  <i>Caution:</i> Can cause drowsiness. If this occurs, discontinue use or reduce the dosage. Should not be combined with alcohol. Not recommended for persons under the age of eighteen, pregnant women, nursing mothers, individuals who suffer from depression or take certain prescription drugs, especially antianxiety drugs, or those with liver or skin diseases. Kava taken in large amounts for extended periods of time may worsen liver function tests.
Kudzu ( <i>Pueraria lobata</i> )	Leaves, roots, shoots.	Phytochemicals: Daidzein, daidzin, genistein, p-coumaric acid, puerarin, quercetin. Nutrients: Calcium, iron, magnesium, phosphorus, potassium, vitamin B <sub>2</sub> .	Suppresses alcohol cravings. Lowers blood pressure and relieves headache, stiff neck, vertigo, and tinnitus. Useful for treating alcoholism, colds, flu, and gastrointestinal problems.	In China and Japan, kudzu has been used as a food starch and medicine for centuries. The Chinese use kudzu extract to treat angina pectoris.
Lady's mantle ( <i>Achillea millefolium</i> )	Entire plant, except the root.	Phytochemicals: Achilleine, alpha-pinene, apigenin, azulene, beta-carotene, betaine, beta-pinene, beta-sitosterol, betonicine, borneol, caffeic acid, camphor, caryophyllene, chamazulene, coumarins, eugenol, guaiazulene, isorhamnetin, limonene, luteolin, mannitol, menthol, myrcene, myristic acid, 1,8-cineole, p-cymene, quercetin, quercitrin, rutin, salicylic acid, stigmasterol, tannin, thujone. Nutrients: Amino acids, calcium, essential fatty acids, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Wound dressing. Has anti-inflammatory, diuretic, and antiviral effects. Helps to heal mucous membranes, improve blood clotting, and increase perspiration. Helps to regulate menstruation, reduce excessive bleeding, and ease cramps. Useful for muscle spasms, fever, gastrointestinal disorders, inflammatory disorders, and viral infections. Applied topically, stops bleeding and promotes healing. Good as a douche for vaginal irritation.	Also called milfoil, old man's pepper, soldier's woundwort, knight's milfoil, herbe militaris, thousand weed, nose bleed, carpenter's weed, bloodwort, staunchweed, devil's nettle, devil's plaything, bad man's plaything, yarroway.  <i>Caution:</i> Interferes with iron absorption and other minerals. Topical use may cause irritation. Individuals who are sun sensitive should avoid it. Not to be used by pregnant women.
Lavender ( <i>Lavandula angustifolia</i> )	Flowers.	Phytochemicals: Alpha-pinene, beta-pinene, beta-santalene, borneol, camphor, caryophyllene, coumarin, geraniol, limonene, linalool, luteolin, 1,8-cineole, rosmarinic acid, tannin, umbelliferone, ursolic acid.	Relieves stress and depression. Beneficial for the skin. Good for headaches, psoriasis, and other skin problems.	Essential oil of lavender is very popular in aromatherapy.  <i>Caution:</i> Should not be used during pregnancy. Lavender oil should not be taken internally.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Lemongrass ( <i>Cymbopogon citratrus</i> )	Leaves, stems.	Phytochemicals: Alpha-pinene, beta-pinene, beta-santalene, borneol, camphor, caryophyllene, coumarin, geraniol, limonene, linalool, luteolin, 1,8-cineole, rosmarinic acid, tannin, umbelliferone, ursolic acid. Phytochemicals: Alpha-pinene, beta-sitosterol, caryophyllene, citral, farnesol, geraniol, limonene, luteolin, myrcene, 1,8-cineole, quercetin, rutin, saponin, triacontanol. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc.	Acts as an astringent, tonic, and digestive aid. Good for the skin and nails. Useful for fever, flu, headaches, and intestinal irritations.	Used in perfumes and other products as a fragrance.
Licorice ( <i>Glycyrrhiza glabra</i> )	Roots.	Phytochemicals: Apigenin, benzaldehyde, beta-carotene, beta-sitosterol, betaine, camphor, carvacrol, estriol, eugenol, ferulic acid, formononetin, geraniol, glabrene, glabridin, glabrol, glycyrrhetic acid, glycyrrhizin, isoliquiritigenin, isoliquiritin, isoquercitrin, lignin, mannitol, phenol, quercetin, salicylic acid, sinapic acid, stigmasterol, thymol, umbelliferone, vitexin. Nutrients: Calcium, choline, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Fights inflammation and viral, bacterial, and parasitic infection. Stimulates the production of interferon and may help inhibit replication of HIV. Cleanses the colon. Reduces muscle spasms, increases fluidity of mucus in the lungs and bronchial tubes, and promotes adrenal gland function. Has estrogen- and progesterone-like effects; may change the pitch of the voice. Helps to inhibit the formation of plaque and prevent bacteria from sticking to tooth enamel. Beneficial for allergies, asthma, chronic fatigue syndrome, depression, emphysema, enlarged prostate, fever, herpesvirus infection, hypoglycemia, glandular functions, inflammatory bowel disorders, premenstrual syndrome, menopausal symptoms, and upper respiratory infections. May prevent hepatitis C from causing liver cancer and cirrhosis and protect against atherosclerosis. Deglycyrrhizinated licorice may stimulate natural defense mechanisms that prevent the occurrence of ulcers by increasing the number of mucus-secreting cells in the digestive tract. This improves the quality of mucus, lengthens intestinal cell life, and enhances microcirculation in the gastrointestinal lining. Cancer patients who took licorice and a soup containing tonic vegetables had less pain. The plant has been shown to have anticancer properties.	Licorice derivatives have been recommended as a standard support for ulcer sufferers in Europe. Licorice-flavored candy does not work for medicinal purposes because it is mostly made with anise, not licorice.  <i>Caution:</i> Should not be used during pregnancy, nor by persons with diabetes, glaucoma, heart disease, high blood pressure, severe menstrual problems, or a history of stroke.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Maca ( <i>Lepidium meyenii</i> )	Roots.	Phytochemicals: Beta-sitosterol, saponin, stigmasterol, tannins. Nutrients: Amino acids, calcium, iron, magnesium, phosphorus, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>12</sub> , C, and E.	Increases energy and supports the immune system. Good for anemia, chronic fatigue syndrome, impotence, fertility, menopausal symptoms, and menstrual problems.	A rainforest herb that is a member of the potato family. An important food in the diet of native Peruvians for over 2,000 years, it is rich in amino acids and high in protein. <i>Caution:</i> People with liver or heart disease should avoid high doses, as it has been shown to worsen liver blood tests and raise blood pressure.
Macela ( <i>Achyrocline satureoides</i> )	Aerial parts.	Phytochemicals: Alpha-pinene, caffeic acid, caryophyllene, chlorogenic acid, coumarin, delta-cadinene, galangin, luteolin, 1,8-cineole, quercetagenin, quercetin, scoparone.	Acts as an anti-inflammatory, antiseptic, antiviral, and antiparasitic. Stimulates and supports the immune system. Good for gastrointestinal and respiratory disorders. Useful in treating cancer, Crohn's disease, colds and flu, diabetes, menstrual problems and menopausal symptoms, and muscle aches and spasms.	A rainforest herb that has been found to have potential anti-HIV properties.
Marshmallow ( <i>Althaea officinalis</i> )	Flowers, leaves, roots.	Phytochemicals: Beta-carotene, betaine, caffeic acid, chlorogenic acid, ferulic acid, kaempferol, mucilage, paraffin, p-coumaric acid, pectin, phytosterols, quercetin, salicylic acid, scopoletin, sorbitol, tannins, vanillic acid. Nutrients: Amino acids, calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Aids the body in expelling excess fluid and mucus. Soothes and heals skin, mucous membranes, and other tissues, externally and internally. Good for bladder infection, digestive upsets, fluid retention, headache, intestinal disorders, kidney problems, sinusitis, and sore throat.	Often used as a filler in the compounding of pills.
Meadowsweet ( <i>Filipendula ulmaria</i> )	Leaves, flower tops.	Phytochemicals: Anthocyanidin, avicularin, coumarin, hyperoside, methyl salicylate, quercetin, rutin, salicin, salicylic acid, vanillin.	Tightens tissues and promotes elimination of excess fluid. Reduces inflammation and strengthens and tones the system. Good for colds, flu, nausea, digestive disorders, muscle cramps and aches, and diarrhea.	The word <i>aspirin</i> is derived from an old name for this plant, <i>spirea</i> . <i>Caution:</i> Because this plant contains compounds related to aspirin, it should not be used by pregnant women, and it should not be given to children with fever due to cold, flu, measles, chickenpox, or any other viral infection, as this increases the risk of Reye's syndrome, a dangerous complication that can alter or damage the liver, brain, and heart.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Milk thistle ( <i>Silybum marianum</i> )	Fruit, leaves, seeds.	Phytochemicals: Apigenin, beta-carotene, fumaric acid, kaempferol, naringenin, quercetin, silandrin, silybin, silychristin, silydianin, silymarin, silymonin, taxifolin. Nutrients: Calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc.	Protects the liver from toxins and pollutants by preventing free radical damage and stimulates the production of new liver cells. People with liver disease who used silymarin had fewer liver-related symptoms and better quality-of-life scores. Also protects the kidneys. Good for gallbladder and adrenal disorders, inflammatory bowel disorders, psoriasis, weakened immune system, and all liver disorders. Has shown anticancer effects against prostate cancer and breast cancer. Silymarin inhibits COX-2 formation.	Also called Mary thistle or wild artichoke. Because milk thistle has poor water solubility, it is not effective as a tea. A concentrated capsule or extract form is best.
Motherwort ( <i>Leonurus cardiaca</i> )	Leaves, flowers, stems.	Phytochemicals: Alpha-pinene, benzaldehyde, caryophyllene, catechin, hyperoside, isoquercitrin, limonene, linalool, marrubiin, oleanolic acid, quercetin, quercitrin, rutin, saponin, stachydrine, tannin, ursolic acid. Nutrients: Vitamin C.	Traditionally used to relieve childbirth pain and as a tranquilizer. Helpful for menstrual disorders, menopausal symptoms, vaginitis, thyroid and rheumatic problems. Has a tonic effect on the heart. Useful for headache, insomnia, and vertigo.	<i>Caution:</i> Should not be used during pregnancy (until the onset of labor), as it can stimulate uterine contractions. Check with your health care provider before using it during the birthing process. Not recommended for persons with clotting disorders, high blood pressure, or heart disease.
Muira puama ( <i>Ptychopetalum olacoides</i> )	Bark, roots.	Phytochemicals: Beta-sitosterol, campesterol, coumarin, lupeol.	Helps relieve pain, acts as a mild laxative and detoxifier, and supports the heart. Has a general tonic effect and balances sex hormones. Beneficial in treating nervous system disorders, impotence, depression, stress, rheumatism, hair loss, asthma, and menopausal and menstrual problems.	An alcohol-based extract is believed to be the best form of this rainforest herb, as the active constituents are neither water soluble nor broken down in the digestive process.
Mullein ( <i>Verbascum thapsus</i> )	Leaves.	Phytochemicals: Beta-carotene, beta-sitosterol, coumarin, hesperidin, saponins. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a laxative, painkiller, and sleep aid. Taken internally, aids in getting rid of warts. Clears congestion. Useful for asthma, bronchitis, difficulty breathing, earache, hay fever, and swollen glands. Used in kidney formulas to soothe inflammation.	
Mustard ( <i>Brassica nigra</i> )	Seeds.	Phytochemicals: Allyl isothiocyanate, caffeic acid, chlorogenic acid, ferulic acid, p-coumaric acid, protocatechuic acid, sinapic acid, vanillic acid.	Improves digestion and aids in the metabolism of fat. Applied externally, helpful for chest congestion, inflammation, injuries, and joint pain.	<i>Caution:</i> Can be irritating when applied directly to the skin. Not recommended for use on children under the age of six.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Myrrh ( <i>Commiphora myrrha</i> )	Resin from stems.	Phytochemicals: Acetic acid, beta-sitosterol, campesterol, cinnamaldehyde, cuminaldehyde, dipentene, eugenol, limonene, m-cresol.	Acts as an antiseptic, disinfectant, expectorant, and deodorizer. Stimulates the immune system and gastric secretions. Tones and stimulates mucous tissue. Helps to fight harmful bacteria in the mouth. Good for bad breath, periodontal disease, skin disorders, asthma, bronchitis, colds, flu, sinusitis, sore throat, herpes simplex, and ulcers. Topically, useful for abscesses, boils, sores, and wounds.	Used in many perfumes and in incense for its aromatic properties. Guggul, the standardized extract of the Indian mukul myrrh tree, lowers both cholesterol and triglyceride levels.
Nettle ( <i>Urtica dioica</i> )	Flowers, leaves, roots.	Phytochemicals: Acetic acid, beta-carotene, betaine, caffeic acid, ferulic acid, lecithin, lycopene, p-coumaric acid, scopoletin. Nutrients: Calcium, copper, essential fatty acids, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, sulfur, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , C, and E.	Acts as a diuretic, expectorant, pain reliever, and tonic. Good for benign prostatic hyperplasia, anemia, arthritis, rheumatism, hay fever, and other allergic disorders, kidney problems, and malabsorption syndrome. Improves goiter, inflammatory conditions, and mucous conditions of the lungs. Used in hair care products, helps stimulate hair follicles and regulate scalp oil buildup.	Also called stinging nettle.
Oat straw ( <i>Avena sativa</i> )	Whole plant.	Phytochemicals: Benzaldehyde, beta-carotene, beta-ionone, beta-sitosterol, betaine, caffeic acid, campesterol, caryophyllene, chlorophyll, ferulic acid, lignin, limonene, p-coumaric acid, quercetin, scopoletin, sinapic acid, stigmasterol, vanillic acid, vanillin. Nutrients: Calcium, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , and E.	Acts as an antidepressant and restorative nerve tonic. Increases perspiration. Helps to ease insomnia. Good for bed-wetting, depression, stress, and skin disorders.	
Olive leaf ( <i>Olea europaea</i> )	Extract from leaves.	Phytochemicals: Apigenin, beta-sitosterol glucoside, cinchonidine, esculetin, kaempferol, luteolin, mannitol, maslinic acid, oleanic acid, oleuropein, quercetin, rutin, tannins. Nutrients: Calcium.	Fights all types of bacteria, viruses, fungi, and parasites. Helps stave off colds and flu. May have antioxidant properties. Has shown potential for lowering high blood pressure. Good for virtually any infectious disease, as well as for chronic fatigue syndrome, diarrheal diseases, inflammatory arthritis, and psoriasis.	
Oregon grape ( <i>Mahonia aquifolia</i> )	Roots.	Phytochemicals: Berberine, tannins.	Purifies the blood and cleanses the liver. Acts as a laxative. Good for many skin conditions, from acne to psoriasis.	Has actions similar to those of goldenseal and barberry.
Papaya ( <i>Carica papaya</i> )	Fruit, leaves.	Phytochemicals: Benzaldehyde, beta-carotene, caryophyllene, linalool, lycopene, malic acid, methyl salicylate, myristic acid, papain, phytofluene, zeaxanthin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , and C.	Stimulates the appetite and aids digestion. Good for heartburn, indigestion, and inflammatory bowel disorders.	The leaves can be used to tenderize meat.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Parsley ( <i>Petroselinum crispum</i> )	Fruit, leaves, roots, stems.	Phytochemicals: Alpha-pinene, apigenin, apiole, benzaldehyde, bergapten, beta-carotene, caffeic acid, chlorogenic acid, geraniol, glycolic acid, kaempferol, limonene, linalool, lutein, myristic acid, myristicin, naringenin, p-coumaric acid, psoralen, quercetin, rosmarinic acid, rutin, xanthotoxin. Nutrients: Calcium, folate, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , C, and E.	Contains a substance that prevents the multiplication of tumor cells. Expels worms, relieves gas, stimulates normal activity of the digestive system, and freshens breath. Helps bladder, kidney, liver, lung, stomach, and thyroid function. Good for bed-wetting, fluid retention, gas, halitosis, high blood pressure, indigestion, kidney disease, obesity, and prostate disorders.	Contains more vitamin C than oranges by weight.
Passionflower ( <i>Passiflora incarnata</i> )	Flowers, leaves, shoots, stems.	Phytochemicals: Apigenin, flavonoids, harmaline, kaempferol, luteolin, maltol, quercetin, rutin, scopoletin, stigmasterol, umbelliferone, vitexin. Nutrients: Amino acids, calcium.	Has a gentle sedative effect and helps lower blood pressure. Helpful for anxiety, hyperactivity, insomnia, neuritis, and stress-related disorders.	Also called maypop.  <i>Caution:</i> Should not be used during pregnancy, as it may stimulate the uterus.
Pau d'arco ( <i>Tabebuia heptaphylla</i> )	Inner bark.	Phytochemicals: Beta-carotene, beta-sitosterol, lapachol.	Fights bacterial and viral infection. Cleanses the blood. Good for candidiasis, smoker's cough, warts, and all types of infection. Helpful for AIDS symptoms, allergies, cancer, cardiovascular problems, inflammatory bowel disease, rheumatism, tumors, and ulcers. Another species, <i>Tabebuia avellanedae</i> , may help restore skin after exposure to fungi and yeasts.	Also called lapacho and taheebo and was first used by the ancient Paraguayans.
Peppermint ( <i>Mentha piperita</i> )	Flowering tops, oil, leaves.	Phytochemicals: Acetic acid, alpha-carotene, alpha-pinene, azulene, beta-carotene, beta-ionone, betaine, caffeic acid, carvacrol, carvone, chlorogenic acid, coumarin, eugenol, hesperetin, limonene, linalool, luteolin, menthol, 1,8-cineole, p-coumaric acid, pectin, rosmarinic acid, rutin, tannin, thymol, vanillin. Nutrients: Calcium, choline, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and E.	Increases stomach acidity, aiding digestion. Slightly anesthetizes mucous membranes and the gastrointestinal tract. Useful for chills, colic, diarrhea, headache, heart trouble, indigestion, irritable bowel syndrome, nausea, poor appetite, rheumatism, and spasms. Patients with irritable bowel syndrome who took peppermint had less abdominal pain, flatulence, and diarrhea.	<i>Caution:</i> May interfere with iron absorption. Should not be used by pregnant or nursing women. Do not ingest pure menthol or pure peppermint leaves.
Plantain ( <i>Plantago major</i> )	Leaves.	Phytochemicals: Adenine, allantoin, aucubin, apigenin, benzoic acid, caffeic acid, chlorogenic acid, cinnamic acid, ferulic acid, fiber, luteolin, oleanolic acid, p-coumaric acid, salicylic acid, tannin, ursolic acid, vanillic acid. Nutrients: Potassium, vitamin A.	Acts as a diuretic and is soothing to the lungs and urinary tract. May slow the growth of tuberculosis bacteria. Has a healing, antibiotic, and styptic effect when used topically for sores and wounds. Useful for indigestion and heartburn. Applied in a poultice, good for bee stings and any kind of bite.	This is not the bananalike fruit. Young leaves are tasty and can be eaten in salads.  <i>Caution:</i> Do not mistake plantain for foxglove ( <i>Digitalis lanata</i> ), which has a similar appearance.
Pleurisy root ( <i>Asclepias tuberosa</i> )	Rhizome.	Phytochemicals: Alpha-amyrin, asclepiadin, beta-amyrin, isorhamnetin, kaempferol, lupeol, quercetin, rutin, viburnitol.	Reduces inflammation of the pleural membranes of the lungs, enhances secretion of healthy lung fluids, and stimulates the lymphatic system. Has antispasmodic properties. Induces sweating and aids expectoration. Beneficial for pleurisy, pneumonia, bronchitis, flu, and coughs.	Also called butterfly weed.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Primrose ( <i>Oenothera biennis</i> )	Seed oil.	Phytochemicals: Beta-sitosterol, caffeic acid, campesterol, ellagic acid, gallic acid, kaempferol, lignin, p-coumaric acid, phytosterols, quercetin, tannin. Nutrients: Amino acids, calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamin E.	Promotes cardiovascular health. Aids in weight loss and reduces high blood pressure. Acts as a natural estrogen promoter. Helpful in treating alcoholism, arthritis, hot flashes, menstrual problems such as cramps and heavy bleeding, multiple sclerosis, and skin disorders.	Also called evening primrose.  <i>Caution:</i> Primrose root should not be used during pregnancy.
Pumpkin ( <i>Cucurbita pepo</i> )	Flesh, seed.	Phytochemicals: Astragalin, beta-carotene, beta-sitosterol, caffeic acid, chlorogenin, cryptoxanthin, diosgenin, ferulic acid, gitogenin, kaempferol, lutein, mannitol, myristic acid, phytosterols, quercetin, ruscogenin, salicylic acid, zeaxanthin. Nutrients: Amino acids, calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins A, C, and E.	Useful for prostate disorders and irritable bladder.	
Puncture vine ( <i>Tribulus terrestris</i> )	Flowers, fruit, leaves, stems.	Phytochemicals: Astragalin, beta-sitosterol, campesterol, chlorogenin, diosgenin, gitogenin, kaempferol, quercetin, ruscogenin, rutin, stigmasterol. Nutrients: Amino acids, calcium, essential fatty acids, iron, phosphorus, potassium, vitamin C.	Improves sex drive. Eases menopausal symptoms. Stimulates production of and balances male and female hormones. Enhances the immune system. Helps build muscles and increase stamina and endurance. Has antifungal, antibacterial, and antiinflammatory actions. Useful as a general tonic and revitalizer for the liver, kidneys, and urinary tract.	Also called caltrop.
Pygeum ( <i>Pygeum africanum</i> )	Bark.	Phytochemicals: Beta-sitosterol, oleanic acid, ursolic acid.	Reduces inflammation and congestion. Lowers levels of inflammatory compounds in the prostate. Effective in reducing prostate enlargement and symptoms associated with benign prostatic hyperplasia such as urinary hesitancy, weak urine flow, nighttime urination, and recurrent urinary infections.	Used clinically in Europe to treat benign prostatic hyperplasia. (BPH).
Red clover ( <i>Trifolium pratense</i> )	Flowers.	Phytochemicals: Beta-carotene, beta-sitosterol, biochanin, caffeic acid, campesterol, chlorogenic acid, coumarin, coumestrol, daidzein, eugenol, formononetin, genistein, isorhamnetin, methyl salicylate, myricetin, p-coumaric acid, salicylic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>3</sub> , C, and E.	Fights infection, suppresses appetite, and purifies the blood. Has expectorant, antispasmodic, and relaxing effects. Relieves menopausal symptoms such as hot flashes. Good for bacterial infections, coughs, bronchitis, inflamed lungs, inflammatory bowel disorders, kidney problems, liver disease, skin disorders, and weakened immune system.	

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Red raspberry ( <i>Rubus idaeus</i> )	Bark, leaves, roots.	Phytochemicals: Alpha-carotene, benzaldehyde, beta-carotene, beta-ionone, caffeic acid, ellagic acid, farnesol, ferulic acid, gallic acid, geraniol, lutein, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, silicon, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , C, and E.	Reduces menstrual bleeding, relaxes uterine and intestinal spasms, and strengthens uterine walls. Promotes healthy nails, bones, teeth, and skin. Good for diarrhea and for female disorders such as morning sickness, hot flashes, and menstrual cramps. Also heals canker sores. Combined with peppermint, good for morning sickness.	
Rhubarb ( <i>Rheum rhabarbarum</i> )	Roots, stalks.	Phytochemicals: Acetic acid, beta-carotene, caffeic acid, chrysophanol, emodin, epicatechin, ferulic acid, fumaric acid, gallic acid, isoquercitrin, lutein, p-coumaric acid, protocatechuic acid, rutin, sinapic acid, vanillic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, sulfur, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , C, and E.	Fights infection and eliminates worms. Enhances gallbladder function and promotes healing of duodenal ulcers. Good for constipation, malabsorption, and disorders of the colon, spleen, and liver.	<i>Caution:</i> Should not be used during pregnancy.
Rose ( <i>Rosa canina</i> )	Fruit (hips).	Phytochemicals: Beta-carotene, betulin, catechin, epicatechin, flavonoids, isoquercitrin, lycopene, malic acid, pectin, tannin, vanillin, zeaxanthin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , C, and E.	Good for bladder problems and all infections. A good source of vitamin C when used fresh. Rose hip tea is good for diarrhea.	Many vitamins and other supplements are derived from rose hips.
Rosemary ( <i>Rosmarinus officinalis</i> )	Leaves.	Phytochemicals: Alpha-pinene, apigenin, beta-carotene, beta-sitosterol, betulinic acid, borneol, caffeic acid, camphor, carnosol, carvacrol, carvone, caryophyllene, chlorogenic acid, diosmin, genkwanin, geraniol, hesperidin, limonene, linalool, luteolin, oleanolic acid, 1,8-cineole, phytosterols, rosmanol, rosmarinic acid, salicylates, squalene, tannin, thymol, ursolic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins B <sub>1</sub> , B <sub>3</sub> , and C.	Fights free radicals, inflammation (COX-2 enzyme), bacteria, and fungi. Relaxes the stomach, stimulates circulation and digestion, and acts as an astringent and decongestant. Improves circulation to the brain. Also helps detoxify the liver, and has anticancer and antitumor properties. Good for headaches, high and low blood pressure, circulatory problems, and menstrual cramps. Can be used as an antiseptic gargle. Rosemary oil impedes the growth of food-borne bacteria and fungi, and someday may be used to prolong the shelf life of foods.	Makes a good food preservative. <i>Caution:</i> Should not be used during pregnancy.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Sage ( <i>Salvia officinalis</i> )	Leaves.	Phytochemicals: Alpha-amyrin, alpha-pinene, alpha-terpineol, apigenin, beta-carotene, beta-sitosterol, betulin, borneol, caffeic acid, campesterol, camphene, camphor, carnosolic acid, caryophyllene, catechin, chlorogenic acid, citral, farnesol, ferulic acid, gallic acid, genkwanin, geraniol, hispidulin, limonene, linalool, luteolin, maslinic acid, oleanolic acid, 1,8-cineole, p-coumaric acid, pinene, rosmarinic acid, saponin, stigmasterol, tannins, terpineol, thymol, ursolic acid, vanillic acid. Nutrients: Boron, calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , B <sub>5</sub> , and C.	Stimulates the central nervous system and digestive tract, and has estrogenic effects on the body. Reduces sweating and salivation. Good for hot flashes and other symptoms of estrogen deficiency, whether in menopause or following hysterectomy. Beneficial for disorders affecting the mouth and throat, such as tonsillitis. In tea form, can be used as a hair rinse to promote shine (especially for dark hair) and hair growth. Also used to dry up milk when women wish to stop nursing.	<i>Caution:</i> Interferes with the absorption of iron and other minerals when taken internally, and decreases milk supply in nursing mothers. Should not be taken by individuals with seizure disorders or high blood pressure. Should not be taken during pregnancy or while nursing.
St. John's wort ( <i>Hypericum perforatum</i> )	Flowers, leaves, stems, oil.	Phytochemicals: Carotenoids, caryophyllene, chlorophyll, flavonoids, hyperoside, isoquercitrin, limonene, lutein, mannitol, myristic acid, phenol, phloroglucinol, phytosterols, quercetin, quercitrin, rutin, saponin, tannins. Nutrients: Vitamin C.	Good for depression and nerve pain. It has been shown to help patients with mild depression get over an acute episode and recover. Helps control stress. In laboratory studies, protects bone marrow and intestinal mucosa from x-ray damage. Applied topically, the oil aids wound healing. It has not been shown to be effective for children with ADHD (attention-deficit/hyperactivity disorder).	<i>Caution:</i> May increase sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.
Sangre de grado ( <i>Croton lechleri</i> )	Bark, resin.	Phytochemicals: Alpha-pinene, betaine, beta-pinene, borneol, camphene, dipentene, eugenol, gamma-terpinene, lignin, linalool, myrcene, p-cymene, tannins, taspine, vanillin.	Fights free radicals, inflammation, and bacterial, viral, and fungal infection. Helps heal wounds and stop bleeding. Good for respiratory and skin disorders, mouth and skin ulcers, sore throat, colds and flu, candida, psoriasis, herpes, and vaginitis.	A rainforest herb whose name means "dragon's blood."
Sarsaparilla ( <i>Smilax species</i> )	Roots, rhizomes.	Phytochemicals: Beta-sitosterol, saponin, stigmasterol. Nutrients: Iron, magnesium, manganese, phosphorus, potassium, selenium, zinc.	Promotes excretion of fluids, increases energy, protects against harm from radiation exposure, and regulates hormones. Useful for female sexual dysfunction, hives, impotence, infertility, nervous system disorders, premenstrual syndrome, psoriasis, rheumatoid arthritis, and disorders caused by blood impurities.	Also called Chinese root, small spikenard.
Saw palmetto ( <i>Serenoa repens</i> )	Berries, seeds.	Phytochemicals: Beta-carotene, beta-sitosterol, ferulic acid, mannitol, myristic acid, tannins, vanillic acid, vanillin.	Acts as a diuretic, urinary antiseptic, and appetite stimulant. Inhibits production of dihydrotestosterone, a form of testosterone that contributes to enlargement of the prostate. Shown to improve lower urinary tract symptoms in men with benign prostatic hyperplasia. May also enhance sexual functioning and sexual desire.	Used clinically in Europe to treat benign prostatic hyperplasia (BPH). Can be combined with nettle root.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Skullcap ( <i>Scutellaria laterifolia</i> )	Leaves, shoots.	Phytochemicals: Beta-carotene, lignin, tannins. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Aids sleep, improves circulation, and strengthens the heart muscle. Relieves muscle cramps, pain, spasms, and stress. Good for anxiety, fatigue, cardiovascular disease, headache, hyperactivity, nervous disorders, and rheumatism. Useful in treating barbiturate addiction and drug withdrawal.	<i>Caution:</i> Should not be given to children under six.
Slippery elm ( <i>Ulmus rubra</i> )	Inner bark.	Phytochemicals: Beta-carotene, campesterol, mucilage, starch, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Soothes inflamed mucous membranes of the bowels, stomach, and urinary tract. Good for diarrhea and ulcers and for treatment of colds, flu, and sore throat. Beneficial for Crohn's disease, ulcerative colitis, diverticulosis, diverticulitis, and gastritis.	Also called moose elm, red elm.
Squawvine ( <i>Mitchella repens</i> )	Leaves, stems.	Phytochemicals: Alkaloids, glycosides, mucilage, saponins, tannins.	Relieves pelvic congestion and soothes the nervous system. Good for menstrual cramps.	Also called partridgeberry.
Stone root ( <i>Collinsonia canadensis</i> )	Whole plant, fresh root.	Phytochemicals: Alpha-pinene, caffeic acid, caryophyllene, limonene. Nutrients: Magnesium.	Acts as a diuretic, sedative, antispasmodic, astringent, and tonic. Good for the urinary tract. Breaks up mucus. Helpful for bronchitis, headache, cramps, indigestion, and hemorrhoids.	Also known as heal-all, horse balm, knob root, and rich weed.
Suma ( <i>Puffia paniculata</i> )	Bark, berries, leaves, roots.	Phytochemicals: Beta-sitosterol, saponin, stigmasterol. Nutrients: Iron, magnesium, zinc, vitamins A, B <sub>1</sub> , B <sub>2</sub> , B <sub>5</sub> , E, and K.	Fights inflammation, boosts the immune system, and combats anemia, fatigue, and stress. Good for, arthritis, cancer, liver disease, menopausal symptoms, high blood pressure, Epstein-Barr virus, and weakened immune system.	Also known as Brazilian ginseng.
Tea tree ( <i>Melaleuca alternifolia</i> )	Essential oil.	Phytochemicals: Alpha-pinene, alpha-terpineol, aromadendrene, beta-pinene, camphor, caryophyllene, limonene, linalool, 1,8-cineole, p-cymene, terpinenes, terpinolene.	Used topically, disinfects wounds and heals virtually all skin conditions, including acne, athlete's foot, boils, cuts and scrapes, earache, fungal infections, hair and scalp problems, herpes outbreaks, insect and spider bites, scabies, and warts. Added to water, can be used as a douche for vaginitis and a gargle for colds, sore throats, and mouth sores (do not swallow it, however).	<i>Caution:</i> Should not be taken internally; can be toxic. If irritation occurs, discontinue use or dilute with distilled water, vegetable oil, primrose oil, or vitamin E oil. If irritation persists after dilution, discontinue use.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Thyme ( <i>Thymus vulgaris</i> )	Berries, flowers, leaves.	Phytochemicals: Alpha-pinene, apigenin, beta-carotene, borneol, caffeic acid, camphor, caprylic acid, carvacrol, carvone, chlorogenic acid, cinnamic acid, citral, eugenol, ferulic acid, gallic acid, geraniol, kaempferol, lauric acid, limonene, linalool, luteolin, myristic acid, naringenin, oleanolic acid, p-coumaric acid, p-cymene, phytosterols, rosmarinic acid, salicylates, tannin, thymol, ursolic acid, vanillic acid. Nutrients: Amino acids, calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Eliminates gas and reduces fever, headache, and mucus. Has strong antiseptic properties. Lowers cholesterol levels. Good for asthma, bronchitis, croup and other respiratory problems, and for fever, headache, and liver disease. Eliminates scalp itching and flaking.	
Turmeric ( <i>Curcuma longa</i> )	Rhizomes.	Phytochemicals: Alpha-pinene, alpha-terpineol, azulene, beta-carotene, borneol, caffeic acid, caryophyllene, cinnamic acid, curcumin, eugenol, guaiaacol, limonene, linalool, 1,8-cineole, p-coumaric acid, p-cymene, turmerone, vanillic acid. Nutrients: Calcium, iron, manganese, phosphorus, potassium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Curcumin, the yellow pigment in turmeric, is the active ingredient. Fights free radicals, protects the liver against toxins, inhibits platelet aggregation, aids circulation, lowers cholesterol levels, and improves blood vessel health. Has antibiotic, anticancer, and anti-inflammatory (COX-2 enzyme) properties. Good for all arthritic conditions. Curcumin has been shown to stop the proliferation of rapidly dividing cancer cells. Under investigation for treating pancreatic and other cancers, psoriasis, and Alzheimer's disease.	Used as a seasoning and the main ingredient in curry powder. Has inhibited the spread of HIV in laboratory tests.  <i>Caution:</i> Extended use can result in stomach distress. Not recommended for persons with biliary tract obstruction, as curcumin stimulates bile secretion.
Uva ursi ( <i>Arctostaphylos uva-ursi</i> )	Leaves.	Phytochemicals: Arbutin, beta-carotene, beta-sitosterol, ellagic acid, gallic acid, hyperin, isoquercitrin, myricetin, oleanolic acid, quercetin, quercitrin, ursolic acid. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Promotes excretion of fluids, fights bacteria, and strengthens heart muscle. Good for disorders of the spleen, liver, pancreas, and small intestine. Useful for bladder and kidney infections, diabetes, and prostate disorders.	Also called bearberry.  <i>Caution:</i> Not recommended for women who are pregnant or nursing, or for children under twelve.
Valerian ( <i>Valeriana officinalis</i> )	Rhizomes, roots.	Phytochemicals: Azulene, beta-carotene, beta-ionone, beta-sitosterol, borneol, bornyl acetate, caffeic acid, caryophyllene, chlorogenic acid, isovaleric acid, kaempferol, limonene, p-coumaric acid, quercetin, valepotriates, valerenic acid, valerenone, valeric acid. Nutrients: Calcium, choline, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a sedative, improves circulation, and reduces mucus from colds. Good for anxiety, fatigue, high blood pressure, insomnia, irritable bowel syndrome, menstrual and muscle cramps, nervousness, pain, spasms, stress, and ulcers. Shown to promote better sleep quality and longer sleeping periods, and reduce the number of times people get up at night. Combining valerian with hops can also promote a better quality of sleep and induce deeper sleep.	A water-soluble extract form is best.  <i>Caution:</i> Should not be combined with alcohol.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Vervain ( <i>Verbena officinalis</i> )	Flowers, leaves, shoots, stems.	Phytochemicals: Adenosine, aucubin, beta-carotene, caffeic acid, citral, tannin, ursolic acid, verbenalin, verbenin.	Strengthens the nervous system. Promotes liver and gallbladder health. Reduces tension and stress. Induces sweating. Promotes menstruation and increases mother's milk. Useful for mild depression, insomnia, headache, toothache, wounds, colds, and fever.	<i>Caution:</i> Should not be used during pregnancy, as it stimulates uterine contractions.
White oak ( <i>Quercus alba</i> )	Bark.	Phytochemicals: Beta-carotene, beta-sitosterol, catechin, gallic acid, pectin, quercetin, quercitrin, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as an antiseptic. Good for skin wounds, bee stings, burns, diarrhea, fevers and cold, bronchitis, nosebleed, poison ivy, and varicose veins. Also good for the teeth. Can be used in enemas and douches.	
White willow ( <i>Salix alba</i> )	Bark.	Phytochemicals: Apigenin, beta-carotene, catechin, isoquercitrin, lignin, p-coumaric acid, quercetin, rutin, salicin, salicylic acid, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Relieves pain. Good for allergies, headache, backache, nerve pain, joint pain, inflammation, menstrual cramps, toothache, and injuries. For backache, use of white willow allowed for a reduction in the use of medications such as for pain.	Contains compounds from which aspirin was derived. <i>Caution:</i> Not recommended for use during pregnancy. May interfere with absorption of iron and other minerals when taken internally. Should not be used by people who are allergic to aspirin.
Wild cherry ( <i>Prunus serotina</i> )	Inner bark, root bark.	Phytochemicals: Benzaldehyde, caffeic acid, kaempferol, p-coumaric acid, quercetin, scopoletin, tannin, ursolic acid. Nutrients: Calcium, iron, magnesium, phosphorus, potassium, zinc.	Acts as an expectorant and mild sedative. Good for coughs, colds, bronchitis, asthma, digestive disorders, and diarrhea.	Also called chokecherry, wild black cherry, Virginia prune. <i>Caution:</i> Wild cherry bark should not be used during pregnancy. Also, the leaves, bark, and fruit pits contain hydrocyanic acid, which can be poisonous. A commercially prepared syrup or tincture is best.
Wild oregano ( <i>Origanum vulgare</i> )	Leaves, shoots, stems.	Phytochemicals: Alpha-pinene, apigenin, beta-carotene, borneol, caffeic acid, camphor, capric acid, carvacrol, caryophyllene, catechol, chlorogenic acid, cinnamic acid, eriodictyol, eugenol, geraniol, kaempferol, limonene, linalool, luteolin, myristic acid, naringenin, naringin, oleanolic acid, 1,8-cineole, p-coumaric acid, phytosterols, quercetin, rosmarinic acid, rutin, tannins, thymol, ursolic acid, vanillic acid, vitexin. Nutrients: Calcium, essential fatty acids, iron, magnesium, manganese, phosphorus, potassium, zinc, vitamins A, B <sub>1</sub> , B <sub>3</sub> , and C.	Fights free radicals, inflammation, and bacterial, viral, and fungal infection. Boosts the immune system. Useful for acne, allergies, animal bites, arthritis, asthma, athlete's foot, bee stings, bronchitis, chronic infections, cold, cough, diarrhea, digestive problems, earache, eczema, fatigue, gum disease, headache, menstrual irregularities, muscle pain, parasitic infections, psoriasis, sinusitis, skin infections, urinary tract disorders, and wounds.	Oregano sold in supermarkets is usually a combination of several oregano species, and does not have the medicinal benefits of <i>Origanum vulgare</i> .

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Wild yam ( <i>Dioscorea villosa</i> )	Rhizomes, roots.	Phytochemicals: Beta-carotene, diosgenin. Nutrients: Calcium, chromium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Relaxes muscle spasms, reduces inflammation, and promotes perspiration. Contains compounds similar to the hormone progesterone. Good for colic, gallbladder disorders, hypoglycemia, irritable bowel syndrome, kidney stones, neuralgia, rheumatism, and female disorders, including premenstrual syndrome and menopause-related symptoms. In one study, postmenopausal women who consumed yam experienced an improvement in the levels of sex hormones, blood lipids, and antioxidants.	Many yam-based products are extracted from plants treated with fertilizers and pesticides, which may end up in the final products. The selection, cleansing, and processing of the raw materials is very important.  <i>Caution:</i> Should not be used during pregnancy and lactation. For use in children, check with your pediatrician.
Wintergreen ( <i>Gaultheria procumbens</i> )	Leaves, roots, stems.	Phytochemicals: Caffeic acid, ferulic acid, gallic acid, p-coumaric acid, methyl salicylate, tannin, vanillic acid.	Relieves pain and reduces inflammation. Stimulates circulation. Good for arthritis, headache, toothache, muscle pain, and rheumatic complaints.	Oil distilled from the leaves is used in perfumes and as a flavoring. Contains a compound composed of 90 percent methyl salicylate, a substance similar to aspirin.
Witch hazel ( <i>Hamamelis virginiana</i> )	Bark, leaves, twigs.	Phytochemicals: Beta-ionone, gallic acid, isoquercitrin, kaempferol, leucodelphinidin, myrcetin, phenol, quercetin, quercetrin, saponins, tannins.	Applied topically, has astringent and healing properties, and relieves itching. Good for hemorrhoids, mouth and skin inflammation, and phlebitis. Very useful in skin care.	
Wood betony ( <i>Stachys officinalis</i> )	Leaves.	Phytochemicals: Betaine, caffeic acid, chlorogenic acid, rosmarinic acid, stachydrine, tannin. Nutrients: Choline, magnesium, manganese, phosphorus.	Stimulates the heart and relaxes muscles. Improves digestion and appreciation of food. Good for cardiovascular disorders, hyperactivity, nerve pain, headaches, and anxiety attacks.	Also called betony.  <i>Caution:</i> Should not be used during pregnancy.
Wormwood ( <i>Artemisia absinthium</i> )	Leaves, tops.	Phytochemicals: Beta-carotene, chamazulene, chlorogenic acid, isoquercitrin, p-coumaric acid, rutin, salicylic acid, tannins, vanillic acid. Nutrients: Vitamin C.	Acts as a mild sedative, eliminates worms, increases stomach acidity, and lowers fever. Useful for loss of appetite and for liver, gallbladder, gastric, and vascular disorders, including migraines. Applied topically, good for healing wounds, skin ulcers and blemishes, and insect bites.	Ingredient of absinthe liquor, banned in many countries. Often used with black walnut for removal of parasites.  <i>Caution:</i> Do not use in high doses or for extended periods because it contains the chemical component thujone that can be poisonous. Should not be used by those who suffer from any type of seizure disorder, or who are pregnant or nursing.

Herb (Scientific Name)	Part(s) Used	Phytochemical and Nutrient Content	Actions and Uses	Comments
Yellow dock ( <i>Rumex crispus</i> )	Roots.	Phytochemicals: Beta-carotene, hyperoside, quercetin, quercitrin, rutin, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Acts as a blood purifier and cleanser, and as a general tonic. Improves colon and liver function. Good for inflammation of the nasal passages and respiratory tract, anemia, liver disease, and skin disorders such as eczema, hives, psoriasis, and rashes. Combined with sarsaparilla, makes a tea for chronic skin disorders.	Also called curled dock.  <i>Caution:</i> Yellow dock leaves should not be consumed in soups or salads. They are high in oxalates and may cause oxalic acid poisoning.
Yerba maté ( <i>Ilex paraguariensis</i> )	Leaves.	Phytochemicals: Caffeine, chlorogenic acid, chlorophyll, rutin, tannin, theobromine, theophylline, ursolic acid, vanillin. Nutrients: Choline, inositol, nicotinic acid, pyridoxine, trace minerals, vitamins B <sub>3</sub> , B <sub>5</sub> , B <sub>6</sub> , C, and E.	Fights free radicals, cleanses the blood, and suppresses appetite. Fights aging, stimulates the mind, stimulates the production of cortisone, and tones the nervous system. Enhances the healing powers of other herbs. When combined with guarana, it was useful at slowing the rate that food left the stomach, thereby promoting a longer sense of fullness. This led to a significant weight loss compared to a control group. Useful for allergies, constipation, and inflammatory bowel disorders.	Also called maté, Paraguay tea, South American holly.  <i>Caution:</i> Should not be used by people who suffer from insomnia.
Yohimbe ( <i>Pausinystalia yohimbe</i> )	Bark.	Phytochemicals: Ajmaline, corynantheine, corynanthine, tannin, yohimbine.	Increases libido and blood flow to erectile tissue. May increase testosterone levels.	Yohimbine, a key component of this herb, is sold as a prescription medication. Available in a wide variety of bodybuilding and sexual aid supplements.  <i>Caution:</i> Yohimbe should not be used by women who are pregnant or nursing. Do not use yohimbe if you have high blood pressure, heart disease, stomach ulcers, depression, or other psychiatric conditions. There have been cases of people dying from taking too much yohimbe.
Yucca ( <i>Yucca baccata</i> )	Roots.	Phytochemicals: Beta-carotene, sarsapogenin, tannin. Nutrients: Calcium, iron, magnesium, manganese, phosphorus, potassium, selenium, zinc, vitamins B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub> , and C.	Purifies the blood. Beneficial in treating arthritis, osteoporosis, and inflammatory disorders.	Routinely prescribed for arthritis in some clinics. Can be cut up, added to water (1 cup of yucca in 2 cups of water), and used as a soap or shampoo substitute. Can be added to shampoo also.

# Medicinal Herbs by Actions and Targets in the Body

Different medicinal herbs have different types of effects and tend to exert their activities on different body systems and organs. The following table classifies some of the best-known herbs according to their actions and areas of prime activity.

Action(s)	Herbs
Antibacterial/antiviral	Aloe, anise, annatto, astragalus, black walnut, boneset, boswellia, burdock, catnip, cat's claw, cayenne, cedar, chanca piedra, chickweed, echinacea, elder, eucalyptus, garlic, goldenseal, jaborandi, jatoba, kudzu, lady's mantle, lemongrass, licorice, macela, meadowsweet, myrrh, olive leaf, pau d'arco, pleurisy root, puncture vine, red clover, rose, rosemary, sangre de grado, slippery elm, suma, tea tree, turmeric, uva ursi, valerian, white oak, wild oregano.
Anticancer/antitumor	Astragalus, birch, burdock, cat's claw, chuchuhuasi, cranberry, dandelion, fennel, garlic, green tea, licorice, macela, milk thistle, parsley, pau d'arco, rosemary, suma, turmeric.
Antifungal	Acerola, alfalfa, aloe, black walnut, boswellia, burdock, cedar, cinnamon, jatoba, puncture vine, rosemary, sangre de grado, tea tree, wild oregano.
Anti-inflammatory	Alfalfa, aloe, annatto, ashwagandha, bilberry, birch, blessed thistle, boldo, boneset, boswellia, buchu, butcher's broom, calendula, catnip, cat's claw, chamomile, chanca piedra, chuchuhuasi, devil's claw, echinacea, elder, fenugreek, feverfew, flax, ginger, goldenseal, jaborandi, jatoba, juniper, lady's mantle, licorice, macela, meadowsweet, mullein, mustard, pleurisy root, puncture vine, pygeum, rosemary, sangre de grado, suma, turmeric, white willow, wild oregano, wild yam, wintergreen, witch hazel, yellow dock.
Antioxidant	Acerola, annatto, bilberry, burdock, cat's claw, celery, elder, ginger, ginkgo, green tea, jatoba, milk thistle, olive leaf, rosemary, sangre de grado, turmeric, wild oregano, yerba maté.
Cleanser/detoxifier	Alfalfa, black walnut, blessed thistle, cascara sagrada, cat's claw, cedar, dandelion, elder, garlic, ginger, goldenseal, guarana, licorice, muira puama, Oregon grape, pau d'arco, rosemary, yellow dock, yerba maté.
Bones/joints	Alfalfa, black cohosh, boswellia, cat's claw, cayenne, celery, chuchuhuasi, dandelion, devil's claw, feverfew, flax, garlic, ginger, jatoba, muira puama, nettle, olive leaf, pau d'arco, peppermint, primrose, red raspberry, St. John's wort, sarsaparilla, skullcap, suma, wild oregano, wild yam, wintergreen, yucca.
Brain/nervous system	Ashwagandha, astragalus, bayberry, bilberry, blessed thistle, blue cohosh, catnip, celery, chamomile, chaste tree, devil's claw, dong quai, eyebright, fennel, fenugreek, feverfew, ginger, ginseng, goldenseal, gotu kola, guarana, hops, jaborandi, kava kava, kudzu, lavender, lemongrass, licorice, marshmallow, motherwort, muira puama, oat straw, passionflower, peppermint, plantain, rosemary, sage, St. John's wort, sarsaparilla, skullcap, squawvine, stone root, suma, thyme, valerian, vervain, white willow, wild cherry, wild oregano, wintergreen, wood betony, wormwood, yerba maté.
Circulatory/cardiovascular systems	Aloe, barberry, bayberry, bilberry, black cohosh, black walnut, blessed thistle, borage, boswellia, butcher's broom, cayenne, celery, chickweed, cinnamon, devil's claw, elder, garlic, gentian, ginger, ginkgo, ginseng, gotu kola, green tea, hawthorn, hops, horse chestnut, hyssop, jaborandi, kudzu, licorice, motherwort, muira puama, olive leaf, parsley, passionflower, pau d'arco, peppermint, primrose, rosemary, skullcap, suma, uva ursi, valerian, white oak, wintergreen, wood betony.
Gastrointestinal/digestive systems	Acerola, alfalfa, aloe, anise, annatto, bilberry, black walnut, blessed thistle, boldo, boswellia, buchu, burdock, cascara sagrada, catnip, cayenne, chamomile, chanca piedra, chuchuhuasi, cinnamon, clove, dandelion, devil's claw, fennel, fenugreek, flax, garlic, gentian, ginger, ginseng, goldenseal, gotu kola, green tea, guarana, horehound, jaborandi, juniper, kava kava, kudzu, lady's mantle, lemongrass, licorice, macela, marshmallow, meadowsweet, muira puama, mustard, olive leaf, Oregon grape, papaya, parsley, pau d'arco, peppermint, plantain, puncture vine, red clover, red raspberry, rosemary, sage, slippery elm, stone root, suma, thyme, turmeric, uva ursi, valerian, vervain, white oak, wild cherry, wild oregano, wood betony, wormwood, yellow dock, yerba maté.
Hair/nails/teeth	Borage, burdock, clove, hops, Irish moss, lemongrass, muira puama, nettle, red raspberry, sage, tea tree, vervain, white willow, wintergreen.
Immune system	Ashwagandha, astragalus, bayberry, burdock, cat's claw, cedar, chuchuhuasi, devil's claw, echinacea, eyebright, elder, garlic, ginseng, goldenseal, green tea, horehound, licorice, maca, macela, milk thistle, myrrh, pau d'arco, puncture vine, red clover, suma, white willow, wild oregano, yerba maté.

Muscles	Blue cohosh, celery, chanca piedra, chuchuhuasi, eucalyptus, feverfew, ginger, hawthorn, horse chestnut, kava kava, lady's mantle, licorice, macela, meadowsweet, puncture vine, skullcap, uva ursi, valerian, wild oregano, wild yam, wintergreen, wood betony.
Reproductive system	<p><i>Menopause:</i> Chaste tree, dandelion, devil's claw, kava kava, licorice, motherwort, puncture vine, sage, suma, wild yam.</p> <p><i>Menstruation:</i> Black cohosh, blue cohosh, calendula, chamomile, chaste tree, chuchuhuasi, corn silk, crampbark, dong quai, false unicorn root, feverfew, licorice, maca, macela, motherwort, muira puama, primrose, red raspberry, rosemary, sarsaparilla, squawvine, valerian, white willow, wild oregano, wild yam.</p> <p><i>Prostate:</i> Buchu, goldenseal, gravel root, hydrangea, juniper, licorice, milk thistle, parsley, pumpkin, pygeum, saw palmetto, uva ursi.</p> <p><i>Sexual function/hormones:</i> Alfalfa, ashwagandha, chaste tree, chuchuhuasi, damiana, dong quai, false unicorn root, gotu kola, muira puama, puncture vine, sarsaparilla, saw palmetto, yohimbe (not recommended).</p>
Respiratory tract	Anise, astragalus, boneset, boswellia, catnip, cayenne, chanca piedra, chuchuhuasi, chickweed, elder, eucalyptus, fennel, fenugreek, feverfew, garlic, ginkgo, ginseng, goldenseal, green tea, horehound, Irish moss, jaborandi, jatoba, juniper, licorice, macela, muira puama, mullein, mustard, myrrh, nettle, parsley, plantain, pleurisy root, red clover, stone root, thyme, white oak, wild cherry, wild oregano, yellow dock.
Skin	Acerola, alfalfa, aloe, annatto, barberry, borage, boswellia, calendula, chickweed, chuchuhuasi, comfrey, cranberry, elder, flax, green tea, Irish moss, lavender, lemongrass, marshmallow, milk thistle, myrrh, oat straw, olive leaf, Oregon grape, primrose, red clover, red raspberry, sangre de grado, sarsaparilla, tea tree, white oak, wild oregano, witch hazel, wormwood, yellow dock.
Urinary tract	Annatto, bilberry, birch, buchu, butcher's broom, cayenne, cedar, celery, chanca piedra, corn silk, cranberry, dandelion, devil's claw, fennel, ginkgo, goldenseal, gotu kola, gravel root, guarana, hydrangea, jatoba, juniper, kava kava, marshmallow, milk thistle, mullein, nettle, parsley, plantain, puncture vine, pumpkin, rose, red clover, saw palmetto, slippery elm, stone root, uva ursi, wild oregano, wild yam.

# Drug Interactions

## INTRODUCTION

Mixing two or more drugs together in the body can sometimes create havoc, and instead of a health benefit the patient suffers a setback. Worse, you may be confronted with a health crisis. Most people think these unintended effects apply only to prescription drugs. However, dietary supplements and even the food we eat can interact with each other, or with over-the-counter (OTC) or prescription drugs, to cause problems. Herbs and vitamins, while not drugs in the strictest sense, are still complex organic chemicals that react with each other and with other chemicals in the body. This is, of course, how they work.

Types of drug interactions that you need to be concerned with can basically be summarized as follows:

- *Drugs interacting with drugs.* Both prescription and over-the-counter medications are included in this category. For instance, taking OTC antacids during a course of the antibiotic ciprofloxacin (Cipro) lowers the effectiveness of the antibiotic. If you take birth control pills, you should know that the antibiotic rifampin could lower their effectiveness. Miconazole (the active ingredient in Monistat and other products), an OTC drug for yeast infections, should not be used with warfarin (Coumadin) or bleeding and bruising could occur. Sildenafil (Viagra) should not be mixed with nitrates (such as nitroglycerin) used to treat heart disease, and certain antidepressants can interfere with blood pressure medicine.
- *Drugs interacting with dietary supplements.* There are many documented cases of herbs and vitamins interacting with prescription and OTC drugs. It was recently discovered that St. John's wort can interfere with the action of irinotecan, a standard chemotherapy drug. St. John's wort also acts with the blood-thinner warfarin and the heart medicine digitalis (Digoxin, Lanoxin), making them less effective. St. John's wort also lowers levels of theophylline, an asthma drug. Taking large doses of vitamin K can nullify the action of any blood-thinning medication a person might be taking. The list goes on and on. The five most common natural products with potential interaction are garlic, valerian, kava, ginkgo, and St. John's wort, according to a study at the Mayo Clinic. Children and adults can experience problems with dietary supplements. In one study, which tracked the adverse drug reaction (ADR) calls to the California Poison Control System, 28 percent were for children.

The most common products involved with ADRs were zinc, echinacea, chromium picolinate, and witch hazel. As of 2009, all dietary supplement labels include a company name to report any adverse events. This information is logged by the company and shared with the FDA if the problem is serious.

- *Drugs interacting with food and beverages.* Taking ciprofloxacin with coffee, chocolate, or even a cola drink that contains caffeine may cause excess nervousness or manic behavior. If foods containing tyramine, such as cheese or soy sauce, are mixed with some MAO inhibitors (a class of medication most often prescribed for mood disorders), there can be a fatal increase in blood pressure. Do not drink grapefruit juice along with blood pressure medications or cyclosporine (a transplant drug); doing this may increase the effect of these drugs. It was discovered in 1991 that grapefruit juice has the ability to inhibit an enzyme that metabolizes many drugs, thus allowing levels of the drugs to build up in the body. Older adults may have a special susceptibility to this reaction.

The U.S. Food and Drug Administration (FDA) has been trying to understand more about drug interactions, particularly in the past fifteen years or so, and has been developing laboratory testing programs to reveal possible problems early in the game. Because clinical trials with humans are generally based on small numbers of people, the safety profile of a proposed drug is not close to complete until the drug actually gets to market and a larger number of people get to try it under real-life conditions. A problem that is relatively rare in nature might not become apparent until several hundred thousand people have taken the drug. While there is a lot of emotion attached to this issue, it is simply impossible to predict beforehand every possible drug reaction and interaction. If people demand that kind of perfection, they have unrealistic expectations. Development costs, already unreasonably high, would certainly skyrocket, and development of new drugs that would benefit millions might be delayed indefinitely or even curtailed.

## WHY ARE THERE DRUG INTERACTIONS?

In recent years, researchers have learned that there is a class of enzymes, called the CYP family of enzymes, that plays an essential role in the metabolism and detoxification of drugs. These enzymes act primarily in the liver, but also

in the intestinal tract and other areas. For instance, there is a single enzyme (of the five known CYP enzymes) that plays a key role in metabolizing over half the drugs prescribed today. It is called CYP3A4 (or cytochrome P450). So, any substance—no matter whether it is another prescription drug, a common food, an OTC product, or an herbal or vitamin supplement—that either inhibits the action of this enzyme (or, conversely, increases its activity) will have a significant effect on how drugs are metabolized in the body. If more enzymes are produced, the drug is removed from the body too quickly and its effectiveness is lessened. If fewer enzymes are produced, the drug may build up in the body to toxic levels.

Further, it is important to know that many drugs operate within a fairly narrow “window” of concentration. That is, there must be enough of the drug to be effective, but only a little bit more can be toxic to the body.

Now that we know about these five enzymes, drugs can be tested by simply seeing if the drug interacts with each of the enzymes in a test tube. Knowing which enzyme actually metabolizes the new drug, researchers can then compare the drug with other drugs metabolized by the same enzyme and eventually build up a list of possible interactions. If two drugs use the same enzyme, it is possible that together there might be a conflict.

Test-tube studies certainly cannot tell the whole story, but they do point the way for targeted trials that might shed more light on possible problems before a new drug gets to market. There are race, gender, age, and other issues involved, too. Members of some ethnic groups may tend to produce very little of one enzyme but lots of the others. That means certain people might not be able to metabolize a new drug, and they can be tentatively identified beforehand.

## Herbs and Drug Interactions

We have already noted that St. John’s wort has the capacity to affect the activity of certain drugs. It does so notably through its potential to affect the enzyme CYP3A4. What about other herbs? We know that herbs are not routinely tested like prescription drugs. There are no FDA Phase 1, Phase 2, or Phase 3 trials for herbal remedies.

Additional investigations have found that kava kava extract made from *Piper methysticum* showed the ability to affect CYP3A4, and certain kavalactone compounds additionally affected CYP3A23. Kava also worsens the side effects of certain anesthetics, as does valerian. The plant sterol guggulsterone from the herb guggul (*Commiphora mukul*) and echinacea (*Echinacea purpurea*) appear to have some effect on one or more of the metabolizing enzymes. Echinacea may reverse the effects of certain steroids. Caffeine, a phytochemical found in a number of plants, certainly has a proven effect. Obviously, much more research is needed to see how herbs might interact with other substances and with prescription drugs.

## Mineral and Drug Interactions

Minerals can form complexes, or chelates, with some drugs. This creates insoluble structures that the body cannot absorb. Antibiotics and calcium are a known interactive pair. Calcium-fortified orange juice has caused chelation with ciprofloxacin (Cipro), gatifloxacin (Tequin), and levofloxacin (Levaquin). These antibiotics were made less effective by the calcium, as was the antibiotic tetracycline. Tetracyclines also bind with aluminum and magnesium, among others.

Calcium carbonate, as used in common antacids, binds with the thyroid hormone levothyroxine. Calcium carbonate should be taken at least four hours before taking the medication.

Iron forms complexes with ciprofloxacin, as well as with the quinolone antibiotics nalidixic acid and norfloxacin. Iron also binds with the Parkinson’s disease medication levodopa (L-dopa). This binding reduces the effectiveness of all these drugs. Copper, manganese, magnesium, and zinc have similar effects on the quinolone antibiotics. Magnesium hydroxide appears to enhance the activity of ibuprofen (found in Advil, Motrin, and other over-the-counter and prescription products), possibly by increasing the gastric pH and creating an environment conducive to absorption. Caution should be used when combining ibuprofen and magnesium hydroxide, as prolonged use has been shown to increase the risk of gastrointestinal irritation.

## Vitamin and Drug Interactions

Interaction between vitamins and prescription and OTC drugs is a wide-open field that needs to be explored. We have already noted that vitamin K counteracts the effects of the blood-thinner warfarin. It is also known that vitamin B<sub>6</sub> (pyridoxine) reduces blood levels of the Parkinson’s disease drug levodopa. Vitamin A supplements, although not at levels typically found in multivitamins, may react badly with isotretinoin (Accutane), an acne medication.

## Dietary Supplements and Drug Interactions

Several interactions have been reported between dietary supplements and prescription medications. Work in rats showed that policosanol increased the anti-ulcer effects of cimetidine (Tagamet). Use of conjugated linoleic acid (CLA) may interfere with hepatic enzyme function and tamoxifen (a breast cancer drug). Some drugs, propranolol and tricyclic antidepressants, for example, lower coenzyme Q<sub>10</sub> levels.

Several drugs have been shown to lower carnitine levels, including sodium valproate, pivampicillin, and isotretinoin. Some patients using these drugs benefit from supplements of carnitine. Melatonin has been reported to interact with a number of prescription drugs. For example, serum melatonin levels increase faster taking fluvoxamine, reducing CYP3A4 enzyme activity. Melatonin interacts with nifedipine, increasing blood pressure and heart rate.

Chondroitin may provoke autoimmune dysfunction and interact with the drug warfarin, increasing the time it takes your blood to clot.

### Foods and Drug Activity

As has been noted throughout this book, supplemental fiber products can significantly delay the absorption of drugs and nutrients (vitamins and minerals). Psyllium-based products used in bulk laxatives, for example, should be taken at least two hours before or after taking medication or nutrients. Some products, such as bran fiber, bulk laxatives, and pectin-containing foods such as apples and pears, should not be consumed along with the heart drug digoxin. These lower the effect of the drug by binding with it and lowering its concentration.

There are many recent articles that have been written about the effects of grapefruit juice. Because drinking grapefruit juice is so common in the United States, especially among dieters, we have cut right to the chase. In short, it has been found that grapefruit juice increases the bioavailability of many drugs (makes their concentration higher in the body) by inhibiting the CYP3A4 enzyme in the small intestine. Some drugs that appear to be affected are:

- Cholesterol-lowering drugs: lovastatin (Mevacor), atorvastatin (Lipitor), simvastatin (Zocor)
- Antihistamines: ebastine (Kestine)
- Calcium channel blockers (blood pressure drugs): nimodipine (Nimotop), felodipine (Plendil), nisoldipine (Sular)
- Psychiatric medications: buspirone (Buspar), triazolam (Halcion), diazepam (Valium), midazolam (Versed), sertraline (Zoloft)
- Immune suppressants: cyclosporine (Neoral)
- Pain medications: methadone (Methadose)
- Anti-HIV medicine: saquinavir (Invirase)
- Antiarrhythmics: amiodarone (Cordarone)
- Antiseizure medications: carbamazepine (Carbatrol, Tegretol)

### Reducing Your Risk of Interactions

There are many things you, as a consumer, can do to reduce your risk. First of all, be aware that drug interactions

do exist, and that nutrients and vitamins, along with food and beverages, must be included in the equation. Second, always read labels carefully on both your prescription drugs and any over-the-counter products you buy. Learn about any warnings that apply to drugs you are taking. These warnings are available in the drug packaging, on the labels in abbreviated form, and on the Internet.

There are programs on the Internet that will allow you to check for drug interactions by typing in the names of the drugs you are going to take and letting the computer find any adverse interactions. One example of such a program can be found at [www.drugdigest.org](http://www.drugdigest.org).

Do not trust any verbal advice unless it comes from a pharmacist or other health care practitioner. What worked for your friend or neighbor might not be best for *you*. Your doctor is a good source of information, but your pharmacist frankly knows more about the actions of drugs and might be a better source.

Before even filling a prescription, make sure your medical record is updated with everything you normally take, and ensure that your doctor is aware of any over-the-counter medications you normally use *plus* any herbal, vitamin, or mineral supplements.

Keep good records of all your medications and their dosages, such as how many milligrams or capsules and how often you take them. Be sure to include the name of the manufacturer. Make a list and keep it in your wallet. You may also want to keep a copy in your home. It's a good idea to let another family member know where you keep these "drug lists."

Ask your doctor if there are any foods, beverages, or supplements you should avoid when getting new medication prescribed. When your doctor writes a new prescription for you, be sure to mention the other drugs you are now taking (or show your list to the doctor). Don't forget to mention any OTC drugs you are taking.

If possible, it's best to use only one pharmacy to get all of your prescriptions. Pharmacies have computer-assisted drug interaction programs that will raise a red flag if they punch in a new prescription and it will interact badly with your other drugs already in the computer. But all of your drugs have to be on the same computer network for this to work properly.

PART TWO

---

*the*  
Disorders

# Introduction

Part One explored the nutritional and dietary needs of the body. In order to be well, the parts of the body must be fueled properly so that breakdown does not occur. With the growing number of stressors in the environment today, the body must obtain the proper nourishment in order to maintain a healthy immune system. If the immune system weakens, the body becomes susceptible to a number of harmful conditions.

Your health care provider may recommend that certain diagnostic tests be performed to help in making a diagnosis. Some tests, such as amniocentesis or surgical biopsy, are invasive; others, such as urinalysis, are not. Many diagnostic tests—especially newer ones such as magnetic resonance imaging (MRI) and computerized tomography (CAT) scans—can be quite expensive. Always be sure you understand exactly what a test involves before agreeing to it—how it is done, what it will show, why it is necessary in your case, what the potential risks are, how much it will cost, and anything else you need to know to feel confident in making a choice. You should also inform your health care provider about all medications, including natural remedies, over-the-counter medications, and supplements you take regularly to avoid potential interactions; any known allergies to foods, medications, anesthetics, X-ray materi-

als, and/or other substances; pregnancy, if applicable; and any other special concerns you may have.

Once a diagnosis has been confirmed, refer to the appropriate dietary guidelines, recommendations, and supplementation program in this book to help speed your recovery. Always be sure to learn as much as possible about the use of any supplement you take. (*See Part One for more detailed supplement information.*) Most of the suggestions in Part Two can be utilized either alone or in conjunction with other therapies. However, if you have any questions about any suggested nutrients or any other therapy, speak to your physician.

From time to time, we recommend specific products by brand name or specific manufacturer. These recommendations may appear on their own or in parentheses following the generic term for the substance in question. This should not be taken to mean that these are the only such products available, or that they are the only ones that will work. There are many good supplements and other nutritional products available from many different manufacturers, and new products are being introduced to the market all the time. However, we occasionally choose to make specific recommendations for particular products because we have found them to be effective and of good quality.

## Troubleshooting for Disorders

Some symptoms are indicative of a variety of illnesses. The following table lists some of the more common disorders that are associated with particular symptoms. It is not meant to serve as a substitute for professional diagnosis. Although you may experience one or more of the symptoms below, you may or may not have one of the illnesses cited. Your body is simply sending a message that something is wrong. Listening to your body can help stop a problem before it becomes serious. The illnesses listed are in alphabetical order. Their inclusion in this sequence does not reflect your chances of having any of them. If you have symptoms, consult with your health care provider. Before contacting your health care provider, write down your symptoms, how frequently you have them, how severe they are, and how long you have experienced them. This information will help you to have a more productive conversation.

Symptom	Possible Cause
Abdominal pain, cramping	<p>Across the abdomen: bladder or kidney disorder; pelvic inflammatory disease; premenstrual syndrome; uterine prolapse.</p> <p>Around the navel: appendicitis; constipation; gas.</p> <p>Lower left side: colitis; Crohn's disease; diarrhea; diverticulitis; lactose intolerance; ovarian cyst; regional enteritis; uterine fibroids or polyps.</p> <p>Lower right side: acute appendicitis; colitis; Crohn's disease; uterine fibroids or polyps.</p> <p>Upper left side: food allergies; heartburn, hiatal hernia; irritable bowel syndrome; peptic ulcer.</p> <p>Upper right side of rib cage: liver or gallbladder problems.</p> <p>Any location: endometriosis; food poisoning; indigestion; internal injury; miscarriage; stress.</p>
Anal bleeding, itching, pain, swelling	Abscess; allergies; anal fissure; bruising; cancer; candidiasis; Crohn's disease; cysts; diverticulitis; food poisoning; genital warts; hemorrhoids; infection; muscle spasms; pinworms; polyps; sexually transmitted diseases; tumor; ulcers; ulcerative colitis.
Back pain	Aortic aneurysm; arthritis; awkward sleeping/sitting position; cancer; disk disease; endometriosis; gallbladder disorders; heart attack; improper lifting; injury; kidney disease; lack of exercise; menstrual cramps; muscle spasms; obesity; osteoporosis; Paget's disease of bone; pelvic inflammatory disease; peptic ulcer; pneumonia; poor posture; pregnancy; scoliosis; spinal tumor; sprain; strained muscle and/or ligament; urinary tract infection; uterine fibroids.
Bad breath	Abscessed tooth; bulimia; constipation; diabetes; dry mouth; gum disease; indigestion; infection (especially sinus and lung infection); liver disease; lung disease; mouth ulcers; mouth-breathing; kidney failure; liver malfunction; periodontal disease; poor oral hygiene; disorders of the metabolism; sinusitis; tooth decay.
Bleeding, menstrual, heavy or irregular	Blood-clotting disorders; cancer; endocrine disorders; endometriosis; hormonal imbalance; menopause; miscarriage; obesity; overzealous dieting or exercise; thyroid disorder; urinary tract infection; use of improper oral contraceptives; uterine polyps or fibroids; vaginal infection; weight loss or gain.
Blinking, frequent	Anxiety; dry eyes; foreign body in the eye; injury; mimic spasm or tic (may occur in Tourette syndrome); Parkinson's disease; stroke; use of contact lenses.
Bloating	Adrenal disorders; allergies; appendicitis; bowel or kidney obstruction; diverticulitis; edema; gallbladder disorders; heart failure; irritable bowel syndrome; kidney disease; lactose intolerance; menstruation; overeating; peptic ulcer; tumor.
Blood in sputum, vomit, urine, stools, or from vagina or penis	Blood clots and swelling of lung tissue; cancer of colon, bladder, etc.; hemorrhoids; infection; peptic ulcer; polyps; prostate cancer; prostatitis; ruptured blood vessel; sexually transmitted disease; tumor.
Body aches	Arthritis; infection; influenza; lupus; Lyme disease; overexertion.
Body odor	Constipation; diabetes; excess toxins; gastrointestinal abnormalities; indigestion; infection; liver dysfunction; poor hygiene.
Breast lumps	Boils; cancer; cysts; fibrocystic disease; infected milk duct; infected sweat gland or lymph node; injury; premenstrual syndrome.
Breast tenderness	Blood clots in veins of breast; breast-feeding-related problems; cancer; estrogen therapy, excessive consumption of fat, salt, and/or caffeine; fibrocystic breast disease; hormonal imbalance; menopause; pregnancy; premenstrual syndrome; stress.

Symptom	Possible Cause
Breath, shortness of	Asthma; cardiovascular disease (especially in women); chronic bronchitis; cystic fibrosis; emphysema; obesity; panic attacks; pneumonia.
Bruising, easy	AIDS; anemia; cancer; Cushing's syndrome; drug reaction; hemophilia; liver or kidney disorder; vitamin C or vitamin K deficiency; weakened immune system.
Chest pain	Angina; anxiety; bruised or broken rib; carditis (inflammation of the muscles of the heart); coronary artery disease; gas; heart attack; heartburn; hiatal hernia; hyperventilation; pleurisy; pneumonia; strained muscle; stress.
Chills	Acute infection; anemia; exposure to cold; fever; hypothermia; shock.
Cold sweats	AIDS; cancer; diabetes; food poisoning; influenza; menopause; mononucleosis; severe heart or circulatory disease; shock; tuberculosis.
Cough, persistent	Allergies; asthma; cancer; chronic bronchitis; emphysema; pneumonia; postnasal drip; tuberculosis.
Delirium	Alcohol abuse; appendicitis; diabetes; drug overdose; drug reaction; epilepsy; high fever; manic episode; stroke.
Disorientation	Acute anxiety (panic attack); alcohol abuse; Alzheimer's disease; anemia; drug reaction or overdose; hypoglycemia; poor circulation; schizophrenia; seizure; stroke; transient ischemic attack (TIA, temporary interference with blood flow to the brain).
Dizziness, light-headedness	Acute anxiety (panic attack); allergies; anemia; brain tumor; inhaling chemical products; dehydration; diabetes; drug reaction; heart disease; high blood pressure; hypoglycemia; infection; low blood pressure; Ménière's disease; motion sickness; stress; stroke or impending stroke; vertigo.
Double vision	Cataracts; concussion; excessive alcohol consumption; eye disorders; hyperthyroidism.
Drooling	Drug withdrawal; ill-fitting dentures; Parkinson's disease; pregnancy-related problems; salivary gland disorders; seizure; stroke.
Drowsiness	Acute kidney failure; allergies; caffeine withdrawal; drug reaction or overdose; encephalitis; narcolepsy; skull fracture; sleep disorders.
Dry mouth	Aging; breathing through the mouth; dehydration; diabetes; drug reactions; Sjögren's syndrome.
Ear discharge	Clogged eustachian tube; earwax buildup; immune system dysfunction; infection; middle-ear infection; ruptured eardrum; severe head injury; tumor.
Eye, bulging	Aneurysm; blood clot or hemorrhage; glaucoma; hyperthyroidism; infection.
Eyelid, drooping	Botulism; diabetes; head or eyelid injury; hypothyroidism; muscle weakness; stroke.
Fever, persistent	AIDS; autoimmune diseases; cancer (especially kidney cancer, leukemia, lymphoma); chronic bronchitis; chronic infection; diabetes; hepatitis; influenza; mononucleosis; rheumatic disorders.
Flushing	Alcohol consumption; anxiety; dehydration; diabetes; heart disease; high blood pressure; hyperthyroidism; menopause; pregnancy; rosacea; use of high doses of niacin or of cholesterol-lowering medications.
Gas, frequent burping	Allergies; candidiasis; digestive problems; gallbladder disorders; gluten intolerance; intestinal obstruction; intestinal parasites; irritable bowel syndrome; lactose intolerance; stomach acid deficiency; swallowing air; ulcer.
Hands and/or feet, cold	Circulatory problems; exposure to cold; Raynaud's phenomenon; stress.
Headaches, persistent	Allergies; asthma; brain tumor; cluster headaches; drug reaction; eyestrain; glaucoma; high blood pressure; migraine; sinusitis; stress; vitamin deficiency.
Heartbeat, irregular or rapid	Anemia; anxiety; arteriosclerosis; asthma; caffeine, alcohol, or tobacco consumption; calcium, magnesium, and/or potassium deficiency; cancer; cardiovascular disease; drug reaction; fever; heart attack; high blood pressure; hormonal imbalance; low blood pressure; obesity; overeating; overzealous exercising.
Hot sweats, then chills	Acute infection; excessive alcohol or sugar consumption; fever; hypoglycemia; thyroid disorders; tuberculosis (mainly night sweats).
Incontinence (urinary)	Advanced neurological disease; Alzheimer's disease; atrophic vaginitis; bladder infection; diabetes; excessive liquid consumption; loss of muscle tone; multiple sclerosis; prostatitis; psychological problems; restricted mobility; spinal cord trauma; stroke; urinary tract infection.
Intercourse, painful	Endometriosis; inflammation or infection of the vulva; muscle spasms; unaccustomed position during sex; urinary tract infection; vaginal dryness.

Symptom	Possible Cause
Irritability, mood swings	Alcohol or drug abuse; Alzheimer's disease; anxiety; brain tumor; depression; diabetes; drug reactions; excessive sugar intake; food allergies; hormonal imbalance; hyperthyroidism; hypoglycemia; hypothyroidism; menopause; nutritional deficiencies; premenstrual syndrome; schizophrenia; stress; stroke; virtually any chronic or disabling illness.
Joint pain, swelling	Arthritis; bone cancer; bone fracture; bone spur; bursitis; carpal tunnel syndrome; chronic overuse; cirrhosis of the liver; diabetes; edema; gout; hemophilia; hepatitis; hormonal imbalance; infection; injury; kidney disease; lupus; Lyme disease; neuritis; Paget's disease of bone; rheumatic fever; sprain; strained muscle and/or ligament; tendinitis.
Leg pain	Arteriosclerosis; bone fracture; cancer; fibromyalgia; improper footwear; injury; Lyme disease; obesity; osteomalacia; overuse; Paget's disease of bone; peripheral artery disease; rickets; sciatica; tendinitis; thrombophlebitis; tumor or infection in intervertebral disk or spinal canal.
Lymph nodes, swollen	AIDS; any acute or chronic infection; cancer; lymphoma; metal toxicity.
Mouth sores	Allergies; cancer; canker sores; chickenpox; consumption of overly acidic foods or liquids; denture wearing; herpes; local trauma; lupus; measles; oral herpes; oral thrush; use of tobacco or aspirin.
Muscle control, loss of	Alcohol and/or drug abuse; extreme exhaustion; fibromyalgia; head injury; multiple sclerosis; muscular dystrophy; narcolepsy; overuse; Parkinson's disease; seizure; stroke.
Muscle cramps	Arthritis; calcium, magnesium, and/or potassium deficiency; dehydration; diabetes; hypothyroidism; injury; overuse; poor circulation.
Muscle pain, weakness	Anemia; arthritis; chronic fatigue syndrome; dehydration; diabetes; drug reaction; fever; fibromyalgia; infection; injury; lupus; multiple sclerosis; overuse.
Nausea	AIDS; alcohol consumption; allergies; anxiety; cancer; celiac disease; cirrhosis of the liver; copper toxicity; dehydration; drug side effect; drug withdrawal; endometriosis; extreme fatigue; food poisoning; gallbladder disorders; heart attack; hepatitis; hormonal imbalance; indigestion; influenza; kidney disease; kidney stones; Ménière's disease; migraine; morning sickness (pregnancy); motion sickness; pancreatitis; poisoning; sinusitis; stress; ulcerative colitis.
Neck pain, stiffness	Allergies; awkward sleeping position; disk disease; fibromyalgia; injury; meningitis; strained muscle and/or ligament; stress.
Night sweats	AIDS; anxiety; autoimmune disorders; bowel disease; cancer; cardiovascular disease; fever; hepatitis; menopause; sleep apnea; stress; tuberculosis; weakened immune system.
Numbness	Carpal tunnel syndrome; diabetes; hyperventilation; multiple sclerosis; pinched nerve; poor circulation; rheumatoid arthritis; stroke; transient ischemic attack.
Pulse, weak	Blood loss; dehydration; drug reaction; heart attack; low blood pressure; malnutrition; shock; trauma; vomiting.
Seizure	Alcoholism; Alzheimer's disease; drug abuse; drug reaction; encephalitis; epilepsy; head injury; high fever; meningitis; stroke; tumor.
Swallowing, difficulty	Bulimia; cancer; dehydration; dry mouth; hiatal hernia; stress; tumor.
Sweating, excessive	Alcohol consumption; anxiety; cardiovascular disease; consumption of hot and/or spicy foods; cystic fibrosis; fever; food allergies; hormonal imbalance; hyperthyroidism; infection; kidney disease; liver disease; lymphoma; malaria; menopause; overexertion; pneumonia; stress.
Swelling of ankles, feet, legs, hands, abdomen	Arthritis; bursitis; cardiovascular disease; chronic overuse; cirrhosis of the liver; diabetes; drug reaction; edema; food allergies; gout; improper footwear; joint infection; kidney disease; lupus; lymphatic disorders; poor circulation; pregnancy; premenstrual syndrome; sprain; strained muscle and/or ligament; varicose veins.
Thirst, excessive	Dehydration; diabetes; diarrhea; drug reaction; fever; menopause-related problems; any viral or bacterial infection.
Tremors	Alcoholism; anxiety; caffeine consumption; drug reaction; hyperthyroidism; multiple sclerosis; muscle fatigue; Parkinson's disease; stress; stroke; tumor; withdrawal from drugs or alcohol.
Urination, frequent	Alcohol or caffeine consumption; bladder infection; cancer; Cushing's syndrome; diabetes; drug reaction; excessive liquid intake; kidney or bladder stones; pregnancy; prostatitis.
Vaginal discharge, itching	Allergies; cancer; chlamydia; genital herpes; pelvic inflammatory disease; polyps; sexually transmitted diseases; urinary tract infection; vaginitis; yeast infection.
Weight gain	Aging; congestive heart failure; depression; diabetes; drug reaction; edema; hormonal imbalance; hypothyroidism; kidney disease; lack of exercise; overeating; poor diet.

Symptom	Possible Cause
Weight loss	Aging; AIDS; Alzheimer's disease; anorexia nervosa; cancer; chronic infection; depression; diabetes; hepatitis; hyperthyroidism; malabsorption syndrome; mononucleosis; Parkinson's disease; stress; tuberculosis.
Wheezing	Allergies; asthma; bronchitis; cardiovascular disease; chronic bronchitis; croup; emphysema; lung cancer; pneumonia; tobacco; upper respiratory infection.

## ABSCESS

An abscess is formed when pus accumulates in a tissue, organ, or confined space in the body due to infection. Abscesses may be located externally or internally, and may result from an injury or a lowered resistance to infection. An abscess can form in the brain, lungs, teeth, gums, underarms, abdominal wall, gastrointestinal tract, ears, tonsils, sinuses, bones, breasts, kidneys, prostate gland, rectum, scrotum, or almost any other body part. Infections are the most common human disorders and can be produced by bacteria, viruses, parasites, and fungi. A boil is an external (skin) abscess. (See BOIL in Part Two.)

The affected area may become swollen, inflamed, hot, red, and tender. The individual may also experience fatigue, loss of appetite, weight loss, and alternating bouts of fever and chills. In severe cases, bacteremia (blood infection) and/or rupture of the abscess can occur. The material inside an abscess consists of living and dead white blood cells, dead tissue, bacteria, and/or toxins—all of which need to be discarded from the body.

An abscess that appears suddenly (in a matter of a few hours or overnight) is said to be acute. If an abscess has been present for a period of days or weeks, it is termed chronic.

Chronic abscesses are more resistant to treatment because the damage is more severe and/or widespread. Acute abscesses are less extensive and generally respond to treatment within a matter of days.

An abscess, if treated, should begin to heal in a few days. Usually there is complete healing in a week or two. An abscess that does not show any signs of healing within this time can be an indication of problems within the immune system. Complications, although rare, can include bleeding or recurrence of the abscess.

Inflamed, red, and tender gums can characterize acute dental abscesses. The affected tooth may be sensitive or loose, and a dull pain is often present. A periodontal abscess can cause an overall sick feeling accompanied by fever and swollen lymph glands. However, chronic dental abscesses often produce no symptoms and are harder to treat than acute abscesses, as they have been present longer and have had the chance to do more extensive damage.

Basically, an abscess is a sign that the body is trying to rid itself of impurities. The impurities may be half-starved cells, deficient in nutrients such as sulfur, or toxins that accumulate because of a failure of the normal eliminative

processes. Such a situation often stems from poor diet and exposure to environmental pollutants, chemicals, and other harmful substances. Eating junk food not only clutters the system with foods lacking in nutrients, but also prevents the cellular wastes from being eliminated efficiently by causing such problems as constipation and sluggish liver, spleen, and kidney function. Eating a diet rich in fruits and vegetables, which contain antioxidants and other nutrients, helps clean wastes and toxins from the body.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half the recommended dose.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Zinc	80 mg daily, in divided doses. Do not exceed a total of 100 mg daily from all supplements.	Powerful immune system stimulant. Necessary for T lymphocyte function, which is needed to fight infection. Needed for all skin disorders.
<i>Important</i>		
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Colloidal silver	Apply topically as directed on label.	Acts as a natural antibiotic and disinfectant. Destroys bacteria, viruses, fungi, and parasites.
Garlic (Kyolic)	2 capsules 3 times daily, with meals.	Acts as a natural antibiotic and stimulates the immune system, and contains sulfur, needed for skin tissue repair.
Methylsulfonylmethane (MSM)	As directed on label.	Naturally occurring organic sulfur compound.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label.	A potent antioxidant. Use a sublingual form for best absorption. An antioxidant complex that contains SOD.
Vitamin A	50,000 IU daily for 5 days, then 25,000 IU daily for 5 days, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Strengthens cell walls to protect against invasion by bacteria and promote tissue repair. Essential to the immune system. Use an emulsion form for easier assimilation and greater safety at high doses.
plus natural carotenoid complex (Betatene)	As directed on label.	Powerful antioxidants that promote healing.

Vitamin B complex	50 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). Take with meals.	For repair and replacement of lost nutrients; aids in healing.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Essential in immune function and tissue repair.
Vitamin E	200 IU daily. You can also open a capsule and apply it directly to the affected area.	Important in circulation and tissue oxygenation. Enhances the immune system and promotes healing. Use d-alpha-tocopherol form.

**Helpful**

Bromelain	500 mg 3 times a day.	Reduces inflammation and swelling; speeds healing.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed for healing.
Proteolytic enzymes or Inf-zyme Forte from American Biologics or Intenzyme Forte from Biotics Research	As directed on label. Take between meals. As directed on label.	To aid in cleanup of the abscess. Powerful free radical scavengers.
	As directed on label.	

**Herbs**

The following herbs are beneficial for healing abscesses and cleansing the blood: burdock root, cayenne (capsicum), dandelion root, red clover, and yellow dock root.

Chamomile tea is good for treating dental abscesses. Drink a cup three or four times daily. If your face is swollen from the infection, chamomile can be prepared as a poultice and applied to the outside of the cheek once or twice a day for five to ten minutes until the infection is gone.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Consuming distilled water with fresh lemon juice, plus 3 cups of echinacea, goldenseal, and astragalus or suma tea every day is helpful. Goldenseal can also be made into a poultice and applied directly to the abscess. (See USING A POULTICE in Part Three.) Or, apply alcohol-free goldenseal extract to sterile gauze and place the gauze over the abscess.

*Cautions:* Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Echinacea tea or extract in warm water can be used as a mouthwash for dental abscesses. Be sure to prepare it warm and rinse your mouth with it every two hours.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

A poultice that combines lobelia and slippery elm bark is soothing and fights infection. (See USING A POULTICE in Part Three.)

Milk thistle, taken in capsule form, is good for the liver and aids in cleansing the bloodstream.

Tea tree oil, applied externally, is a potent natural anti-septic that kills infectious organisms without harming healthy cells. Mix 1 part tea tree oil with 4 parts water and apply the mixture with a cotton ball three times a day. This will destroy the bacteria, hasten healing, and prevent the infection from spreading.

**Recommendations**

Eat fresh pineapple daily. Pineapple contains bromelain, an enzyme that fights inflammation and aids healing.

Include garlic and onions in your diet. They are high in sulfur and can help to both prevent and cure abscesses.

Add kelp to the diet for beneficial minerals.

Perform a liquid fast using fresh juices for twenty-four to forty-eight hours. (See FASTING in Part Three.)

For an external abscess, apply honey to the affected area. Honey destroys bacteria and viruses, apparently by drawing all the moisture out of them.

To cleanse the affected area, apply chlorophyll liquid mixed with water several times a day.

If you must take antibiotics, supplement your diet with the B vitamins and products containing "friendly" bacteria, such as acidophilus and yogurt.

If pain, redness, swelling, bleeding, or discharge increases or continues for more than a week, call your doctor.

**Considerations**

For very mild external abscesses, the application of heat from a warm-water soak, along with improved nutrition, can usually provide sufficient treatment. Most abscesses, however, require treatment with antibiotics or herbs. Taking acidophilus and B vitamins and increasing your intake of liquids can often aid in the healing process. In some cases, the abscess may have to be lanced (pierced), drained, deep cleaned, and treated with antibiotics.

To heal an abscess, you may have to get plenty of bed rest, drink plenty of fluids, and use warm-water packs, ice packs, hot baths, a heating pad, or a heat lamp to alleviate the pain.

❑ To aid healing, the blood must be cleansed, and vitamin deficiencies that accompany skin eruptions must be corrected.

❑ Abscesses do not usually interfere with normal bathing or showering, but you should remove bandages first so the wound may be gently washed with surgical, antibacterial, or other mild, unscented soap. Afterward, apply a new bandage.

❑ If an abscess breaks open and drains without assistance, your doctor may still need to make sure the entire area is sufficiently clean to prevent recurrence. This minor surgery involves making an incision across and through the abscess so it can be opened enough to ensure that all pockets of pus are opened and thoroughly drained. Sterile gauze may be provided to absorb any additional fluids that may appear. This also allows healing to begin from the base up.

❑ If an abscess spreads to the blood, it may jeopardize the health of the rest of the system, and immediate treatment by a health care professional is necessary.

❑ Deep abscesses must be watched to ensure that they are not affecting or obstructing the function of deeper tissues and organs.

❑ Good hygiene and careful cleansing of the skin to prevent a wound or injury from becoming infected may prevent some abscesses.

❑ Appropriate treatment for a dental abscess depends on the type of abscess. Most often, the pus is drained from the infected area, antibiotics are prescribed, and deep cleaning is necessary. In other cases, a tooth may have to be extracted or root-canal surgery performed. (See PERIODONTAL DISEASE in Part Two.)

❑ Good dental hygiene can help prevent dental abscesses. This includes regular brushing and flossing, as well as regular dental checkups.

## ACID/ALKALI IMBALANCE

Acidity and alkalinity are measured according to the pH (potential of hydrogen) scale. Water, with a pH of 7.0, is considered neutral—neither acid nor alkaline. Any substance with a pH below 7.0 is acidic, while anything with a pH above 7.0 is alkaline. The ideal pH range for the human body is between 7.35 and 7.45 (the human body is naturally mildly alkaline). For the body, values below pH 7.35 are considered on the acidic side. Values above pH 7.45 are on the alkaline side.

### Acid and Alkaline Self-Test

This test will determine whether your body fluids are either too acidic or too alkaline. Purchase litmus paper, which is available at most drugstores, and apply saliva and/or urine to the paper. The paper will change color to indicate whether your system is overly acidic or alkaline.

Red litmus paper turns blue in an alkaline medium and blue litmus paper turns red in an acid medium. Always perform the test either before eating or at least one hour after eating. If your test indicates that your body is too acidic, consult the recommendations under Acidosis, below. If your body is too alkaline, see Alkalosis on page 146. If you take a blood test for alkalinity or acidity, you may receive a normal result but still experience symptoms. This is because small changes in the body's pH can have a considerable impact on the body. Over the past twenty years, the pH of the human body is becoming more acidic due to poor diet.

### Acidosis

Acidosis is a condition in which body chemistry becomes imbalanced and overly acidic. Symptoms associated with acidosis include frequent sighing, insomnia, water retention, recessed eyes, arthritis, migraine headaches, abnormally low blood pressure, acidic or strong perspiration, dry hard stools, foul-smelling stools accompanied by a burning sensation in the anus, alternating constipation and diarrhea, difficulty swallowing, halitosis, a burning sensation in the mouth and/or under the tongue, sensitivity of the teeth to vinegar and acidic fruits, and bumps on the tongue or the roof of the mouth.

There are two classifications of acidosis: respiratory and metabolic. Respiratory acidosis is caused by an interruption of the acid control of the body, resulting in an overabundance of acidic fluids or the depletion of alkali (base) fluids. Simply, it occurs if the lungs are unable to remove carbon dioxide. Respiratory acidosis can be a result of asthma, bronchitis, or obstruction of the airway. It can be either mild or severe.

Metabolic acidosis occurs when chemical changes in the body disturb the body's acid-base balance, creating an excessive amount of acid in the body fluids. Diabetes mellitus, kidney failure, the use of unusually large amounts of aspirin, and metabolic diseases are some of the conditions that can deplete the body's alkaline base. Other contributing factors can include liver and adrenal disorders, stomach ulcers, improper diet, malnutrition, obesity, ketosis, anger, stress, fear, anorexia, toxemia, fever, and the consumption of excessive amounts of niacin and vitamin C.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Tri-Salts from Ecological Formulas	As directed on label.	For acid-alkaline balance.
<i>Helpful</i>		
Buffer pH by Växa International, Inc.	As directed on label.	Helps to reduce the acidity in the body to normal.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.

Kelp	1,000–1,500 mg daily.	Reduces acid in the body. Aids in maintaining a proper balance of minerals.
Multi-Zyme from FoodScience of Vermont	As directed on label.	Contains HCl. Beneficial if you have too little stomach acid.
Oxy-Caps or Oxy-Max from Earth's Bounty	As directed on label.	Increases stamina and vitality. Nourishes the body's cells with added oxygen while reducing high acid content in the body. Has unique antiviral, antibacterial, and antifungal properties that help normalize friendly bacteria and keep the acid/alkali balance in check.
Phosphorus	As directed on label.	A mineral that helps in the conversion of food to energy.
Potassium	99 mg daily.	Increases metabolism. Aids in balancing the pH in the blood.
S-Adenosyl-methionine (SAME)	As directed on label.	Helps reduce stress. Promotes a sense of well-being. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin A	50,000 IU daily for one month, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Helps to protect mucous membranes.
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Needed for proper digestion.

## Herbs

- Use elder bark, hops, and willow for acidosis.
- Externally, apply ginger compresses to the kidney area.

## Recommendations

- Eat a diet of 50 percent raw foods. Raw foods not only maintain the correct acid/alkaline balance within the body, but they are also richer in nutrients that are easily assimilated into the body. Recommended foods include apples, avocados, bananas, bilberries, blackberries, grapefruit, grapes, lemons, pears, pineapples, strawberries, and all vegetables. Fresh fruits (especially citrus fruits) and vegetables reduce acidosis. Start with small amounts of citrus fruits and gradually add larger amounts. If you don't want to adopt a strict raw diet, eating lots of fruits and vegetables of any kind prepared in any way will help your pH to become more alkaline. In addition, limiting protein intake to no more than 80 grams a day and grains to 8 servings also will help reduce blood acidity.
- Chew your food slowly, and do not overindulge. Make sure food is mixed well with saliva to form a liquid consistency before swallowing. Do not drink fluids during meals.

Prepare cooked foods with care. Maintain clean working surfaces and wash vegetables and fruit. Keep meat and vegetables separate—you can contaminate vegetables with bacteria from raw meat. Do not overcook vegetables, as this makes them lose not only their flavor, but also their nutritional value. Eat processed foods in moderation only. They are low in nutrients and overexert the digestive system. Both cooked and processed foods tend to make the body more acid. Also avoid eating late at night, as this makes the body work more on digestion and less on restoration.

Drink potato broth every day. (See THERAPEUTIC LIQUIDS in Part Three for the recipe.)

Avoid animal protein (especially beef and pork), as it leads to acidity.

Since excess vitamin C may lead to acidosis, reduce your intake of vitamin C for a few weeks. When taking vitamin C, use a non-acid-forming (buffered) variety.

Heartburn and indigestion can be the result of food digesting poorly. If you suffer from heartburn, taking small swallows of a teaspoon or two of natural cider vinegar in a glass of water may be of some help. It may cause a burning sensation when you swallow it, but then, in approximately twenty minutes, you should feel relief. If the cider vinegar method works, this may indicate that you lack sufficient acid in your stomach and the cider vinegar compensated for this insufficiency. In this case, consider taking digestive enzyme supplements containing hydrochloric acid (HCl). Stomach acid is important for breaking down food, and also prevents germs from irritating the intestines.

Practice deep breathing.

Check your urine pH daily using pH paper. See the inset on page 147 for a list of acid-forming foods to avoid until your pH is corrected.

## Considerations

Phosphorus and sulfur act as buffers to maintain pH. Sulfur can be taken in supplement form, and phosphorus is also found in dairy products.

Umeboshi plums contain many alkaline minerals that aid in treating acidosis. You can eat one plum every four hours (four plums per day) for three days, then reduce your intake to one per day.

## Alkalosis

Alkalosis is the inverse of acidosis—it is a condition in which the body is too alkaline. Alkalosis is less common than acidosis and produces overexcitation of the nervous system. The peripheral nerves are affected first. The symptoms may be manifested as a highly nervous condition, including hyperventilation and even seizures. Other symptoms can include sore muscles, creaking joints, bursitis,

drowsiness, protruding eyes, hypertension, hypothermia, seizures, edema, allergies, night cramps, asthma, chronic indigestion, night coughs, vomiting, too-rapid blood clotting and thick blood, menstrual problems, dry hard stools, prostatitis, and thickening of the skin, with burning, itching sensations. Alkalosis may cause calcium to build up in the body, as in bone or heel spurs.

Alkalosis is often the result of excessive intake of alkaline drugs such as sodium bicarbonate for the treatment of gastritis or peptic ulcers. It can also result from excessive vomiting, high cholesterol, endocrine imbalance, poor diet, diarrhea, and osteoarthritis.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half the recommended dose.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Alfalfa		See under Herbs, below.
Betaine hydrochloride (HCl)	As directed on label.	A digestive enzyme that releases acid in the digestive tract.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
L-cysteine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed to produce glutathione, a major detoxifying chemical. Also aids in making the tissues more acid. (See AMINO ACIDS in Part One.)

## Acid- and Alkaline-Forming Foods

A basic rule of thumb to follow to achieve and maintain pH balance is to eat 80 percent alkaline-forming foods and drinks and 20 percent acid-forming foods and drinks each day. If a pH test indicates that your body is too acidic, you should eat more alkaline-forming foods and omit acid-forming foods from your diet until another pH test shows you have returned to normal. Conversely, if your body is too alkaline, eat more acid-forming foods and omit alkaline-forming foods. Use the list below as a guide to which foods are acid-forming and

which are alkaline-forming. Low-level acid-forming and low-level alkaline-forming foods are almost neutral.

Litmus paper may also be called nitrazine paper. It can be purchased at most local pharmacies. If your local pharmacy does not carry it or urine test strips for pH, check with a medical supply company (listed under *Medical Equipment, Supplies and Repair* in the yellow pages) or a hospital pharmacy. Or contact TriMedica or Växa, listed under Manufacturer and Distributor Information in the Appendix.

### Acid-Forming Foods

Alcohol  
Beans  
Buckwheat  
Catsup  
Chickpeas  
Cocoa  
Coffee  
Cornstarch  
Cranberries  
Eggs  
Fish  
Flour, flour-based products  
Legumes  
Lentils  
Meat  
Milk  
Mustard  
Noodles  
Oatmeal  
Olives  
Organ meats

Pasta  
Pepper  
Poultry  
Prunes  
Sauerkraut  
Shellfish  
Soft drinks  
Sugar, all foods with sugar added  
Tea  
Vinegar  
Aspirin, tobacco, and most drugs are also acid-forming.

### Low-Level Acid-Forming Foods

Butter  
Canned or glazed fruit  
Cheeses  
Dried coconut  
Dried or sulfured fruit (most)

Grains (most)  
Ice cream  
Ice milk  
Lamb's quarters  
Nuts and seeds (most)  
Soy products

### Alkaline-Forming Foods

Avocados  
Corn  
Dates  
Fresh coconut  
Fresh fruits (most)  
Fresh vegetables (onions, potatoes, rutabagas)  
Honey  
Horseradish  
Maple syrup  
Molasses  
Mushrooms  
Onions  
Raisins

Sprouts  
Umeboshi plums  
Watercress

*Note:* All vegetables, especially raw vegetables, balance the acidity and alkali levels in the blood. Although it might seem that citrus fruits would have an acidifying effect on the body, the citric acid they contain actually has an alkalizing effect in the system.

### Low-Level Alkaline-Forming Foods

Almonds  
Blackstrap molasses  
Brazil nuts  
Chestnuts  
Lima beans  
Millet  
Soured dairy products

Methylsulfonylmethane (MSM)	As directed on label.	An acid-forming mineral that helps to correct pH balance.
Raw kidney glandular	500 mg daily.	Stimulates kidney function.
S-Adenosylmethionine (SAME)	As directed on label.	Good for the nervous system and chronic fatigue. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Protects against free radicals produced in alkalosis.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	Essential for stable and normal pH.  Needed for hydrochloric acid (HCl) production. Also relieves fluid retention.
Vitamin C with rose hips and citrus bioflavonoids	3,000–6,000 mg daily, in divided doses.	A potent antioxidant and free radical scavenger.
Vitamin D	400 IU daily.	Necessary for the absorption and utilization of calcium and phosphorus by the intestinal tract.
Vitamin E	As directed on label.	A powerful antioxidant. Use d-alpha-tocopherol form.

## Herbs

Alfalfa is beneficial for the digestive tract. It is a good source of vitamin K and other nutrients. Use supplements plus natural sources, such as alfalfa sprouts.

## Recommendations

Adopt a diet that consists of 80 percent whole grains and includes beans, breads, brown rice, crackers, lentils, macaroni, nuts, soy sauce, and whole-grain cereals. The other 20 percent of the diet should include fresh fruits, vegetables, fish, chicken, eggs, and natural cheese.

Do not use antacids or mineral supplements, except those mentioned above, for two weeks.

Avoid sodium.

Cut back on megadoses of vitamins and minerals for two weeks.

Check your urine pH daily using litmus paper. See the inset on page 147 for a list of alkaline-forming foods to avoid until your pH is corrected.

## Considerations

Your breathing can affect the acid-alkali balance of your body. Prolonged hyperventilation may cause tempo-

rary alkalosis, resulting in anxiety and a feeling that one cannot get enough air, despite the fact that breathing itself is not actually restricted in any way. If this happens, breathe into a paper bag and rebreathe the air from the bag. This often helps to correct the chemical imbalance.

## ACIDOSIS

See under ACID/ALKALI IMBALANCE.

## ACNE

Acne is an inflammatory skin disorder characterized by pimples, blackheads, and whiteheads. To some degree, it affects about 80 percent of all Americans between the ages of twelve and forty-four. According to the American Academy of Dermatology, acne is one of the most common skin abnormalities. For those who suffer from acne, it is not merely a cosmetic problem. The consequences include emotional stress that can have a strong impact on one's self-esteem.

Acne often arises at puberty, when the body dramatically increases its production of androgens (male sex hormones). These hormones stimulate the production of keratin (a type of protein) and sebum (an oily skin lubricant). If sebum is secreted faster than it can move through the pores, a blemish arises. The excess oil makes the pores sticky, allowing bacteria to become trapped inside. Blackheads form when sebum combines with skin pigments and plugs the pores. If scales below the surface of the skin become filled with sebum, whiteheads appear. In severe cases, whiteheads build up, spread under the skin, and rupture, which eventually spreads the inflammation. Although proper skin care is important in the treatment of acne, acne is not caused by uncleanliness, but is more likely to be a result of overactive oil glands.

Although more than 20 million teenagers suffer from this disorder, acne is not just affecting kids anymore—it is also affecting increasing numbers of adults. While teenage acne most commonly occurs on the face and/or upper body, adult acne is usually limited to the chin and jawline, and involves fewer, but possibly more painful, blemishes.

Many women suffer premenstrual acne flare-ups prompted by the release of progesterone after ovulation. Oral contraceptives high in progesterone can cause breakouts, too. The presence of candidiasis can also cause hormonal changes that encourage the liver to produce the wrong substances for healthy sebum. (See CANDIDIASIS in Part Two.)

Factors that can contribute to acne include heredity, oily skin, hormonal imbalance, monthly menstrual cycles, and candidiasis. Other possible contributing factors are allergies, stress, and the use of certain types of drugs, such as steroids, lithium, oral contraceptives, and some anti-epileptic drugs. Nutritional deficiencies and/or a diet high in saturated fats, hydrogenated fats, and animal products can also

be involved. Exposure to industrial pollutants such as machine oils, coal tar derivatives, and chlorinated hydrocarbons are some environmental factors that can have an adverse effect on the condition. A body pH that is too acidic or too alkaline also fosters the nesting and breeding of acne-causing bacteria. (See ACID/ALKALI IMBALANCE in Part Two.)

The skin is the largest organ of the body. One of its functions is to eliminate a portion of the body's toxic waste products through sweating. If the body contains more toxins than the kidneys and liver can effectively discharge, the skin takes over. In fact, some doctors call the skin the "third kidney." As toxins escape through the skin, the skin's healthy integrity is disrupted. This is a key factor behind many skin disorders, including acne.

The skin also "breathes." If the pores become clogged, the microbes that are involved in causing acne flourish because they are protected against the bacteriostatic action of sunshine. Dirt, dust, oils, and grime from pollution clog the pores, but this can be eliminated by cleansing the skin properly, and with the proper products.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half the recommended dose.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Acidophilus	As directed on label.	Replenishes essential bacteria to reduce outbreaks.
Acneadvance (Futurebiotics)	As directed on label.	Clinically tested ingredient from milk to reduce redness and heal skin.
Chromium picolinate	As directed on label.	Aids in reducing infections of the skin.
Essential fatty acids (flaxseed oil and primrose oil are good sources)	As directed on label.	To supply essential gamma-linolenic acid. Needed to keep the skin smooth and soft, repair tissues, and dissolve fatty deposits that block pores. Also aids in healing.
Potassium	99 mg daily.	Deficiency has been associated with acne.
Vitamin A	25,000 IU daily until healed. Then reduce to 5,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	To strengthen the protective epithelial (skin) tissue. Use an emulsion form for easier assimilation.
with natural carotenoid complex (Betatene)	As directed on label.	Antioxidant and precursor of vitamin A.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Important for healthy skin tone. The antistress vitamin.
plus extra vitamin B <sub>3</sub> (niacinamide)	100 mg 3 times daily. Do not exceed this amount.	Improves blood flow to the surface of the skin. Deficiencies have been associated with acne.

**Caution:** Do not substitute niacin for niacinamide. Do not take additional niacinamide if you have a liver disorder, gout, or high blood pressure.

Vitamin C with bioflavonoids	1,000–1,600 mg 3 times daily.	Promotes immune function and reduces inflammation. Needed for collagen repair of the skin tissue. Use a buffered type.
Vitamin D	400 IU daily.	Promotes healing and tissue repair.
Vitamin E	400 IU daily.	An antioxidant that enhances healing and tissue repair. Use d-alpha-tocopherol form.
Zinc	30–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Aids in healing of tissue and helps to prevent scarring. A necessary element in the oil-producing glands of the skin.

#### Important

Garlic (Kyolic) from Wakunaga)	2 capsules 3 times daily, with meals.	Destroys bacteria and enhances immune function.
--------------------------------	---------------------------------------	---

#### Helpful

Chlorophyll	As directed on label.	Aids in cleansing the blood, preventing infections. Also supplies needed nutrients.
Clear Skin Image from Coenzyme-A Technologies	As directed on label.	A nutrient formula that supports healthy skin by correcting imbalances to address deficiencies in fatty acid metabolism and balance production of adrenal and sex hormones.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote overall skin health.
L-cysteine	500 mg daily, on an empty stomach. Take with water or juice.	Contains sulfur, needed for healthy skin. (See AMINO ACIDS in Part One.) Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Needed for better absorption of the essential fatty acids.
Methylsulfonylmethane (MSM) (MSM Capsules from Aerobic Life Industries)	As directed on label.	Makes cell walls permeable, allowing water and nutrients to freely flow into cells, and wastes and toxins to properly flow out.
Multienzyme complex with hydrochloric acid (HCl)	As directed on label. Take with meals.	To aid digestion. <b>Caution:</b> Do not use HCl if you have a history of ulcers.
O <sub>2</sub> Spray from Earth's Bounty	As directed on label.	A skin cleanser with antibacterial and antifungal properties that aids in healing blemishes.
Oxy-Caps from Earth's Bounty	As directed on label.	Provides essential oxygen that allows cells to function at their optimum.

Proteolytic enzymes	As directed on label. Take with meals or between meals.	Free radical scavengers. Aid in breaking down undigested food particles in the colon.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Encourages tissue elasticity and is a powerful antioxidant.
Tretinoin (Retin-A)	As prescribed by physician.	Acts as a gradual chemical peel; speeds up sloughing off of top layers of skin, leaving new, smoother skin. Available by prescription only. Takes around 6 months to show results.

## Herbs

Burdock root, dandelion leaves, milk thistle, and red clover are good for acne. Burdock root and red clover are powerful blood cleansers. Milk thistle aids the liver in cleansing the blood. A good place to begin an acne program is herbal cleansing of the blood. Both burdock and dandelion can help cleanse the liver. A liver that is not performing at its best can worsen acne because it cannot break down and clear excess hormones from the body as it should. Burdock and dandelion also contain inulin, which can improve the quality of skin by removing bacteria.

A poultice using dandelion and yellow dock root can be applied directly to the areas of skin with acne. (See USING A POULTICE in Part Three.)

Chaste tree berry (*Vitex agnus-castus*) extract can aid in preventing premenstrual breakouts. Take it each morning as directed on the product label.

Lavender, red clover, and strawberry leaves can be used as a steam sauna for the face. Lavender kills germs and stimulates new cell growth. Using a glass or enamel pot, simmer a total of 2 to 4 tablespoons of dried or fresh herbs in 2 quarts of water. When the pot is steaming, place it on top of a thick potholder on a table, and sit with your face at a comfortable distance over the steam for fifteen minutes. You can use a towel to trap the steam if you wish. After fifteen minutes, splash your face with cold water. Allow your skin to air-dry or pat it dry with a towel. If desired, you may follow this treatment with the use of a clay mask: Blend 1 teaspoon of green clay powder (available in health food stores) with 1 teaspoon raw honey, and apply the mixture to your face, avoiding the eye area. Leave it on for fifteen minutes, then rinse with lukewarm water.

*Caution:* If acne is extensive or badly inflamed, do not use steam treatments, as this may worsen the condition.

Lavender essential oil is a good antibiotic and antiseptic that can be applied directly to individual blemishes.

Tea tree oil is a natural antibiotic and antiseptic. Dab full-strength tea tree oil (sparingly) on blemishes three times a day, or add 1 dropper of tea tree oil to ¼ cup warm water and pat it on the affected area with a clean cotton ball (be

sure to use 100 percent cotton). Tea tree oil soap also works well. Discontinue it if a rash appears.

Other beneficial herbs include alfalfa, cayenne (capsicum), echinacea, and yellow dock root.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

## Recommendations

Adopt a low-glycemic-load diet that is rich in fruits and vegetables and low in processed grains. Following this diet for twelve weeks has been shown to significantly reduce the number of acne lesions.

Eat a high-fiber diet. This is important for keeping the colon clean and ridding the body of toxins.

Increase your intake of raw foods. The more natural raw foods consumed, the faster the skin will clear and heal. Especially include raw foods that contain oxalic acid, including almonds, beets, cashews, and Swiss chard. Exceptions are spinach and rhubarb; these contain oxalic acid, but should be consumed in small amounts only.

Eat a lot of fruits. This is always good for the skin because of the nutritional value and water content of fruit. You can also use certain fruits as a tonic on the surface of the skin. Grapes, strawberries, and pineapple are rich in alpha-hydroxy acids (AHAs). These acids help to exfoliate the skin by removing the dead skin cells that can clog the oil glands.

Eat more foods rich in zinc, including shellfish, soybeans, whole grains, sunflower seeds, and a small amount of raw nuts daily. Zinc is an antibacterial agent and a necessary element in the oil-producing glands of the skin. A diet low in zinc may promote flare-ups.

Be sure your diet contains vitamins A, C, E, and essential fatty acids. Supplements of these vitamins can prove to be beneficial for acne sufferers. Although vitamin A is important in fighting acne, you must be sure not to take too much. Vitamin E can help regulate vitamin A levels and can also aid in scar prevention.

Drink at least eight glasses of quality water per day.

Avoid alcohol, butter, caffeine, cheese, chocolate, cocoa, cream, eggs, fat, fish, fried foods, hot and spicy foods, hydrogenated oils and shortenings, margarine, meat, poultry, wheat, soft drinks, and foods containing brominated vegetable oils.

Try eliminating dairy products from your diet for one month. Acne may develop due to an allergic reaction to dairy products, and the fat content of the dairy products can worsen the condition. Modern dairy and other animal products often contain hormones and steroids that can upset the body's natural hormonal balance. In the case of children, substitute soy milk for dairy products.

- ❑ If you are not allergic to dairy products, eat plenty of soured products, such as low-fat yogurt, to maintain healthy intestinal flora.
- ❑ Avoid all forms of sugar. Sugar impairs immune function. In addition, biopsies of individuals with acne have shown their tissues' glucose tolerance to be seriously flawed. One researcher calls this condition "skin diabetes." Sugar also promotes the growth of candida, which may be a contributing factor to acne. (See CANDIDIASIS in Part Two.)
- ❑ Eliminate all processed foods from the diet, and do not use iodized salt. Enzymes induce the nutrients in food to be used to construct muscle tissue, nerve cells, bone, skin, and glandular tissue. Because processed foods contain so few enzymes, they can result in damage to the skin and its collagen. Processed foods also contain high levels of iodine, which is known to worsen acne. For the same reason, avoid fish, kelp, and onions.
- ❑ Follow a fasting program. (See FASTING in Part Three.)
- ❑ Use cleansing enemas to remove toxic buildup in the system and promote faster healing. (See ENEMAS in Part Three.)
- ❑ Keep the affected area as free of oil as possible. Shampoo your hair frequently. Use an all-natural soap with sulfur that is designed for acne (available at health food stores). Wash your skin thoroughly but gently no more than twice daily; never rub hard. Overwashing, vigorous scrubbing, and repeated touching of the skin can make acne worse by overstimulating the sebaceous glands, causing them to produce excessive amounts of sebum.
- ❑ Avoid wearing makeup. If you feel you must use cosmetics, use only natural, water-based products. Do not use any oil-based formulas, and avoid any products containing harsh chemicals, dyes, or oils. Wash and dip makeup applicator brushes and sponges in alcohol after each use to avoid contamination.
- ❑ Use a mixture of organic apple cider vinegar and quality water to balance the skin's pH. Mix 1 part apple cider vinegar with 10 parts quality water, and apply the mixture on the affected area.
- ❑ Friction makes pimples more likely to rupture, so avoid wearing tight clothing like turtlenecks. Carefully adjust straps on sports equipment such as bicycle or football helmets. Even using the telephone can exacerbate inflammation if you hold the receiver against your cheek for long periods. Keep your hair away from your face to prevent excess oil and bacteria from being deposited on the skin.
- ❑ If you must shave an area of skin affected by acne, using an electric razor may be beneficial. When shaving with a blade, use a single-edge blade razor and always shave in the direction of hair growth.
- ❑ As much as possible, avoid stress. Stress can promote hormonal changes and cause flare-ups. Many dermatologists also recommend fifteen minutes of sunshine each day, regular exercise, and sufficient sleep for people with acne.

- ❑ Avoid the use of oral or topical steroids, which can aggravate acne.
- ❑ Do not squeeze the blemishes. To do so is to risk increasing the inflammation by causing breaks in the skin in which harmful bacteria can lodge. Do not touch the affected area unless your hands have been thoroughly cleaned.

### Considerations

- ❑ Acne is a message that something may be wrong with your body chemistry, diet, and/or skin care routine. Proper diet, nutritional supplements, and finding the right skin care products may be all that is needed to correct the problem.
- ❑ For severe acne, the drug isotretinoin (Accutane) has been the only reliable treatment. It disrupts plug formation, shrinks the sebaceous glands, and reduces the amount of sebum within the glands. Isotretinoin cures or greatly reduces acne in about 90 percent of the people who use it, but it can cause side effects like dry skin, nosebleeds, headaches, and joint and muscle pain. The most dangerous side effect of isotretinoin is that it can cause serious birth defects, such as fetal brain deformities, if taken during pregnancy. It can even cause birth defects if a woman becomes pregnant up to two months after it is discontinued. If a woman with acne is in her childbearing years, isotretinoin is not recommended unless she is using effective birth control. There have also been isolated cases of depression and other mental disorders among people using this drug, and a study published in the *Archives of Dermatology* found that it might cause a loss of bone density, raising questions regarding its effect on the risk of developing osteoporosis later in life.
- ❑ For severe acne, a treatment that is much safer than Accutane has been developed. It is called Levulan PDT, or the "Blue Light Treatment," and it is ideal for patients of all ages, including teens. During a painless, in-office treatment, the face is first given a mild microdermabrasion (sanding) to remove the surface layer of dead skin, then Levulan (5-aminolevulinic acid) is applied to the face. This application makes acne bacteria more sensitive to light. After about thirty minutes, the Levulan is washed off and up to ten minutes of a special high-intensity blue light (not ultraviolet) is used to kill the bacteria. Some people require more than one session. Skin is more sensitive to sunlight right after treatment, and SPF 45 sunscreen is recommended for at least twenty-four hours.
- ❑ The weapon of choice against moderate cases of acne is topical tretinoin (Retin-A). It helps to keep the pores from becoming clogged by increasing the rate at which dead surface skin cells are shed. Like isotretinoin, tretinoin should not be used during pregnancy. Use it with caution, because it renders the skin extremely vulnerable to sun damage. In addition, the safety of long-term use of tretinoin has not been established. Some "sibling" forms of tretinoin are

being studied in the hope that they may not be as drying to the skin.

Research is being conducted on the development and use of androgen-blocking drugs to stop the oil glands from being turned on by hormonal functions.

An antibiotic cream or an oral antibiotic, such as tetracycline, erythromycin, or clindamycin, is sometimes prescribed for acne. If these drugs are not effective, minocycline may be prescribed. Be aware that this drug can have such side effects as shortness of breath and joint pain. Antibiotics have been known to cause yeast infections (candidiasis) in some people, leading to worsened acne. If you must take antibiotics, it is wise to take some form of acidophilus because antibiotics kill “friendly” bacteria along with “unfriendly” bacteria.

Benzoyl peroxide is the active ingredient in many over-the-counter acne products. It can be helpful, particularly in mild cases, but it is extremely drying and can cause allergic reactions. It should not be applied around the eyes or mouth.

A study conducted by the Department of Dermatology of the Royal Prince Alfred Hospital in New South Wales, Australia, found that a 5 percent solution of tea tree oil was as effective as a 5 percent solution of benzoyl peroxide for most cases of acne, without the irritating side effects.

Blackheads should be removed only with a specially designed instrument, a procedure best done by a professional. Picking, squeezing, or scratching the blemishes may cause scarring, according to dermatologists.

Niacinamide is a major nutrient in the repair of any skin condition because it aids circulation. This increases the supply of fresh, healthy blood to the surface of the skin, which supplies the skin with blood and nutrients.

Dimethylsulfoxide (DMSO), a by-product of wood processing, can be applied to acne lesions to reduce inflammation and promote healing. If used regularly, it may also help minimize scarring from severe cystic acne.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

An acne treatment program called Derma-Klear from Enzymatic Therapy may be helpful.

In rare cases, acne may be a sign of a potentially serious hormonal disorder caused by tumors in the adrenal glands or ovaries. Other symptoms of such problems include irregular menstrual periods and excess facial hair. If such symptoms develop, consult your health care provider.

## ADDISON'S DISEASE

See under ADRENAL DISORDERS.

## ADRENAL DISORDERS

The adrenal glands are a pair of triangular-shaped organs that rest on top of the kidneys. Each gland normally weighs about 5 grams (slightly less than 1/5 ounce) and is composed of two parts. The cortex, or outer section, is responsible for the production of the hormones cortisone, cortisol, aldosterone, androstenedione, and dehydroepiandrosterone (DHEA). The medulla, or central section, secretes another hormone, adrenaline (also called epinephrine), and norepinephrine, which functions as both a hormone and a neurotransmitter.

Adrenaline, cortisol, DHEA, and norepinephrine are the body's four major stress hormones. The highest levels of these hormones are released in the morning and the lowest at night. Cortisol is also involved in the metabolism of carbohydrates and the regulation of blood sugar. Aldosterone helps to maintain electrolyte (salt) and water balance in the body. Androstenedione and DHEA are androgens, hormones that are similar to—and that can be converted into—testosterone. DHEA has been promoted as a cure-all for aging. However, very little is known about the action of DHEA in the body, and while it is available from numerous sources, it is a steroidal hormone and it should be used with caution, preferably under a doctor's supervision. The long-term effects of using DHEA are unknown. (See DHEA THERAPY in Part Three.) Adrenaline speeds up the rate of metabolism and produces other physiologic changes designed to help the body cope with danger. It is produced when the body is under stress. Under circumstances of extreme stress, large amounts of cortisol are released, which can lead to a host of health problems.

Disorders that are directly related to the adrenal glands include reduced adrenal function, usually referred to as *low adrenal reserve*. The adrenals still produce enough hormones to maintain a relatively normal state of health, but stressful situations increase the need for hormones that the malfunctioning adrenals cannot produce, leading to anything from fatigue to total collapse. Symptoms of reduced adrenal function can include weakness, lethargy, fatigue,

recurrent infections, dizziness, low blood pressure when first standing, headaches, memory problems, food cravings, allergies, and blood sugar disorders.

If the adrenal cortex is seriously underactive, a rare condition called Addison's disease may develop. Symptoms include fatigue, loss of appetite, dizziness or fainting, low blood pressure, nausea, diarrhea, depression, craving for salty foods, moodiness, a decrease in the amount of body hair, and an inability to cope with stress. The individual may also constantly complain about feeling cold. Discoloration and darkening of the skin is common in people with Addison's disease; discoloration of knees, elbows, scars, skin folds, and creases in the palms are more noticeable when these body parts are exposed to the sun. The mouth, the vagina, and freckles may appear darker. This disease is also characterized by the development of bands of pigment running the length of the nails and by darkening of the hair. The most common type of this disorder is autoimmune Addison's disease. This comes about when the immune system mistakenly attacks the tissue of the adrenal glands, destroying them. It may be associated with other autoimmune diseases that affect other endocrine glands. The most common of these is hypothyroidism (an underactive thyroid). Addison's disease that coexists with hypothyroidism is known as Schmidt's syndrome. Less commonly, Addison's disease occurs together with insulin-dependent diabetes mellitus, another autoimmune disease; or insufficiencies of the parathyroid glands and/or gonads; or with pernicious anemia. Addison's disease is a chronic condition that requires lifelong treatment. Fortunately, people with Addison's disease can have a normal life expectancy if they stay on the proper medication as prescribed by an endocrinologist (a specialist in hormonal diseases).

Cushing's syndrome is a rare disorder caused by excessive production of cortisol or by excessive use of cortisol or similar glucocorticoid (steroid) hormones. Persons with Cushing's syndrome take on a characteristic appearance: They generally are heavy in the abdomen and buttocks but have very thin limbs, and they have rounded "moon" faces. Muscular weakness and wasting of muscles are also characteristic of this syndrome. Round, red marks mimicking acne may appear on the face, and the eyelids may appear swollen. An increased growth of body hair is common, and women may grow mustaches and beards. People with Cushing's syndrome generally are more susceptible to illness and have trouble healing properly. Thinning of the skin from Cushing's syndrome often leads to stretch marks and bruising. Other symptoms include fatigue, mood swings, depression, increased thirst and urination, and, in women, absence of menstrual periods. If untreated, Cushing's syndrome may cause extreme muscle weakness, poor skin healing, weakening of the bones that results in osteoporosis, and increased susceptibility to serious infections such as pneumonia and tuberculosis.

Adrenal problems that crop up in later life can be due to heredity. In addition, refined carbohydrates in the diet, such

as sugar and white flour, deplete many of the nutrients required for adrenal support, especially the B vitamins. Adrenal enzyme deficiency, vascular spasm, degeneration, trauma, nutritional deficiencies, pituitary disease, tuberculosis, toxic chemical attack, or even exposure to electromagnetic fields can affect the adrenals. Organic chlorine and carbonates are suspected agents. Dioxin and fire ant poisons are known agents. Other chemicals that might be involved include tobacco, alcohol, street drugs, heavy metals, coffee, sugar, pesticides, herbicides, and fungicides.

The functioning ability of the adrenal glands can be impaired as a result of the extensive use of cortisone therapy for nonendocrine diseases, such as arthritis and asthma. The long-term use of cortisone drugs often causes the adrenal glands to shrink in size.

Unless otherwise specified, the dosages recommended in this section are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### Adrenal Function Self-Test

Normally, systolic blood pressure (the first number in the measurement of blood pressure—120/80) is approximately 10 points higher when you are standing than when you are lying down. If the adrenal glands are not functioning properly, however, this may not be the case.

Take and compare two blood pressure readings—one while lying down and one while standing. First, lie down and rest for five minutes. Then take your blood pressure. Then stand up and immediately take your blood pressure again.

If your blood pressure reading is lower after you stand up, suspect reduced adrenal gland function. The degree to which the blood pressure drops upon standing is often proportionate to the degree of hypoadrenalism. However, practice a bit with the blood pressure cuff, as readings can vary a lot, especially with beginners. Or use a digital blood pressure measuring device to avoid errors.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	All B vitamins are necessary for adrenal function.
plus extra pantothenic acid (vitamin B <sub>5</sub> )	100 mg 3 times daily.	The adrenal glands do not function adequately without pantothenic acid.
Vitamin C with bioflavonoids	4,000–10,000 mg daily, in divided doses.	Vital for proper functioning of the adrenal glands.

**Very Important**

Coenzyme A from Coenzyme-A Technologies	As directed on label.	Needed for proper functioning of the adrenal glands. Reduces stress.
L-tyrosine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aids adrenal gland function and relieves excess stress put on the glands. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug.

**Important**

Raw adrenal glandular and raw adrenal cortex glandular	As directed on label. As directed on label.	Protein derived from this adrenal gland substance helps to rebuild and repair the adrenal glands. (See GLANDULAR THERAPY in Part Three.)
Chlorophyll	As directed on label.	Cleanses the bloodstream.
Coenzyme Q <sub>10</sub>	60 mg daily.	Carries oxygen to all glands.
Multivitamin and mineral complex with calcium and magnesium plus natural beta-carotene and copper and potassium and zinc	1,500 mg daily. 750 mg daily. 15,000 IU daily. 3 mg daily. 200 mg daily. 50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	All nutrients are needed to support proper adrenal function. Use a high-potency formula.  If you have diabetes, use a formula without beta-carotene.  Needed to balance with sodium. Potassium is depleted with this disorder. Boosts immune function.
Raw liver extract	As directed on label.	Supplies natural B vitamins, iron, and enzymes.
Raw spleen glandular and raw pituitary glandulars	As directed on label.	Boosts immune function and aids healing process. (See GLANDULAR THERAPY in Part Three.)
S-adenosylmethionine (S-AdoMet) (SAME Rx-Mood from Nature's Plus)	As directed on label.	Helps reduce stress and depression. Gives a sense of well-being. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.

**Herbs**

The herb astragalus improves adrenal gland function and aids in stress reduction.

*Caution:* Do not use this herb in the presence of a fever.

China Gold from Aerobic Life Industries is a liquid herbal combination formula that helps to stimulate adrenal function and combat fatigue. It contains ten different varieties of ginseng plus twenty-six other valuable herbs.

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Using echinacea can increase white blood cell production and protect tissues from bacterial invasion.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Milk thistle extract aids liver function, which in turn helps adrenal function.

Calming herbs such as kava kava, St. John's wort, and valerian are good stress reducers.

*Cautions:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

Siberian ginseng is an herb that helps the adrenal gland prepare the body for stressful situations. The best dosage is 1 to 2 grams (1,000 to 2,000 milligrams) per day, taken in divided doses. Use a ninety-day course for ginseng, alternating with licorice derivatives.

*Cautions:* Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Ashwagandha (*Withania somnifera*), also known as winter cherry, may be helpful.

**Recommendations**

Consume plenty of fresh fruits and vegetables—particularly green leafy ones. Brewer's yeast, brown rice, legumes, nuts, olive and safflower oils, seeds, wheat germ, and whole grains are healthy additions to the diet as well.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Eat deepwater ocean fish, salmon, or tuna at least three times a week. Limit tuna to once a week.

Include in the diet garlic, onions, shiitake mushrooms, and pearl barley. These foods contain germanium, a powerful stimulant for the immune system.

Avoid alcohol, caffeine, and tobacco, as these substances are highly toxic to the adrenal and other glands.

Stay away from fats, fried foods, ham, pork, highly processed foods, red meat, sodas, sugar, and white flour. These foods put unnecessary stress on the adrenal glands.

Get regular, moderate exercise (at least three hours per week). This stimulates the adrenal glands and also helps relieve stress.

- Measure your waist circumference at the smallest width. Women should be less than 35 inches and men less than 40 inches. If you are over this number, you may be chronically overproducing cortisol, which forces body fat to appear on the abdomen. Following a low-glycemic-load diet can help maintain healthy adrenal function.
- Decrease your consumption of caffeine and alcohol, as well as your intake of fats, salt, and sugar.
- If you smoke, stop.
- As much as possible, avoid stress. Continuous and prolonged stress from a troubled marriage, job-related problems, illness, or feelings of low self-esteem or loneliness can be detrimental to the adrenal glands. Take positive action to relieve stressful situations. (See STRESS in Part Two.)

**Considerations**

- A person with Addison’s disease must take medication as prescribed and pay careful attention to diet. Nutritional supplements are recommended. Patients with Cushing’s syndrome need regular physician monitoring.
- Treatment of steroid excess involves management of high blood sugar with diet and medication, replacement of potassium, treatment of high blood pressure, early treatment of any infections, adequate calcium intake, and appropriate adjustments in steroid dosages at times of acute illness, surgery, or injury.
- Adrenocorticotrophic hormone (ACTH), a hormone released by the pituitary gland when under stress, sets a sequence of biochemical events in motion, resulting in the activation of substances that raise blood pressure. The presence of this hormone leads to sodium retention and potassium excretion. As a result of this mechanism, stress not only puts strain on the adrenal glands, but may also cause the body to retain water, which can lead to hypertension.
- Unresolved stress is the most important factor in “adrenal burnout,” with all its manifestations, including immune deficiency and degenerative diseases. Professional help to deal with anger and rage, and to deal with psychological or spiritual issues will help reduce cortisol levels. Any stress-reduction technique that works for you should be pursued.

**AGE SPOTS**

Age spots are flat brown spots that can appear anywhere on the body as it ages. They are also called liver spots. Most age spots appear on the face, neck, and hands. These brown spots are harmless, but they can be a sign of more serious underlying problems. They are the result of a buildup of wastes known as lipofuscin accumulation, a by-product of free radical damage in skin cells. (See FREE RADICALS under ANTIOXIDANTS in Part One.) These spots are actually signs

that the cells are full of the type of accumulated wastes that slowly destroy the body’s cells, including brain and liver cells. In other words, they are a surface sign of free radical intoxication of the body that may affect many internal structures as well, including the heart muscle and the retina.

Factors leading to the formation of age spots include poor diet, lack of exercise, smoking, poor liver function, the ingestion of oxidized oils over a period of time, and, above all, excessive sun exposure. Exposure to the sun causes the development of free radicals that may damage the skin. Most people who have significant numbers of age spots live in sunny climates or have had excessive sun exposure.

The formation of lipofuscin is associated with a deficiency of a number of important nutrients, including vitamin E, selenium, glutathione, chromium, and dimethylaminoethanol (DMAE). Consuming alcohol increases lipofuscin formation.

Unless otherwise specified, the dosages recommended in this section are for adults.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Zinc	80 mg daily, in divided doses. Do not exceed a total of 100 mg daily from all supplements.	Powerful immune system stimulant. Necessary for T lymphocyte function, which is needed to fight infection. Needed for all skin disorders.
ACES + Zn from Carlson Labs	As directed on label.	A combination of powerful antioxidants. Helps to protect against free radical damage.
Ageless Beauty from Biotec Foods	As directed on label.	A free radical destroyer.
Kyolic Formula 105 from Wakunaga	As directed on label.	Supplies an array of antioxidants that are potent cell protectors.
Vitamin B complex plus extra pantothenic acid (vitamin B <sub>5</sub> )	100 mg of each major B vitamin 3 times daily. (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	Needed by older adults for proper assimilation of all nutrients. Supports adrenal gland function.
Vitamin C with bioflavonoids repair.	3,000–6,000 mg daily, in divided doses.	A powerful antioxidant and free radical scavenger necessary for tissue repair.
<i>Important</i>		
Kyo-Dophilus	As directed on label.	Aids in liver regeneration and digestion.
Vitamin E	200 IU daily.	A powerful antioxidant. Fights cellular aging by protecting cell membranes. Improves circulation and prolongs the life of red blood cells. Use d-alpha-tocopherol form.

Helpful		
Calcium and magnesium and vitamin D <sub>3</sub>	1,500–2,000 mg daily. 750–1,000 mg daily. 400 IU daily.	Older adults need these nutrients. Aspartate or chelate forms are best.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Grape seed extract	As directed on label.	A powerful antioxidant that helps prevent age spots.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	To provide antioxidants, amino acids, and herbs that promote overall skin health.
L-carnitine	As directed on label. Take between meals.	Aids in breaking up fat in the bloodstream so it can be removed from the body.
Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Needed for proper brain function and healthy cell membranes. Works well as an antioxidant when taken with vitamin E.
Superoxide dismutase (SOD) plus selenium	As directed on label. As directed on label.	A powerful antioxidant. Good for reducing brown age spots. A powerful antioxidant.
Tretinoin (Retin-A)	As directed by physician.	Acts as a gradual chemical peel; speeds up sloughing off of top layers of skin. Also removes fine wrinkles. Available by prescription only. Takes around six months to show results.

## Herbs

- Burdock, milk thistle, and red clover aid in cleansing the bloodstream.
- Ginkgo biloba improves circulation and is a potent antioxidant.

**Caution:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Emu oil has shown good results on brown spots.
- Other herbs beneficial for age spots include ginseng, green tea, and licorice.

**Caution:** Do not use ginseng if you have high blood pressure, or are pregnant or nursing. Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

## Recommendations

- Eat a diet that is high in vegetable protein and that consists of 50 percent raw fruits and vegetables, plus fresh grains, cereals, seeds, and nuts. Be aware that seeds and nuts become rancid quickly when subjected to heat and/or exposed to the air. Purchase only raw nuts and seeds that have been vacuum-sealed; keep tightly sealed once opened.
- Omit all animal protein from the diet for one month.
- Avoid caffeine, fried foods, saturated fats, red meat, processed foods, sugar, and tobacco.
- Follow a fasting program to cleanse the liver and rid the body of toxins. A properly functioning liver and a clean colon are important. Use black radish extract or dandelion root and beet juice along with three days of fasting a month with distilled water and fresh lemon, fruit, and vegetable juices. (See FASTING in Part Three.) Use cleansing enemas while fasting. (See ENEMAS in Part Three.)
- Limit sun exposure.
- Do not use cleansing creams, especially hydrogenated, hardened creams. Cleanse your skin with pure olive oil and a warm wet washcloth, then rinse with lemon juice and water.
- This has worked for some people: At night, saturate a cotton ball with pure lemon juice and put it over the spots (but do not apply it near the eyes). There may be some tingling, but only for a few minutes. If there is no sign of irritation, apply morning and night.

## Considerations

- The prescription drug tretinoin (retinoic acid or Retin-A) is being used for age spots with good results.
- Freezing brown or yellow spots off can usually eliminate them. During a painless in-office procedure, the doctor brushes liquid nitrogen on the spots with a cotton swab. In two seconds the cells freeze, and within five days, cells flake away, and the spots disappear. Alternatively, a doctor can burn the spots off with acid applied directly to the spots, or remove them using laser light. With this process, there is no lightening of the skin after removal is completed.
- See AGING in Part Two.

## AGING

Aging is not an illness, but it does make the body more vulnerable to disease. There are many theories on aging and its causes. Some of the more prominent ones are as follows:

- **DNA/genetic theory.** The DNA in our bodies contains a genetic blueprint, which we inherit from our parents and ancestors. This is a unique code, which determines a number of factors affecting aging. Things that happen during our lifetime that damage the DNA, such as expo-

sure to pollutants, toxins, radiation, our diet, and many other environmental and lifestyle factors, can affect the ability of our body to repair damage. This genetic damage can cause the production of abnormal proteins and sugar-protein complexes, which leads to defective cell repair, loss of cell elasticity, and other symptoms of the aging process.

- *Neuroendocrine theory.* The pituitary gland and hypothalamus (a structure in the brain) regulate the release of key hormones to influence cell metabolism, protein synthesis, immune function, and the biochemical functioning of all bodily cells. The theory is that the hypothalamus over time loses its ability to regulate all these functions. The secretion of hormones gradually decreases over time, and this deterioration in the regulatory and hormone production process leads to aging. For instance, the decline in the polypeptide hormone insulin-like growth factor 1, or IGF-1, is linked to a decline in cell activity. IGF-1 is a liver-produced product of human growth factor (HGH) that is secreted by the pituitary gland. Research has shown that IGF-1 increases insulin sensitivity, increases lean body mass, reduces fat, and builds bone, muscle, and nerves. One of IGF-1's greatest feats is the ability to repair peripheral nerve tissue that has been damaged.
- *Free radical or oxidation theory.* This theory asserts that unrepaired cumulative cell damage caused by free radicals, generated by normal metabolism, and contributed to by outside sources, is the cause for aging. Outside factors in the environment, such as exposure to toxins, pollutants, radiation, alcohol, and tobacco, as well as diet, cause highly reactive cell by-products called free radicals to be formed. These free radicals are molecules or portions of molecules capable of independent existence. Because they have odd numbers of electrons (electrons normally occur in pairs), they are unstable and react quickly with other compounds, trying to capture a needed electron to gain stability. When an attacked molecule loses an electron to a free radical, it becomes a free radical itself. This process can cascade to cause disruption to living cells. Only when two free radicals react together do they eliminate each other and stop the process. Of special interest in aging are the oxygen free radicals, which often take an electron away from another molecule to pair with their single free electron. This process is called *oxidation*. Toxic metabolites can accumulate that interfere with the function of the cell membranes, protein synthesis, and the cellular DNA/RNA itself. Cell energy production is adversely affected, which accelerates the aging process. The vitamins C and E, among many other antioxidants, are thought to protect against the destructive effects of free radicals by donating one of their electrons to end the cascading reaction. These nutrients are stable even in this state. In effect, they act as scavengers, helping to protect against

cell and tissue damage. Denham Harman, M.D., Ph.D., Professor Emeritus at the University of Nebraska, is considered the founder of the free radical theory of aging. He postulated that many of the degenerative disorders we associate with aging, including cancer and hardening of the arteries, are not inevitable results of the passage of time, but rather are the result of the breakdown of nucleic acids, proteins, and cell structures caused by the presence of free radicals. (See ANTIOXIDANTS in Part One.) One study showed that oxidation to DNA can be mitigated in elderly subjects who take one multivitamin each day. This indicates that the regular diet does not always supply the right mix of nutrients to reduce oxidative damage, and that supplementation, especially in the elderly, is warranted.

- *Cross-linking theory.* During normal metabolism, sugars such as glucose or fructose and reactive compounds known as aldehydes and ketones may attach to free amino groups on proteins. This process is called *glycation* and the protein is then saddled with sugar molecules. This protein then can react, or "cross-link," with other proteins to cause a bond between the two. The resulting so-called carbonyl groups act as a glue to attach the two proteins. Carbonyls are formed when either a sugar or free radical (or an aldehyde or ketone) reacts with amino acids on a protein. It is possible to have not only protein-protein cross-linking, but also protein-lipid and protein-DNA cross-linking. This cross-linking results in large aggregates of damaged proteins within the tissues, called advanced glycosylation end products (AGEs). These may go on to react with free radicals to cause tissue damage through oxidation, they inhibit certain cellular processes, they can be mutagenic (cancer-causing), and they stimulate cells to produce even more damaging free radicals. AGEs also act to accelerate cell death. Thus, treatment to both inhibit cross-linking and to reverse it, if possible, should be beneficial in combating the aging process.
- *Immune theory.* The immune system gradually gets less effective as we age. For instance, the thymus gland, which is responsible for the production of thymic lymphoid, or T cells, can decrease its function by up to 80 percent as we reach our middle years. As we age, the immune system is less able to produce the antibodies, macrophages, natural killer (NK) cells, and others that the body needs to fight off infections and other assaults from the outside. There is also an increased tendency to produce antibodies against the body itself—the autoimmune response, which is responsible for a host of autoimmune diseases.
- *Telomere theory.* Cells in the body are replaced by means of cell division, and there is a limit to the number of times they may divide successfully. That is, most cells normally divide approximately fifty times before they

stop dividing and die a natural death. It is theorized that the mechanism that controls this cell division lies with the telomere, which is a caplike structure on the end of each of the twenty-three pairs of chromosomes. Chromosomes are the helical structures of DNA that are found in all cell nuclei that carry our genetic code. Every time a cell divides, the telomere shortens up a bit. This constant shortening of the telomere means that after a certain number of divisions the telomere disappears, and the end of the chromosome begins to fray and stop dividing. This leads eventually to the death of the cell. Over time, this cumulative cell death leads to aging. However, an enzyme called telomerase has been discovered. This enzyme acts to repair damage to the telomere, and helps to maintain its length and stability. The theory is that by using telomerase, we may be able to prolong cell life and slow down or even reverse the aging process. For now, we know that certain controllable factors—smoking, obesity, low vitamin D levels, and stress—hasten telomere attrition. Diseases such as heart disease and diabetes also speed up telomere shortening, but this process is slowed with good medical management such as by keeping blood cholesterol and blood sugar close to normal levels.

- *Stem cell theory.* This theory holds that as we age, we begin losing stem cells from the reserve we are granted at birth. This also means that the body's ability to repair and generate tissues is diminished, and we accumulate more and more dysfunctional cells as time passes. Aging is simply the accumulation of these dysfunctional cells, and the damage they cause to skin, organs, the immune system, the muscles, and every other system in the body can only be undone by the addition of new stem cells.
- *Cell metabolic theory.* Nutrition has an effect on the rate at which cells divide (see Telomere Theory, above). Caloric restriction has been shown in one animal study to increase life span by affecting the cell division rate. In another study, it was concluded that caloric restriction primarily slowed the aging process by an associated decrease in oxygen free radicals produced by the mitochondria (the energy-generating structures within the cells). No human studies have been conducted to date, but cultural/anthropological data indicates a possible link.

Whatever theory of aging ultimately proves to be correct, and probably there are a number of factors which, in combination, will eventually be found to have a profound effect, it is unquestionably true that a significant number of problems faced by people over the age of sixty may also be attributable to nutritional deficiencies. Many elderly people have malabsorption problems, in which the nutrients in food are not properly absorbed from the gastrointestinal tract. In addition, as we age, our bodies do not assimilate nutrients as well as they once did. At the same time, as the

body ages, its systems slow down and become less efficient, so the correct nutrients are more important than ever for the support, repair, and regeneration of the cells.

There are many disorders associated with an inability to absorb nutrients successfully. One study of older people living in an urban area found that 90 percent of those examined had an inadequate intake of vitamins B<sub>1</sub> (thiamine) and B<sub>6</sub> (pyridoxine), and 30 to 40 percent demonstrated deficiencies of vitamin A, vitamin B<sub>3</sub> (niacin), vitamin B<sub>12</sub>, vitamin C, calcium, and iron. Low blood levels of selenium and total carotenoids such as beta-carotene predicted early death. Only 10 percent of the subjects consumed adequate amounts of protein. Many Americans in nursing homes and other confined environments are deprived of sunlight, making them deficient in vitamin D. A diet that lacks essential nutrients over a long period of time leads to a greater risk of degenerative disease, heart disease, and some forms of cancer.

Vitamin B<sub>12</sub> deficiency is a particular problem. A lack of vitamin B<sub>12</sub> can lead to the development of neurological symptoms ranging from tingling sensations, inability to coordinate muscular movements, weakened limbs, and lack of balance to memory loss, mood changes, disorientation, and psychiatric disorders. Symptoms of vitamin B<sub>12</sub> deficiency can easily be misinterpreted as signs of senility. Folic acid is also related to the level of cognition in the elderly. Low folate levels were indicators of cognitive decline with aging and could contribute to the development of Alzheimer's disease. Vitamin E is an important nutrient, but in one study, at doses of 300 IU per day, it did not have an effect on memory in elderly women. It is possible that this amount was too low to create a benefit.

Many older people become deficient in vitamin B<sub>12</sub> because they do not produce adequate amounts of stomach acid for proper digestion. This creates a perfect environment for the overgrowth of certain bacteria that steal whatever vitamin B<sub>12</sub> is extracted from protein in the digestive tract. Other people do not produce enough of a substance called intrinsic factor, without which vitamin B<sub>12</sub> cannot travel from the stomach to the rest of the body, even if nothing else is standing in its way.

One can have vitality and a zest for living at any age. You should not assume that pain and illness are inevitable parts of aging. You can feel better at sixty than you did at thirty by making healthy changes in your diet and lifestyle.

Adding the right supplements should give you the added power needed to boost immunity and prevent or cure most disorders—not to mention making you able to work or play longer than people much younger than you are. Looking youthful for your age is an added bonus. But remember: It takes years for these problems to develop, so it usually takes some time to resolve them as well. There are no silver bullets or magic potions, only the simple fact that if you give your body the correct fuel, it will perform for you and ward off illness. Supplements work best in combination with a nutrient-rich diet that contains plenty

of protein and regular exercise. Elderly people have been shown to benefit from including pomegranate juice in their diet instead of apple juice for better antioxidant protection. In addition, those who included chocolate, wine, and tea performed better on tests of memory and cognition.

Most of the supplements listed below can be found in complexes containing many nutrients. Be sure to check the amounts of different nutrients in your multinutrient supplements, and either exclude individual nutrients or adjust the dosages, as appropriate. For best absorption of nutrients, use as many sublingual, liquid, and powdered supplements as possible. It makes sense for older adults to use nutrients in drink form, but there are many good supplements in powder and liquid forms as well.

Unless otherwise specified, the dosages recommended in this section are for adults.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Alpha-lipoic acid	As directed on label.	A powerful antioxidant. Aids proper blood sugar balance (diabetes) and liver function.
Super Carnosine	500–1,000 mg daily, or per health care practitioner's advice	Offers protection against glycation (cross-linking) that creates AGEs. Also available in combination with vitamin B <sub>1</sub> , benfotiamine, and luteolin from Life Extension.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Coenzyme Q <sub>10</sub>	100 mg daily.	Aids circulation, improves cellular oxygenation, and protects the heart.
Dimethylglycine (DMG) (Aangamik DMG from Food Science of Vermont)	As directed on label.	Improves cellular oxygenation. Use a sublingual form.
Glutathione	500 mg daily, on an empty stomach.	A potent free radical scavenger and mental booster that acts as a mood elevator. Also destroys ammonia, which interferes with brain function.
Inositol hexaphosphate (IP <sub>6</sub> ) from Enzymatic Therapy or Jarrow Formulas	As directed on label.	A powerful antioxidant that has many benefits (see under NATURAL FOOD SUPPLEMENTS in Part One).
L-arginine and L-carnitine and L-lysine and L-methionine and L-ornithine and L-tyrosine plus	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. It is best to take a complex containing all the amino acids as well (but separately).	See AMINO ACIDS in Part One for the benefits of amino acids. Do not take single amino acids for longer than 2 months at a time. To avoid creating imbalances, alternate taking them for a month and then stopping for a month. Protects the heart and liver; decreases blood triglycerides; enhances the effectiveness of antioxidants; improves muscle strength and brain function.

N-acetylcysteine	500 mg twice daily, on an empty stomach.	Attaches to heavy metals such as lead and mercury and removes them from the body. Also enhances brain function. Used by the body to produce glutathione, a powerful antioxidant and detoxifier.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	An excellent cell protector. See under ANTIOXIDANTS and NATURAL FOOD SUPPLEMENTS in Part One for its many benefits.
Multivitamin and mineral complex with vitamin A and natural beta-carotene and all the carotenoids and potassium and selenium	15,000 IU daily. 25,000 IU daily. 99–200 mg daily. 300 mcg daily.	All nutrients are needed. Use a high-potency formula with chelated trace minerals. Important antioxidants. Protect the lungs. Needed for growth and repair of body tissues. Promotes smooth skin.
and zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Plays a role in cellular integrity and water balance. Prevents premature aging, boosts immunity, protects against cancer and heart disease. Needed for wound healing and healthy skin. Enhances immune function.
Omega-3 essential fatty acids (flaxseed oil, primrose oil, salmon oil, and Ultra Omega-3 Fish Oil from Health From The Sun are good sources)	As directed on label 3 times daily, with meals.	Plays an important role in cell formation. Essential for proper brain function. Protects the heart and helps keep plaque from adhering to the arteries.
Pycnogenol or grape seed extract	50 mg twice daily. As directed on label.	Possibly the most powerful free radical scavengers. They can pass through the blood-brain barrier to protect brain cells from free radical damage.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label. As directed on label.	A potent antioxidant that destroys free radicals, which damage body cells and cause premature aging. Consider injections (under a doctor's supervision). An antioxidant complex containing SOD.
Taurine Plus from American Biologics	As directed on label.	A building block for all amino acids that improves white blood cell function. Use the sublingual form.
Vitamin B complex plus extra pantothenic acid (vitamin B <sub>5</sub> ) and choline and inositol and para-aminobenzoic acid (PABA)	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). If you use sublingual forms, you need less. Follow label directions. 50 mg 3 times daily. 50 mg 3 times daily. 50 mg 3 times daily.	The B vitamins fight depression; aid in transforming proteins, fats, and carbohydrates into energy. Necessary for the formation of certain proteins and for the functioning of the nervous system. Essential for healthy red blood cells and the absorption of nutrients, including iron. Injections (under a doctor's supervision) are best. If injections are not available, use sublingual forms.

Vitamin B <sub>3</sub> (niacinamide)	50–100 mg 3 times daily.	Important in proper functioning of the nervous system. A vasodilator that protects the heart and body cells. <i>Caution:</i> Do not substitute niacin for niacinamide. Niacin can be toxic in such high doses.
Vitamin C with bioflavonoids	4,000–10,000 mg daily, in divided doses.	A powerful antioxidant and immune system enhancer that reduces allergies, protects the brain and spinal cord, keeps white blood cells healthy, fights fatigue, and increases energy.
Vitamin E	Start with 100 IU daily and slowly increase to 200 IU daily. If you take blood-thinning medication, consult your physician before increasing the dose.	A potent antioxidant that fights cellular aging by protecting cell membranes. Also improves circulation and prolongs the life of red blood cells. Use d-alpha-tocopherol form.

**Very Important**

Boron	3–6 mg daily. Do not exceed this amount.	Aids calcium absorption and brain function.
Calcium and magnesium and vitamin D or Bone Defense from KAL	1,500–2,000 mg daily.  750 mg daily.  600–1,000 mg daily.  As directed on label.	Necessary to prevent bone loss and for normal heart function. Use calcium chelate or calcium aspartate form. Needed to balance with calcium for correct muscle and heart function. Enhances calcium absorption and bone formation. Contains calcium, magnesium, phosphorus, and other valuable bone-reinforcing nutrients.
Chromium picolinate	400–1,000 mcg daily.	Improves insulin efficiency, which maintains the health of the glands that control aging.
5-Hydroxy L-tryptophan (5-HTP) (Natural Balance is a good source)	As directed on label.	An important neurotransmitter.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label 3 times daily. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. deficiencies.	To supply needed protein. Older adults often have difficulty assimilating dietary protein, and so are likely to have amino acid
Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Improves brain function and memory. Protects nervous system cells. A fat emulsifier.
Phosphatidylserine	1,000 mg 3 times daily.	Improves brain function.
RNA and DNA	As directed on label.	Good for healthy cell reproduction. Use a sublingual form. <i>Caution:</i> Do not take this supplement if you have gout.

**Helpful**

Acidophilus	As directed on label.	To improve liver function and aid in digestion by replacing bowel flora.
Benfotiamine	150–600 mg daily, or as recommended by health care practitioner.	Protects against diabetic neuropathy or retinopathy. This fat-soluble form of

		vitamin B <sub>1</sub> lasts longer in the body and is less toxic than the water-soluble form. Blocks absorption of excess glucose into cells. <i>Caution:</i> Do not use if you are pregnant or nursing.
Dehydroepiandrosterone (DHEA)	As directed on label. Women should not take more than 15 mg daily except under medical supervision.	Studies show it slows the aging process. ( <i>See under</i> NATURAL FOOD SUPPLEMENTS in Part One.)
Dimethylglycine (DMG)	As directed on label.	Boosts mental energy, enhances the immune system. ( <i>See under</i> NATURAL FOOD SUPPLEMENTS in Part One.)
Glucosamine sulfate or N-Acetylglucosamine (N-A-G from Source Naturals) plus chondroitin	As directed on label.  As directed on label.	Important for the formation of bones, skin, nails, connective tissues, and heart valves; also plays a role in the mucous secretions of the digestive, respiratory, and urinary tracts.
Lutein	As directed on label.	Protects the retinas from macular degeneration, the leading cause of blindness in older adults.
Melatonin or ChronoSet from Allergy Research Group	1.5–5 mg daily, taken 2 hours or less before bedtime.  As directed on label.	Delays the aging process and improves sleep. Good for many disorders associated with aging. Contains melatonin.
Multienzyme complex with pancreatic and ox bile (Digestive Aid #34 from Carlson Labs)	As directed on label, after meals.	To aid digestion. Most older adults lack sufficient digestive enzymes. <i>Caution:</i> If you have a history of ulcers, do not use a formula containing HCl.
Raw thymus glandular	500 mg daily.	Enhances the immune system.
S-adenosylmethionine (SAME)	As directed on label.	Aids in reducing stress and depression, giving a sense of well-being. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
Silica (Jarrosil from Jarrow Formulas or Body Essential Silica from NatureWorks)	As directed on label.	Protects connective tissues and cells; keeps skin, bones, hair, nails, and other tissues youthful.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Increases antibodies and protects the eyes against macular degeneration and vision loss. Very important for the prostate. Needed to balance with zinc.

## Herbs

Astragalus and echinacea help to boost the immune system.

*Caution:* Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Bilberry and ginseng are good for giving extra energy, improving brain function, increasing circulation, and promoting better blood flow to supply oxygen to the cells. Bilberry also protects the eyes.

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Burdock root and red clover cleanse the bloodstream. They can be used separately or in combination.

Dandelion and milk thistle promote good liver function and bile flow.

Garlic helps immune function and protects the heart.

Ginkgo biloba has powerful antioxidant properties and increases the supply of oxygen to the brain cells, enhancing brain function.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Green tea aids in cancer prevention and is a powerful antioxidant.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Noni (*Morinda citrifolia*) is a plant that grows in Hawaii. Its fruit has many health benefits and has been used for thousands of years to ease pain and inflammation, relieve joint problems, promote cellular regeneration, boost the immune system, and improve digestion. Earth's Bounty NONI is a good source of this herb.

Kava kava, St. John's wort, and valerian root are valuable as sleep aids and tranquilizers. St. John's wort is also a natural antidepressant.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Licorice root is an effective anti-inflammatory and anti-allergenic agent that supports the organ systems.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with

diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Nettle is full of vital minerals and is good for hypoglycemia, allergies, arthritis, depression, prostate and urinary tract disorders, and a host of other problems.

Saw palmetto aids in preventing cancer and, for men, in improving benign (noncancerous) prostate enlargement. It inhibits the production of dihydrotestosterone, a hormone that contributes to enlargement of the prostate.

Wild yam contains natural steroids that have a rejuvenating effect. Steroids are what help exercise to melt off more weight and build muscle. This hormone is found in the human body as dehydroepiandrosterone (DHEA). Take larger amounts—2,400 mg daily, dropping to 1,600 mg daily—for two weeks, then stop for two weeks.

## Recommendations

Eat a balanced diet that includes raw vegetables, fruits, grains, seeds, nuts, and quality protein such as fish and soy foods. Consume less animal protein. Include in your diet broccoli, cabbage, cauliflower, spinach, kale, fish, fruits, whole grains, nuts, oats, seeds, and soybeans. Avoid processed foods.

Eat dark-skinned fruits such as red apples and nectarines, which are good sources of bioflavonoids. The skin contains the bioflavonoids, so leave it on. Red Delicious and McIntosh apples have the most bioflavonoids in the skin, the Northern Spy has the most in its flesh. Fuji apples have the highest overall.

Eat blueberries, raspberries, and blackberries regularly. Wild blueberries contain more bioflavonoids than domestic varieties. Bioflavonoids found in most fruits and vegetables keep free radicals from harming the brain and may help protect against Alzheimer's disease.

Black, green, and orange pekoe teas all contain bioflavonoids called catechins. Green tea contains the most epigallocatechin-3-gallate, an antioxidant effective in preventing degenerative brain disease.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Eat 80 to 100 grams of protein a day, meting it out evenly at three meals and two to three snacks. Protein, along with exercise, is important to prevent muscle wasting. Sarcopenia is a disease of muscle wasting that leads to profound weakness and ennui, and affects elderly people who do not consume adequate protein or get enough exercise. Sarcopenia is becoming a more prevalent condition as people live longer.

Consume four or five small meals daily.

A low-calorie diet is best for maintaining good health as you age. Eat only when you are hungry, and consume foods that are fresh and cooked in a fashion that maintains their nutritional content. A diet too high in carbohydrates may increase glucose levels (see DIABETES in Part Two). Decrease your overall food consumption, but increase your intake of raw foods.

Avoid gaining and losing weight, which can result in the loss of lean tissue (or muscle). The loss of lean muscle tissue in the elderly could precipitate sarcopenia. However, excess body fat increases the risk of heart disease and diabetes, especially in the elderly, and weight loss will reduce these risks. If you are over sixty years of age and are advised to trim down, lose no more than six to nine pounds over one to one and a third years to avoid losing too much lean body mass.

Consume steam-distilled water. Drink even when you don't feel thirsty—your body needs plenty of water. Dehydration has been identified as one of the most frequent causes of hospitalization among people over the age of sixty-five, according to a recent study published in the *American Journal of Public Health*. Common symptoms of dehydration include fatigue; headache; dry nasal passages; dry, cracked lips; and overall discomfort.

Include in your diet garlic, onions, shiitake mushrooms, and pearl barley. These foods are good sources of germanium, potassium, and many other nutrients that lessen free radical damage and act as catalysts in the supply of oxygen to oxygen-poor tissue.

An occasional glass of red wine is good for the heart, but limit your alcohol consumption otherwise.

Cut back on salt.

Avoid saturated fats.

Avoid caffeine, red meat, white flour, white sugar, chemical food additives, drugs, pesticides, and tap water.

Get regular exercise. Exercise is most important in slowing the aging process because it increases the amount of oxygen available to body tissues, a key determinant of energy and stamina. Brisk walking and stretching exercises are good. Swimming is even better because it provides low-impact exercise and exerts no pressure on the joints. For those with arthritic conditions, swimming is the ideal way to exercise. Exercise can ward off conditions such as arthritis, cardiovascular disease, diabetes, and osteoporosis, and because it releases endorphins into the body, exercise can also help overcome depression. Our brains need exercise as much as our bodies do. Bodily exercise increases the supply of oxygen to the brain. Studies have found that no matter how old you are—whether you are in your sixties, seventies, eighties, or even in your nineties—you can rebuild muscle. Science has found that brain cells do not die as we age if we keep our minds active. Hobbies, reading, and acquiring new skills exercise the brain and help prevent memory loss. If you don't currently exercise, start walking and build up to thirty minutes a day. The goal is to eventually be getting one hour of

moderate exercise a couple of times a week. Some elderly people have found that the dietary supplement creatine increases muscle mass when coupled with exercise. In one study, people taking 20 grams of creatine a day experienced increased strength, power, and lower-body motor function performance in just seven days. Others found that taking 20 grams of creatine improved long-term memory. Even small amounts—about 3 grams a day—helped build muscle.

Improve your blood's oxygenation and circulation with deep breathing exercises. Try holding your breath for thirty seconds every half hour. Inhale and hold for thirty seconds, then place your tongue on the roof of your mouth where your teeth meet your gums and release the air slowly. Repeat this exercise every day.

Keep the colon clean. This is crucial for warding off degenerative diseases and slowing the aging process. Eat a high-fiber diet and use a cleansing enema once weekly. (See ENEMAS in Part Three.) Get extra fiber by eating plenty of fresh vegetables, whole grains, bran, and oats. Consider retention enemas, a potent way to assure that your body will assimilate and use needed nutrients.

Learn how to relax. Keep active and be enthusiastic about life. By keeping up your appearance, exercising every day, and being involved in hobbies and other activities, you can keep your mind active. This is most important.

Allow yourself sufficient sleep. Proper rest is important.

Do not use harsh soaps on your skin. Use olive, avocado, or almond oil to cleanse the skin. Pat the oil on, then wash it off with warm water and a soft cloth. Use a facial loofah occasionally with the oil and warm water to remove dead skin. Use liquid creams and lotions (not solid creams) that contain nutrients and natural ingredients to keep your skin from becoming too dry. Do not use cold creams, cleansing creams, or solid moisturizing creams. These are hardened saturated fats that become rancid rapidly and then create free radicals, which can cause premature wrinkles. Free radicals can cause the brownish spots on the skin known as age spots. (See AGE SPOTS in Part Two.) Exposing the skin to the sun also promotes free radicals. To halt wrinkles, stay out of the sun and use all-natural lotions or oils that contain nutrients and antioxidants.

Don't smoke or overexpose yourself to harmful chemicals such as environmental pollutants.

### Considerations

Growing older is inevitable; however, we can try to slow the aging process and prolong our lives by taking measures to promote continuous cell division. If science could keep the cells from dying and doing bodily harm, the aging process could conceivably be suspended.

Many older adults complain of sleep difficulties. One common cause is the consumption of sugar after dinner. Complex carbohydrates have a relaxing effect. A good nighttime snack is popcorn, or nut butter and crackers.

❑ Fatigue is a common, but not necessary, result of aging. Human growth hormone is available to increase muscle mass, which in turn boosts strength and energy. Published studies on the use of human growth hormone in elderly people have shown that there are too many side effects and not enough benefits to endorse its widespread use. However, if fatigue is a serious issue, some medical centers offer human growth hormone treatment. For natural management of fatigue, some elderly people have reported less physical and mental fatigue after taking acetyl L-carnitine—2 grams, twice a day.

❑ A burning sensation, mainly on the bottom of the feet, is not unusual among elderly people. A deficiency of the B vitamins, especially vitamin B<sub>12</sub>, is often the cause. Since many older people have problems with absorption of the B vitamins, it is best to take supplements of these nutrients in a way that bypasses the digestive tract. Injections are best. Sublingual administration is also effective.

❑ The *American Journal of Clinical Nutrition* reported that up to 30 percent of people over the age of sixty-five are unable to absorb vitamin B<sub>12</sub> and folic acid properly because they do not produce enough hydrochloric acid and/or they suffer from an overgrowth of bacteria in the intestinal tract.

❑ There are a number of substances available that have properties that make them “natural life extenders,” such as the following:

- Coenzyme Q<sub>10</sub> protects the heart, increases tissue oxygenation, and is vital for many bodily functions. The liver and heart muscle have the highest levels of coenzyme Q<sub>10</sub> of tissue. Since the liver is the main detoxifying organ of the body, optimal liver function is vital for minimizing damage to all the body’s tissues.
- Dimethylaminoethanol (DMAE) is beneficial for memory and mental ability, acting to increase alertness and focus. It may also enhance mood and vision.
- Dimethylglycine (DMG) is a derivative of the amino acid glycine. It boosts immune function and improves tissue oxygenation.
- Glutathione is an amino acid compound that is a valuable antioxidant and detoxifier. Cellular glutathione levels tend to drop by 30 to 35 percent with age; increasing glutathione, particularly in the liver, lungs, kidneys, and bone marrow, may have an antiaging effect. Glutathione can be taken in supplement form. Glutathione levels can also be increased by taking supplements of N-acetylcysteine, which is converted into glutathione in the body. (See AMINO ACIDS in Part One.)
- Human growth hormone (HGH or GH), also known as somatotropin, is the hormone that regulates growth. Administered to older adults, it rebuilds muscle mass and reduces the amount of fat tissue, reversing changes that occur with aging. It is available only under the supervision of a physician. (See GROWTH HORMONE THERAPY in Part Three.)

- Lipoic acid is critical in glycolysis and in the Krebs’s cycle, two complex biochemical processes essential for the generation of cellular energy. The liver relies on these processes to meet its large energy demands. Lipoic acid is used extensively in Germany to enhance liver function and treat diabetes. It should be taken with acetyl L-carnitine for maximum effectiveness. Juvenon from Juvenon Inc. is a good source of both ingredients.
- Melatonin is a natural hormone that acts as an antioxidant. Early in life, the body produces an abundant supply, but as we age, production steadily declines. In one laboratory experiment, mice given melatonin lived almost one-third beyond normal life expectancy. Melatonin may also help prevent cancer, counteract insomnia, and boost immunity.
- Morel, reishi, shiitake, and maitake are mushrooms that were touted by the ancient Chinese as superior medicines that give eternal youth and longevity. They prevent high blood pressure and heart disease, lower cholesterol, prevent fatigue and viral infections, and much more. They are found in supplement form as well as fresh.
- Pantothenic acid (vitamin B<sub>5</sub>) keeps hair healthy, with little graying, and prevents premature hair loss. It is also very important for normal adrenal and immune function.
- Para-aminobenzoic acid (PABA) is one of the B vitamins. It keeps skin healthy and delays wrinkles. In addition, the combination of PABA and dimethylaminoethanol (DMAE) has been found to enhance brain function, immunity, and cellular regeneration.
- Pregnenolone is a naturally occurring hormone that may improve brain function, enhancing mood, memory, and thinking ability. (See under NATURAL FOOD SUPPLEMENTS in Part One.)
- Pycnogenol is a powerful bioflavonoid and antioxidant.
- Superoxide dismutase (SOD) is an enzyme that is a powerful free radical scavenger that protects the cells.
- Vitamin B<sub>12</sub> and vitamin D are nutrients essential for optimal health and brain function, but many elderly people are deficient in both. Unfortunately, they are not common in many foods, so supplementation is often needed. The elderly should have their blood levels tested.

❑ As people age falls are all too common. Older adults are more likely to have weak muscles, poor vision, weaker legs, decreased sensation, or other medical conditions that make them more likely to fall easily, and with more troublesome consequences. They are also more likely than younger people to take prescription medications, some of which can slow reflexes, decrease perception, and/or impair mobility—in so doing, increasing the danger of injury through an accidental fall. Physical injury is only one potential consequence of a fall for older adults, especially those who are frail to begin with. Recovery is often prolonged even after relatively minor falls, and this can lead to complications such as bedsores,

## Selected Prevention and Screening Recommendations for Adults

One of the keys to staying healthy as we age is to practice preventive health care. In addition to adhering to a healthy diet and lifestyle, with appropriate nutritional supplementation, doctors recommend undergoing certain routine screening procedures. The following is a summary of recom-

mendations for some of the most important medical tests. If you are at risk of any particular illness due to heredity or personal history, you should probably undergo testing more frequently to ensure that all is well. Ask your physician what he or she recommends in your particular case.

Test	Why It's Done	Who Should Be Tested	How Often
Blood cholesterol	To look for signs of cardiovascular disease.	Men and women forty and over.	Once every five years. If your tests show a high LDL (bad cholesterol) level, you may need more frequent testing. Also, a high triglyceride level may be predictive of future heart disease. Ask your physician.
Blood pressure	To check heart function.	Men and women over forty.	Every visit to the physician, or at least once a year.
Breast self-exam and physician breast exam and mammogram	To detect breast cancer.	Women thirty and over. Women thirty and over. Women forty and over (men can get breast cancer too, but it is so rare that routine screening is not done).	Once a month. Once a year.
Colonoscopy	To detect colorectal cancer.	Men and women fifty and over, earlier if there is a family history of the disease.	Once every three to five years after initial exam, or more often if recommended by physician.
Complete physical examination; may include complete blood count (CBC) and/or blood chemistry (Chem 7 [SMA7] or Chem 20 [SMA20])	To assess overall health. To check for anemia and leukemia. To check for liver dysfunction, thyroid problems, kidney function, and diabetes.	Men and women twenty and over.	From age twenty to thirty, once every five years. From age thirty to sixty, once every two years. Over age sixty, once annually.
Pap smear/pelvic examination	To test for cervical cancer and other reproductive problems.	Women eighteen and over, or younger if they become sexually active at an earlier age.	Once a year. After three consecutive negative tests, frequency may be decreased at physician's discretion.
PSA test and rectal examination	To look for signs of prostate cancer.	Men forty and over.	Once a year.
Stool guaiac test	To test for blood in the stool.	Men and women over forty.	Once a year.

In addition, doctors recommend that all adults receive a tetanus vaccine booster every ten years.

greater muscle weakness, and increased susceptibility to infection. Keeping physically active is important for maintaining strength and coordination, and is one of the best defenses against such accidental injuries. It is also important to discuss with your physician or pharmacist the possible side effects of any medications you are taking.

❑ Aging is not an illness, but it does increase one's chances of developing certain health problems. Constipation, depression, diarrhea, dizziness, heart palpitations, heartburn and indigestion, and weight gain are some of the more common complaints that accompany aging. Detailed information on the causes of and treatments for many problems that commonly affect older people may be found in the relevant sections of this book. *See* AGE SPOTS; ALZHEIMER'S DISEASE; APPETITE, POOR; ARTERIOSCLEROSIS/ATHEROSCLEROSIS; ARTHRITIS; BEDSORES; CANCER; CARDIOVASCULAR DISEASE; CIRCULATORY PROBLEMS; CONSTIPATION; DEPRESSION; DIABETES; EYE PROBLEMS; GLAUCOMA; HAIR LOSS; HEARING LOSS; HEART ATTACK; HIGH BLOOD PRESSURE; HIGH CHOLESTEROL; INDIGESTION; INSOMNIA; MEMORY PROBLEMS; MUSCLE CRAMPS; OBESITY; OSTEOPOROSIS; PROSTATITIS/ENLARGED PROSTATE; SENILITY; WEAKENED IMMUNE SYSTEM; and/or WRINKLES, all in Part Two.

❑ If you follow the suggestions in this section and do not feel a positive change in your energy level, *see* COLITIS; DIVER-TICULITIS; and/or MALABSORPTION SYNDROME in Part Two.

## AGNOSIA

*See under* RARE DISORDERS.

## AIDS (ACQUIRED IMMUNODEFICIENCY SYNDROME)

AIDS is an immune system disorder in which the body's ability to defend itself is greatly diminished. When human immunodeficiency virus (HIV, the virus that causes AIDS) invades key white blood (immune) cells called T lymphocytes and multiplies, it causes a breakdown in the body's immune system, eventually leading to overwhelming infection and, ultimately, to death. AIDS used to be a series of various illnesses such as cancer, infections, and skin problems made possible by the initial HIV infection. Since the mid-1990s, medicines have become available to reduce the stress load of the virus, thereby reducing its affect on the body. Since its discovery in the early 1980s, AIDS has transformed from a death sentence to a chronic condition that requires regular medical management. Just about anything you want to know about AIDs and HIV is found on the National Institutes of Health (NIH) website ([www.aidsinfo.nih.gov](http://www.aidsinfo.nih.gov)), and it is updated regularly. Worldwide, approximately 33 million people have HIV infection and AIDS, and 7,500 become infected each day. On average, life expectancy is shortened by twenty years, but people with less access to modern drug regimens have below average life spans, and those in wealthier nations, with greater access to medical care, live longer.

The origin of HIV is unknown, but it is closely related to a virus found in simians (monkeys). Whatever its origin, HIV is a type of virus known as a retrovirus that is spread primarily through sexual contact or blood-to-blood contact, such as occurs with the sharing of needles by intravenous drug users. It can also be spread by blood transfusion (now rare) or the use of blood products such as clotting factors, if the blood used for these purposes is infected. Hemophiliacs, who require a specific coagulation factor from blood concentrates, historically have been especially vulnerable to HIV. In the United States, as well as in many other parts of the world, blood is routinely screened for the presence of HIV antibodies, the warning sign of HIV infection. It is possible HIV-infected blood may occasionally pass through the careful screening processes. HIV antibodies may not appear in the blood for as many as three to six months after a person is infected, so their presence in blood taken from a person who contracted the virus recently may not be detectable. Blood products are now subjected to heat to destroy the virus, although some AIDS advocates raise concerns that this process may not be 100 percent effective. The chance of a blood donation having undetectable HIV is less than one in one million. You cannot get HIV from donating blood, as was once rumored.

It is possible for dentists and medical workers who come into close contact with the bodily fluids of infected persons to become infected under certain conditions. This is why paramedics, emergency medical technicians, dentists and dental hygienists, hospital and clinic employees, emergency room personnel, and law enforcement officers wear rubber gloves to prevent contact with blood products or saliva. The practice of wearing gloves and eyewear also protects patients.

Many people who are infected with HIV are not even aware that they have it. The U.S. Centers for Disease Control and Prevention (CDC) has estimated that one in five of the more than one million HIV-infected people in the United States are not aware that they are infected. While some people experience a mild flulike illness within two to four weeks of exposure to the virus, it may take at least two to five years before any symptoms of HIV infection appear. The virus does not lie dormant during this time, however. Instead, it immediately attacks the immune system.

The virus quickly begins producing a billion copies of itself each day, which in turn forces the human immune system to produce the same number of antibodies as an attempted defense against the intruders. Year after year, the body struggles to beat the virus until finally, its over-worked immune system simply wears out and AIDS results. The novelty of the virus is that it lives in the immune cells called T cells, which are your body's only defense against the disease. When the T cells are compromised, it's nearly impossible for the body to fight off the virus.

In many cases, the first symptoms of HIV and AIDS are nonspecific and variable. One of the most common is a tongue coated with white bumps. This is oral thrush, or

candidiasis. Candidiasis indicates a compromised immune system. Intestinal parasites are another common problem.

Other possible symptoms include:

- Prolonged, unexplained fatigue.
- Swollen glands (lymph nodes).
- Unexplained fever lasting more than ten days.
- Excessive sweating (especially at night).
- Mouth lesions, including thrush and painful, swollen gums.
- Sore throat.
- Cough.
- Shortness of breath.
- Changes in bowel habits, including constipation.
- Frequent diarrhea.
- Symptoms of a specific opportunistic infection.
- Tumor (Kaposi's sarcoma).
- Skin rashes or lesions of various types.
- Unintentional weight loss.
- General discomfort or uneasiness (malaise).
- Headache.

Additional symptoms that may be associated with HIV and/or AIDS include speech impairment, memory loss, joint swelling, joint pain, bone pain or tenderness, a lump or lumps in the groin, blurred vision, genital sores, muscle atrophy, decreasing intellectual function, joint stiffness, unusual or strange behavior, anxiety, stress, tension, pruritus (generalized itching), sensitivity to light, decreased vision or blindness, blind spots in the field of vision, and chest pain.

No one should assume he or she is infected with HIV just because he or she has one or more of the above symptoms, however. These symptoms can be related to many illnesses, so being tested for HIV is the only way to be sure. This can be done by a doctor or with a home HIV testing kit. Simple to perform, this test requires a very small blood sample, obtained by pricking a fingertip. The sample is mailed to a laboratory, which analyzes it and offers a diagnosis by telephone in a matter of days. Each test is identified by a code number (no personal information is attached to any sample), so the test and the results are completely confidential.

To date, the FDA has approved only one home test kit, the Express HIV-1 Test System from Home Access Health Corporation (see Manufacturer and Distributor Information in the Appendix). Beware of fraudulent or unproven home HIV test kits. Doctors say if a kit claims to provide "instant" test results through a visual indicator such as a colored dot on a piece of paper after saliva has been applied, the outcome may be unreliable. If you believe you

have used a questionable test kit, contact your doctor for another test or use the approved test kit.

Further, testing HIV-positive does not mean that one has AIDS. Rather, it means that one has been exposed to HIV, as demonstrated by the presence in the blood of antibodies to the virus. However, a confirmed positive HIV test result is often the earliest indication that the person may eventually develop AIDS. The medical criteria for a diagnosis of full-blown AIDS are quite specific, requiring the presence of one or more opportunistic infections or cancers known to be associated with HIV infection. According to the CDC, these include:

- *Pneumocystis carinii* pneumonia.
- Candidal esophagitis, esophagitis from herpes simplex, or cytomegalovirus.
- Cryptosporidiosis of the intestine for more than four weeks.
- Primary lymphoma of the central nervous system.
- Kaposi's sarcoma.
- Herpes simplex ulcers, extensive in location, lasting for more than one month.
- Toxoplasmosis of the brain.

The risk of developing AIDS is proportional to the degree of immune suppression and the amount and duration of exposure to HIV.

HIV is highly adaptable and capable of changing its form. According to scientists at Oxford University in England, this may be the key to its survival. They say that through subtle mutations, or changes in its genetic structure, HIV evades and ultimately defuses the body's mechanisms for the elimination of infected cells. As a result, it continues to survive despite the immune system's aggressive attacks. If you suspect you have HIV, get tested immediately and begin treatment at once if necessary, because the earlier treatment is started the longer the life expectancy with fewer complications.

In 2007 there were 3,792 children under thirteen years of age living with AIDS in the United States. The vast major-

## Risk Factors for AIDS

Since the beginning of the epidemic in the 1980s, several health conditions and lifestyle factors have been identified that increase an individual's risk of contracting HIV and developing AIDS. The more factors present, the greater the risk. They include the following:

- Male to male sexual contact
- High-risk heterosexual contact
- Injection drug use.

## Women and AIDS

Seventy-five percent of people with AIDS in the United States are male. Women account for one out of every four new cases, and of these newly infected women, about two out of three are African American. AIDS is now the leading cause of death for African American women age twenty-five to thirty-four, and they are more than twenty-one times as likely to die from HIV/AIDS as non-Hispanic white women. Most women contract HIV through sex with a man who is infected. Today, AIDS is the fifth leading cause of death for women age thirty-five to forty-four. The following are steps you can take to protect yourself:

- Use latex condoms anytime you have sex, whether vaginal, oral, or anal.
- If you use drugs and cannot or will not stop injecting drugs, use new, sterile syringes to prepare and inject drugs.
- If you are getting a tattoo or having your body pierced, ask what procedures they use to combat the spread of HIV. If they do not use new, sterilized, or disinfected equipment, go somewhere else.

ity of these children acquired the virus from their mothers during pregnancy, labor, delivery, or breast-feeding. A pregnant woman can take medicine to lower the chance of giving her baby HIV, but research shows that only 33 percent of pregnant women with HIV take the drugs.

The optimal treatment of AIDS is called HAART (Highly Active Antiretroviral Therapy). HAART is made up of a combination of several different kinds of medicines. It is an aggressive therapy used to suppress the replication of the HIV virus and the progression of HIV disease. The reason that there are so many drug options is that the virus has mutated over the years and has become stronger and more difficult to treat. Patients with HIV/AIDS may get any of a number of drug combinations depending upon the physician's assessment. The virus gets attacked in a variety of ways using HAART. Viral loads are a measure of how active an impact the virus has in the body. Basically, HAART tries to outsmart a very smart virus. The drugs that may be used in HAART are:

- Nucleoside reverse transcriptase inhibitors (NRTIs)
- Non-nucleoside reverse transcriptase inhibitors (NNRTIs)
- Protease inhibitors (PIs)
- Fusion inhibitors
- Integrase inhibitors
- Entry inhibitors
- Combination drugs

After being diagnosed, patients usually start off with one NNRTI and two NRTIs, or with PIs and two NRTIs, but it is best to leave it to a physician to choose the best drugs for your individual case. If you experience side effects from one of the drugs, such as stomach pain, diarrhea, or both, tell your doctor as soon as possible so that a new one can be substituted. Once you are on HAART, it is important to stay on the medications. Since HAART was introduced, the death rate from non-HIV-related causes exceeded those caused directly by AIDS. Non-AIDS-related deaths in those thirteen years of age and older increased by 33 percent, while AIDS-related deaths decreased by 60 percent. Now the major cause of death in the United States is heart disease, non-AIDS-related cancer, and substance abuse.

Before HAART, many HIV/AIDS patients had difficulty absorbing nutrients from food and supplements and often appeared malnourished. This is not a concern with HAART. Instead HAART often leads to obesity, an increased risk of heart disease, and diabetes. Patients taking the HAART medications are also at risk of developing metabolic syndrome, which is common in patients with diabetes and heart disease. Metabolic syndrome is defined by having three of the following conditions: high blood sugar, high insulin, high cholesterol levels, high blood pressure, and abdominal obesity. In a three-hundred-patient study conducted in the greater Boston area, 13 percent of men and 29 percent of women with AIDS were obese. These obese HIV patients had lower essential micronutrient intakes than those patients of normal weight. Thus, despite eating more calories, the nutrient content of those calories was poor. What is interesting is that calorie needs are greater for HIV-positive patients compared to those without the virus. Patients with the virus need about 100 more calories per day. However, the Boston study underscores the fact that the calories consumed should come from high-quality, nutrient-dense foods.

Many patients taking HAART develop HIV lipodystrophy, which is characterized by abdominal fat, regional areas around the body of fat pads, and profound metabolic abnormalities like low good cholesterol (HDL), high triglycerides, and malfunctioning insulin (or insulin resistance). These factors predispose HIV patients to heart disease.

Because of the issues discussed above, people with HIV/AIDS are good candidates for supplementation. Multivitamins have been shown to delay the progression of HIV disease. Many of the nutrients listed below can be found in combination formulas. A high-potency multivitamin and mineral supplement should be included as well. Be sure to check the amounts of different nutrients in the complex you choose against those in the table below. Make sure that the supplement contains at least the DRI for vitamin A with beta-carotene, a B-complex with folate, and vitamins C and E. In studies, these were most likely to reduce the progression of the disease. The treatment of HIV/AIDS has come a long way in recent years. In this new edition we

have fine-tuned the list of supplements to create a complementary regimen for people who are responding well to the new treatment protocols.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. Adolescents especially have been shown to have poor nutrient intakes, especially of vitamins A, E, and C, and the minerals zinc and iron. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

All ingested substances pose a threat to the way HIV/AIDS are tolerated. If you are having trouble with your medications, stop any herbal or supplement use until the issue is resolved. It is more important to take the medications than the herbs or supplements.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Acetyl-L-carnitine	As directed on label.	An energy carrier, metabolic facilitator, and cell membrane protector. Also protects the heart.
Body Language Super Antioxidant from OxyFresh	As directed on label.	Protects the body from free radical damage, environmental stresses, and pollutants.
Bone Support from Synergy Plus	As directed on label.	Contains minerals needed for better absorption of calcium.
Coenzyme Q <sub>10</sub>	100–200 mg daily.	Increases circulation and energy, and protects the heart. A powerful antioxidant and significant immune stimulant.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals. Or place 1 dropperful of Kyolic liquid in a 6- to 8-ounce glass of distilled water.	A powerful immunostimulant that also aids in digestion, endurance, and strength. It is a natural antibiotic and is good for candida infections.
Glutathione	As directed on label, on an empty stomach.	Inhibits the formation of free radicals. Aids in red blood cell integrity and protects immune cells.
Kyo-Dophilus	As directed on label.	To supply essential friendly bacteria for the intestinal tract and liver function. Fights candida infection, often associated with HIV.
Kyo-Green from Wakunaga	As directed on label.	Supplies nutrients and chlorophyll needed for repair. Important in immune response.
Lycopene	As directed on label.	A strong cancer preventer.
Multivitamin/Multimineral with trace elements including selenium, copper, chromium, and magnesium	As directed on label.	Nutrients are designed to support general health and wellness, in addition to supporting immune function. Use a high-potency, hypoallergenic powdered form.

Natural carotenoid complex (Betatene)	As directed on label.	Powerful antioxidant, free radical scavenger, potential cancer fighter, and immune enhancer. Also protects against heart disease.
Pycnogenol	As directed on label.	A unique bioflavonoid. A potent antioxidant and immune enhancer.
and/or grape seed extract	As directed on label.	One of the most potent antioxidants known. Protects the cells.
or OPC Goldblend from Primary Source	As directed on label.	A combination of grape seed and pine bark extracts.
Quercetin	As directed on label.	Aids in preventing allergic reactions and increases immunity.
plus bromelain	As directed on label. Take on an empty stomach.	Increases absorption of quercetin and aids in reducing inflammation.
or Activated Quercetin from Source Naturals	As directed on label.	Contains quercetin plus bromelain and vitamin C.
S-adenosylmethionine (SAME)	As directed on label.	Good for depression and chronic fatigue. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Superoxide dismutase (SOD)	As directed on label.	Free radical scavenger needed for cell protection.
Taurine Plus from American Biologics	As directed on label.	An important antioxidant and immune regulator necessary for white blood cell activation and neurological function. Use liquid sublingual form.
Vitamin C	1,000–3,000 mg daily.	Strengthens the immune system. Use buffered powdered ascorbic acid or Ester-C with minerals.
Vitamin D	400 IU daily.	Necessary for proper immune function.
Vitamin E	600 IU daily.	A powerful antioxidant.
<b>Helpful</b>		
Acid-Ease from Enzymatic Therapy	As directed on label. Take with meals. Take between meals also if excess acid is a problem.	Contains pure plant enzymes that function in the breakdown and assimilation of foods.
Aerobic 07 from Aerobic Life Industries	9 drops in water 3 times daily.	For tissue oxygenation. Kills harmful bacteria and viruses.
Ultimate Oil from Nature's Secret	As directed on label.	Supplies essential fatty acids, a most important element of the diet.

### Herbs

Aloe vera contains carrisyn, which appears to inhibit the growth and spread of HIV. Take 2 cups twice daily. Use a pure, food-grade product. If diarrhea occurs, reduce the dosage.

Astragalus boosts the immune system.

*Caution:* Do not use this herb if you have a fever.

Black radish, dandelion root, and silymarin (milk thistle extract) protect and aid in repairing the liver, and also cleanse the bloodstream. The liver is the organ of detoxification and must function optimally. Use these extracts as directed on the product labels.

Cat's claw enhances immune function, and has been shown to be helpful for people with AIDS and AIDS-related cancers. Cat's Claw Defense Complex from Source Naturals is a combination of cat's claw and other herbs, plus antioxidants such as beta-carotene, N-acetylcysteine, vitamin C, and zinc.

*Caution:* Do not use cat's claw during pregnancy.

The seeds and peels of the Chinese cucumber inhibit cancer. The root is currently being used in AIDS research.

ClearLungs from Ridgecrest Herbals is a Chinese herbal formula that is good for all lung disorders.

Ginkgo biloba extract is good for the brain cells and circulation.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

For mouth sores, place alcohol-free goldenseal extract on a piece of sterile gauze and apply the gauze between the lips and gums or to mouth sores before going to bed. Leave it on overnight. Sores and inflammation should heal in a few days with this treatment.

Licorice and wild yam root are good for endocrine gland function.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Magnolia vine berries increase oxygen absorption and boost the immune system. They coordinate the activities of the internal organs and help control the balance of the body's physiological processes.

Pau d'arco is a natural antibiotic and potentiates immune function. It is also a powerful antioxidant and is good for destroying candida in the colon.

St. John's wort contains two substances, hypericin and pseudohypericin, that inhibit retroviral infections and could be useful in the treatment of AIDS.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Siberian ginseng helps bronchial disorders and boosts energy.

*Caution:* Do not use this herb if you have hypoglycemia, high blood pressure, or a heart disorder.

Echinacea is an immune stimulant, and should be avoided. In fact, it stimulates replication of T cells, which in

turn enhances replication of the virus, according to Dr. Tieraona Low Dog, Director of the Fellowship at the Arizona Center for Integrative Medicine.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

## Recommendations

If you test positive for HIV, arrange for repeat testing as soon as you can to rule out the possibility of a false-positive result. If the initial result is confirmed, immediately begin taking measures to boost your immune system. This is the single most important factor in disease prevention, and it is the best defense for the person with HIV. Your first step should be to obtain the necessary medications to reduce your viral load. In addition, correct diet, appropriate supplements, exercise, stress reduction, a proper environment, and a healthy mental outlook all play significant roles in keeping the immune system working adequately.

Pay special attention to meeting your nutritional needs and requirements, and keep in mind that a higher than normal intake of nutrients will probably be necessary.

Increase your intake of fresh fruits and vegetables. Eat a diet consisting of 75 percent raw foods, organically grown if possible (avoid foods that have been treated with pesticides and other sprays), plus lentils, beans, seeds, nuts, and whole grains, including brown rice and millet, and also non-acid-forming fruit such as bananas, all berries, peaches, apples, and melons. Raw foods are particularly important because cooking depletes foods of their vital enzymes.

Eat plenty of cruciferous vegetables, such as broccoli, Brussels sprouts, cabbage, and cauliflower. Also consume yellow and deep-orange vegetables such as carrots, pumpkin, squash, and yams.

Consume plenty of fresh live juices. Juicing is extremely beneficial for supplying nutrients. (See JUICING in Part Three.) "Green drinks" made from leafy greens such as kale, spinach, and beet greens, and carrot and beet root juice, should be consumed on a daily basis, with garlic and onion added. Kyo-Green from Wakunaga is an excellent "green drink" product that contains chlorophyll, protein, vitamins, minerals, and enzymes. Take this drink three times a day.

Drink steam-distilled water only (not tap water), and lots of it—eight to ten 8-ounce glasses daily—to flush out toxins from the body. All cells and organ systems need water. Drink plenty of water even if you are not thirsty. The organs, and especially the brain, become dehydrated long before thirst develops.

Eat onions and garlic, or take garlic in supplement form (see under Nutrients, above).

Add shiitake, reishi, and maitake mushrooms to the diet, or take them in supplement form (see under Nutrients, above).

Eliminate from your diet colas, foods with additives and colorings, junk foods, peanuts, processed refined foods, saturated fats, salt, sugar and sugar products, white flour, all animal protein, and anything containing caffeine.

Take supplemental fiber daily. Alternate between psyllium husks and freshly ground flaxseeds. Take psyllium with a glass of water and drink it quickly before it thickens.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Exercise caution in your choice of foods so as to avoid exposure to foodborne illness. Food poisoning can be very dangerous for people with HIV or AIDS infection. (See **FOODBORNE/WATERBORNE ILLNESS** in Part Two.)

Do not smoke, and stay away from secondhand smoke.

Avoid alcohol, noxious chemicals, and anything else that can damage the liver.

Obtain as much fresh air and rest as possible, and moderate amounts of sunshine.

Determine what food sensitivities or allergies may be present. The best way to do this is to have yourself tested by a health care professional. It is important to eliminate allergenic foods from the diet because they wreak havoc in the body, causing damage to the immune system. (See **ALLERGIES** in Part Two.)

Always use a condom (latex, not sheepskin) and spermicide (spermicide kills HIV) for any sexual contact. If you use a lubricant with a latex condom, use only a water-based lubricant such as K-Y jelly. Do not use petroleum jelly (Vaseline), vegetable shortening (Crisco), hand lotion, or baby oil, as these substances can break down latex in a matter of minutes. Be aware, however, that even the proper use of a condom is not a guarantee against the transmission of HIV.

Seek out the care of a qualified health care provider—if possible, one who has a great deal of experience in treating people with HIV. Research shows that the length of survival of a person with AIDS is closely linked to how much his or her physician knows about treating the condition.

Educate yourself. HIV and AIDS are complicated conditions, and treatment options are constantly changing and expanding. In order to stay well, it is vital to be as informed as possible.

### Considerations

Studies show that a modified form of bacteria normally present in the vagina may one day be used to protect women from AIDS. Researchers used a strain of *Lactobacillus jensenii*, generally abundant in mucus secreted by the mucous membrane lining a healthy vagina. The bacteria were modified to produce a protein called CD4, which

binds to the HIV virus that causes AIDS. In laboratory tests, the enhanced bacteria reduced the rate of HIV infection in susceptible cells by at least half.

Ever since the AIDS epidemic began, researchers have been looking for a “magic bullet”—a single miracle drug to combat the virus, or a vaccine to seek out and destroy the virus in the bloodstream and lymphatic system. Research into this field is promising, however, and existing therapies almost guarantee that people with AIDS will live much longer and have more productive lives than was once the case.

For persons infected with HIV, the most logical approach to staying well is to eliminate all known causes of immune suppression and to implement the use of therapies that inhibit viral activity and stimulate immune function.

Human growth hormone (HGH) therapy has been shown to help prevent and/or reverse wasting syndrome. This treatment must be given under a doctor’s supervision. Human growth hormone also has been shown to reduce abdominal body fat and correct abnormal fats in the blood. (See **GROWTH HORMONE THERAPY** in Part Three.)

Hyperbaric oxygen therapy is sometimes used, together with medications and other treatments, to help overcome opportunistic infections associated with AIDS. (See **HYPERBARIC OXYGEN THERAPY** in Part Three.)

N-acetylcysteine and L-carnitine both show some promise in the ability to prevent and counteract the extreme weight loss common in people with AIDS.

There are some AIDS survivors (epidemiologists call them long-term nonprogressors) who are free from all symptoms and lead absolutely normal lives years after being identified as HIV-positive. This is a rare subset of all those infected worldwide, and they are being studied intensively. A key to the AIDS cure may reside in these people, some of whom have had HIV for over ten years and who nevertheless remain healthy. Many thousands will continue to be HIV-positive but not manifest full-blown AIDS. And, unknown to the general public and many in the medical establishment, there are also people who are now antibody-negative though once diagnosed as HIV-positive. They apparently no longer have the virus present in their bodies. The same thing happened during the plague; not everyone who was exposed developed symptoms.

See also **SEXUALLY TRANSMITTED DISEASE** in Part Two.

For information about organizations that can provide information and assistance for people with HIV and AIDS, see **Health and Medical Organizations** in the Appendix.

### ALCOHOLISM

With an estimated 64 percent of American adults over eighteen consuming alcohol, it is hardly a surprise that one out of ten people suffers adverse consequences of alcohol consumption.

Alcoholism is a chronic, progressive disease that can have fatal consequences. It is a condition marked by a dependence on ethanol (ethyl alcohol). This dependence can be physiological, psychological, social, or genetic. There are two separate classes of alcohol-related problems: alcohol abuse, or “problem drinking,” and alcohol dependence, or alcoholism. Problem drinkers use alcohol on a regular basis, and although they may need a degree of support or guidance, they are not as physically and/or emotionally dependent on the drug as chronic drinkers, or alcoholics. We will use the term alcoholism loosely below for practical purposes, but it is important to remember this distinction.

According to the National Council on Alcoholism and Drug Dependence, some 18 million Americans abuse alcohol, and heavy drinking contributes to illness in each of the top three causes of death: heart disease, cancer, and stroke. Alcoholism affects approximately four times as many men as women, but the incidence of alcoholism among women is on the rise, as is the use of alcohol by children, adolescents, and college students.

Women are physiologically more sensitive to alcohol than men are. Because of their bodies' lower water content and higher fat content, alcohol becomes more concentrated in the bloodstream and is also retained in their bodies longer. Also, men produce more alcohol dehydrogenase, the enzyme in the stomach that breaks down alcohol before it reaches the bloodstream, than women do. Even after you adjust for body weight, women are still affected more than men by the same amount of alcohol. This may be why alcohol abuse seems to have more serious long-term consequences for women.

The overall rate of premature death related to alcohol abuse is 50 to 100 percent higher for women than for men. Women develop liver disease at lower levels of alcohol intake than do men, and they are at increased risk for osteoporosis.

Alcoholic women are more likely than alcoholic men to suffer from other psychiatric disorders, including depression, anxiety, and eating disorders. Often, these disorders existed prior to the onset of alcoholism, which means that these problems do not go away once the drinking stops; usually, independent treatment is required. Early treatment for these disorders, however, may help prevent alcohol abuse from occurring.

Alcohol affects everyone differently. Some become intoxicated with the first drink; others may be able to consume four or five drinks before showing any effects, often because they have built up a tolerance to the drug. In alcoholics, each drink triggers a craving for another. Alcoholism is a progressive disease that usually starts with acceptable social drinking. This leads to a drink for every mood: one to calm down, one to perk up, one to celebrate, one to “drown one's sorrows,” and so on. The alcoholic soon needs no excuse to drink. In time, the alcoholic is completely controlled by his or her dependence on alcohol.

Overindulgence often leads to depression, anxiety, mem-

ory loss, and lack of coordination, and can exaggerate antisocial behaviors such as aggression and/or other personality disorders.

Intoxication also causes blood pressure and heart rates to be higher at first and then to decrease with prolonged consumption. Irregular, inefficient beating of the heart can lead to stroke. Respiration rates are lowered, and reflexes and reaction times slowed.

Alcoholics often become ashamed and angry at their compulsive behavior, leading them to further alcohol abuse.

The National Council on Alcoholism and Drug Dependence and the American Society of Addiction Medicine define alcoholism as “. . . a primary, chronic disease with genetic, psychosocial, and environmental factors influencing its development and manifestations.” It is a complex disorder that is unique to each individual.

Some people drink moderate to heavy amounts of alcohol for years before becoming clinically dependent on it, while others may become addicted to alcohol the very first time they ever take a drink. It is known, however, that alcohol itself is not the only cause of alcoholism. There is considerable debate as to whether alcoholism is principally caused by genetic, environmental, or psychological factors. There are certain stress hormones that appear to be associated with alcoholism. Depression can lead some people to alcohol. A family history of alcoholism is common among both men and women with the disorder, and research has shown that heredity is involved almost 50 percent of the time. Certain genetic factors may cause a person to be vulnerable due to an imbalance of brain chemicals.

Excessive alcohol use can produce harmful effects on the brain and nervous system and can cause fatigue, short-term memory loss, and weakness of the eye muscles. More serious health effects include:

- *Liver disorders.* The liver processes 95 percent of alcohol ingested, at a rate of about ¼ to ½ ounce per hour. The repeated consumption of alcohol inhibits the liver's production of digestive enzymes, impairing the body's ability to absorb proteins, fats, and the fat-soluble vitamins (vitamins A, D, E, and K), as well as B-complex vitamins (especially vitamin B<sub>1</sub> [thiamine] and folic acid) and other water-soluble vitamins. It inhibits protein uptake, leading to amino acid deficiencies, and reduces the body's storage of zinc. Furthermore, many essential nutrients are not retained for use by the body; they are rapidly eliminated through the urine. Alcoholic hepatitis, an inflammation of the liver, can follow. Signs and symptoms include loss of appetite, nausea, vomiting, abdominal pain and tenderness, fever, jaundice (yellow skin), and mental confusion. Excessive amounts of fat accumulate in the liver, a result of alcohol's effect on the body's ability to digest fats properly. Hepatitis is a condition in which liver cells become inflamed and may die. The final, usually fatal, stage of alcoholic liver damage is cirrhosis of the liver, which affects one in five

alcohol abusers and is a disease characterized by inflammation, hardening, and scarring of the liver. This prevents the normal passage of blood through the liver, inhibiting the organ's ability to filter out toxins and foreign substances. The liver is one of the most robust organs of the body. It is the only organ that has the ability to regenerate itself after certain types of damage. Up to 75 percent of the liver can be removed in patients without any underlying liver disease—in those with liver disease 60 percent can be removed. It takes four to six weeks for the liver to grow back to its original size. If cared for properly, it will function more than adequately for decades. Alcohol is one of the toxins that the liver doesn't handle as well as others. The liver cannot regenerate after being severely damaged by alcohol.

- *Gastrointestinal problems.* Gastritis, or inflammation of the stomach lining, can lead to tearing in the upper part of the stomach and lower esophagus. Peptic ulcers also can form.
- *Cardiovascular problems.* High blood pressure and cardiomyopathy (heart muscle damage) are possible. Problem drinkers may also experience visible dilation of blood vessels just beneath the skin's surface, as well as pathological enlargement of the heart that can progress to congestive heart failure.
- *Blood sugar problems.* Alcohol prevents release of glucose from the liver and can cause low blood sugar (hypoglycemia). If you have diabetes and are taking insulin, this can have serious consequences. The pancreas also can be involved (pancreatitis), which can affect production of insulin so as to cause diabetes. A diseased pancreas can also interfere with the production of glucagon, a hormone that helps increase the amount of glucose in the blood, which can cause metabolism problems and can affect production of certain digestive enzymes.
- *Sexual function or menstrual problems.* Alcohol abuse can cause reduced testosterone production and erectile dysfunction in men and can interrupt menstruation in women.
- *Birth defects.* A woman who drinks excessively during pregnancy runs the risk of having a child with fetal alcohol syndrome and increases the chance of miscarriage. In fact, any alcohol consumption during pregnancy can affect the fetus. Alcohol passes through the mother's placenta and into the fetal circulation. This toxic substance depresses the central nervous system of the fetus. Further, the fetal liver must try to metabolize the alcohol, but since the fetus's liver is not fully developed, the alcohol remains in the fetal circulation. Women who drink during pregnancy generally give birth to babies with lower birth weights. Their growth may be retarded or stunted; their brains may be smaller than normal; and they may be of lower than normal intelligence, or even suffer mental retardation. Limbs, joints, fingers, and fa-

cial features may be deformed. Heart and kidney defects, and abnormalities of the skin, may occur. Some children exposed to alcohol *in utero* become hyperactive at adolescence and exhibit learning disabilities. Every drink a pregnant woman consumes increases her child's risk of being born with fetal alcohol syndrome, and also increases the chance of miscarriage. Even moderate amounts of alcohol may be harmful, especially in the first three to four months of pregnancy.

- *Neurological problems.* The nervous system can be affected by excessive drinking, causing numbness of extremities, disordered thinking, and, eventually, dementia.
- *Cancer.* The risk of getting cancer of the esophagus, larynx, liver, and colon is much higher for those who are alcohol abusers than for the general population.

Alcoholism causes metabolic damage to every cell in the body and depresses the immune system. It may take years before the consequences of excessive drinking become evident, but if an alcoholic continues to drink, his or her life span may be shortened by ten to fifteen years or more. The social consequences of alcoholism can be very destructive as well. Alcohol abuse takes a tremendous toll on society through traffic and other accidents, poor job performance, and emotional damage to entire families. Alcoholism is currently the second major preventable cause of death in the United States, second only to cigarette smoking.

Most alcohol abusers enter treatment with great reluctance because they are in denial. They refuse to believe that they have a problem and often think there is a conspiracy against them by family, friends, or coworkers. Intervention must be handled carefully with professional advice. Treatment can vary with the individual. If the person to be treated is alcohol dependent, complete abstinence should be the goal. If a person isn't dependent on alcohol but is experiencing the adverse effects of drinking, reduction of the alcohol-related problems is required. Seek counseling or intervention. Intervention may involve alcohol-abuse specialists, and should involve some type of goal-setting and behavior modification, along with counseling and follow-up care. Resident treatment programs for serious alcoholics are often complex and usually involve a professional staff.

Dietary supplements, while important for everyone, are especially vital for alcoholics. Evidence has shown that some of the diseases associated with alcoholism can be avoided by improving the nutritional health of the body. The program that follows is designed to help recovering alcoholics to improve their nutritional condition.

There are also some supplements that help with the psychological aspects of recovery by decreasing the desire for alcohol. You should begin with a high-potency multivitamin and mineral complex, and then add the nutrients listed that are not included in the complex.

Unless otherwise specified, the dosages recommended in this section are for adults. For children between the ages

# Signs and Symptoms of Alcohol Abuse and Alcoholism

While each case of alcohol abuse and alcoholism is in some ways unique to the individual, there are certain common features that can serve as warning signs. These include:

- Drinking alone or in secret.
- Not remembering commitments or conversations. Having blackouts.
- Ritualizing drinking at certain times, places, or events, and becoming agitated or annoyed if the ritual is changed or questioned.
- Not caring anymore about long-term hobbies, interests, and activities.
- Feeling an overwhelming need for a drink.

- Irritability and agitation increasing as normal drinking time nears, especially if alcohol is not available or cannot be available due to work or social commitment.
- Hiding alcohol at work, at home, or in the car.
- When drinking, gulping drinks, ordering “doubles” or setups.
- Getting intoxicated to feel normal.
- Having problems with finances, social interaction, relationships, or employment.
- Building up a tolerance to alcohol that requires “more of the same” to hit the same plateau of intoxication.
- Having physical withdrawal symptoms when you can’t drink, such as sweating, shaking, or nausea.

of twelve and seventeen, reduce the dose to three-quarters the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Free form amino acid	500 mg each 3 times daily, on an empty stomach. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aids in withdrawal; needed for brain and liver function; necessary for regeneration of liver cells. (See AMINO ACIDS in Part One.)
plus extra L-cysteine or N-acetylcysteine	Start with 500 mg daily and slowly work up to 1,000 mg daily.	
Gamma-aminobutyric acid (GABA)	750 mg once or twice daily, as needed.	To calm the body and prevent anxiety and stress.
plus inositol and niacinamide	As directed on label. 500 mg once or twice daily, as needed.	<i>Caution:</i> Do not substitute niacin for niacinamide. Niacin can be toxic in such high doses.
Glutathione	3,000 mg daily, on an empty stomach.	Protects the liver and reduces craving for alcohol. Note: Do not take substitute glutamic acid for glutathione.
and L-methionine	1,000 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 25 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Protects glutathione, making it available to the liver. (See AMINO ACIDS in Part One.)
Pantothenic acid (vitamin B <sub>5</sub> )	100 mg 3 times daily.	Aids the body in alcohol detoxification. Needed to counteract stress.
Vitamin B complex injections or sublingual	As prescribed by physician. 100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	To correct deficiencies. Injections (under a doctor’s supervision) are best. If injections are not available, use a sublingual form.
plus extra vitamin B <sub>6</sub>	As directed on label.	Often deficient in alcoholics.

along with vitamin B <sub>12</sub>	1,000 mcg 3 times daily.	Reduces water retention and helps to relieve anxiety, fear, and tension associated with recovery.
Vitamin B <sub>1</sub> (thiamine)	200 mg 3 times daily.	Alcoholics often are deficient in B vitamins, especially B <sub>1</sub> .

## Very Important

Alpha-lipoic acid	100 mg 2 times daily.	Aids in protecting the liver and pancreas from alcohol damage. A powerful antioxidant.
Calcium and magnesium	2,000 mg daily, at bedtime. 1,000 mg daily, at bedtime.	A vital mineral that has a sedative effect. Works with calcium. Magnesium is depleted from the body with alcohol use.
Multienzyme complex plus proteolytic enzymes	As directed on label. As directed on label. Take between meals.	To aid digestion. Essential for assimilation of protein. <i>Caution:</i> Do not give these supplements to a child.
Primrose oil	1,000 mg 3 times daily, with meals.	Used successfully in Europe, this supplement is a good source of essential fatty acids. It may also help reduce withdrawal symptoms.
Pycnogenol or grape seed extract	30 mg 3 times daily. 30 mg 3 times daily.	Powerful antioxidants for the protection of the cells.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Acts as a powerful antioxidant with healing potential, and promotes production of interferon, which helps the body resist infection, to which alcoholics are generally more susceptible.

## Important

Acidophilus	As directed on label. Take on an empty stomach.	Needed for proper digestion. Helps the damaged liver.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system’s detoxification of many dangerous substances.

Inositol hexaphosphate (IP <sub>6</sub> ) (Cell Forté with IP-6 from Enzymatic Therapy)	As directed on label.	Enhances natural killer cell activity.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Good for brain function. Helps correct fatty liver degeneration. May protect against cirrhosis.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Protects liver and brain cells. Reduces stress.
Multivitamin and mineral complex with manganese and selenium	As directed on label.  200 mcg daily. Take separately from calcium. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	All nutrients are needed because of malabsorption problems. Important trace minerals that enhance immune function.
<b>Helpful</b>		
Choline complex or acetylcholine complex or phosphatidyl choline	As directed on label. As directed on label. As directed on label.	Effective combinations that reduce fatty liver changes, improving liver function.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	125 mg 3 times daily.	Carries oxygen to the cells.
Flaxseed oil	As directed on label.	Strengthens the brain's gray matter.
L-glutamine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	An amino acid that helps to stop cravings and balance blood sugar.
Lithium	As prescribed by physician.	A trace mineral that may help depression. Available by prescription only.
Raw liver extract and raw pancreas glandular	As directed on label. As directed on label.	A rich source of vitamins and minerals that aids in repairing the liver and in preventing anemia. (See GLANDULAR THERAPY in Part Three.) Helps prevent pancreatic damage; beneficial for people with diabetes associated with alcoholism.
S-adenosylmethionine (SAME)	As directed on label.	Its antioxidant effects can improve the health of the liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	To counteract deficiencies. Vitamin A is poorly absorbed if the liver is damaged. Use emulsion forms for easier assimilation and greater safety at higher doses. Avoid capsule or tablet forms.

Vitamin E	200 IU daily.	A powerful antioxidant. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Deficiency can cause pathological changes in the stomach similar to those caused by alcohol.

## Herbs

- Alfalfa is a good source of needed minerals.
- Burdock root and red clover cleanse the bloodstream.
- Dandelion root and silymarin (milk thistle extract) help to repair damage done to the liver. Silymarin acts as a powerful antioxidant.
- Valerian root has a calming effect. It is best taken at bedtime.

## Recommendations

- Avoid all alcohol. Total abstinence is an absolute requirement for regaining control over your life. Even after years of sobriety, you cannot begin drinking again.
- Seek help from someone knowledgeable about this disorder. Alcoholics Anonymous has been doing wonderful work for many years in helping alcoholics achieve and maintain sobriety. Al-Anon and Alateen are similar groups that provide support for the friends and families of alcoholics. A strong support system can make behavioral changes much easier for everyone. The assistance and counseling services of these groups are available in nearly every city and town nationwide. Look in your local telephone directory for the group nearest you, or call your local mental health association for information.
- Some programs, such as Moderation Management, are available to help problem drinkers (not true alcoholics) reduce their drinking without completely stopping. This program entails a thirty-day abstinence period. After that, you may consume no more than four drinks a day and no more than fourteen drinks per week (for women, three per day and nine per week).
- If possible, consult a nutritionally oriented physician to determine your specific nutritional needs.
- Go on a ten-day live juice and cleansing fast to remove toxins from the body quickly; only do this if you are at or above normal weight. (See FASTING in Part Three.)
- Eat a nutrient-dense diet of fresh whole foods, organically grown if possible, and follow the nutritional supplement program outlined above. Your primary foods should be raw fruits and vegetables, whole grains, and legumes.
- Avoid saturated fats and fried foods, which put stress on the liver. For essential fatty acids, use primrose oil supplements plus small amounts of cold-pressed organic vegetable oils.

- Do not consume refined sugar or anything that contains it. Alcoholics often have disorders of sugar metabolism.
- Get plenty of rest, especially in the early weeks of recovery, to allow your body to cleanse and repair itself.
- Avoid people, things, and places that are associated with drinking. Make new friendships with people who do not drink. Taking up a hobby, becoming involved in sports, and exercising promote self-esteem and provide a productive outlet for energy.
- As much as possible, avoid stress. Cultivate patience; this will be needed for the long, slow road to recovery.
- Do not take any drugs except for those prescribed by your physician.
- If you suspect that someone you know may be abusing alcohol, encourage the person to seek professional care.

### Considerations

- Depending on the individual, treatment for alcoholism may involve one or more of the following:
  - *Detoxification and withdrawal.* This usually takes four to seven days and will probably involve medications to prevent delirium tremens or withdrawal seizures. Alcoholics who stop drinking often experience withdrawal symptoms, especially during the first week or so that they abstain from alcohol. Insomnia, visual and auditory hallucinations, convulsions, acute anxiety, a rapid pulse, profuse perspiration, and fever can occur. With time and appropriate supervision, these symptoms pass and the alcoholic is set free to begin the lifelong work of recovery.
  - *Medical assessment and treatment.* This may entail examination and treatment for high blood pressure, liver disease, high blood sugar, and heart disease, among other problems.
  - *Psychological support/psychiatric care.* This includes counseling and therapy to get at the underlying problems that may have led to alcohol abuse.
  - *Acceptance/abstinence.* It is necessary to accept the situation (admit that one is a problem drinker or an alcoholic) and desire to abstain in order to be cured.
  - *Drug treatment.* A drug called disulfiram (Antabuse) may be used to cause an aversion reaction to the consumption of alcohol. Those on this drug experience nausea, vomiting, severe headaches, blurred vision, and sometimes an impending feeling of death if they take even a small sip of alcohol. Naltrexone (ReVia) is an opiate blocker and is used to block the alcohol “high” and reduce the urge to drink. This is usually administered as a 50-milligram daily dose for twelve consecutive weeks. A nonaddictive drug, acamprosate calcium (Campral), has been approved for treating those who want to re-

main alcohol-free after successfully stopping their drinking. Administered as two 355-milligram capsules three times a day with meals, it effectively eliminates the discomfort caused by alcohol withdrawal. Acamprosate calcium is thought to act on the brain pathways directly to reduce withdrawal symptoms.

- *Aftercare.* This is continued care to manage relapses and assist with lifestyle changes.
  - Poor nutrition can enhance the adverse effects of ethanol. Alcoholics are at much greater risk of malnutrition than other people, since as much as 50 percent of their caloric intake may come from ethanol at the expense of nutritious foods. Alcoholics are commonly deficient in folic acid, and malabsorption due to pancreatic insufficiency is often a major problem.
  - Long-term alcohol abuse can promote a zinc-deficient state, most likely because of increased fecal and urinary losses. Zinc plays a vital role in a variety of enzyme systems in the body, as well as in DNA and RNA production. It also helps to regulate copper levels in the brain, reducing anxiousness and paranoia. A deficiency of zinc can result in anorexia, impaired senses of smell and taste, growth retardation, disorders of the reproductive system, and impaired wound healing and immune function. Pathological changes in the stomach occur due to zinc deficiency. Alcohol-related zinc deficiency accelerates the poisoning of cells that come into contact with alcohol by altering the metabolism of fats, carbohydrates, and nutrients. This leads to malabsorption problems, a depressed metabolism, and nutritional deficiencies.
  - A Department of Health and Human Services study showed that tobacco smokers and alcohol drinkers who regularly use high-alcohol mouthwash may be more likely than other people to get oral, pharyngeal (throat), and esophageal cancers.
  - Alcohol is one of the most damaging substances to the stomach and the small intestine. It reduces the absorption of nutrients in the small intestine, and it is one of the few substances that can penetrate the lining of the stomach to cause damage. Gastric secretions increase with alcohol consumption, causing excess acidity and diluting digestive enzymes. This can lead to gastritis.
  - Chronic alcohol consumption alters red blood cell membranes and causes various other types of cells, including gastrointestinal cells, to lose their normal flexibility.
  - A recovering alcoholic who resumes drinking, even after years of sobriety, will damage his or her liver as though the drinking had never stopped in the first place.
  - The drug naltrexone (ReVia) blocks the pleasurable effects of endogenous opioids, opiatelike substances released by the brain in response to alcohol, and may help problem drinkers remain sober by reducing the craving for alcohol. In two separate studies conducted at the Univer-

sity of Pennsylvania and the Yale University School of Medicine, people who took this drug were three times likelier than other patients to stick with their recovery programs. However, this drug is not suitable for people with liver disease.

❑ Alpha-lipoic acid, a powerful antioxidant, has been used successfully to treat alcohol-induced liver damage. It aids in protecting the liver and pancreas from alcoholic damage.

❑ In some countries, hyperbaric oxygen has been used successfully in the treatment of alcoholism. (See HYPERBARIC OXYGEN THERAPY in Part Three.)

❑ Binge drinking is a sign of severe alcoholism. The binge drinker will drink to the point of intoxication and stay that way for a few days, often without consuming many solid foods. The binge may end in vomiting, which is the body's way of getting rid of the excess alcohol, and then passing out. Frequently the person does not remember the events that happened during the binge. Binge drinkers consume larger quantities of alcohol on a regular basis and also experience more intoxication and alcohol-related problems than non-binge drinkers do. Binge drinking can cause dangerous cardiac arrhythmias.

❑ Research has found that children of alcoholics are more inclined than children of nonalcoholics to use drugs, including cocaine. These children are 400 times more likely to use drugs than those who do not have a family history of alcohol addiction.

❑ Studies conducted in Sweden revealed that the majority of babies of alcoholics who were adopted by nonalcoholic families eventually grew up to become alcoholics, indicating a correlation between chemical dependency and genetics.

❑ Limiting one's drinking to beer or wine does not protect against alcoholism or damage from alcohol. Twelve ounces of beer or 5 ounces of wine is comparable in alcohol content to 1.5 ounces of 80-proof liquor. Because it is more concentrated, straight liquor is absorbed into the bloodstream more quickly than beer and wine.

❑ Researchers have found that children who were diagnosed with ADHD (attention deficit hyperactivity disorder) are more likely than their peers to report alcohol-related problems, as well as drug and tobacco addictions, later in life. This study was reported in the *Journal of Abnormal Psychology*. Youngsters with severe inattention problems were five times more likely than others to have used an illegal drug other than alcohol or marijuana at an early age. This turned out to be a uniquely important variable even when the presence of oppositional defiant disorder (ODD) and conduct disorder (CD) were considered. The risk factor for inattention paralleled the importance of family history as a predictor.

❑ Alcohol enters the bloodstream relatively quickly, as it can be absorbed through both the stomach and small intes-

tines (unlike food, which is absorbed through the intestines only). It takes nearly one hour for the body to break down one unit of alcohol in the bloodstream (for older people, it can take longer). The more drinks are consumed in an hour, the higher the alcohol content of the blood. Blood alcohol levels of 400 mg/dL (milligrams per tenth of a liter) can be life-threatening.

❑ Once alcohol is in the blood, there is *nothing* that can be done to hurry the process of removing it. The idea that cold showers, coffee, and/or eating can help you sober up is false.

❑ Although some people fall asleep faster when drinking, alcohol depresses REM (rapid eye movement) sleep. REM is an essential part of the healthy sleep cycle, and if disturbed, the result is usually a desire to sleep longer in the morning and a sluggish feeling that lasts throughout the day.

❑ "Hangovers" could be caused by a combination of factors, including dehydration, overeating, and disturbed sleep. Even small amounts of alcohol can sometimes cause unpleasant side effects the next morning in some individuals. Usually, the best remedy includes rest and rehydration. Drinking a large glass of water before retiring and another in the morning may help take the edge off "the morning after." Taking over-the-counter pain medication such as acetaminophen, ibuprofen, naproxin, or aspirin before hangover symptoms begin sometimes helps with the headache; however, extreme caution must be used. When combined with alcohol, these medications may irritate your stomach and can even be toxic to the liver. The liver is the central clearinghouse for medications, including over-the-counter types, and it is already working in overdrive to clear the alcohol from the system. This is why there is now a required warning label on over-the-counter painkillers, and medications that contain them, cautioning against using them if you consume more than three alcoholic drinks per day. Mixing alcohol with any medication is not recommended.

❑ Medications such as tranquilizers, antidepressants, codeine, morphine, phenobarbital, and even some antibiotics can form toxic combinations with alcohol. Combining alcohol with antihistamines can enhance depression of the central nervous system. Combining alcohol with sleeping aids can be deadly.

❑ In recovery from alcoholism, it is best to avoid tranquilizers, as there is a danger of substituting one drug addiction for another. Sobriety should be drug-free.

❑ Pregnant women should avoid all alcohol.

❑ Women in general should limit their alcohol intake. Women who have had breast cancer and drink alcohol are at increased risk of recurrence. Although alcohol seems to affect women with estrogen-positive breast tumors, all women at risk of breast cancer should consider abstaining from alcohol. The more alcohol a woman consumes and the more years she drinks increase the chances that her breast tissue will be adversely affected.

❑ Alcohol has been shown to affect older adults differently than other people. It is more likely to hinder the absorption of nutrients, and it can also pose a danger if mixed with many medications taken to control age-related or chronic illnesses. Unfortunately, alcoholism among elderly people is more common than one might think, and can often go unnoticed or without intervention. Some people tend to think that older people have “earned the right to drink.” The truth is, however, that elders have just as much right to recovery as anyone else.

❑ Contrary to popular belief that alcohol heightens sexual arousal, it actually has the opposite effect—depression. It can cause sexual dysfunction in men and disrupt menstrual cycles in women.

❑ Various studies have shown that, in small amounts, alcohol can have protective effects against certain cardiovascular and cancerous diseases. The amount of alcohol shown to be protective has varied slightly from study to study. The accepted definition of moderate alcoholic intake according to the U.S. Department of Agriculture is one drink or less per day for women and two drinks or less per day for men (a “drink” being defined as 12 ounces of beer, 5 ounces of wine, or 1.5 ounces of 80-proof liquor). Nobody is suggesting that nondrinkers begin drinking to protect their hearts. Instead, they suggest less risky options such as regular light exercise, not smoking, and decreasing the amount of saturated fat in the diet.

❑ *See also* CIRRHOSIS OF THE LIVER and DRUG ADDICTION, both in Part Two.

❑ For information about organizations that can provide information and assistance for people dealing with alcoholism, *see* Health and Medical Organizations in the Appendix.

## ALKALOSIS

*See under* ACID/ALKALI IMBALANCE.

## ALLERGIC RHINITIS

*See* HAY FEVER.

## ALLERGIES

An allergy is an inappropriate response by the body’s immune system to a substance that is not normally harmful. The immune system is a highly complex defense mechanism that helps us to fight infections. It does this by identifying foreign invaders and mobilizing the body’s white blood cells to fight them. In some people, the immune system wrongly identifies a nontoxic substance as an invader, and the white blood cells overreact, creating more damage to the body than the invader. Thus, the allergic response becomes a disease in itself.

Typical allergic responses are nasal congestion, coughing, wheezing, itching, shortness of breath, headache, fatigue, and hives and other skin rashes. Substances that provoke allergic responses are called allergens. Almost any substance can cause an allergic reaction in someone, somewhere in the world, but the most common allergens are pollen, dust, certain metals (especially nickel), some cosmetics, lanolin, dust mites, animal hair, insect venom, some common drugs (such as penicillin and aspirin), some food additives (such as benzoic acid and sulfur dioxide), animal dander, and chemicals found in soap, washing powder, cleaning supplies, and many other chemicals.

Many people are allergic to mold. Molds are microscopic living organisms, neither animal nor insect, that thrive where no other life form can. Molds live throughout the house—under the sink and in the bathroom, basement, refrigerator, and any other damp, dark place. They also flourish in the air, in soil, on dead leaves, and on other organic material. Molds can be both destructive and beneficial. Molds help to make cheese, fertilize gardens, and speed decaying of garbage and fallen leaves. Penicillin is made from molds. Molds can also provoke allergic reactions.

Mold spores are carried by the wind and predominate in the summer and early fall. They thrive year-round in warm climates. Cutting grass, harvesting crops, or walking through tall vegetation can provoke an allergic reaction. People who repair old furniture are also at risk because old wood often harbors mold spores.

Foods also can provoke allergic reactions. Some of the most common allergenic foods in adults are shrimp, lobster, crab, strawberries, chocolate, shellfish, peanuts, walnuts and other tree nuts, fish, and eggs. In children, eggs, milk, peanuts, soy, and wheat are the main culprits. Children typically outgrow allergies to milk, egg, soy, and wheat, but allergies to peanuts, tree nuts, fish, and shrimp persist. Adults do not normally lose an allergy once they have it.

There is a difference between food allergies and food intolerances. A person with food intolerance is unable to digest and process that food correctly, usually due to a lack of a certain enzyme or enzymes. Many such people have gas, bloating, or other unpleasant reactions to something they eat. Only about 1.5 percent of adults, and less than 6 percent of children younger than age three, in the United States have a true food allergy. A food allergy occurs when a person’s immune system generates an antibody response to the ingested food. Milk is a good example of the distinction between an allergy and intolerance. Most people who can’t drink milk are lactose intolerant, not allergic. In rare cases (less than 10 percent), a person may have a true milk allergy where their body mounts an immune response to milk proteins rather than to the lactose (or sugar). An estimated 150 Americans die each year from severe allergic reactions to food, according to Hugh A. Sampson, M.D., director of the Jaffe Food Allergy Institute at the Mount Sinai School of Medicine in New York City. Food intolerances

can lead to allergies, however, if particles of undigested food manage to enter the bloodstream and cause a reaction known as leaky gut syndrome.

Food should not normally provoke a response from the immune system. When someone has a food allergy, the immune system responds inappropriately. First, an antibody called immunoglobulin E (or IgE) is produced that circulates in the blood. People who have food allergies typically inherit this tendency to form the IgE against a particular food. During digestion of the problem food, tiny protein fragments prompt certain cells to produce the specific IgE against that food. The IgE then circulates and attaches to the surfaces of the mast cells. Mast cells are found in all body tissue, but especially in the areas that are typical sites for allergic reaction, such as the nose, throat, lungs, skin, and gastrointestinal tract. The next time that food is eaten, the protein reacts with the specific IgE on the mast cells to trigger the release of chemicals, such as histamine. It is these chemicals that cause the symptoms of an allergic reaction.

If the mast cells release their chemicals in the nose and throat, the person may experience an itching tongue or mouth, and may have trouble breathing and swallowing. If mast cells in the gastrointestinal tract are involved, the person may experience diarrhea or abdominal pain. Activated mast cells in the skin can produce hives or intense itching.

The food protein fragments responsible for initiating the allergic reaction are not broken down by either cooking, stomach acids, or enzymes. These proteins can cross the gastrointestinal lining, travel through the bloodstream, and cause allergic reactions throughout the body. The onset of symptoms may occur anywhere from a few minutes to an hour or two after ingestion.

Cerebral allergies cause swelling of the lining of the brain. Entire food families can cause such allergic reactions in susceptible individuals. Recurrent headaches, or schizophrenic, violent, or aggressive reactions, can be an indicator of cerebral allergy. Foods such as corn, wheat, rice, milk, and chocolate, along with certain food additives, are the most common offenders.

Research indicates that the number of people with allergies is skyrocketing in both developed and developing countries, and will probably continue to grow. Dr. Sampson also cites recent studies that indicate that growing up in a large family or attending a day care center appears to *decrease* a child's risk of developing an allergy. This is attributed to the immune system's being too "busy" fighting off infections and other environmental factors to concentrate on allergens.

Currently, the only way to deal with food allergies is to avoid foods that trigger reactions. In 2004, Congress passed the Food Allergen Labeling and Consumer Protection Act. The law applies to both domestic and imported foods and dietary supplements. The labels clearly identify the source of all ingredients that are—or are derived from—the eight most common food allergens. These food labels will help allergic consumers identify foods or ingredients so they

can avoid them. There are 160 foods that can cause allergic reactions; the law identifies 8, which account for 90 percent of allergic reactions to foods. These foods are: milk, eggs, fish (bass, flounder, cod), shellfish (crab, lobster, shrimp), tree nuts (almonds, walnuts, pecans), peanuts, wheat, and soybeans.

Those with food allergies severe enough to cause anaphylactic reactions (shortness of breath, pale blue color, hives or itching, and anxiousness) should wear medical alert bracelets or necklaces and carry a syringe of adrenaline (epinephrine) to use in emergencies (these are available only by prescription). Anaphylactic reactions can be fatal even if they begin with mild symptoms, such as tingling in the throat or gastrointestinal discomfort. Antihistamines and bronchodilators can be used to treat less severe symptoms.

For most people, allergies are no more than another frustrating fact of life. But for people with asthma, or for those who suffer severe allergic reactions, allergies can be life-threatening. In people with asthma, hypersensitivity to irritants results in mucus secretions and, in severe cases, inflammation, edema, and swelling of the bronchial tubes. (See ASTHMA in Part Two.) According to the National Institute of Allergy and Infectious Diseases, serious allergies affect more than 50 million Americans. Allergies affect one's quality of life and productivity at work or home, school studies, or athletic pursuits. They can also lead to secondary diseases like ear and sinus infections.

To make matters worse, due to the consistently warmer and wetter winters occurring in most parts of the world in recent years, seasonal allergy sufferers can count on longer periods of misery. Hay fever (acute seasonal allergic rhinitis) is the most common type of seasonal allergy. Its symptoms closely resemble those of the common cold, but there are some differences. Cold symptoms generally disappear in a week to ten days, but allergic rhinitis can linger miserably for weeks, or even months. The nasal discharge caused by a cold is generally watery at the very beginning, but then turns thick and yellow, while the allergic reaction produces a consistently thin and clear discharge from the nose, in addition to itchy eyes, mouth, and skin. While it is difficult to determine the cause of the common cold, in most cases the cause of an allergy can be identified. This is at least one heartening fact for allergy sufferers. No one knows why some people are allergic to certain substances. According to the Asthma and Allergy Foundation of America, some allergies have a genetic component.

If one parent has allergies, it is statistically likely that one in three of their children will have allergies. If both parents have allergies, the chance that their children will have allergies rises to seven in ten. It is also believed that babies who are not breast-fed are more likely to develop allergies. Although persons between the ages of fifteen and twenty-five are the most allergy-prone, allergies can strike at any age. Emotional factors such as stress and anger may aggravate allergies, especially if the immune system is not functioning properly.

### Food Allergy Self-Test

If you suspect that you are allergic to a certain food, a simple test can help you determine if you are correct. By recording your pulse rate after consuming the food in question, you can reveal if you are having an allergic reaction.

Using a watch with a second hand, sit down and relax for a few minutes. When completely relaxed, take your pulse at the wrist. Count the number of beats in a sixty-second period. Normal pulse readings, by age, are as follows:

- Newborn infants: 100 to 160 beats per minute
- Children 1 to 10 years: 70 to 120 beats per minute
- Children over 10: 60 to 100 beats per minute
- Adults: 60 to 100 beats per minute
- Well-trained athletes: 40 to 60 beats per minute

After taking your pulse, consume the food that you are testing for an allergic reaction. Wait twenty minutes and take your pulse again. If your pulse rate has increased more than ten beats per minute, omit this food from your diet for one month, and then retest yourself.

For the purposes of this test, it is best to use the purest form of the suspected food available. For example, if you are testing yourself for an allergy to wheat, it is better to use a bit of plain cream of wheat cereal than to use wheat bread, which contains other ingredients besides wheat. This way you will know that if you observe a reaction, it is the wheat that is responsible.

When choosing supplements such as the ones listed below, develop a plan. Consider introducing one new supplement at a time. Many people with allergies don't know the cause, and bombarding the system with too many new ingredients at once could set off an attack. If you find a company whose supplements seem to work for you, stick with that company when choosing other supplements; companies use different ingredients and some may cause allergic reactions. At the very least, include a multivitamin and calcium/magnesium supplement, especially if you are avoiding dairy or another major food group. Deficiencies can arise quickly, and treating allergies should not lead to malnutrition. If you are losing weight, contact your health care provider to help with dietary management.

Unless otherwise specified, the dosages recommended in this section are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus	As directed on label.	Powerful immune enhancer with digestive enzymes for improved digestion.

Anti-Allergy formula from Freeda Vitamins	As directed on label.	A combination of quercetin, calcium pantothenate, and calcium ascorbate (vitamin C).
Calcium and magnesium	1,500–2,000 mg daily. 750 mg daily.	Needed to help reduce stress. Use calcium chelate form. Needed to balance with calcium.
Inositol hexaphosphate (IP <sub>6</sub> ) (Cell Forté from Enzymatic Therapy)	As directed on label.	Supports the immune system.
Kyolic Formula 102 from Wakunaga	50 mg 3 times daily.	Powerful immune enhancer with digestive enzymes. For improved digestion.
Methylsulfonylmethane (MSM)	As directed on label.	Has antiallergic properties equal to or better than those of antihistamines.
Multienzyme complex or pancreatin	As directed on label. Take with meals.	For improved digestion. <i>Caution:</i> If you have a history of ulcers, do not use a formula containing HCl.
Quercetin (Quercetin-C from Ecological Formulas) plus bromelain	500 mg twice daily. 100 mg twice daily.	Increases immunity and decreases reactions to certain foods, pollens, and other allergens. Enhances absorption of quercetin and reduces inflammation.
or Activated Quercetin from Source Naturals	As directed on label.	Contains quercetin plus bromelain and vitamin C.
Raw adrenal glandular and raw spleen glandular and raw thymus glandular	500 mg each twice daily.	To stimulate proper immune function. Raw adrenal is very important to prevent adrenal exhaustion.
Vitamin B complex plus extra pantothenic acid (vitamin B <sub>5</sub> ) and vitamin B <sub>12</sub>	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily.	Needed for proper digestion and nerve function. Use a high-stress formula. Consider injections. The antistress vitamin. Use a lozenge or sublingual form.
and Vitamin B <sub>6</sub>	300–1,000 mcg 3 times daily. 50 mg 3 times daily.	Needed for proper assimilation of nutrients. Use a lozenge or sublingual form. Helps to relieve wheezing and allergy attacks.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. ( <i>See ASCORBIC ACID FLUSH in Part Three.</i> )	Protects the body from allergens and moderates the inflammatory response.

#### Important

Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	An excellent cell protector.
Natural carotenoid complex (Betatene)	As directed on label.	Free radical scavengers that inhibit allergic reactions.
Proteolytic enzymes	As directed on label. Take between meals on an empty stomach.	To aid digestion and destroy free radicals. <i>Caution:</i> Do not give these supplements to a child.

Helpful		
Aller Bee-Gone from CC Pollen	As directed on label.	A combination of herbs, enzymes, and nutrients designed to fight acute allergy attacks.
Bee pollen	Start with a few granules at a time and work up to 2 tsp daily.	Strengthens the immune system. Use raw crude pollen, preferably produced within 10 miles of your home. <i>Caution:</i> Bee pollen may cause an allergic reaction in some individuals. Discontinue use if a rash, wheezing, discomfort, or other symptoms occur.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Coenzyme Q <sub>10</sub>	100 mg daily.	Improves cellular oxygenation and immune function.
Free form amino acid	As directed on label.	Supplies protein in a form that is rapidly absorbed and assimilated. Use a sublingual form.
Grape seed extract	As directed on label.	A powerful antioxidant to prevent free radical damage.
Glucosamine sulfate or N-acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Important for regulating the mucous secretions of the respiratory system.
L-cysteine and L-tyrosine	500 mg each daily, on empty stomach. Take with water or juice, not milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Promotes healing from respiratory disorders. Helpful for stress and allergic disorders. (See AMINO ACIDS in Part One.)
Manganese	4 mg daily for 3 months. Take separately from calcium.	An important component in many of the body's enzyme systems. Use manganese chelate form.
Multivitamin and mineral complex with calcium and magnesium and vitamin D <sub>3</sub>	As directed on label.  400 IU daily.	All nutrients are needed in balance. Use a hypoallergenic formula. Three nutrients necessary for proper immune function.
Potassium	99 mg daily.	Necessary for adrenal gland function. Use potassium protinate or potassium chelate form.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label.  As directed on label. Take between meals, on an empty stomach.	To aid digestion and destroy free radicals. <i>Caution:</i> Do not give these supplements to a child.
Vitamin A and vitamin E and zinc	10,000 IU daily.  200 IU daily.  50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Three nutrients necessary for proper immune function. Use d-alpha-tocopherol form.

Herbs

- Herbs have the potential to create allergic effects, so introduce them slowly and systematically at the beginning.
- Boswellia (*Boswellia serrata*, also known as Indian frankincense) works at the cellular level to reduce inflammatory and allergic responses.
- Decongest Herbal Formula from ZAND is also a good allergy-fighting product.
- Eucalyptus and/or thyme leaves can be used to ease congestion. Soak an ounce of either one in a cup of boiling water and inhale the steam.
- Eyebright tea has been noted to reduce hay fever symptoms such as watery eyes and runny nose in children.
- Goldenseal root aids the absorption of nutrients. A saline nasal spray that contains goldenseal has been used to wash out pollen and help prevent infection.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Japanese researchers have found that licorice root can help allergy sufferers. It has been traditionally used in Japan to battle allergic inflammation. Licorice root produces a hormone that acts as an anti-inflammatory agent and helps restore normal breathing.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Nettle (also known as stinging nettle) reduces inflammation in the sinus cavities. It is also a powerful antioxidant that helps prevent free radical damage and aids in preventing allergy attacks.
- Wild yam stimulates the production of hormones that reduce inflammation caused by allergies. Wild yam is not for everyone, however (see HERBS in Part One).
- Yerba maté helps to relieve allergic symptoms. Take 2 to 3 teaspoons of yerba maté in 16 ounces of hot water on an empty stomach.
- The following Chinese herbs support sinus health:
  - Magnolia flower (*Magnolia liliflora*, also known as xho yi hua) has been used for centuries in traditional Chinese medicine to open nasal passages and relieve headaches associated with sinus problems.
  - Scutellaria (*Scutellaria baicalensis*) root contains powerful flavonoids and antioxidants that enhance the immune

system. It inhibits the contraction of tissues in allergic reactions.

- Trichosanthe (*Trichosanthes kirilowii*) has been used for centuries in traditional Chinese medicine to benefit the respiratory system.
- Wild angelica (*Angelica dahurica*, also known as aka bai zhi) is particularly useful for clearing sinus problems. It has been found to help relieve discomfort around the eyes that occurs when the sinuses above the eyes are blocked. It normalizes swelling, opens nasal passages, and promotes the discharge of pus often associated with sinus infections. Another important action of this herb is the balancing of histamine levels.

Ayurveda is a body of medical knowledge originating in India. (See AYURVEDIC REMEDIES in Part Three.) According to this system, some allergic responses are created by the presence of ama, or toxins in the system that are the by-products of improperly digested food. The Ayurvedic herbs picrorrhiza (*Picrorrhiza kurrooa*) and phyllanthus (*Phyllanthus acidus*) are suggested for cooling and cleaning the blood, and helping the liver detoxify the body of ama. Tri-fala is a traditional Ayurvedic herbal combination formula that is sometimes recommended for allergies. It is said to act on vata, one of the three vital principles that govern the body (vata controls respiration, among other functions) in the intestines and keep it from aggravating and drying the upper respiratory system. Other Ayurvedic herbs suggested for allergies include amla (*Emblica officinalis*), guggul (*Commiphora mukul*), and mulethi (*Glycyrrhiza glabra*, better known in English as licorice).

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Other herbs that can be beneficial for allergies include burdock, milk thistle, butterbur, dandelion, ginkgo, and horseradish.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

## Recommendations

Rotate your foods. (See Rotating Foods: Sample Daily Menus, at the end of this section.) Eat a different group of foods for each of four days and then repeat the cycle. You can select as many of the foods allowed on a specific day as you like but it is essential that no type of food be ingested more often than every four days.

If you suffer from ragweed allergy (or other weed allergies) do not eat melon, cucumbers, bananas, sunflower seeds, chamomile, or any herbal preparation containing

echinacea. These substances can add to the symptoms during an episode.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

See Detecting Hidden Food Allergies on page 182 and fill out the Food Sensitivity Questionnaire. Then omit from your diet for thirty days any food you have listed as consumed four times per week or more.

Adults may follow a fasting program. (See FASTING in Part Three.) After a fast, you can try adding back the “foods to avoid” (listed below) in very small amounts, such as one teaspoonful at a time. Record your reactions after eating. If you feel bloated or have a slight headache, an upset stomach, gas, diarrhea, a rapid pulse, or heart palpitations after eating certain foods, eliminate them from your diet for sixty days and try introducing them again in small amounts. If you experience a reaction again, eliminate them from your diet permanently.

Avoid the following foods until it is determined you are not allergic to them: bananas, beef products, caffeine, chocolate, citrus fruits, corn, dairy products, eggs, oats, oysters, peanuts, processed and refined foods, salmon, strawberries, tomatoes, wheat, and white rice.

Avoid mucus-producing foods, such as dairy products, sugar, wheat, and food additives (see below).

Avoid any food products that contain artificial color, especially FD&C Yellow No. 5 dye. Many people are allergic to food colorings. Other food additives to avoid include vanillin, benzaldehyde, eucalyptol, monosodium glutamate, BHT-BHA, benzoates, and annatto. Read labels carefully.

If you are allergic to ragweed, do not eat cantaloupe. It contains some of the same proteins as ragweed.

Take the underarm temperature test to determine if you have an underactive thyroid. (See HYPOTHYROIDISM in Part Two.)

Be sure to take only hypoallergenic supplements, as these do not contain potentially irritating substances.

Keep rooms free from dust, keep windows shut (use the air conditioner whenever possible), and use a dehumidifier in the basement.

Use mold-proof paint and a disinfectant on walls and furniture.

Purchase an air filter with fine enough filtering capability, such as the HEPA filter, to clean pollen, molds, and dust from your home or office. Standard air filters sold in most stores do not filter pollen. Make sure any filter purchased states on its label that it is suitable for filtering pollen and mold spores.

# Detecting Hidden Food Allergies

The first step in discovering hidden food allergies is to develop a list of suspect foods. Using the form below, keep track of how often you consume different foods.

Be careful to note each time you consume one of the foods listed below. Add up your weekly total for each food. Do this for a four-week period.

## FOOD SENSITIVITY QUESTIONNAIRE

Type of Food	First Week	Second Week	Third Week	Fourth Week
<b>Beans and Legumes</b>				
Kidney beans	_____	_____	_____	_____
Lentils	_____	_____	_____	_____
Lima beans	_____	_____	_____	_____
Mung beans	_____	_____	_____	_____
Pinto beans	_____	_____	_____	_____

Note any other snacks or other foods not listed above that you eat regularly. \_\_\_\_\_

After the one-month recording period, go through the form and compile a list of all the foods you ate four times a week or more. This is your list of suspect foods.

**KEEPING A FOOD DIARY**

Once you have your list of suspect foods, omit these foods from your diet for a period of thirty days to give your body a rest from them. Then reintroduce the suspect foods, one at a time. Add only one new food a day. As you add foods back to your diet, keep a diary of any symptoms you experience and monitor your reaction with the Food Allergy Self-Test (see page 179), as in the following sample:

**Sample Food Diary**

Date	Meal	Time	Foods Consumed	Symptoms
4/12	Breakfast	8:39 a.m.	milk, toast	gas, bloating
	Lunch	12:30 p.m.	pea soup, salad	no symptoms

If you note a reaction to any of the reintroduced foods, omit that food from your diet for another two months, then try a small amount of it again. If you have a reaction after the second reintroduction, eliminate that food from your diet permanently.

Use the form that follows to record your experiences as you reintroduce the banished foods into your diet. By first eliminating foods, then slowly adding them back into your diet, you will be able to pinpoint exactly which foods are giving you trouble.

### Food Diary

Miscellaneous: \_\_\_\_\_  
 \_\_\_\_\_

When monitoring your reactions to different foods, it is important to be aware that food allergies can manifest themselves in many ways, not all of them obvious. The following symptoms are the most common manifestations of food allergies:

- Acne, especially pimples on the chin or around the mouth.
  - Arthritis.
  - Asthma.
  - Chest and shoulder pains.
  - Colitis.
  - Depression.
  - Fatigue.
  - Headaches.
  - Hemorrhoids.
  - Insomnia.
  - Intestinal problems.
  - Muscle disorders.
  - Sinus problems.
  - Ulcers.
- Your health care provider may look also for the following signs and symptoms when trying to determine if you have an allergy:
- Acid/alkaline imbalance.
  - Anemia.
  - Bed-wetting.
  - Conjunctivitis.
  - Diarrhea.
  - Dizzy spells and floating sensations.
  - Excessive drooling.
  - Dark circles under the eyes or puffy eyes.
  - Eye pain, tearing.
  - Fluid retention.
  - Hearing loss.
  - Hyperactivity.
  - Learning disabilities.
  - Nasal congestion or chronic runny nose.
  - Noises in the ear.
  - Periods of blurred vision.
  - Phobias.
  - Poor memory and concentration.
  - Poor muscle coordination.
  - Red circles on the cheeks (as if wearing rouge, even in children).
  - Repeated colds or ear infections, especially in children.
  - Sensitivity to light.
  - Severe menstrual symptoms.
  - Swollen fingers and cold hands.
  - Unusual body odor.
  - Watery, itchy, red eyes.
  - Recurrence of any illness despite treatment.

### The Rotation Diet

Although some people have a reaction soon after ingesting a particular food for the first time, food allergies often develop slowly. The reason for this is that if you consume the same foods daily, your body eventually develops an intolerance. Rather than nourishing the body, these foods provoke harmful reactions.

Once you have identified and avoided an allergenic food for sixty to ninety days, you can usually reintroduce it without any adverse reactions, as long as you maintain a rotation diet. If you have been diagnosed with a food allergy, check with your health care provider before reintroducing the offending food. The basic principle behind the rotation diet is that each type of food is to be consumed only on one out of every four days. For example, if you eat beans on Monday, you wouldn't eat beans

again on Tuesday, Wednesday, or Thursday. If you eat salmon on Friday, you would wait at least until Tuesday before consuming any other fish. Rotating foods in this way will not only make you feel better, it will also help to stabilize your weight.

Before starting the rotation diet, follow a fasting program to cleanse your system of offending foods and toxins. (See FASTING in Part Three.) After you have finished the program, consume only the following foods for the next two weeks: For children, confirm with the pediatrician that this is acceptable to support growth and normal development.

- Baked or broiled chicken or turkey.
- Broiled, boiled, or baked fish.
- Brown rice.

- Fresh, unsweetened fruit and vegetable juices.
- Fresh fruits (except oranges).
- Herbal teas.
- Raw, steamed, or broiled vegetables.

Although you may feel that this list of foods does not offer much variety, there are numerous fruits and vegetables available, in addition to a variety of fish. After two weeks on this cleansing diet, you can once again begin to

eat a greater number of different foods, but on a rotating basis, eating each type of food on no more than one out of four days. Use the sample menus below as a guide to help you put together daily menus rotating among different foods. Of course, if you are sensitive to any of the foods listed, substitute a food that agrees with you.

Once you start following this program, you should start seeing an increase in your energy level in a week or less.

### Rotating Foods: Sample Daily Menus

Breakfast	Lunch	Dinner	Snacks
<i>Day 1</i>			
Glass of distilled water Papaya juice with vitamin C Fresh papaya or peach Oatmeal or oat bran cereal with 1 tbsp raw honey Skim milk Rose hip tea	Tomato stuffed with tuna salad or tuna burger on wheat-free bread with tomato, onion, alfalfa sprouts, and eggless mayonnaise Fresh lemonade	Broiled whitefish or salmon with dill Cole slaw or sprout salad with tomato, onion, celery, and eggless mayonnaise Steamed asparagus Herbal tea or lemonade <i>Substitutions:</i> Cauliflower, Brussels sprouts, or sau- erkraut can be substituted for asparagus.	Celery sticks Pecans Fresh papaya or peach
<i>Day 2</i>			
Glass of distilled water Apple juice with vitamin C Fresh apple Cream of wheat cereal with 2 tsp pure maple syrup and soymilk Herbal tea	Home-cooked sliced turkey or chicken on whole wheat bread with lettuce and mustard Potato soup and wheat crackers (make soup with soymilk) Herbal tea or apple juice  <i>Substitutions:</i> Soy burger or eggless egg salad with eggless mayonnaise for turkey or chicken; tofu soup for potato soup.	Baked skinless turkey or chicken with lemon juice, garlic, and onion powder Baked potato with 2 tsp ses- ame oil, chopped chives, and a dash of onion pow- der Tossed salad with radishes, zucchini, yellow squash, kale, and soy oil dressing Herbal tea  <i>Substitutions:</i> Cornish game hens for turkey or chicken; vinaigrette dressing for soy oil dressing.	Apple Walnuts  <i>Substitutions:</i> Baked apple with pure maple syrup; wheat crackers; sugar-free applesauce topped with walnuts.

*Day 3*

Glass of distilled water	½ avocado filled with cooked brown rice and fresh peas, water chestnuts, and a dash of herbal seasoning and lemon juice, topped with slivered almonds	Stir-fried vegetables with broccoli, green peppers, leeks, pea pods, sweet red peppers, bean sprouts, bamboo shoots, and grated fresh ginger, served over cooked brown rice	Raw almonds
Cranberry juice with vitamin C			Rice crackers with almond butter
Sliced banana with almond milk			Sliced bananas
Cream of rice or puffed rice cereal	Split pea soup with rice crackers (make soup with rice milk)	Rice cakes with almond butter	
Herbal tea		Coffee substitute (from a health food store) or herbal tea	

*Day 4*

Glass of distilled water	Egg salad with chopped cucumber, green onions, black olives, and low-fat cottage cheese, topped with raisins	Spinach-mushroom quiche	RyKrisp crackers with sugar-free grape jam or sesame butter and sesame seeds
Grape juice with vitamin C		Fresh spinach salad with hard-boiled eggs, artichoke, shredded raw beets, raisins, and olive oil and lemon dressing	Fresh grapes
Rye toast with sugar-free grape jam	RyKrisp crackers with sugar-free grape jelly or jam	Iced herbal tea flavored with grape juice	Raisins
2 poached or soft-boiled eggs or corn cereal	Lentil soup or cool lentil salad		Hard-boiled eggs
Herbal tea			

## Sulfite Allergies

Sulfites are common food additives used as sanitary agents and preservatives to prevent discoloration of foods. They are usually used in restaurant salad bars and are also present in many supermarket foods, including frozen foods, dried fruits, and certain fresh fruits and vegetables. Many people are allergic to sulfites. The types and severity of reactions to sulfites in sensitive individuals vary, and may include breathing difficulties, anaphylactic shock, severe headaches, abdominal pain, stuffy and/or runny nose, flushing of the face and a "hot flash" feeling, diarrhea, irritability, and/or feelings of anger. These symptoms tend to occur quickly, usually within twenty to thirty minutes after consuming sulfites.

Sulfites pose a greater danger to some people than to

others. People with asthma, a history of allergies, or a deficiency of the liver enzyme sulfite oxidase can suffer great harm. It is not always easy to determine if a food product contains sulfites. Sulfiting agents appear in food ingredient lists in a variety of ways, including sodium sulfite, sodium bisulfite, sodium metabisulfite, potassium bisulfite, potassium metabisulfite, and sulfur dioxide. Any ingredient ending in *-sulfite* should be assumed to be a sulfiting agent. If you have ever suffered a reaction after ingesting a food you believe contained sulfites, you should beware of the foods and beverages listed in the table below, which often contain these substances. Sulfite-free forms of some of these foods may be found in health food stores.

### FOODS AND BEVERAGES THAT OFTEN CONTAIN SULFITES

**Fresh Fruits and Vegetables**

Avocado dip (guacamole)	Grapes	Potatoes	Prepared cut fruit or vegetable salads
Cole slaw	Mushrooms		

**Fish and Shellfish**

Canned seafood soups	Dried fish	Frozen, canned, or dried shellfish	Oysters
Clams	Fresh shellfish, especially shrimp	Lobster	Scallops
Crabs			Shrimp

**Prepared/Processed Foods**

Beet sugars	Cornstarch	Horseradish	Sauerkraut
Breading mixes	Dietetic processed foods	Jams and jellies	Shredded coconut
Breakfast cereals	Dried or canned soups	Maraschino cherries	Trail mixes
Brown sugar	Dry salad dressing mixes	Noodle and rice mixes	Wine vinegar
Canned fruit pie fillings	Frozen, canned, or dried fruits and vegetables	Olives	
Canned mushrooms	Frozen French fries	Onion relish	
Caramels	Glazed fruits	Pickles	
Corn, maple, and pancake syrups	Hard candies	Potato chips	
		Sauces and gravies	

**Miscellaneous**

Apple cider	Bottled, canned, or frozen vegetable juices	Cordials	Gelatin
Baked goods	Cocktail mixes	Cornmeal	Instant tea mixes
Beer	Colas	Frozen doughs	Wines
Bottled, canned, or frozen fruit juices		Fruit drinks	

For airborne particles that cause allergies, try using a stand-alone air purification device. Many brands are available, the electrostatic type being the lowest maintenance and the replaceable filter type being the highest. The Air Supply personal air purifier from Wein Products is a miniature unit that is worn around the neck. It sets up an invisible pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants) in the air. It also eliminates vapors, smells, and harmful volatile compounds in the air.

Depending on the severity of your allergies be sure to wear long pants and long-sleeved shirts when spending time outside. Change your clothes and shower as soon as you return indoors. For some, using a “high-efficiency” mask (available in drugstores and medical supply stores) may be advisable.

Pollen counts in late summer are highest between 5:00 A.M. and 10:00 A.M., so schedule your gardening and other outdoor activities with this in mind. You can learn what trees and plants are pollinating around you and what the mold and pollen count is by contacting the National Allergy Bureau ([www.aaaai.org/nab/index.cfm?p=pollen](http://www.aaaai.org/nab/index.cfm?p=pollen)).

If you are a chronic allergy sufferer, avoid exercising outdoors.

On windy days, when more pollen is blown through the air, try to avoid going outside if your allergies are severe. The best time for you to be outdoors is after a rainstorm, when pollen levels drop significantly.

Do not smoke, and avoid secondhand smoke.

Avoid taking aspirin within three hours of eating.

**Considerations**

Steroid nasal sprays can be very effective for allergies and are less expensive than many prescription medications. These sprays, however, do not relieve itchiness of the eyes. They generally need up to ten days to become effective, so it is advisable to begin taking them about a week prior to hay fever season. Be sure to check first with your doctor before using them, as recent studies suggest a possible link between steroid nasal sprays and the development of glaucoma—a concern for older adults. In 2009, the FDA warned consumers to stop using and discard three zinc-containing Zicam intranasal products because the products may cause a loss of sense of smell.

Plants produce oxygen as a normal part of their growth and living process, and help to remove pollutants from indoor air. Some plants suggested for this purpose include areca palm, bamboo palm, Boston fern, dracaena, dwarf date palm, English ivy, ficus alii, lady palm, peace lily, rubber plant, and spider plant.

Acupressure and acupuncture have had some success in relieving allergy symptoms. (See ACUPRESSURE and ACUPUNCTURE under PAIN CONTROL in Part Three.)

*The British Medical Journal* reported that taking aspirin before consuming an allergenic food makes it possible for

more of the allergy-provoking food to be absorbed. In contrast, taking ABC Aerobic Bulk Cleanse from Aerobic Life Industries combined with aloe vera juice may slow the absorption of foods that cause a reaction. Taking oat bran or guar gum in the morning works in the same way. Wheat bran is not recommended as a source of fiber for allergy-prone individuals because wheat is highly allergenic. (See NATURAL FOOD SUPPLEMENTS in Part One for a discussion of fiber.)

Many allergy sufferers are turning to homeopathic remedies to combat allergy symptoms. They work with the body's natural functions to shut off the allergic response instead of masking symptoms. Combination remedies are often the easiest way to use homeopathy for allergies. BioAllers has a line of homeopathic combination remedies designed for specific allergies, including Animal Hair/Dander, Grain/Dairy, Grass Pollen, Mold/Yeast/Dust, Pollen/Hayfever, Sinus & Allergy Nasal Spray, and Tree Pollen Allergy Relief formulas.

Research is being conducted on the ability of coenzyme Q<sub>10</sub> to counter histamine for asthma and allergy sufferers.

Quercetin—found in apples, berries, grapefruit, onions, cabbage, tea, and red wine—is a potent flavonoid. Recently, researchers at the Nippon Medical School in Japan found seasonal allergy sufferers taking it had a 96 percent decrease in histamine release. Quercetin is better absorbed when taken with bromelain, an enzyme normally found in pineapple. For allergies, try taking one 500-milligram quercetin capsule along with one 100-milligram bromelain capsule and 500 milligrams vitamin C with meals, twice daily.

To find useful products for allergy sufferers, go to [www.allergybuyersclub.com](http://www.allergybuyersclub.com).

For information about organizations that can provide information and assistance for people with allergies, see Health and Medical Organizations in the Appendix.

## ALOPECIA

See HAIR LOSS.

## ALPHA-1 ANTITRYPSIN DEFICIENCY

See under RARE DISORDERS.

## ALUMINUM TOXICITY

Aluminum is not a heavy metal, but it can be toxic if present in excessive amounts—even in small amounts, if it is deposited in the brain. Many of the symptoms of aluminum toxicity are similar to those of Alzheimer's disease and osteoporosis. Aluminum toxicity can lead to colic, rickets, gastrointestinal disturbances, poor calcium metabolism, ex-

treme nervousness, anemia, headaches, decreased liver and kidney function, forgetfulness, speech disturbances, memory loss, softening of the bones, and weak, aching muscles.

Because aluminum is excreted through the kidneys, toxic amounts of aluminum may impair kidney function.

The accumulation of aluminum salts in the brain has been implicated in seizures and reduced mental faculties. To reach the brain, aluminum must pass the blood-brain barrier, an elaborate structure that filters the blood before it reaches this vital organ. Although elemental aluminum does not readily pass through this barrier, certain aluminum compounds will, such as aluminum fluoride. Many municipal water supplies are treated with both alum (aluminum sulfate) and fluoride, and these two chemicals readily combine with each other in the blood. Moreover, aluminum fluoride, once formed, is very poorly excreted in the urine.

Intestinal absorption of high levels of aluminum and silicon can result in the formation of compounds that accumulate in the cerebral cortex and prevent nerve impulses from being carried to and from the brain in the proper manner. Chronic calcium deficiency can aggravate the situation.

People who have worked in aluminum smelting plants for long periods have been known to experience dizziness, impaired coordination, and loss of balance and energy. The accumulation of aluminum in the brain has been cited as a possible cause for these symptoms. Perhaps most alarming, there is evidence to suggest that long-term accumulation of aluminum in the brain may contribute to the development of Alzheimer's disease.

It has been estimated that the average person ingests between 3 and 10 milligrams of aluminum a day. Aluminum is the most abundant metallic element in the earth's crust. It is absorbed into the body primarily through the digestive tract, but also through the lungs and skin, and is absorbed by and accumulates in body tissues. Because aluminum permeates our air, water, and soil, it is found naturally in varying amounts in nearly all food and water. Aluminum is also used to make cookware, cooking utensils, and foil.

Many other everyday products contain aluminum, including over-the-counter painkillers, anti-inflammatories, and douche preparations. Aluminum is an additive in most baking powders, is used in food processing, and is present in products ranging from antiperspirants and toothpaste to dental amalgams to bleached flour, grated cheese, table salt, and beer (especially when packaged in aluminum cans). One prominent source of aluminum is our municipal water supplies.

The excessive use of antacids is probably the most common cause of aluminum toxicity in this country, especially in people who have kidney problems. Many over-the-counter antacids contain amounts of aluminum hydroxide that may be too much for the kidneys to excrete successfully. Even antacids containing a mixture of aluminum and other ingredients may pose a problem; in some people, such products may cause the same reaction as products composed entirely of aluminum compounds. Moreover,

the chemical solution (dialysate) used during kidney dialysis contains aluminum. It may be associated with "dialysis dementia" sometimes experienced by patients. There has been some study on the possible link between aluminum and Alzheimer's disease, but the results have been mixed. (See ALZHEIMER'S DISEASE in Part Two for a discussion of aluminum and Alzheimer's disease.)

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Apple pectin	2 tbsp twice daily.	Binds with metals in the colon and excretes them from the body.
Calcium and magnesium	1,500 mg daily. 750 mg daily.	Minerals that bind with aluminum and eliminate it from the body. Use chelate forms. <i>Caution:</i> Men should check with a physician before taking calcium.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Acts as a detoxifier.
Kelp	2,000–3,000 mg daily.	Has a balanced mineral content. Acts as a detoxifier of excess metals.
Lecithin granules or before meals. capsules	1 tbsp 3 times daily, and cell membranes. 1,200 mg 3 times daily, before meals.	Aids in healing of the brain
L-glutathione	As directed on label.	Aids in blocking damage from toxic metals and radiation.
Multivitamin and mineral complex	As directed on label.	Basic for stabilizing vitamin and mineral imbalances in toxic conditions. Use a hypoallergenic high-potency formula.
Oxy-Cleanse from Earth's Bounty	As directed on label.	Helps remove heavy metals, other pollutants, and anaerobic pathogens from the body.
S-Adenosylmethionine (SAME)	As directed on label.	Helps reduce stress and nervousness caused by excess aluminum. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex plus extra vitamin B <sub>6</sub> and vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. 300 mcg 3 times daily.	The B vitamins, especially B <sub>6</sub> , are important in ridding the intestinal tract of excess metals and in removing them from the body. Sublingual forms are recommended for better absorption. Injections (under a doctor's supervision) may be necessary.
Vitamin E	200 IU daily.	A powerful antioxidant. Fights cellular aging by protecting cell membranes. Also improves circulation and prolongs the life of red blood cells. Use d-alpha-tocopherol form.

### Herbs

Burdock root, echinacea, fiber, ginkgo biloba and ginseng when taken regularly, are beneficial for blocking damage to the body by toxic heavy metals and radiation.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

### Recommendations

- Maintain a diet that is high in fiber and includes apple pectin.
- Use only stainless steel, glass, or iron cookware. Stainless steel is best.
- Beware of products containing aluminum. Read labels and avoid those that contain aluminum, or dihydroxyaluminum.
- Include bottled waters with silica in your diet.

### Considerations

- A hair analysis can be used to determine levels of aluminum in the body. (See HAIR ANALYSIS in Part Three.)
- If you use chelation therapy, use oral chelating agents only. (See CHELATION THERAPY in Part Three). Many researchers believe aluminum cannot be chelated out of the body, as some metals can, but it can be displaced or moved.
- Some research indicates that the longer you cook food in aluminum pots, the more they corrode, and the more aluminum compounds migrate into food and are absorbed by the body. Aluminum is more readily dissolved by acid-forming foods, such as coffee, cheeses, meats, black and green tea, cabbage, cucumbers, tomatoes, turnips, spinach, and radishes.
- Acid rain leaches aluminum out of the soil and into drinking water.
- See also ALZHEIMER'S DISEASE below.

### ALZHEIMER'S DISEASE

Alzheimer's disease is a common type of dementia, or decline in intellectual function. Once thought rare, Alzheimer's disease is now known to affect as many as 5.3 million people in the United States, according to the Alzheimer's Association. It afflicts 10 percent of Americans over sixty-five and as many as 50 percent of those over eighty-five. However, the disease does not affect only the elderly, but may strike when a person is in his or her forties.

This disorder was first identified in 1906 by a German neurologist named Alois Alzheimer. It is characterized by

progressive mental deterioration to such a degree that it interferes with one's ability to function socially and at work. Memory and abstract thought processes are impaired. Alzheimer's disease is an irreversible, progressive disorder. Deterioration in critical areas of the brain may precede symptoms by as much as twenty to forty years. As Alzheimer's disease progresses, there is severe memory loss, particularly in short-term memory. The person may recall past events but be unable to remember a just-viewed television show. At this stage, disorientation usually begins as well. Dysphasia (the inability to find the right word) may occur, and mood swings can be unpredictable and sudden. In the final stage, Alzheimer's disease creates severe confusion and disorientation, and possibly hallucinations or delusions. Some people become violent and angry, while others may be docile and passive. It is in this later stage that people with Alzheimer's disease may wander without purpose, experience incontinence, and neglect personal hygiene. Since the behavioral symptoms of Alzheimer's disease result from changes in the brain, the person neither intends to nor can control this behavior.

Once considered a psychological phenomenon, Alzheimer's disease is now known to be a degenerative disorder that is characterized by a specific set of physiological changes in the brain. Nerve fibers surrounding the hippocampus, the brain's memory center, become tangled (neurofibrillary tangles), and information is no longer carried properly to or from the brain. New memories cannot be formed, and memories formed earlier cannot be retrieved. Characteristic plaques accumulate in the brain as well. These plaques are composed largely of a protein-containing substance called beta-amyloid. Scientists believe that the plaques accumulate in and damage nerve cells.

Many people worry that their forgetfulness is a sign of Alzheimer's disease. Most of us forget where we have put our keys or other everyday objects at one time or another, but this is not an indication of Alzheimer's disease. A good example of the difference between forgetfulness and dementia is the following: If you do not remember where you put your glasses, that is forgetfulness. If you do not remember that you wear glasses, that may be a sign of dementia.

Other disorders can cause symptoms similar to those of Alzheimer's disease. Dementia may result from arteriosclerosis (hardening of the arteries) that slowly cuts off the supply of blood to the brain. The death of brain tissue from a series of minor strokes, or from pressure exerted by an accumulation of fluid in the brain, may cause dementia.

The presence of small blood clots in vessels that supply the brain, a brain tumor, hypothyroidism, and advanced syphilis all can cause symptoms similar to those of Alzheimer's disease. In addition, the average person over the age of sixty-five is likely to be taking between eight and ten different prescription and over-the-counter drugs. Drug reactions, coupled with a nutrient-poor diet, often adversely affect people not only physically, but mentally as well.

The precise cause or causes of Alzheimer's disease are unknown, but research reveals a number of interesting clues. Many of them point to nutritional deficiencies. For example, people with Alzheimer's disease tend to have low levels of vitamin B<sub>12</sub>, vitamin B<sub>3</sub>, and zinc in their bodies. The B vitamins are important in cognitive functioning, and it is well known that the processed foods constituting so much of the modern diet have been stripped of these essential nutrients. Low levels of B<sub>6</sub>, B<sub>12</sub>, and folic acid coupled with high homocysteine levels predict cognitive decline with aging. In fact, 1 milligram of folic acid helped one medication, a cholinesterase inhibitor used for treating early Alzheimer's disease, work more effectively. The development of the neurofibrillary tangles and amyloid plaques in the brain that are characteristic of the disease have been associated with zinc deficiency. Malabsorption problems, which are common among elderly people, make them more prone than others to nutritional deficiencies. Alcohol and many medications further deplete crucial vitamins and minerals.

Levels of the antioxidant vitamins A and E and the carotenoids (including beta-carotene) are also low in people with Alzheimer's disease. These nutrients act as free radical scavengers; deficiencies may expose the brain cells to increased oxidative damage. However, some data indicates that taking vitamin E or C does not reduce the risk of developing Alzheimer's disease or overall dementia. In addition, deficiencies of boron, potassium, and selenium have been found in people with Alzheimer's disease.

Some research has drawn a connection between Alzheimer's disease and high concentrations of aluminum in the brain. Autopsies of people who have died of Alzheimer's disease reveal excessive amounts of aluminum in the hippocampus area and in the cerebral cortex, the external layer of gray matter responsible for higher brain functions such as abstract thinking, judgment, memory, and language.

It may be that exposure to excessive amounts of aluminum, especially if combined with a lack of essential vitamins, minerals, and antioxidants predisposes one to developing Alzheimer's disease. However, one study, published in *Archives of Neurology* in May 1998, showed no further correlation between the density of neurofibrillary tangles in the frontal and temporal lobes of the cortex and bulk aluminum concentration. This study further demonstrated that levels of aluminum are not elevated in the cerebrospinal fluid of patients with Alzheimer's disease.

In a more recent study, a single dose of aluminum given to patients with Alzheimer's disease had no effect on cognition. However, there is concern that the correct dose may not have been used and that the one-day study was not sufficient to rule out aluminum as a cause of Alzheimer's disease. One way to rid the body of aluminum is to consume silicic acid (silica), which is found in some bottled waters. Silicic acid binds to aluminum and reduces its bio-

activity. In one study, Alzheimer's patients who consumed about one and a half quarts of water daily with silicic acid showed an increase in their excretion of silicic acid and a decrease in urinary aluminum. This translated into an overall reduction of aluminum in the body. In fact, the study showed that women who drink water with appreciable amounts of silica have a reduced risk of developing Alzheimer's disease.

Many people who develop Alzheimer's disease have a family history of the disorder, suggesting that heredity may be involved. By age ninety, the risk is at least 50 percent for those with a first-degree relative (father, mother, brother, sister) who has (or had) Alzheimer's disease. For twins, it is even higher—58 percent to 79 percent of Alzheimer's disease is hereditary. As with other brain disorders, such as schizophrenia and bipolar mood disorder, the hereditary pattern is complicated.

At least four gene variations are linked to Alzheimer's disease. All of them reduce the clearance, or increase the production, of beta-amyloid. A variation of a gene involved in the synthesis of beta-amyloid, located on chromosome 21, is associated with a rare type of Alzheimer's disease that typically begins between the ages of forty and fifty. Interestingly, people with Down syndrome, who carry an extra copy of chromosome 21, are prone to develop very early Alzheimer's disease, beginning in their thirties and forties. No one knows for sure when the disease actually begins, and the onset of the illness may predate clinical symptoms by years, or even decades.

Yet another possible culprit in the death of brain cells is the immune system. Many illnesses result from immune system malfunction causing it to attack the body's own tissues. Powerful immune system proteins called complement proteins have been found around the plaques and tangles in the brains of people who have died of Alzheimer's disease.

In animals, brain injury is known to result in an alteration in the genetic "instructions" for two kinds of complement proteins. Some experts theorize that complement proteins normally help clear away dead cells, but in Alzheimer's disease, they begin to attack healthy cells as well. Cell degeneration results in accumulations of amyloid. Many researchers believe that beta-amyloid is a key player in this memory-destroying disease. This substance is not unique to the brain, but is produced in virtually every cell in the body as a result of the degeneration of tissue. Many of the dangerous effects of beta-amyloid seem to arise from oxidative damage. Amyloid itself is not highly toxic, but it might possibly trigger dementia if a critical mass accumulates in the brain. Further evidence reveals that the presence of amyloid may trigger the release of a cascade of complement proteins, perhaps sparking a vicious cycle of inflammation and further plaque deposits. However, an immune system attack on brain cells may be a result, or may be merely one element, of Alzheimer's disease, rather

than the cause. Other potential risk factors being studied are head injury, very high blood pressure, and low education levels.

Although all of these findings offer hope that Alzheimer's disease may one day be fully understood, and thereby prevented, science does not yet know what can be done to arrest the mental deterioration. Even diagnosis of the disease is not a precise science.

There are tests that can suggest a diagnosis of Alzheimer's disease and that can dismiss other problems as the cause of symptoms, but currently there is no single laboratory procedure or biochemical marker that can definitively confirm the disorder in a living person. A study conducted at the National Institute of Mental Health (NIMH) and reported in the *Journal of the American Medical Association (JAMA)* showed that testing spinal fluid for beta-amyloid and tau proteins (which make up the tangles) could help identify people at risk for the disease. It would first be necessary to establish a baseline measurement, then track the changes over time, but using these two biomarkers may signify some progress in the diagnosis of the disease. At present, physicians make a probable diagnosis by performing a comprehensive evaluation including a complete health history and physical examination, a mental status assessment, neurological tests, blood tests, urinalysis, an electrocardiogram (EKG), and X-rays. Additional tests may be conducted, such as a computerized tomography (CAT) scan, electroencephalogram (EEG, a recording of brain-wave patterns), and formal psychiatric assessment. These tests are necessary to rule out other possible causes of dementia symptoms, such as pernicious anemia, hypothyroidism, or tumors. Documenting symptoms over time, in a diary-like fashion, helps doctors to understand each individual case. Unfortunately, the diagnosis of Alzheimer's disease is often made long after the person has lost the ability to communicate and comprehend information. Milder signs of Alzheimer's disease may not be detected in the very old, and many people die before developing obvious symptoms. People with family members who have Alzheimer's disease are probably more able to detect the early signs than are doctors.

As more is learned about the contribution of genetic and other factors to Alzheimer's disease, the possibility of delaying the progression of the disease may become more real.

Nutrients may have a beneficial effect, and one study has shown that vitamin E slowed the progress of some components of the disease by up to seven months in those who already have Alzheimer's disease. Research also indicates that the herb ginkgo biloba, a natural remedy known for many years, may be helpful in treating some symptoms, although it should be used with caution as its use can sometimes lead to excessive bleeding, especially if it is used in conjunction with aspirin therapy.

A study done at the Rush Institute for Healthy Aging in Chicago indicated that people with low levels of niacin (vi-

tamin B<sub>3</sub>) were 70 percent more likely to get Alzheimer's disease than those who had higher levels in their diet. Niacin is required for cell respiration, helps release energy, and assists in metabolizing carbohydrates, fats, and proteins. The secretion of bile, functioning of the nervous system, synthesis of sex hormones, and many other processes require this vitamin. The study showed the protective effect began at 17 milligrams per day, about what a healthy male normally requires (females require 13 milligrams per day). Supplements are usually taken in 100-milligram increments, so benefits certainly can be expected at this level.

No one should accept a diagnosis of Alzheimer's disease without first undergoing a trial of intensive nutritional therapy, using zinc, vitamin B<sub>3</sub> (as described above), and vitamin B<sub>12</sub>, perhaps as injections. Vitamin B<sub>12</sub> functions in numerous metabolic processes affecting nerve tissue, including the synthesis of neurotransmitters and the formation of the insulating sheath surrounding many nerves, and it may play a role in the fight against Alzheimer's disease. Strange prickly or tingling sensations, loss of coordination, and dementia can be caused by B<sub>12</sub> deficiency even if the person does not have pernicious anemia, the classic sign of that deficiency. If an individual responds to vitamin treatment, Alzheimer's disease can be ruled out.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Acetylcholine	500 mg 3 times daily, on an empty stomach.	Deficiency has been implicated as possibly causing dementia.
Acetyl-L-carnitine	500 mg twice daily.	May enhance brain metabolism. Slows down deterioration of memory and reduces the production of free radicals.
Boron	3 mg daily. Do not exceed this amount.	Improves brain and memory function.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Coenzyme Q <sub>10</sub>	100–200 mg daily.	Increases oxygenation of cells and is involved in the generation of cellular energy.
Folic acid	As directed on label.	To aid in controlling homocysteine levels. Studies have shown high levels of homocysteine in this disorder.
Iron	As directed by physician.	A deficiency may be present. <i>Caution:</i> Do not take iron unless prescribed by your physician.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Needed for improved memory. Contains choline.
Multivitamin and mineral complex with potassium	99 mg daily.	All nutrients are necessary in balance. Use a high-potency formula. Needed for proper electrolyte balance.

Phosphatidyl serine	300 mg 3 times daily.	Improves memory. However, this was from bovine sources, which are no longer available, and the efficacy of newer products has not been determined.
Pycnogenol or grape seed extract	60 mg three times daily. As directed on label.	Potent antioxidants that readily pass the blood-brain barrier to protect brain cells from free radical damage.
S-Adenosylmethionine (SAME)	400 mg twice daily.	Lowers homocysteine levels. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
Selenium	200 mcg daily.	Powerful antioxidant for brain cell protection.
Trimethylglycine (TMG)	500–1,000 mg daily, in the morning.	Assists the body in utilizing vitamin B <sub>12</sub> , folic acid, and vitamin B <sub>6</sub> . It also helps to rid the body of toxic elements (such as homocysteine) and increases levels of the natural mood elevator S-adenosylmethionine.
Vitamin A plus carotenoids (including beta-carotene) and vitamin E	15,000 IU daily. 25,000 IU daily. 200 IU daily.	Deficiencies of antioxidants expose the brain to oxidative damage. An antioxidant that helps in the transport of oxygen to the brain cells and protects them from free radical damage. Use d-alpha-tocopherol form. <i>Caution:</i> If you are taking blood-thinning medication, consult your physician before taking vitamin E.
Vitamin B complex injections plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	2 cc 3 times weekly or as prescribed by physician. ½ cc once weekly or as prescribed by physician. 1 cc 3 times weekly or as prescribed by physician.	Needed for brain function; aids in the digestion of food. Deficiency can cause depression and mental difficulties. Important for brain function. Deficient in people with Alzheimer's disease. Injections (under a doctor's supervision) are fast and produce good results.
or vitamin B complex plus extra pantothenic acid (vitamin B <sub>5</sub> )	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily.	If injections are not available, use a sublingual form. Plays a role in converting choline into acetylcholine, needed for memory.
Zinc	80 mg daily, in divided doses. Do not exceed a total of 100 mg daily from all supplements.	Powerful immune system stimulant. Necessary for T lymphocyte function, which is needed to fight infection.

Important		
Apple pectin	As directed on label.	Aids in removing toxic metals such as mercury, which can contribute to dementia.
Calcium and magnesium	1,600 mg daily, at bedtime. 800 mg daily.	Has a calming effect and works with magnesium. Acts as a natural calcium channel blocker.
Free form amino acid	1,000–2,500 mg daily, 1 hour before meals. Take with 8 oz of fluid and a small amount of vitamins B <sub>6</sub> and C for better assimilation.	Needed for improved brain function and tissue repair. Use free form amino acids for best absorption.
Huperzine A	100 mcg daily.	Improves cognitive functions and may improve short-term memory.
Kelp	1,000–1,500 mg daily.	Supplies needed minerals and aids in thyroid function.
Melatonin	2–3 mg daily, taken 2 hours or less before bedtime.	Improves brain function and aids sleep. Reduces cell destruction in the brain and has antioxidant properties.
RNA and DNA	As directed on label.	These are the brain's cellular building blocks. Use a formula containing 200 mg RNA and 100 mg DNA per tablet. <i>Caution:</i> Do not take this supplement if you have gout.
Superoxide dismutase (SOD) plus copper	As directed on label. 3 mg daily.	A potent antioxidant that improves utilization of oxygen. SOD needs copper to function properly as an antioxidant.
Vitamin C with bioflavonoids	6,000–10,000 mg daily, in divided doses.	Enhances immune function and increases energy level; a powerful antioxidant. Use a buffered form.

## Herbs

- Butcher's broom promotes healthy circulation.
- Curry consumption in nondemented patients seemed to improve cognitive performance. Whether it helps patients who already have Alzheimer's disease is unknown, but it is certainly reasonable to include it when cooking.
- Ginkgo biloba extract, taken in liquid or capsule form, acts as an antioxidant and increases blood flow to the brain. According to a report published in the October 22, 1977, edition of the *Journal of the American Medical Association (JAMA)*, ginkgo biloba extract can stabilize and, in some cases, improve the mental functioning and social behavior of people with Alzheimer's disease. This was later confirmed in a 1997 study. Take 100 to 200 mg of ginkgo biloba extract three times daily.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Kava kava and St. John's wort help to calm people who anger easily.

*Cautions:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

- Recent studies from Japan suggest that curcumin (a compound in turmeric) and rosmarinic acid inhibit the formation and extension of beta-amyloid fibrils, and destabilize existing beta-amyloid plaques. The recommended dosage for curcumin is 600 mg a day. Rosmarinic acid is a plant phenolic that is present in significant quantities in oregano, sanicle, gypsywort, rosemary, marjoram, the mints, and sage. Capsules commonly contain 35 milligrams of rosmarinic acid; four to six capsules (140 to 210 milligrams) a day is the normal dosage.

*Cautions:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

- The Chinese herb qian ceng ta (*Huperzia serata*) increases memory retention. This is the same herb that is the source of huperzine A, and it is also known as club moss. Pure and standardized extracts of this herb have been shown to increase mental acuity, language ability, and memory in a significant percentage of subjects with Alzheimer's disease. It is a potent blocker of acetylcholinesterase, an enzyme that regulates the activity of acetylcholine, which is an important chemical of the brain that maintains healthy learning and memory functions.

- Valerian root improves sleep patterns when taken at bedtime.

## Recommendations

- Keeping the brain busy may help slow down the progression of the disease. This means keeping active and intellectually involved, as well as getting plenty of exercise.
- Eat a well-balanced diet of natural foods and follow the supplementation program recommended above.
- Have a hair analysis to rule out the possibility of heavy metal intoxication as the cause of symptoms. (See HAIR ANALYSIS in Part Three.)
- Include plenty of fiber in your diet. Try oat bran or rice bran.
- Have allergy testing performed to rule out environmental and/or food allergies. (See ALLERGIES in Part Two.)
- Avoid alcohol, cigarette smoke, processed foods, and environmental toxins, especially metals such as aluminum and mercury. Smoking more than doubles the risk of developing dementia and Alzheimer's disease, according to a

study published in the British medical journal *Lancet*. While recent studies have not substantiated a connection between aluminum and Alzheimer's disease, it is still wise to avoid aluminum intake as much as possible. All metals in excess are toxic to the body.

❑ Do not drink tap water, as it may contain aluminum. Consume steam-distilled water only and drink at least eight glasses a day. (See WATER in Part One.)

❑ If you are involved in caring for someone with Alzheimer's disease, seek counseling and support from the various agencies and groups, such as the Alzheimer's Association, that are trained to help. They can teach you how to handle such things as difficult behaviors. With aggressive behaviors, for example—whether name-calling, shouting, or physical aggression toward the caregiver—understanding why the behavior occurred is the key. Some tips from the Alzheimer's Association:

- Think about what happened just before the reaction that may have "triggered" the behavior.
- Look for the feelings behind the words.
- Be positive, reassuring, and speak slowly, with a soft tone.
- Use music, massage, and/or exercise to help soothe the person.

Memory loss and confusion can cause a person with Alzheimer's disease to become suspicious of those around him or her. If this occurs, try not to take offense or argue, but rather offer a simple answer or try to divert the person's attention to another activity. For all caregivers, take time to care for yourself. The aging process is shown to increase according to telomere measurements in the caregivers of spouses who have Alzheimer's disease. Make arrangements to leave your spouse to engage in things you like to do. Be sure to keep up your own diet and exercise regimen.

### Considerations

❑ A test that measures electrical activity in the brain and stores the information on a computer disk for analysis can be used to help diagnose Alzheimer's disease.

❑ A skin test using lasers under development in Australia may provide earlier and more rapid diagnosis. Developed at the National Ageing Research Institute at the University of Melbourne, this test detects blood flow restrictions associated with Alzheimer's disease. The test involves the use of lasers along with a mild electrical current that activates a chemical useful in assessing blood flow. It is hoped that the test will become a public screening measure in the near future.

❑ Using your brain, remaining busy, writing, reading, and learning new things are important overall factors in staying sharp and preventing mental disorders.

❑ Carbamazepine (Tegretol), an antiseizure medication, can ease Alzheimer's disease-related anger and hostility, according to one study. Aggression was markedly reduced in three out of four of the Alzheimer's disease patients in the study.

❑ Recent studies show that the progression of Alzheimer's disease can be slowed or even reversed by reducing free radical accumulation through the use of antioxidants. Tests conducted in Switzerland over a twenty-two-year period produced evidence of significantly higher memory scores associated with antioxidant therapy.

❑ Omega-3 fatty acids were tested in patients with mild to moderate Alzheimer's disease to see whether they would help slow the progression of the disease. At the dose used (1.7 grams DHA and 0.6 grams EPA), after six months no effect was observed. However, patients still have a biological need for omega-3 supplementation, so include fish in the diet and fish oil capsules if desired.

❑ The herbs balm and sage are being researched for possible beneficial effects on brain chemistry. Balm appears to simulate the neurological receptors that bind acetylcholine. Sage contains compounds that are cholinesterase inhibitors. Current drugs used to treat Alzheimer's disease are typically cholinesterase inhibitors.

*Cautions:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

❑ Preliminary studies performed on rats at the University of Washington in Seattle indicate that cat's claw, when mixed with other herbal extracts (such as ginkgo, gotu kola, and rosemary), inhibits the buildup of plaques in the brain.

*Caution:* Do not use cat's claw during pregnancy. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

❑ Some experts distinguish between a rapidly progressing form of Alzheimer's disease that begins earlier in life (usually between the ages of thirty-six and forty-five) and a more gradual form that develops in people around the ages of sixty-five or seventy. For more information, consult *Complete Guide to Symptoms, Illness and Surgery for People Over 50* by H. Winter Griffith, M.D. (The Body Press/Perigee Books, 4th revised edition, 2000).

❑ The signs of alcohol abuse and the symptoms of Alzheimer's disease can be very similar. For example, actress Rita Hayworth, who had Alzheimer's disease, was at first thought to be an alcoholic.

❑ Research studies supported by the Alzheimer's Association and studies done at the Department of Research at Oakwood College in Huntsville, Alabama, found that liquid aged garlic extract (Kyolic) might prove to be useful in the improvement of Alzheimer's disease symptoms. Kyolic protected the cells from toxic effects of beta-amyloid.

❑ Homocysteine, an amino acid that forms as the result of the breakdown of another amino acid, methionine, is a bio-

marker for the development of dementia and Alzheimer's disease. Some scientists speculate that Alzheimer's disease might be avoided if people reduced the levels of homocysteine in their blood, although it has not yet been determined whether homocysteine itself actually contributes to Alzheimer's disease. A more likely explanation is that elevated homocysteine levels are an indication of a severe disruption of methylation (a type of biochemical process essential for the repair and maintenance of genetic material and the production of neurotransmitters, among other things) in the brains of people with Alzheimer's disease. Methylation deficiencies can result in severe damage to brain cells. Other researchers report that abnormal amino acid metabolism in Alzheimer's disease causes higher homocysteine levels. This may lead to the neurological damage that occurs as the disease advances.

❑ A decline in the sense of smell often occurs as much as two years prior to the beginning of mental decline in people with Alzheimer's disease. Scientists at the University of California–San Diego Medical Center found that people with Alzheimer's disease must be exposed to very strong concentrations of a substance before they can detect its odor. The rate at which the sense of smell is lost can predict how rapidly cognitive functioning is lost. Smoking can damage cells involved in the sense of smell, making this test less useful for smokers.

❑ Regular exercise throughout adulthood can reduce the chances of developing Alzheimer's disease. Activities associated with reduced risk include biking, walking, swimming, and golf. Two studies in major medical journals showed that walking three times a day improved cognitive function and reduced the risk of Alzheimer's disease. Those already with the disease should continue this sort of exercise program for as long as possible.

❑ Researchers at the University of California–Davis questioned the caregivers of eighty-eight elderly people, half of whom had either Alzheimer's disease or a related form of dementia, about their eating habits. Half of the people with Alzheimer's disease had such a strong desire for sweets that their access to these foods had to be restricted.

❑ No treatment can stop or reverse Alzheimer's disease. However, for people in the early and middle stages of the disease drug therapy using cholinesterase inhibitors such as donepezil (Aricept), rivastigmine (Exelon), or galantamine (Razadyne) may alleviate some symptoms for a limited period of time. These are the first line of defense for drug therapies. They prevent the breakdown of acetylcholine, a chemical messenger important for learning and memory. A new class of drug introduced in 2003, which is currently the only available neuroprotective therapy, is memantine (Namenda), which has been approved for treatment of moderate to severe cases. However, this drug does not appear to be the "silver bullet" everyone has been looking for and, indeed, might only offer some slight relief to those patients already in the last stages of the disease. This

drug regulates the activity of glutamate, a different messenger involved in learning and memory.

❑ There is some evidence that inflammation in the brain may contribute to damage caused by the disease. As a result, studies were being conducted on the effect of nonsteroidal anti-inflammatory drugs (NSAIDs) to see if they could slow its progression. But at this point, one study on rofecoxib (Vioxx) and naproxen sodium (Aleve) was inconclusive, and another on celecoxib (Celebrex) and naproxen sodium was discontinued. Rofecoxib has since been withdrawn from the market.

❑ Because the beta-amyloid plaques appear to be in large measure the culprits behind Alzheimer's disease damage, if a way could be developed to clear them out, or prevent their buildup altogether, the disease could be managed. Researchers at Lilly Research Laboratories and Elan Pharmaceuticals have discovered that certain monoclonal antibodies bind to beta-amyloid and clear it from the brain. In animal experiments, a treatment with monoclonal antibody M266 both cleared beta-amyloid from the brains of the subjects and reversed some existing memory problems. Meanwhile, a study published in the *Journal of Neuroscience* in March 2003 showed that levels of neprilysin, a beta-amyloid-degrading enzyme, could be boosted by means of gene therapy. This caused a reduction in the plaque found in the brains of the animal subjects. Another study, published in *Nature Medicine*, was conducted that pointed to astrocytes, naturally occurring cells that protect neurons, as mechanisms that counter beta-amyloid. Researchers theorize that defects in the ability of astrocytes to clear beta-amyloid could be a contributing factor in plaque development.

❑ A research study published in the *Proceedings of the National Academy of Sciences* has shown that mice modified to lack the enzyme insulysin (which degrades insulin) had did levels of beta-amyloid 1.5 times greater in their brains than did control mice. Because insulysin is so closely tied to insulin and glucose metabolism, and because there appears to be a link between diabetes and Alzheimer's disease, scientists hope that modifying insulysin activity or some other aspects of insulin metabolism may assist in management of the disease.

❑ Research reported in the journal *Biochemistry* indicated possible therapeutic potential of anti-beta-amyloid proteolytic antibody light chain fragments. These fragments are able to zero in on the beta-amyloid and reduce its toxicity, and they can be introduced into the parts of the brain that contain heavy concentrations of the plaque by noninvasive methods.

❑ A Phase I safety trial has been run on humans with a proposed vaccinelike drug that showed a lot of promise in animal studies. As these trials showed no ill effects on the subjects, a Phase II trial was begun in 2001 with 360 participants. Unfortunately, the trial was halted due to some severe side effects, but the results even of the foreshortened trial showed great promise. The drug appears to have re-

duced the amount of beta-amyloid plaques in one patient, and a significant number of those treated did develop antibodies to beta-amyloid, and showed little or no cognitive decline as compared to those who failed to develop the antibodies. This study has encouraged researchers to try different approaches based on the underlying theory because there did appear to be a positive effect caused by the drug. This avenue, immune therapy, shows much promise, and may be a path to an effective treatment in the future.

□ Preliminary trials suggest that nicotinamide adenine dinucleotide (NADH) may benefit those afflicted with Alzheimer's disease. In a study conducted by Austrian researcher and physician Dr. George Birkmayer and colleagues, seventeen patients with Alzheimer-type dementia were treated with NADH for eight to twelve weeks. The patients' cognitive function improved as measured by two standard tests, according to the Folstein Mini-Mental Status Examination and the Global Deterioration Scale. The patients reportedly did not suffer any adverse side effects.

□ High doses of lecithin may be helpful for people with Alzheimer's disease. However, a double-blind controlled trial of high doses of lecithin reported in the *Journal of Neurology, Neurosurgery & Psychiatry* found that there may be a "therapeutic window" for the effects of lecithin on people with Alzheimer's disease, and that this may be more evident in older people.

□ Women with Alzheimer's disease have been found to have lower estrogen levels than their healthy counterparts.

□ Researchers at the Massachusetts Institute of Technology discovered that levels of choline and ethanolamine are significantly lower than normal in people suffering from Alzheimer's disease. Both choline and ethanolamine are used for the synthesis of phospholipids that are major components of the cell membranes of neurons in the brain.

□ Scientists at the University of Kentucky found that levels of glutamine synthetase, an enzyme that controls the production of ammonia and glutamate, were higher in a group of people with Alzheimer's disease than in a healthy control group. Glutamate is vital to the brain in small amounts, but it can be poisonous in high concentrations. Abnormally high levels of glutamate have recently been associated with amyotrophic lateral sclerosis (ALS, also known as Lou Gehrig's disease) and glaucoma.

□ An estimated 2 percent of Americans have two copies of a gene for the production of a substance called apolipoprotein E4, or APO-E4. APO-E4 transports cholesterol through the bloodstream and also changes the form of amyloid in the brain. People who inherit one copy of the gene for the production of APO-E4 have an increased chance of developing Alzheimer's disease; those who inherit two copies of the allele are at even greater risk.

□ Experts say that it is in an individual's best interest to be told as soon as there is reason to suspect a diagnosis of Alzheimer's disease. Early warning cannot prevent the

disease, but it gives people time to settle their affairs and make informed judgments about future care and other matters.

□ People who tend to experience psychological distress appear to be more likely to develop Alzheimer's disease than those who are less prone to experience distress. In a study reported in the journal *Neurology*, people who most often experienced negative emotions such as depression and anxiety were twice as likely to develop the disease as those who were less prone to experience these negative emotions. However, more research is needed before across-the-board prescription of antidepressants is approved to prevent Alzheimer's disease.

□ The omega-3 fat DHA (docosahexaenoic acid), which is found in many cold-water fish (such as salmon, tuna, and mackerel), is known to have cardioprotective effects. Researchers at the University of California-Los Angeles School of Medicine found that genetically engineered mice fed a diet rich in DHA were found to have less brain cell damage than those fed a diet which substituted safflower oil, which is low in omega-3 fatty acids. The American Heart Association recommends at least two meals a week of fish rich in omega-3 fatty acids. While this is for good cardiovascular health, it is possible that this diet can also favorably affect people who have Alzheimer's disease or who have a high risk of developing the disease. This is surely a case of "It can't hurt, and it might help."

□ Anyone who cares for a person with Alzheimer's disease may eventually find the job overwhelming and need support. For many, adult day-care centers are a godsend. A good day-care center should be clean, safe (without glass doors, uneven or slippery floors, furniture with sharp corners, and so on), and have barriers at entrances and exits to protect wanderers without making them feel trapped. Food should be nutritious and appetizing. Staff members should be friendly, compassionate, and professionally trained to work with Alzheimer's disease patients. There should be psychologists or social workers on the staff to help patients cope with the ordinary frustrations of daily life and to assist them in coping with anger and depression. A quiet room should be available where an agitated or ill person can be separated from others. The availability of other specific services, such as physical therapy, help with hygiene, family counseling, or support groups for caregivers, as well as the usual activities of the center, should be suited to the particular needs of the individual and his or her family.

□ The calming effect of watching fish swimming peacefully in an aquarium is found to help people with Alzheimer's disease eat better by helping them to concentrate long enough to eat well, according to Nancy Edwards, Ph.D., an associate professor of nursing at Purdue University.

□ For names and addresses of organizations that can provide further information about this disorder, see Health and Medical Organizations in the Appendix.

## AMBLYOPIA

See DIMNESS OR LOSS OF VISION under EYE PROBLEMS.

## ANEMIA

Millions of Americans suffer from anemia, a reduction in either the number of red blood cells or the amount of hemoglobin in the blood. This results in a decrease in the amount of oxygen that the blood is able to carry. Anemia reduces the amount of oxygen available to the cells of the body. As a result, they have less energy available to perform their normal functions. Important processes, such as muscular activity and cell building and repair, slow down and become less efficient. When the brain lacks oxygen, dizziness may result, and mental faculties are less sharp.

Anemia is not a disease, but rather a symptom of various diseases. Anything that causes a deficiency in the formation or production of red blood cells, or that leads to the too-rapid destruction of red blood cells, can result in anemia. It is sometimes the first detectable sign of arthritis, infection, or certain major illnesses, including cancer. Drug use, hormonal disorders, chronic inflammation in the body, surgery, infections, peptic ulcers, hemorrhoids, diverticular disease, heavy menstrual bleeding, repeated pregnancies, liver damage, thyroid disorders, rheumatoid arthritis, bone marrow disease, and dietary deficiencies (especially deficiencies of iron, folic acid, and vitamins B<sub>6</sub> and B<sub>12</sub>) can all lead to anemia. Anemia can also be caused by medications such as chemotherapy. Women who are postmenopausal should not be anemic. If you are eating a normal diet and are not a vegetarian, and you become anemic, consult your doctor. The body likes to maintain its iron status, so anemia is a signal that something isn't right.

There are also a number of hereditary disorders, such as sickle cell disease and thalassemia, that cause anemia.

Sickle cell anemia affects about 70,000 to 80,000 people (mostly of African-American and Mediterranean descent) in the United States. It is a rare, inherited blood disease that causes red blood cells to become brittle and crescent-shaped. Painful "crises" arise when affected cells become jammed in narrow blood vessels, producing painful swelling of the hands and feet accompanied by fever, fatigue, and pneumonia-like symptoms.

Pernicious anemia is a severe form of anemia that is due to vitamin B<sub>12</sub> deficiency. Persons with this disorder cannot absorb any form of vitamin B<sub>12</sub> from the gastrointestinal tract. Malabsorption can cause pernicious anemia, as can poor eating habits, gastrointestinal infection, Crohn's disease, gastric surgery, and sometimes even strict vegetarianism. If B<sub>12</sub> levels fall too far, the result is lagging energy, depression, indigestion, diarrhea, and anemia. Ongoing vitamin B<sub>12</sub> deficiency carries a risk of neurological damage.

The most common cause of anemia is iron deficiency. Iron is an important factor in anemia because this mineral is used to make hemoglobin, the component of red blood

cells that attaches to oxygen and transports it. Red blood cells exist only to oxygenate the body, and have a life span of about 90 to 120 days. If a person lacks sufficient iron, the formation of red blood cells is impaired. Iron-deficiency anemia can be caused by insufficient iron intake and/or absorption, or by significant blood loss. The latter is commonly seen in women who suffer from menorrhagia (heavy or prolonged menstrual bleeding), which in turn may be caused by a hormonal imbalance, fibroid tumors, or uterine cancer. Women who use intrauterine devices for contraception are also at a higher risk of blood loss, as are those who overuse anti-inflammatory medications such as aspirin or ibuprofen, which can cause blood loss through irritation of the digestive tract. Excessive aspirin usage, particularly by elderly people, may cause internal bleeding.

Anemia's symptoms can easily go unrecognized. The first signs of developing anemia may be loss of appetite, constipation, headaches, irritability, and/or difficulty in concentrating.

Established anemia can produce such symptoms as weakness; fatigue; coldness of the extremities; depression; dizziness; overall pallor, most noticeable in pale and brittle nails; pale lips and eyelids; soreness in the mouth; and in women, cessation of menstruation. Anemia has also been linked to a loss of libido. Twelve percent of females age twelve to forty-nine and 7 percent of children age one to two are iron deficient.

Anemia should always be investigated and the cause determined. A complete blood count, or CBC, should be run by your doctor if anemia is suspected. This will measure both your red blood cell count and hemoglobin level. Hemoglobin normally should be between 12 and 18 grams per deciliter (g/dL). If you are anemic and your diet is ironclad, your physician can run a simple test called ESR (erythrocyte sedimentation rate) to detect any inflammation lurking in the body.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Iron	As prescribed by physician. Take with 100 mg vitamin C for better absorption.	To restore iron. Use a ferrous gluconate form. <i>Caution:</i> Do not take iron unless anemia is diagnosed.
or	2 tsp twice daily.	
Floradix Iron + Herbs from Salus Haus		Contains a readily absorbable form of iron that is nontoxic and from a natural source.

Raw liver extract	500 mg twice daily.	Contains all the elements needed for red blood cell production. Use liver from organically raised beef. Consider injections (under a doctor's supervision).
-------------------	---------------------	---

**Very Important**

Blackstrap molasses	1 tbsp twice daily for adults; 1 tsp added to milk for children and infants.	Contains iron and essential B vitamins.
Folic acid plus biotin	800 mcg twice daily. 300 mcg twice daily.	Needed for red blood cell formation.
Vitamin B <sub>12</sub> injections or vitamin B <sub>12</sub>	2 cc once weekly or as prescribed by physician. 2,000 mcg 3 times daily.	Essential in red blood cell production and to break down and prepare protein for cellular use. Injections (under a doctor's supervision) are best. If injections are not available, use a lozenge or sublingual form for best absorption.

**Important**

Vitamin B complex plus extra pantothenic acid (vitamin B <sub>5</sub> ) and vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. 100 mg daily.	B vitamins work best when taken together. A sublingual form is recommended. Important in red blood cell production. Involved in cellular reproduction. Aids absorption of vitamin B <sub>12</sub> .
Vitamin C plus bioflavonoids	3,000–10,000 mg daily.	Important in iron absorption.

**Helpful**

Brewer's yeast	As directed on label.	Rich in basic nutrients and a good source of B vitamins.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Copper and zinc	2 mg daily. 30 mg daily. Do not exceed this amount.	Needed in red blood cell production. Note: If more zinc is used, increase copper proportionately. Needed to balance with copper.
Raw spleen glandular	As directed on label.	See GLANDULAR THERAPY in Part Three for its benefits.
S-Adenosylmethionine (SAME)	As directed on label.	Helps reduce stress and depression. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin A plus natural beta-carotene or carotenoid complex (Betatene)	10,000 IU daily. 15,000 IU daily. As directed on label.	Important antioxidants.

Vitamin E	200 IU daily. Take separately from iron supplements.	Important for red blood cell survival; prolongs the life span of these cells. Use an emulsion form for easier assimilation. Use d-alpha-tocopherol form.
-----------	--	--

**Herbs**

Alfalfa, bilberry, cherry, dandelion, goldenseal, grape skins, hawthorn berry, mullein, nettle, Oregon grape root, pau d'arco, red raspberry, shepherd's purse, and yellow dock are good for anemia.

*Cautions:* Do not take goldenseal or Oregon grape root during pregnancy. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Herbalists consider nettle (*Urtica dioica*), a nutritious plant rich in iron, vitamin C, chlorophyll, and other minerals, an effective supplement in the treatment of iron-deficiency anemia.

**Recommendations**

Have a complete blood test to determine if you have an iron deficiency before taking iron supplements. Excess iron can damage the liver, heart, pancreas, and immune cell activity, and has been linked to cancer. Use iron supplements only under the supervision of a qualified health care provider. Include in your diet foods such as meats, poultry, fish, and enriched cereals. Continue with regular blood testing to monitor the effect of iron. Taking too much or too little could be harmful.

Also include the following in your diet: apples, apricots, asparagus, bananas, broccoli, egg yolks, kelp, leafy greens, okra, parsley, peas, plums, prunes, purple grapes, raisins, rice bran, squash, turnip greens, whole grains, and yams. Also eat foods high in vitamin C to enhance iron absorption.

Consume at least 1 tablespoon of blackstrap molasses twice daily (for a child, use 1 teaspoon in a glass of milk or formula twice daily). Blackstrap molasses is a good source of iron and essential B vitamins.

Eat foods containing oxalic acid in moderation or omit them from the diet. Oxalic acid interferes with iron absorption. Foods high in oxalic acid include almonds, cashews, chocolate, cocoa, kale, rhubarb, soda, sorrel, spinach, Swiss chard, and most nuts and beans.

Avoid beer, candy bars, dairy products, ice cream, and soft drinks. Additives in these foods interfere with iron absorption. For the same reason, avoid coffee (which contains polyphenols) and tea (which contains tannins).

- Because iron is removed through the stool, do not eat foods high in iron and/or iron supplements at the same time as fiber. Avoid using bran as a source of fiber.
- If you are a strict vegetarian, watch your diet closely. Taking supplemental vitamin B<sub>12</sub> is advised. (See VITAMINS in Part One.)
- Do not smoke. Avoid secondhand smoke.
- Minimize your exposure to lead and other toxic metals. (See ALUMINUM TOXICITY; CADMIUM TOXICITY; LEAD POISONING; and/or MERCURY TOXICITY for suggestions.)
- Do not take calcium, vitamin E, zinc, or antacids at the same time as iron supplements. These can interfere with iron absorption.

### Considerations

- Iron from animals is in a heme form (from animals). All other foods containing iron are in a non-heme form (not from animals). As mammals, our bodies preferentially recognize and absorb the heme form better than the non-heme form. The fastest way to restore iron in the blood to normal is to consume meat (beef and poultry) and seafood and take an iron supplement as needed.
- The following foods are among the highest in iron content, with over 5 milligrams of iron per average serving: kidney beans, pinto beans, liver (eat only liver from organically raised animals), blackstrap molasses, rice bran, raw beet greens (not the beets), mustard greens, lentils, dried peaches, and prune juice. Foods with a moderately high iron content (3 to 5 milligrams per average serving) include cooked dried apricots, cooked beet greens, dates, lean meat (lamb, turkey, and veal), lima beans, chili, cooked spinach, and dry and fresh peas.
- Eating fish at the same time as vegetables containing iron increases iron absorption. Omitting all sugar from the diet increases iron absorption as well.
- Iron-deficiency anemia should disappear when the underlying cause is corrected.
- Physicians can sometimes detect vitamin B<sub>12</sub> deficiency by measuring serum B<sub>12</sub> levels, taking a complete blood cell count, and doing a blood test called the Schilling test, which evaluates B<sub>12</sub> absorption. Persons with pernicious anemia must take vitamin B<sub>12</sub> sublingually (dissolved under the tongue), by retention enema, or by injection. This treatment must be maintained for life, unless the underlying cause of the deficiency can be corrected.
- Hydroxyuria (Droxia), a cancer drug, may be prescribed for people with sickle cell anemia who are over the age of eighteen and have experienced three or more crises in a one-year period. The drug eases symptoms, but is not a cure for the disease.
- The American Academy of Pediatrics (AAP) recommends that children under one year old not drink cow's

milk. Milk can cause anemia by interfering with iron absorption and possibly causing internal bleeding. The AAP published the results of a University of Iowa study that found the blood content in the stool of infants fed cow's milk was five times higher than in children fed infant formula. Researchers concluded the amount of iron lost was "nutritionally important."

### ANGINA

See under **CARDIOVASCULAR DISEASE**.

### ANKYLOSING SPONDYLITIS

See under **ARTHRITIS**.

### ANOREXIA NERVOSA

The term anorexia nervosa was first coined in 1873. A doctor writing in the British medical journal *The Lancet* used the term to describe people who, although thin and weak, insisted that they needed to lose weight and would not eat a sufficient amount of food to remain alive.

Anorexia nervosa is a nervous, psychological eating disorder characterized by a refusal to eat, even to the point of starvation. Other symptoms include an intense fear of becoming fat that never goes away, no matter how thin the individual becomes; extreme overactivity and an obsession with working out; negative feelings about the way the body looks; deep feelings of shame; and problems with drug and/or alcohol abuse. Ninety-five percent of the people who suffer from this disorder are female. Anorexia typically appears during adolescence. The incidence of eating disorders, particularly among young women in the United States, has escalated dramatically during the past decade.

An estimated 8 million Americans (7 million women and 1 million men) struggle with anorexia, according to the National Association of Anorexia Nervosa and Associated Diseases (ANAD). Eating disorders are not limited to teenage girls. Women aged forty and older are also susceptible. Doctors suspect that low levels of serotonin, a neurotransmitter, may be the cause, producing psychological problems linked to anorexia and bulimia.

Some people with anorexia just quit eating; some make themselves vomit immediately after eating; some take laxatives after eating; and some do all three. Most people with anorexia have normal feelings of hunger at the onset of the disease but teach themselves to ignore them. Despite their refusal to eat, people with anorexia often become obsessed with food and may spend hours fantasizing about it, reading recipes, or even preparing elaborate meals for others.

Another characteristic feature of the disorder is that people with anorexia usually deny that there is anything wrong and claim that they simply "aren't hungry" and even insist that they need to lose more weight.

Many females who are anorexic are also bulimic. Bulimia nervosa is defined as the consumption of extremely large quantities of food in short periods of time (bingeing), followed by self-induced vomiting or the use of either diuretics or cathartics (purging). (See BULIMIA.) If anorexia and bulimia occur in the same individual, the disorder is called bulimarexia.

Anorexia can lead to underweight, extreme weakness, dizziness, cessation of menstruation, swelling of the neck, ulcers and erosion of the esophagus, erosion of the enamel of the back teeth from repeated vomiting, broken blood vessels in the face, and a low pulse rate and blood pressure. In some extreme cases, spoons or sticks used to induce vomiting have become stuck in the digestive tract and have had to be surgically removed. Systemic physiological changes in those suffering from anorexia include thyroid dysfunction, disturbances in the heartbeat, and irregularity in the secretion of growth hormone and the hormones cortisol, gonadotropin, and vasopressin.

Eventually, if anorexic behavior continues long enough, classic complications associated with starvation appear.

Electrolyte imbalances created by insufficient potassium and sodium levels cause dehydration, muscle spasms, and, ultimately, cardiac arrest. If laxatives are used, these further deplete the body of potassium. Hypokalemia (potassium deficiency) is a major problem for people with anorexia. Chronic hypokalemia can cause an irregular heartbeat, which can lead to heart failure and death. Patients may require intravenous nutrition to restore normal body mass (muscle) and weight. Because it takes a long time both to lose and to gain weight, this is a slow process.

Initially, anorexia nervosa was thought to be strictly a psychological problem. However, in the last few years, medical scientists and nutritionists have identified several physical components as well. For example, people with eating disorders have been found to have chemical imbalances similar to those found in individuals with clinical depression. Some cases of anorexia have been found to be caused by severe zinc deficiency.

Nevertheless, the psychological elements continue to be important. Teasing by peers or parents can play a role in making individuals obsessed with the idea that they are fat. In addition, many people who suffer from anorexia display great fear at the prospect of growing up, and girls often have difficult mother/daughter relationships.

Some may try to live up to images their parents set for them, but feel inadequate—that they are not as beautiful or intelligent as their parents want them to be. A girl with anorexia may then develop an inferiority complex, seeing herself as fat and/or ugly, and no amount of common sense or persuasion can alter her distorted mental image.

About 30 percent of all people with anorexia struggle with the disorder all their lives. Another 30 percent have at least one life-threatening bout with it, while the remaining 40 percent outgrow it. Even if an individual recovers fully from the acute phase of the disorder, serious damage may have been done to the body.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Multivitamin and mineral complex with natural beta-carotene and mixed carotenoids and vitamin A and calcium and magnesium and potassium and selenium	25,000 IU daily.  Amounts in a complex will vary. 10,000 IU daily.  1,500 mg daily.  1,000 mg daily.  99–200 mg daily.  200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	All nutrients are needed and must be taken in extremely high doses because they are passed through the gastrointestinal tract rapidly and are poorly assimilated.
Zinc plus copper	80 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	All enzymes important for increased appetite and taste require zinc and copper. Zinc and copper work together to prevent copper deficiency.
<i>Important</i>		
Acidophilus	As directed on label. Take on an empty stomach so that it passes quickly to the small intestine.	Needed to replace the “friendly” bacteria lost from use of laxatives and/or from vomiting.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply easily assimilable protein, needed for tissue repair.
5-Hydroxy L-tryptophan (5-HTP)	As directed on label.	Aids in treating depression and nervousness.
Gamma-aminobutyric acid (GABA)  or S-Adenosylmethionine (SAMe)	As directed on label.  As directed on label.	Low levels of this amino acid have been found in people who suffer from anxiety and depression.  Aids in reducing stress and depression, providing a sense of well-being. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Helps reduce stress and anxiety.
Primrose oil or flaxseed oil or Kyolic-EPA from Wakunaga	As directed on label.  As directed on label.  As directed on label.	Important for all body functions and cell repair and reduces inflammation in nerve cells.  To calm the nervous system.

Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Helps to prevent anemia and replaces lost B vitamins. The B vitamins are important for proper brain functioning and help increase the appetite. Use a sublingual form.
Vitamin B <sub>12</sub> injections	1 cc 3 times weekly or as prescribed by physician.	Increases appetite; prevents loss of hair and damage to many bodily functions. If injections are not available, use a lozenge or sublingual form.
plus liver extract injections	2 cc 3 times weekly or as prescribed by physician.	To supply B vitamins and other valuable nutrients.
Vitamin C with bioflavonoids	5,000 mg daily, in divided doses.	Needed for the impaired immune system and to alleviate stress on the adrenal glands.

### Helpful

Bio-Strath from Nature's Answer or Floradix Iron + Herbs from Salus Haus	As directed on label 3 times daily.	An herbal and yeast-based tonic. A natural source of iron.
Brewer's yeast	Start with 1 tsp daily and work up to 1 tbsp daily.	Contains balanced amounts of the B vitamins.
Kelp	2,000–3,000 mg daily.	Needed for mineral replacement and thyroid function.
Proteolytic enzymes	As directed on label. Take between meals and with meals.	To aid in digestion and in rebuilding of tissue.
Vitamin D	600 IU daily.	Needed for calcium uptake and to prevent bone loss.
Vitamin E	200 IU daily.	Increases oxygen uptake in the body for healing and a powerful antioxidant. Use d-alpha-tocopherol form.

### Herbs

- To rebuild the liver and cleanse the bloodstream, use dandelion, milk thistle, red clover, or wild yam.
- The following herbs are appetite stimulants: ginger root, ginseng, gotu kola, and peppermint.

**Caution:** Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

- St. John's wort and kava kava calm the nervous system and aid in preventing depression.

**Cautions:** St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants. Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

### Recommendations

- While a normal eating pattern is being established, eat a well-balanced diet that is high in fiber. Eat plenty of fresh raw fruits and vegetables. These foods are cleansing to the system. When the body is cleansed, the appetite tends to return to normal.
- Be sure to eat adequate amounts of healthy protein foods, such as fish and soy protein. Quality protein is important for repairing body tissues and restoring lost muscle mass.
- Many people with this disease will not eat any food that contains fat because they think it will make them fat. Fat is an essential component in the diet and should be included at every meal.
- Consume no sugar, and avoid white flour products.
- Avoid processed and junk foods. The additives these foods contain tend to add to the aversion to eating.
- Seek out a practitioner or practitioners who specialize in the treatment of eating disorders and who can address the complex of physical and psychological elements involved. Some type of specialized counseling, in addition to nutritional counseling, is usually necessary for recovery.
- Women with low self-esteem tend to engage in self-destructive behaviors such as entering into abusive relationships, compulsive sexual behavior, and eating disorders. Cultivate relationships with people who make you feel important—people who are admiring and encouraging of your accomplishments and interests. As much as possible, remove from your life anything and anyone who makes you feel inadequate and “put-down.” Consider counseling to help you learn to cope with those negative situations you cannot avoid.

### Considerations

- If an individual shows any of the signs of anorexia, he or she should be seen by a physician.
- In many cases, a person with anorexia must be hospitalized and given intravenous nutrient feedings of potassium and multivitamins.
- Starvation tends to increase feelings of depression, anxiety, irritability, and anger. It may take up to a year or more for a person recovering from anorexia to improve his or her body image, to establish normal eating patterns, and to reverse the effects of starvation on mood and behavior.
- Some researchers believe that neurotransmitters—such as dopamine, serotonin, norepinephrine, and the endogenous opioids—play a role in anorexia.
- Researchers have found that zinc supplementation not only decreases depression and anxiety, but that anorexic women taking zinc gain twice as much weight, on average, as anorexic women who do not take the supplement. Zinc,

whether as part of the diet or in supplemental form, has been successful in helping many individuals with anorexia to regain their normal appetite and weight. Zinc deficiency by itself, however, does not cause anorexia nervosa.

❑ The self-esteem problems typical of those with anorexia often begin at an early age. A child who is told that she is stupid, worthless, and/or unlovable is likely to come to believe it. In addition, recent research has shown that many (if not most) American girls undergo a severe loss of self-esteem in early adolescence, the very time that eating disorders are most likely to occur.

❑ An unexplained loss of five to ten pounds requires immediate medical attention. Significant weight loss is considered a 10 percent decrease; 40 percent weight loss is nearly always associated with death. Weight loss can also be a sign of something other than anorexia nervosa.

❑ For information on organizations that can help you learn more about eating disorders and treatments, see Health and Medical Organizations in the Appendix.

## ANXIETY DISORDER

Anxiety disorder is a far more common problem than was once thought. It can affect people in their teenage years through middle age and later. Anxiety disorder appears to affect twice as many women as men, though there may not actually be that wide a disparity between the sexes. Psychologists believe that men are far less prone to report or even acknowledge having a problem of this nature.

Anxiety disorder can be either acute or chronic. Acute anxiety disorder manifests itself in episodes commonly known as panic attacks. A panic attack is an instance in which the body's natural "fight or flight" reaction occurs at the wrong time. This is a complex, involuntary physiological response in which the body prepares itself to deal with an emergency situation. Stress causes the body to produce more adrenal hormones, especially adrenaline. The increased production of adrenaline causes the body to step up its metabolism of proteins, fats, and carbohydrates to quickly produce energy for the body to use. In addition, the muscles tense, and heartbeat and breathing become more rapid. Even the composition of the blood changes slightly, making it more prone to clotting.

In the face of a threat such as an assault, an accident, or a natural disaster, this type of reaction is perfectly normal and helpful for survival. At other times, the symptoms caused by a surge in adrenaline can be distressing and frightening. A person having a panic attack often is overwhelmed by a sense of impending disaster or death, which makes it impossible to think clearly. Other feelings that can accompany a panic attack include shortness of breath; a smothering, claustrophobic sensation; heart palpitations; chest pain; dizziness; hot flashes and/or chills; trembling; numbness or tingling sensations in the extremities; sweating; nausea; a feeling of unreality; and a distorted percep-

tion of the passage of time. Eventually, the disorder can have other, cumulative effects, such as generalized aches and pains, muscular twitching and stiffness, depression, insomnia, nightmares and early waking, decreased libido, and abnormal feelings of tension with an accompanying inability to relax. Women may experience changes in the menstrual cycle and increased premenstrual symptoms.

Panic attacks are usually abrupt and intense. They can occur at any time of the day or night, lasting from several seconds up to half an hour. To the panic sufferer, it often feels as though they are much longer. A person having a panic attack often believes that he or she is experiencing a heart attack or a stroke. The attacks themselves are very unpredictable; some people experience one every few weeks, while others may have several a day. They are often triggered by stress (conscious or unconscious) or certain emotions, but may also occur in response to certain foods, drugs, or illness. Food allergies and hypoglycemia are both common among people with this disorder, and can promote panic attacks. An attack may follow ingestion or overindulgence in caffeine-based stimulants such as tea or coffee. Some attacks occur with no apparent cause. The unpredictability of the attacks makes them even more distressing.

Many people with acute anxiety disorder become fearful of being alone and of visiting public places because they fear having a panic attack. Of course this only adds to the level of anxiety and leads to their lives being abnormally restricted. Many psychologists believe that at least in some cases, panic attacks are self-induced; that is, the fear of a panic attack is the very thing that brings one about.

For years, panic attacks were dismissed as a psychosomatic phenomenon. However, repeated studies have shown that this disorder has a real, physical basis. Experts believe that panic attacks are caused principally by a malfunction in brain chemistry, wherein the brain sends and receives false "emergency signals." Researchers have recently identified a genetic factor that appears to influence anxiety in women. Combining DNA analysis, brain activity recordings, and psychological testing, investigators at the National Institute on Alcohol Abuse and Alcoholism (NIAAA) found that both Caucasian and Native American women with the same gene variant had similarly high scores on anxiety tests. These women also had similar electroencephalograms (EEGs), recordings of the brain's electrical activity that indicated tendencies toward an anxious temperament. This study was reported in the journal *Psychiatric Genetics*.

COMT is an acronym for a major enzyme responsible for the metabolism of certain neurotransmitters (chemical messengers of the nervous system), including norepinephrine, which affects anxiety. Other studies have confirmed a genetic link that might explain why more women than men experience anxiety disorders. In general, women have been found to have lower COMT levels than men. If the gene that encodes the COMT enzyme is faulty, the metabolism of these neurotransmitters is affected. Hyperactivity in cer-

tain areas of the brain causes the release of norepinephrine, which causes the pulse, blood pressure, and breathing to become more rapid, producing the classic symptoms of a panic attack.

According to Mayo Clinic researchers, between 10 and 20 percent of Americans will have a panic attack at some time in their lives. Panic attacks are now recognized as a potentially disabling but treatable condition.

Chronic anxiety is a milder, more generalized form of this disorder. Many sufferers feel a vague sense of anxiety much of the time, but the intensity of the feeling does not reach the levels of those in an actual panic attack. They may feel chronically uneasy, especially in the presence of other people, and tend to startle easily. Headaches and chronic fatigue are common among people with this form of the disorder.

Generalized anxiety disorder can begin at any age, but the onset typically occurs in one's twenties or thirties. Some people with chronic anxiety disorder also suffer from occasional panic attacks.

Anxiety disorder may be hereditary to some extent, as it seems to run in families. Some cases may be linked to a relatively harmless abnormality of heart function called mitral valve prolapse. Anxiety disorder manifests itself in different ways, but doctors agree that conflict, whether internal or interpersonal, promotes a state of anxiety.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium	2,000 mg daily. 600–1,000 mg daily.	A natural tranquilizer. Helps relieve anxiety, tension, nervousness, muscular spasms, and tics. Best taken in combination with calcium.
Floradix Iron + Herbs from Salus Haus	As directed on label.	Have your physician check for iron deficiency before taking any iron supplement. Floradix is a natural source of iron.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Helps reduce stress and anxiety.
Multivitamin and mineral complex with potassium and selenium	As directed on label. 99 mg daily. 100–200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	To provide all needed nutrients in balance. Essential for proper functioning of the adrenal glands. Low levels have been found in this disorder. A powerful antioxidant that protects the heart.
S-Adenosylmethionine (SAME)	400 mg twice daily.	Important physiological agent involved in over forty

biochemical reactions in the body. Is a natural antidepressant and has a calming effect. *Caution:* Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.

Vitamin B complex plus extra vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>6</sub> (pyridoxine) and niacinamide	As directed on label. 50 mg 3 times daily, with meals. 50 mg 3 times daily, with meals. 100 mg 3 times daily.	Helps maintain normal nervous system function. Helps reduce anxiety and has a calming effect on the nerves. A known energizer that also exerts a calming effect. Important in the production of certain brain chemicals. In large doses, has a calming effect. <i>Caution:</i> Do not substitute niacin for niacinamide. Niacin can be toxic in such high doses.
Vitamin C	5,000–10,000 mg daily, in divided doses.	Necessary for proper function of adrenal glands and brain chemistry. In large doses, can have a powerful tranquilizing effect and is known to decrease anxiety. Vital for dealing with stress.
Vitamin E	As directed on label.	Helps transport oxygen to brain cells and protect them from free radical damage. Use d-alpha-tocopherol form.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Can have a calming effect on the central nervous system.

*Important*

Chromium picolinate	200 mcg daily.	Chromium deficiency can produce symptoms of anxiety.
DL-Phenylalanine (DLPA)	600–1,200 mg daily. Discontinue use if no improvement is seen in 1 week.	For chronic anxiety. Increases the brain's production of endorphins, which help relieve anxiety and stress. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or suffer from panic attacks, diabetes, high blood pressure, or PKU.
L-glutamine and L-tyrosine plus L-glycine	500 mg 3 times daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. 500 mg 3 times daily, on an empty stomach. 500 mg 3 times daily, on an empty stomach.	Has a mild tranquilizing effect. (See AMINO ACIDS in Part One.) Important for anxiety and depression. <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug. Necessary for central nervous system function.

Helpful		
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Essential fatty acids (flaxseed oil and Total EFA from Health From The Sun)	As directed on label.	Important for proper brain function.
Gamma-aminobutyric acid (GABA) plus inositol	750 mg twice daily.  As directed on label.	Necessary for proper brain function. (See AMINO ACIDS in Part One.) Combined with inositol, has a tranquilizing effect.
Melatonin	Start with 2–3 mg daily, taken ½ hour before bedtime. If necessary, gradually increase the dosage until an effective level is reached.	A natural sleep aid. Helpful if symptoms include insomnia.

## Herbs

☐ A body under stress is more vulnerable to free radical damage. Bilberry, ginkgo biloba, and milk thistle are rich in flavonoids that neutralize free radicals. Milk thistle also protects the liver.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

☐ Catnip, chamomile, cramp bark, hops, kava kava, linden flower, motherwort, passionflower, and skullcap promote relaxation and aid in preventing panic attacks.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Kava kava can cause drowsiness. If this occurs, discontinue use or reduce the dosage. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

☐ Fennel relieves anxiety-related gastrointestinal upsets, reduces flatulence and abdominal tension, and relaxes the large intestine. It is most effective when taken as a tea, before or after meals, and has no known side effects. Lemon balm and willow bark also soothe stomach distress.

☐ Feverfew, used to relieve migraines, can help with anxiety-induced headaches. Drinking meadowsweet tea or extract can also relieve headaches related to anxiety and stress, with no side effects.

*Cautions:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

☐ St. John's wort can ease depression and restore emotional stability. Results in mood should be noticed in approximately two to four weeks.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

☐ Skullcap and valerian root can be taken at bedtime to promote sleep and aid in preventing panic attacks at night.

☐ Mandarin oil can help alleviate the oppressive feelings of anxiety and depression. A member of the orange family, mandarin (*Citrus nobilis*) originated in China. Mandarin peels are pressed to produce a pleasant aromatic oil. It can be rubbed on the skin, added to bathwater, or used in massage or aromatherapy. Try diffusing 5 drops of mandarin oil along with 3 drops of bergamot oil in an aroma lamp to relieve stress.

*Caution:* If you rub mandarin oil on your skin, try to avoid exposure to the sun for six hours after application. Brown spotting on the skin can occur when the oil is exposed to the sun's rays.

## Recommendations

☐ Include in the diet apricots, asparagus, avocados, bananas, blackstrap molasses, brewer's yeast, broccoli, brown rice, dried fruits, dulse, figs, fish (especially salmon), garlic, green leafy vegetables, legumes, raw nuts and seeds, soy products, whole grains, and yogurt. These foods supply valuable minerals such as calcium, magnesium, phosphorus, and potassium, which are depleted by stress.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

☐ Try eating small, frequent meals rather than the traditional three meals a day.

☐ Limit your intake of animal protein. Concentrate on meals high in complex carbohydrates and vegetable protein.

☐ Avoid foods containing refined sugar or other simple carbohydrates. For a nutritional treatment plan to have maximum benefits, the diet should contain no simple sugars, carbonated soft drinks, tobacco, or alcohol.

☐ Do not consume coffee, black tea, cola, chocolate, or anything else that contains caffeine.

☐ Keep a food diary to detect correlations between your attacks and the foods you eat. Food allergies and sensitivities may trigger panic or anxiety attacks. (See ALLERGIES in Part Two.)

☐ Learn relaxation techniques. Biofeedback and meditation can be very helpful.

☐ Get regular exercise. Any type of exercise will work—a brisk walk, bicycle riding, swimming, aerobics, or whatever fits your individual lifestyle. After a few weeks of regular exercise, most people notice an improvement in anxiety symptoms.

- Be sure to get adequate rest. If sleep is a problem, consult **INSOMNIA** in Part Two for suggestions.
- To help manage an acute attack, use breathing techniques.
  - Inhale slowly through the nose for a count of four.
  - Hold your breath for a count of four.
  - Exhale from the mouth slowly for a count of four.
  - Repeat this sequence until the attack subsides.
  - Remind yourself that panic attacks last for a limited amount of time, and that the attack will pass after a few minutes. Although it is rare, some may last up to a few hours.
- Call a trusted friend or family member. Talking things over can diffuse anxiety.
- If the self-help recommendations in this section do not help, and particularly if panic or anxiety is interfering with your life, consult your health care provider. If an underlying physical problem is ruled out, expect to be referred to a mental health professional for evaluation and treatment.

### Considerations

- People with anxiety disorder, especially those who experience acute attacks, often seek medical assistance in hospital emergency rooms only to be told they are just suffering from stress and that everything will be fine with rest. In one study, up to 70 percent of people who had panic attacks were found to have seen ten or more different physicians before being correctly diagnosed.
- Taking tricyclic antidepressants such as imipramine hydrochloride (Janimine, Tofranil) or imipramine pamoate (Tofranil-PM) in the presence of low serum levels of iron may increase the risk of developing anxiety and jitteriness.
- A type of cognitive-behavioral therapy called panic control is being used with promising, long-term results for many chronic sufferers of panic attacks. Therapists coach patients into re-creating the feeling of an attack and then teach them to deal with the sensations it produces. Often panic control is used in conjunction with antidepressant drugs or tranquilizers.
- Chromium deficiency can produce nervousness, shakiness, and other general symptoms of anxiety. Chromium deficiency is common among alcoholics and people who consume large amounts of refined sugars. Brewer's yeast is a rich source of this essential trace element.
 

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.
- There have been numerous reports on the benefits of DL-phenylalanine (DLPA) in treating anxiety and depression. DLPA is a supplement consisting of both

D-phenylalanine and L-phenylalanine, and is much more potent than either of these amino acids taken alone. This should be used under the supervision of a nutritionally oriented physician. Doses of 75 to 200 milligrams per day were shown to be effective for depression and anxiety.

- Selenium has been shown to elevate mood and decrease anxiety. These effects were more noticeable in people who had lower levels of selenium in their diets to begin with.
- Biofeedback can aid in managing anxiety symptoms. (*See under PAIN CONTROL* in Part Three.)
- Music can be effective in reducing anxiety. (*See MUSIC AND SOUND THERAPY* in Part Three.) Color also can be used to induce relaxation and calm. (*See COLOR THERAPY* in Part Three.)
- A number of different drugs are used to block panic attacks. Their use must be carefully monitored by a physician. The effectiveness of any given drug varies from individual to individual, and all drugs used for this disorder can cause unpleasant side effects. Alprazolam (Xanax), one of the drugs most commonly used for this illness, has varying effectiveness and can cause drowsiness and lightheadedness. It also can be very addictive. The risk of dependence and its severity seem to be higher if this drug is taken in relatively high doses (more than 4 milligrams per day) and for more than eight weeks.
- Recreational drugs such as marijuana can cause anxiety attacks.
- A healthy diet plus appropriate nutritional supplementation can be of considerable benefit, reducing overall anxiety and even decreasing the frequency and intensity of panic attacks. If you are taking antianxiety medication, following the plan outlined in this section may make it possible to stop taking the medication, or at least to reduce the dosage. You should always consult with your physician before making any change in a prescription regimen, however. *See also STRESS* in Part Two.

### APPENDICITIS

Appendicitis is inflammation of the appendix, a lymphoid organ that opens into the first part of the large intestine. For many years, the appendix was believed to be a vestigial organ that served no function, but that is no longer the belief. In the fetus, the appendix contains endocrine cells that manufacture hormones and other important body chemicals. In young adults, the appendix is believed to play a part in the functioning of the immune system. It is involved in the maturation of B lymphocytes (a type of white blood cell) and assists in producing an antibody called immunoglobulin A.

Appendicitis is primarily caused by improper diet. It can be either acute or chronic. Most cases involve a blockage of the large intestine resulting from a fiber-deficient diet. The blockage stops the natural flow of fluids, which

facilitates the growth of harmful bacteria from the intestinal tract, resulting in inflammation of the appendix. Appendicitis is rare in children under the age of two. The incidence peaks between the ages of fifteen and twenty-four. The risk of developing appendicitis increases after a recent illness, especially a gastrointestinal infection or a roundworm infestation.

Symptoms include severe abdominal pain that begins close to the navel and migrates toward the right lower abdomen. Taking deep breaths, coughing, sneezing, moving, or being touched in this area worsens the pain. Frequently, nausea and vomiting accompany these symptoms, with the pain becoming persistent and well-localized. Other symptoms may include diarrhea, abdominal swelling (in late stages), mild fever (usually less than 102°F), an elevated white blood cell count, constipation, inability to pass gas, painful urination, and blood in the urine.

Acute appendicitis is the most common reason for abdominal surgery. Without prompt treatment, the likelihood increases that the inflamed appendix will burst, contaminating the abdominal cavity with fecal matter and causing peritonitis. Seek help immediately. It is better to be assessed and told it was nothing than to have an appendix burst. Today, surgical treatment is mainly done laparoscopically, so hospitalization and postoperative care is shorter compared to the open appendectomies of the past, where a larger incision was made into the abdomen.

Appendicitis is seldom found in older people. Since the symptoms are usually milder in this age group, however, there is a greater danger for rupture, with resulting peritonitis or the formation of abscesses. In addition, the symptoms can be difficult to diagnose because they are similar to those of bladder infections, kidney stones, and inflammations of the colon, stomach, and small bowel (and, in women, pelvic infections or ovarian cysts). Older adults in particular should be very aware of the symptoms of appendicitis.

The nutrients and herbs recommended in this section are intended to support recovery after surgery, if appropriate, has been performed. Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Carotenoid complex with beta-carotene	25,000 IU 4 times daily.	Enhances immunity and protects against infection.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.

Liquid chlorophyll	In water three times daily as directed on the label.	Helps speed the cleansing of the bloodstream.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Necessary for proper assimilation of all nutrients.

*Very Important*

Vitamin C (Ester-C, vitamin C crystals, or capsules)	1/4 tsp 4 times daily or as directed on label.	Helps detoxify the system, protects against infection, and enhances immunity.
Vitamin E	200 IU twice daily, with meals.	Promotes healing. A powerful antioxidant. Use d-alpha-tocopherol form.

*Important*

Zinc	30 mg daily.	Strengthens immune system and accelerates healing. Use zinc picolinate form.
------	--------------	--

**Herbs**

- Alfalfa, agrimony, buckthorn, and slippery elm teas are soothing.
- Aloe (*Aloe vera*) juice, cold-pressed from the whole leaf, can help to reduce intestinal problems and is good for general colon health.
- Echinacea relieves discomfort and enhances the immune system.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

**Recommendations**

- If you suspect appendicitis, do not take a laxative and do not use a heating pad, as these can provoke rupturing of the appendix. Also, avoid pain relievers, as they can lead to a misdiagnosis. Avoid eating and drinking. See your doctor immediately.

**Considerations**

- To lessen the risk of appendicitis, you should eat a diet high in soluble fiber, avoid refined and fried foods, and limit your intake of cooked animal proteins to one serving a day.

**APPETITE, POOR**

A poor appetite is not a disorder in itself, but usually a symptom of some other problem. Emotional factors such as depression, illness, stress, and trauma may cause a person's appetite to diminish noticeably. Certain controllable factors, such as the use of alcohol, tobacco, or other drugs, can also result in poor appetite. An undetected underlying illness,

heavy metal poisoning, and/or nutritional deficiencies may also be involved. If you lose even five to ten pounds unintentionally, you should consult your health care provider.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Bio-Strath from Nature's Answer	As directed on label.	A yeast and herb formula that aids in gaining back strength and energy.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Floradix Iron + Herbs from Salus Haus	As directed on label.	Helps digestion and stimulates appetite. <i>Caution:</i> Do not use iron without a physician's consent.
Multivitamin and mineral complex with vitamin A and calcium and magnesium	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 1,500 mg daily.	All nutrients are needed in large amounts. Use a high-potency formula.
S-Adenosylmethionine (SAMe)	As directed on label.	Helps reduce stress and depression. Gives a sense of well-being. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex	100 mg or more of each major B vitamin daily, before meals (amount of individual vitamins in a complex will vary).	Increases the appetite. Use a high-stress formula. A sublingual form is recommended. Injections (under a doctor's supervision) may be necessary.
Vitamin E	200 IU daily.	To correct deficiencies. All nutrients are important for improving appetite. Use a d-alpha-tocopherol form.
Zinc plus copper	80 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Enhances the sense of taste. Needed to balance with zinc.
<b>Helpful</b>		
Brewer's yeast	Start with 1/2 tsp daily and work up to 1 tbsp daily.	Rich in nutrients, especially the B vitamins. Improves the appetite.
Spiru-tein from Nature's Plus	As directed on label. Take between meals.	To supply protein, needed to build and repair tissue. Also acts as an appetite stimulant.

### Herbs

To stimulate a poor appetite, try using catnip, fennel seed, ginger root (*see below*), ginseng, gotu kola, papaya leaves, peppermint leaves, and/or saw palmetto berries.

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Ginger helps to stimulate the heart and circulatory system and promotes appetite and digestion. Its spicy components activate the flow of saliva and the production of digestive juices. It is said that the Chinese scholar Confucius had every dish he ate spiced with ginger. The main active ingredients of ginger root are oils containing zingiberene and bisabolene, as well as camphene, linalol, citral, and cineol. It also contains vitamins A and B, minerals, fats, protein, and roughage. Ginger can be grated and sprinkled over selected portions of a meal to enhance appetite. Ginger tea is made by pouring boiling water over 1 to 2 tablespoons of freshly grated or chopped ginger. Steep for ten to fifteen minutes, then strain. Mix with honey and a splash of lemon juice to relieve gas, bloating, and cramping. We suggest that this tea be taken after meals. Ginger is also a well-known remedy for nausea and motion sickness.

### Recommendations

To obtain needed protein and calories, drink three or more 8-ounce glasses a day of 2 percent milk or soymilk. Use a soy carob drink and yogurt fruit shakes. Eat only whole-grain bread, rolls, macaroni, crackers, and hot and cold cereals. Use cream soups (made with soymilk) as desired. These are usually higher in protein than broth soups.

Between meals, snack on foods such as avocados, banana soy pudding, buttermilk, cheese, chicken or tuna, custard, fruit shakes, nuts and nut butters, whole-grain breads and cereals, turkey, and yogurt. In addition to promoting weight gain, these snacks are easy to digest, and are high in protein and essential fatty acids.

Do not drink liquids before or during meals.

Take supplemental B vitamins as outlined under "Nutrients," above. The B-complex vitamins increase appetite.

Try eating small quantities of food at frequent intervals throughout the day rather than two or three large meals. The sight of large amounts of food can cause a person to lose his or her appetite. Frequent small meals may be better tolerated, with a gradual increase in the volume of food.

Exercise if possible, but avoid strenuous exercise. Walking and/or moderate exercise can increase the appetite. Exercise also helps the body to better assimilate nutrients.

If you smoke, quit. Smoking decreases the appetite. It is one of the main causes of loss of appetite.

When trying to stimulate a poor appetite, consider whether the appearance and aroma of the foods are appealing, and whether the environment is conducive to eating.

If you experience a significant loss of appetite, see your physician to rule out an underlying physical problem.

### Considerations

To stimulate a poor appetite, the diet must be individualized according to the person's tolerances and tastes.

There are many products on the market that can be helpful for people with appetite and weight problems. They are often found in the "sports" sections of health food stores, and quite often in grocery stores. These liquid drinks can be quite tasty and are similar to milk shakes. They are not only for those who are into sports. Because they are usually fortified with vitamins and minerals, don't forget to include these in calculating your daily intake of nutrients to prevent overdosing.

Megace (megestrol acetate) was a drug used in breast cancer patients, but it was found to increase appetite and body weight, especially as fat. If you are prescribed this drug, be sure to engage in moderate exercise and consume adequate protein to avoid gaining weight.

See ANOREXIA NERVOSA and BULIMIA in Part Two. See also HYPOTHYROIDISM in Part Two for the self-test.

### ARSENIC POISONING

Arsenic is a highly poisonous metallic element found at varying levels in a wide variety of sources, including pesticides, laundry aids, smog, tobacco smoke, bone meal, dolomite, kelp, table salt, beer, seafood, and even drinking water. When ingested, inorganic arsenic is deposited in the hair, skin, and nails. Once it makes its way into the hair follicles, its presence can be detected in the hair shaft for years.

Headaches, confusion, drowsiness, convulsions, and changes in fingernail pigmentation may occur with chronic arsenic poisoning. Symptoms of acute arsenic poisoning include vomiting, diarrhea, bloody urine, muscle cramps and/or weakness, fatigue, hair loss, dermatitis, gastrointestinal pain, and convulsions. Arsenic poisoning primarily affects the lungs, skin, kidneys, and liver. The accumulation of toxic levels of arsenic can result in coma and death.

Exposure to arsenic has also been implicated in the development of certain types of cancer. Workers involved in pesticide production, agricultural insecticide spraying, copper smelting, mining, sheep dipping, and metallurgical industries are at a high risk for skin cancer, scrotal cancer, a type of liver cancer, cancer of the lymphatic system, and lung cancer due to arsenic exposure. The toxic effects of arsenic are cumulative.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and

twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Garlic (Kyolic from Wakunaga)	2 tablets 3 times daily, with meals.	A potent detoxifier.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label.	A powerful detoxifying agent.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	An antioxidant complex that contains SOD. A potent detoxifier. (Use a buffered form.)
<i>Helpful</i>		
L-cysteine and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Potent detoxifiers of the liver. Cysteine contains sulfur, which eliminates arsenic. (See AMINO ACIDS in Part One.)
Pectin plus antioxidant complex (ACES + Zn from Carlson Labs)	As directed on label.	Aids in removing arsenic from the body. To protect against free radical damage.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Helps to rid the body of arsenic.

### Recommendations

Sulfur helps eliminate arsenic from the body. Eat eggs, onions, beans, legumes, and garlic to obtain sulfur. You can also obtain sulfur from garlic supplements, and the amino acid cysteine provides sulfur. Sulfur can be purchased in tablet form as well.

Supplement your diet with plenty of fiber daily.

*Note:* Always take supplemental fiber separately from other supplements and medications.

If you have symptoms of chronic arsenic poisoning, have a hair analysis performed to determine the level of toxic metals in your body. (See HAIR ANALYSIS in Part Three.)

In case of accidental arsenic ingestion, immediately take 5 charcoal tablets, and take 5 more every fifteen minutes until you reach your health care provider or the emergency room of the nearest hospital. Charcoal tablets should be kept on hand in every household in case of accidental overdose of drugs.

### Considerations

Chelation therapy removes toxic metals from the body. (See CHELATION THERAPY in Part Three.)

☐ See also CHEMICAL POISONING and ENVIRONMENTAL TOXICITY in Part Two.

## ARTERIOSCLEROSIS/ATHEROSCLEROSIS

Arteriosclerosis and atherosclerosis involve the buildup of deposits on the insides of the artery walls, which causes thickening and hardening of the arteries. In arteriosclerosis, the deposits are composed largely of calcium; in atherosclerosis, the deposits consist of fatty substances, and artery walls lose elasticity and harden. Both conditions have about the same effect on circulation, causing high blood pressure and ultimately leading to angina (chest pain brought on by exertion), heart attack, stroke, and/or sudden cardiac death.

Although arteriosclerosis causes high blood pressure, high blood pressure can also cause arteriosclerosis. Calcium-based and fatty deposits typically form in areas of the arteries weakened by high blood pressure or strain. The consequent narrowing of the arteries then makes blood pressure even higher. As the arteries become less pliable and less permeable, cells may experience ischemia (oxygen starvation) due to insufficient circulation. The fatty plaques can be either stable or unstable. Unstable plaque allows particles to break away and cause further blockage downstream, in the smaller vessels, so it is of more immediate clinical importance.

If one of the coronary arteries becomes obstructed by accumulated deposits or by a blood clot that has either formed or snagged on the deposit, the heart muscle will be starved for oxygen and the individual will suffer a heart attack, also referred to as a myocardial infarction (MI) or coronary occlusion (a coronary). Older adults are at a greater risk for this kind of heart trouble. When arteriosclerosis occludes the arterial supply of blood to the brain, a cerebrovascular accident, or stroke, occurs.

Approximately eight million Americans suffer from peripheral arterial disease (PAD), also called peripheral vascular disease, and three out of four people aren't aware they have it, according to a study published in *Circulation: Journal of the American Heart Association*. This is a relatively common condition affecting as many as 20 percent of the American population aged sixty-five or older at a given time. Most of those affected have at least one of the major risk factors for atherosclerosis: smoking, family history, hypertension, diabetes, or abnormal cholesterol levels. Advancing age increases the likelihood of developing these diseases, as does atherosclerosis of the coronary or cerebral arteries.

Peripheral atherosclerosis, also called arteriosclerosis obliterans, is a type of peripheral vascular disease in which the lower limbs are affected. In the early stages, the major arteries carrying blood to the legs and feet become narrowed by fatty deposits. Atherosclerosis of the leg or foot can not only limit a person's mobility, but can also lead to loss of a limb. People who have diseased arteries in the leg

or foot are likely to also have them elsewhere, mainly in the heart and brain. Early signs of peripheral atherosclerosis are aching muscles, fatigue, and cramping pains in the ankles and legs. Depending on which arteries are blocked, there may also be pain in the hips and thighs.

Pain in the legs (most often in the calf, but sometimes in the foot, thigh, hip, or buttocks) brought on by walking and quickly relieved by rest is called intermittent claudication. This is typically the first symptom of developing peripheral atherosclerosis. Additional symptoms include numbness, weakness, and a heavy feeling in the legs. These symptoms occur because the amount of oxygenated blood passing through the plaque-clogged arteries is insufficient to meet the needs of the exercising leg muscles. The closer the problem lies to the abdominal aorta—the central artery that branches into the legs—the more tissue affected and the more dangerous the condition.

### Peripheral Artery Function Self-Test

A simple test can determine how well your blood flows through the arteries of your legs. There are three areas on the lower leg where a pulsating artery can be felt by lightly touching the skin covering the artery. One spot is the top of the foot, the second spot is the inner aspect of the ankle, and the third spot is behind the knee.

Apply pressure lightly to the skin on these spots. If you cannot find a pulse, this is an indication that the artery supplying the leg may be narrowed. Special studies may be needed and you should consider consulting your health care provider.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium plus vitamin D	1,500 mg daily, taken at bedtime. 750 mg daily, taken at bedtime. 400 mg daily.	Needed to maintain proper muscle tone in the blood vessels. Use chelate forms.  Aids calcium uptake; enhances immune system.
Coenzyme Q <sub>10</sub>	100 mg daily.	Improves tissue oxygenation.
Essential fatty acids (flaxseed oil, MaxEPA, or omega-3 oil complex)	As directed on label.	Reduces blood pressure, and helps to maintain proper elasticity of blood vessels. Be sure to use a product that contains vitamin E to keep the essential fatty acids from becoming rancid.
Garlic (Kyolic from Wakunaga)	As directed on label.	Has a lipid (fat) regulating effect.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed for protection.
Vitamin C (Ester-C) with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Antioxidant that acts as a free radical scavenger. Use a buffered form.

Important		
Choline or lecithin granules or capsules	As directed on label.  1 tbsp 3 times daily, with meals. 2,400 mg 3 times daily, with meals.	Aids in breaking down fat and expelling it from the body. Phosphatidylcholine is best. A good source of choline.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	125 mg 3 times daily.	Improves tissue oxygenation.
Melatonin	2–3 mg daily, taken 2 hours or less before bedtime.	A powerful antioxidant that also improves sleep.
Multiple enzyme complex	As directed on label. Take with meals.	Important for proper digestion.
Proteolytic enzymes	As directed on label. Take with meals.	Aids in destroying free radicals. Improves digestive function.
Pycnogenol or grape seed extract	50 mg twice daily. As directed on label.	Possibly the most powerful free radical scavengers. Also enhances and strengthens connective tissue, including that of the cardiovascular system.
Helpful		
L-cysteine  and L-methionine plus L-carnitine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. 500 mg daily, on an empty stomach. 500 mg daily, on an empty stomach.	Promotes the burning of fat and the building of muscle.  Helps to prevent fatty buildup in the arteries. Protects the heart and lowers blood triglyceride levels.
Trimethylglycine (TMG) (anhydrous betaine)	1,000 mg per day in divided doses, with meals, for maintenance; up to 2,000 mg to lower homocysteine levels under guidance of a health care professional.	Methyl donor, required for reduction of homocysteine back to methionine and for accurate synthesis of DNA and RNA. Homocysteine is a toxic amino acid, and maintenance of normal levels is important to the health of the cardiovascular system.

## Herbs

The following herbs are helpful if you suffer from arteriosclerosis: cayenne (capsicum), chickweed, and hawthorn berries.

Ginkgo biloba has been called “nature’s circulation wonder.” It can improve circulation, increasing oxygen and blood flow in the arms, brain, and heart.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Green tea lowers cholesterol and lipid levels, thus decreasing chances of atherosclerosis. Drink green tea (we suggest one to four cups each day) or take it in extract form. A recent Japanese study recommends not only green tea

but also black tea to lower your rate of lipoprotein oxidation, a chemical reaction that makes fats in the blood more likely to be deposited in the arteries.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

## Recommendations

Eat high-fiber foods that are low in saturated fat and cholesterol. Fruits, vegetables, legumes, and grains should be your primary foods.

Eat plenty of foods rich in vitamin E to improve circulation. Good choices include dark green leafy vegetables, legumes, nuts, seeds, soybeans, wheat germ, and whole grains.

Use only pure cold-pressed olive oil or unrefined canola oil (in moderate amounts) as fats in the diet. These may aid in lowering cholesterol. Do not heat these oils.

Drink steam-distilled water only.

Do not eat any candies, chips, fried foods, gravies, high-cholesterol foods, junk foods, pies, processed foods, red meat, or saturated fats. Avoid egg yolks, ice cream, salt, and all foods containing white flour and/or sugar. Do not use stimulants such as coffee, colas, and tobacco. Also, eliminate alcohol and highly spiced foods.

Maintain a healthy weight for your height. Obesity causes unfavorable changes in serum lipoprotein levels.

Reduce stress and learn techniques to help you handle stress that cannot be avoided. (See STRESS in Part Two.)

Get regular moderate exercise. A daily walk is good.

*Caution:* If you are over thirty-five and/or have been out of shape for some time, consult your health care provider before beginning any type of exercise program.

Periodically monitor your blood pressure, and take steps to lower it if necessary. Control of high blood pressure is important. (See HIGH BLOOD PRESSURE in Part Two.)

Do not smoke. Avoid exposure to secondhand smoke. Cigarette smoke contains large quantities of free radicals, many of which are known to oxidize low-density lipoproteins (LDL, the so-called bad cholesterol), making them more likely to be deposited on the walls of blood vessels. The free radical is one of the primary factors in the development of atherosclerosis. The effect of cigarette smoke may be due to the direct oxidation of lipids and proteins, and may also have indirect effects, such as the depletion of various antioxidant defenses, which then allows other cellular processes (inflammation, for example) to modify LDL. In addition, smoking increases levels of LDL, lowers levels of high-density lipoproteins (HDL, or good cholesterol), and increases the blood’s tendency to form clots.

❑ Do not take any preparations containing shark cartilage unless specifically directed to do so by your health care provider.

### Considerations

❑ Because of the large number of new cases of peripheral arterial disease (PAD), each year the Society of Interventional Radiology recommends more-intensive screening efforts through the use of the ankle-brachial index (ABI) test. This simple, painless procedure tests the blood pressure in the legs versus that in the arms. This indicates whether or not blood flow is within a tolerable range and whether additional testing is required.

❑ In the Lifestyle Heart Trial study, conducted over a period of six years at the California Pacific Medical Center, eighteen of twenty-two people (82 percent) who adopted a vegetarian diet that restricted fat intake to 10 percent of total calories showed a significant regression of advanced coronary artery disease after one year, and even greater benefits after five years. The diet also limited dietary cholesterol to no more than 5 milligrams per day. In the Lyon Diet Heart Study, changes in fat composition but not the quantity of fat in the diet led to a significant reduction in heart and artery problems. Most Americans consume 37 percent of their total calories as fats and 300 to 500 milligrams of dietary cholesterol each day.

❑ Dehydroepiandrosterone (DHEA) is a natural hormone that has been shown to help prevent hardening of the arteries. (See DHEA THERAPY in Part Three.)

❑ Chelation therapy can break up arterial plaque and improve circulation. Some two to three thousand doctors perform this type of therapy in the United States. (See CHELATION THERAPY in Part Three.)

❑ Hyperbaric oxygen is used in some countries to treat arteriosclerosis. (See HYPERBARIC OXYGEN THERAPY in Part Three.)

❑ Many doctors recommend angioplasty or bypass surgery for people with hardening of the arteries, particularly for those with disabling angina. Angioplasty is a procedure in which blocked vessels are reopened by flattening cholesterol and debris against artery walls. Bypass surgery involves taking healthy blood vessels from elsewhere in the body (usually the leg) and inserting them to detour around a diseased coronary artery. According to a recent study, having a bypass performed while the heart beats (rather than while connected to a heart-lung machine) leads to fewer problems immediately after surgery and a shorter hospital stay. However, unless people undergoing these procedures make significant nutritional and lifestyle changes the disease process (atherosclerosis) will continue, and it is only a matter of time before the fatty deposits begin to build up again.

❑ Anticoagulants such as aspirin are often prescribed to make the blood less prone to clotting. For this to be effective,

supplemental vitamin K and foods rich in vitamin K must be avoided. (See CARDIOVASCULAR DISEASE in Part Two.)

❑ Erectile dysfunction can result from this disease. (See ERECTILE DYSFUNCTION in Part Two.)

❑ Omega-3 essential fatty acids (EFAs) can be beneficial for the cardiovascular system. They are precursors of prostaglandins that aid in reducing hypertension, migraine headaches, arthritis, and other conditions. Omega-3 EFAs are found in fresh deepwater fish, fish oil, canola oil, flaxseed oil, and walnut oil. The omega-3s from fish are more bioactive than those from plants; the plant omega-3s are only 10 percent as effective as the fish oils. Reports indicate that native Arctic peoples, whose diets are high in omega-3s, have very low rates of arteriosclerosis. In a recent double-blind study at the University of Southampton in England, test subjects were given omega-3 fatty acid capsules, omega-6 capsules, and capsules containing a mixture of oils common in the Western diet. Those getting the omega-3 capsules had a 50 percent increase in stable over unstable plaque. While plaque was not removed, it was converted into a safer, more stable form that did not shed fat particles as easily. This reduces the risk of sudden heart attack. The study was published in the British medical journal *Lancet*.

❑ Enhanced external counterpulsation therapy (EECP) may provide relief for sufferers of stable angina and other conditions caused by blocked vessels in the lower extremities. This painless, noninvasive outpatient procedure involves wrapping inflatable cuffs around the calves, thighs, and buttocks. The cuffs inflate and gently force blood from the lower extremities to the heart. In a course of five treatments a week for seven weeks, blood vessels are encouraged to branch out and form natural bypasses around blocked vessels, thus restoring blood flow to the heart.

### ARTHRITIS

Arthritis is the inflammation of one or more joints. It is usually accompanied by pain and stiffness, especially in the morning or after exercise, as well as swelling, deformity, and/or a diminished range of motion. Bone growths or spurs may develop in the affected joints, increasing pain and decreasing mobility. Arthritic joints may make noise when they move. Joints affected by rheumatoid arthritis tend to make a sound like crinkling cellophane, whereas osteoarthritic joints make popping, clicking, and banging noises.

Although the term *arthritis* literally means “joint inflammation,” arthritis really refers to a group of more than one hundred rheumatic diseases and conditions that can cause pain, stiffness, and swelling in the joints. Certain conditions can affect other parts of the body—such as the muscles, bones, and some internal organs—and can result in debilitating and sometimes life-threatening complications. If left undiagnosed and untreated, arthritis can cause irreversible damage to the joints. According to the Arthritis

Foundation, 46 million Americans suffer from osteoarthritis, rheumatoid arthritis, and related conditions, including fibromyalgia, gout, lupus, Lyme disease, juvenile arthritis, psoriatic arthritis, bursitis, scleroderma, Reiter's syndrome, infectious arthritis, Sjögren's syndrome, and ankylosing spondylitis. Indeed, arthritis and other diseases of the musculoskeletal system are the primary source of disability in the United States today.

Arthritis is not a modern ailment—it has been with us since the beginning of time. Archeologists have discovered evidence of the disorder in the skeletons of Neanderthals and other prehistoric mammals, and even dinosaurs. Still, as long as this disorder has plagued humankind, conventional medicine has not conclusively proven how it occurs.

These conditions affect the body's movable, or synovial, joints at the knees, wrists, elbows, fingers, toes, hips, and shoulders. The neck and back also have joints between the bones of the spine. There are six different types of synovial joints (hinge, ball-and-socket, and so on), but although the types of motion they allow are different, their underlying physiological structure is essentially the same: two or more adjoining movable bones, whose adjacent surfaces are covered with a layer of cartilage, surrounded by a fluid-filled capsule made up of ligaments (tough, fibrous tissue). Fluid is secreted by a thin membrane, the synovial membrane, that lines the inside of the joint capsule. Thanks to this viscous fluid, and to the smooth, rubbery, blue-white cartilage covering the ends of the bones, the bones within the joint normally glide smoothly past one another. In healthy joints, the synovial membrane is thin, the cartilage that covers the bones is smooth, and a thin layer of synovial fluid covers the bone surfaces. A problem in any of these areas can result in arthritis. Arthritis may appear suddenly or come on gradually. Some people feel a sharp burning or grinding pain. Others compare the pain to that of a toothache. Moving the joint usually hurts, although sometimes there is only stiffness. The swelling and deformity that takes place in arthritic joints can result from a thickening of the synovial membrane, an increase in the secretion of synovial fluid, enlargement of the bones, or some combination of these factors.

There are many different types of arthritis. Refer to Quick Reference Guide: Common Forms of Arthritis and Related Conditions on page 218 for a quick summary of many of them. In this section, we primarily discuss the most common forms, osteoarthritis (OA) and rheumatoid arthritis (RA). Ninety percent of people with arthritis have OA.

Osteoarthritis, also called degenerative joint disease, involves deterioration of the cartilage protecting the ends of the bones. It is sometimes caused by injury or an inherited defect in the protein that forms cartilage. More commonly, it is a result of the wear and tear of aging, diet, and lifestyle. The once-smooth surface of cartilage becomes rough, resulting in friction. The cartilage begins to break down, and the normally smooth sliding surfaces of the bones become pitted and irregular. Osteoarthritis not only affects the

weight-bearing joints—the knees, hips, and back—severely, but also commonly affects the hands and the knuckles. The tendons, ligaments, and muscles holding the joint together become weaker, and the joint becomes deformed, painful, and stiff. There is usually some stiffness and pain (more stiffness than pain at first), but little or no swelling. Any resulting disability is most often minor. However, fractures become an increasing risk because osteoarthritis makes the bones brittle. As osteoarthritis advances, bony outgrowths called osteophytes tend to develop. Often referred to as “spurs,” osteophytes can be detected by X-ray, and develop near degenerated cartilage in the neck or in the lower back. This condition does not change a person's appearance.

Many people with this condition use glucosamine, chondroitin, or both to get relief from symptoms. Numerous studies support their use, but not all. In a two-year study in over two hundred patients with hip osteoarthritis, taking 1,500 milligrams a day of glucosamine did not lessen symptoms or progression of the disease. In addition, a meta-analysis (summary of twenty clinical studies) with chondroitin use in osteoarthritis of the hip and knee revealed no symptomatic benefit. These two studies appeared in major medical journals that strongly influence physician preference. However, since these supplements have few side effects at the recommended doses, it seems prudent to try them. If you do not experience a benefit within two months, you are not likely to.

Rheumatoid arthritis (RA) is an autoimmune disorder, usually affecting women and girls. The body's immune system inaccurately identifies the synovial membrane as “foreign.” Inflammation, pain, and eventual destruction of cartilage ensue. Damaged tissue is replaced by scar tissue and bones fuse together. During the course of the disease, symptoms include stiffness, swelling, anemia, weight loss, fatigue, fever, and crippling pain. In one study, taking 10 grams of cod liver oil allowed patients to use 39 percent less of the medication—nonsteroidal anti-inflammatory drugs (NSAIDs)—used to treat RA. These drugs have side effects (gastrointestinal toxicities, increased blood pressure, and risk of heart disease) and lose their effectiveness over time, so cod liver oil (or fish oil) may offer a safe and natural way to manage patients' symptoms.

Arthritis can also be caused by bacterial, viral, or fungal infection of a joint. The microorganisms most commonly involved in this type of the disorder are streptococci, staphylococci, gonococci, hemophilus, or tubercle bacilli, and fungi such as *Candida albicans*. Usually the infecting organism travels to the joint through the bloodstream from an infection elsewhere in the body, but injury or even surgery can result in joint infection as well. Symptoms include redness, swelling, pain, and tenderness in the affected joint, often accompanied by systemic symptoms of infection such as fever, chills, and body aches.

The spondyloarthropathies are a group of rheumatic disorders that tend to affect the spine. Ankylosing spondylitis (AS) is the most common of these. In this disorder,

certain joints of the spine become inflamed, then stiffen and become rigid. If confined to the lower back, AS causes virtually no limitation of movement. In some cases, however, the entire spine may become rigid and bent. If the joints between the ribs and spine are affected, breathing problems may result as the chest wall's ability to expand becomes limited. Postural deformities are common. It is estimated that at least 500,000 adults in the United States have AS, according to the Spondylitis Association of America. Canadians appear to have the condition in almost the same overall numbers as Americans. Some investigators feel that populations living closer to the poles have a higher incidence of the condition. Fish oil taken at large doses (4.55 grams of omega-3s a day) was shown to reduce the symptoms of the disease, allowing patients to feel and function better.

Gout, an acute form of inflammatory arthritis, occurs most often in people who are overweight and/or who indulge regularly in rich foods and alcohol. It typically attacks the smaller joints of the feet and hands, especially the big toe. Deposits of crystallized uric acid salt in the joint cause swelling, redness, and a sensation of heat and extreme pain. Approximately 1 million Americans suffer from gout, and unlike most forms of arthritis, gout overwhelmingly affects men. Ninety percent of those who suffer from gout are male. (See GOUT in Part Two.)

Some forms of arthritis can be reversible, and in some cases curable, with proper diet and lifestyle changes. These simple changes can not only relieve the inflammation and pain but also stop degeneration and rejuvenate the affected joints. Most of the supplements listed in Nutrients can be found in multinutrient complexes.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Bromelain	As directed on label 3 times daily.	An enzyme that helps to stimulate production of prostaglandins. Reduces inflammation when taken between meals. Helps digestion of protein when taken with meals.
Chondroitin sulfate	500–1,000 mg daily.	Nutritional support for strengthening joints, ligaments, and tendons.
Essential fatty acids (Total EFA from Health From The Sun, omega-3 and omega-6 oil complexes, salmon oil from Carlson Labs, Kyolic-EPA from Wakunaga, or Lyprinol)	As directed on label twice daily. Take with meals.	To supply essential fatty acids that increase production and activity of anti-inflammatory prostaglandins. Helps to control arthritis pain and inflammation.
Glucosamine sulfate (GS-500 from Enzymatic Therapy) or	As directed on label.	Very important for the formation of bones, tendons, ligaments, cartilage, and synovial (joint) fluid.

N-Acetylglucosamine (N-A-G from Source Naturals)	500–1,000 mg daily.	
Methylsulfonylmethane (MSM)	500–1,000 mg 3 times daily.	A sulfur compound needed for reducing inflammation and for joint and tissue repair.
S-Adenosylmethionine (SAME) (SAME Rx-Mood from Nature's Plus)	400 mg twice daily.	A deficiency results in the inability to maintain cartilage properly. Aids in reducing pain and inflammation. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
Sea cucumber (bêche-de-mer)	As directed on label.	A rich source of specific lubricating compounds found abundantly in all connective tissues, especially the joints and joint fluid. It may take 3 to 6 weeks to note an improvement.
Silica	As directed on label.	Supplies silicon, important for formation of apatite crystal, the primary constituent in bone.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label.	An antioxidant that protects fluid in the joints from destruction by free radicals. A sublingual form is recommended. Consider injections (under a doctor's supervision). An antioxidant complex that contains SOD.
Trimethylglycine (TMG)	500–1,000 mg in the morning.	Reduces homocysteine levels.
Vitamin E	200 IU daily.	A powerful antioxidant that protects the joints from damage by free radicals. Increases joint mobility. Low levels of vitamin E have been found in people with arthritis and lupus. Use d-alpha-tocopherol form. <i>Caution:</i> If you are taking blood-thinning medication, consult your physician before taking this supplement.
<i>Very Important</i>		
Boron	3 mg with each meal.	A trace mineral required for healthy bones and uptake of calcium. Also reduces COX-2 and LOX enzymes for anti-inflammatory value.
Calcium and magnesium plus copper	2,000 mg daily. 1,000 mg daily. 3 mg daily.	Needed to prevent bone loss. Use calcium chelate form. Needed to balance with calcium. A cofactor for lysyl oxidase, which strengthens connective tissue and bone formation. Needed for calcium uptake and bone formation.
and vitamin D and	800 IU daily.	Needed for bone growth. Often deficient in those with arthritis.
zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Use zinc picolinate form.

## Quick Reference Guide: Common Forms of Arthritis and Related Conditions

Swollen, painful joints can have a variety of causes. The particular symptoms make different arthritic and related conditions distinguishable from one another. Here is an overview of different types of arthritic disorders and their characteristic features.

### Juvenile Arthritis

This is a general term for all types of arthritis that occur in children. Juvenile rheumatoid arthritis is the most prevalent form in children, and there are three major types: polyarticular (affecting many joints), pauciarticular (affecting a few joints), and systemic (affecting the entire body). The signs and symptoms of juvenile rheumatoid arthritis vary from child to child. There is no single test that establishes conclusively a diagnosis of juvenile arthritis, and the condition must be present consistently for six or more consecutive weeks before a correct diagnosis can be made. Heredity is thought to play some part in the development of juvenile arthritis. However, the inherited trait alone does not cause the illness. Researchers think this trait, along with some other unknown factor (probably in the environment), triggers the disease. The Arthritis Foundation says that juvenile arthritis is even more prevalent than juvenile diabetes and cerebral palsy.

### Gout

Gout is a disease that causes sudden, severe attacks of pain, tenderness, redness, warmth, and swelling in some joints. It usually affects one joint at a time, especially the joint of the big toe. Needle-shaped uric acid crystals that precipitate out of the blood are deposited in the joint and cause the pain and swelling associated with gout. In people with gout, the body does not produce enough of the digestive enzyme uricase, which oxidizes relatively insoluble uric acid into a highly soluble compound. Factors leading to increased levels of uric acid, and then gout, include obesity, improper diet, overeating, stress, surgery, joint injury, excessive alcohol intake, hypertension, kidney disease, and certain drugs. (More details can be found in GOUT in Part Two.)

### Ankylosing Spondylitis

This is a chronic inflammatory disease of the spine that can fuse the vertebrae to produce a rigid spine. Spondylitis is a result of inflammation that usually starts in tissue outside the joint. The most common early symptoms of spondylitis are low back pain and stiffness that continues for months. Although the cause of spondylitis is unknown, scientists have discovered a strong genetic or family link, according to the Arthritis Foundation. Most people with spondylitis have a genetic marker known as HLA-B27. (Genetic markers are protein molecules located on the surface of white blood cells that act as a "name tag.") Having this genetic marker does not mean a person will develop spondylitis, but people with the marker are more likely to develop the disease. Ankylosing spondylitis usually affects men between the ages of sixteen and thirty-five, but it also affects women. Other joints besides the spine can be involved.

### Systemic Lupus Erythematosus

Systemic lupus erythematosus is an autoimmune disease that can involve the skin, kidneys, blood vessels, joints, nervous system, heart, and other internal organs. Symptoms vary among those affected, but may include a skin rash, arthritis, fever, anemia, hair loss, ulcers in the mouth, and kidney sediment or function abnormalities. In most cases, the symptoms first appear in women of childbearing age; however, lupus can occur in young children or in older people. Studies suggest there is an inherited tendency to get lupus, and lupus affects women about nine to ten times as often as men. It is also more common in African-American women.

### Bursitis, Tendinitis, and Myofascial Pain

Bursitis, tendinitis, and myofascial pain are localized, nonsystemic (not affecting the entire body) painful conditions. Bursitis is inflammation of the sac surrounding any joint that contains a lubricating fluid. Tendinitis is inflammation of a tendon, and myofascial pain is a problem that results from the strain or improper use of a muscle. These conditions may start suddenly and usually stop within a matter of days or weeks.

### Carpal Tunnel Syndrome

This is a condition in which pressure on the median nerve at the wrist causes tingling and numbness in the fingers. It can begin suddenly or gradually and can be associated with another disease, such as rheumatoid arthritis, or it may be unrelated to any other condition. If untreated, it can result in permanent nerve and muscle damage. With early diagnosis and treatment there is an excellent chance of complete recovery.

## Fibromyalgia Syndrome

Fibromyalgia syndrome is a condition characterized by generalized muscular pain, fatigue, and poor sleep. It is believed to affect approximately 2 percent of the U.S. population, or about 5 million people. The name *fibromyalgia* means “pain in the muscles, ligaments, and tendons.” The condition mainly affects muscles and their attachments to bones. Although it may feel like a joint disease, the Arthritis Foundation says it is not a true form of arthritis and it does not cause deformities of the joints. It is, instead, a form of soft tissue and muscular rheumatism.

## Infectious Arthritis

This is a form of joint inflammation that is caused by a bacterial, viral, or fungal infection. The diagnosis is made by culturing the organism from the joint. Infectious arthritis can be cured using antibiotic medications.

## Osteoarthritis (OA)

Osteoarthritis rarely develops before the age of forty, but it affects nearly everyone past the age of sixty. Nearly three times as many women as men have it and, at present, 27 million Americans, most over the age of forty-five, are affected. Previously known as “degenerative joint disease,” osteoarthritis results from the “wear and tear” of life. Other risk factors include joint trauma, obesity, and repetitive joint use. The simple effect of gravity causes physical damage to the joints and surrounding tissues, leading to pain, tenderness, swelling, and decreased function. Initially, osteoarthritis is non-inflammatory, and it may be so mild that a person is unaware of it until it appears on an X-ray. Usually, only one or two joints are affected, most often the knee, hip, and hand. Pain is the earliest symptom, usually exacerbated by repetitive use.

## Psoriatic Arthritis

This condition is similar to rheumatoid arthritis. About 5 percent of people with psoriasis, a chronic skin disease, also develop psoriatic arthritis. (See PSORIASIS in Part Two.) With psoriatic arthritis there is joint inflammation and sometimes inflammation of the spine. Fewer joints may be involved than in rheumatoid arthritis, and there is no rheumatoid factor in the blood.

## Reiter's Syndrome

Reiter's syndrome involves inflammation in the joints, and sometimes at the location where tendons attach to bones. This form of arthritis usually develops following an intestinal or a genital/urinary tract infection. People with Reiter's syndrome have arthritis and one or more of the following: urethritis, prostatitis, cervicitis, cystitis, eye problems, or skin sores.

## Rheumatoid Arthritis (RA)

Rheumatoid arthritis, a type of inflammatory arthritis, is an autoimmune disorder that occurs when the body's own immune system mistakenly attacks the synovium (the cell lining inside the joint). An overactive immune system can be just as harmful as a weak one. As with other autoimmune disorders, rheumatoid arthritis is a “self-attacking-self” disease. In this case, the body's immune system improperly identifies the synovial membrane as *foreign*. The synovium becomes inflamed and thickened. Inflammation damages cartilage and tissues in and around the joints. Often, the bone surfaces are destroyed as well because inflammation in the joints triggers the production of enzymes that slowly digest adjacent tissue. The body replaces this damaged tissue with scar tissue, forcing normal spaces within the joints to become narrow and the bones to fuse together. Rheumatoid arthritis creates stiffness, swelling, fatigue, anemia, weight loss, fever, and, often, crippling pain. Rheumatoid arthritis frequently occurs in people under forty years of age. Currently, 1.3 million Americans have this disabling disorder, down from 2.1 million just a decade ago. Women are two to three times more likely than men to develop RA. Juvenile arthritis is a form of rheumatoid arthritis that strikes children under the age of eighteen. It affects nearly 300,000 young Americans, again most of them female. The onset of rheumatoid arthritis is associated with physical or emotional stress, poor nutrition, and bacterial infection. Rheumatologists have discovered that the blood of many people with rheumatoid arthritis contains antibodies called *rheumatoid factors*, a finding that can aid in the diagnosis of the condition. While osteoarthritis affects individual joints, rheumatoid arthritis affects all of the body's synovial joints.

## Scleroderma

This is a disease of the body's connective tissue that causes thickening and hardening of the skin. It can also affect joints, blood vessels, and internal organs. There are two types of scleroderma: localized and generalized.

Cerasomal-cis-9-cetylmyristoleate (CMO)	300 mg morning and night daily.	An anti-inflammatory that reduces inflammation in the joints. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or if you have liver problems.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	125 mg 3 times daily.	Helps to prevent further damage to joints.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply protein, needed for tissue repair. Protein is a major component of bone tissue.
Glucosamine/Chondroitin MSM Ultra Rx-Joint Cream from Nature's Plus	As directed on label.	Topical cream for relief of inflamed joints.
Kelp or alfalfa	As directed on label.	A rich source of minerals needed for good skeletal health. <i>See under Herbs, below.</i>
Multienzyme complex	As directed on label. Take with meals.	To aid digestion. <i>Caution:</i> If you have a history of ulcers, do not use a product containing HCl.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A powerful antioxidant.
Vitamin B complex with para-aminobenzoic acid (PABA) plus extra vitamin B <sub>3</sub> (niacin) or niacinamide	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily. Do not exceed this amount.	B vitamins work best when taken together. Use a hypoallergenic formula. Good for swelling. Increases blood flow by dilating small arteries. Good for knee pain. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure. <i>Caution:</i> Do not substitute niacin for niacinamide. Niacin can be toxic in such high doses.
plus vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	500–1,000 mg daily. 50 mg daily.	Especially for rheumatoid arthritis; vital for the production of steroids in the adrenal gland. Reduces swelling in tissue.
Vitamin B <sub>12</sub> and folic acid	1,000 mcg daily. 400 mcg daily.	Needed for proper digestion, the formation of cells, and the production of myelin, and the protective coating surrounding the nerves. Prevents nerve damage.
Vitamin C plus bioflavonoids	3,000–10,000 mg daily, in divided doses. 500 mg daily.	Powerful free radical destroyer that also aids in pain relief because of its anti-inflammatory effect. Use a buffered form. Boosts the activity of vitamin C.
Vitamin K	As directed on label.	Helps deposit minerals into the bone matrix.

*Helpful*

Bone Defense from KAL	As directed on label.	Contains calcium, magnesium, phosphorus, and other valuable bone-reinforcing nutrients.
DL-Phenylalanine (DLPA)	500 mg daily every other week.	Good for pain relief. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Inhibits the formation of free radicals, which can damage the joints.
Healthy Joint Image from Coenzyme-A Technologies	As directed on label.	Contains pantothenic acid, glucosamine sulfate, chondroitin sulfate, cerasomal-cis-9-cetylmyristoleate, methylsulfonylmethane (MSM), and other nutrients to support healthy bone, joint, ligament, and cartilage function.
L-cysteine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A detoxifier essential for immune function; a source of sulfur and a component of collagenous tissue. ( <i>See AMINO ACIDS in Part One.</i> )
L-histidine	As directed on label.	Aids in building joints and connective tissue.
MSM Lotion from Aerobic Life Industries	Apply topically as directed on label.	Good for stiffness and pain.
Multivitamin complex with vitamin A and natural beta-carotene	10,000 IU daily. 15,000 IU daily.	All nutrients are needed to aid in repairing tissues and cartilage.
Pregnenolone	As directed on label.	Good for pain and inflammation.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label. Take between meals. As directed on label.	To protect the joints from free radical damage.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Improves joint flexibility, repairs connective tissue by reducing the prostaglandins that cause inflammation, and inhibits histamine release responsible for tissue damage.
Shark cartilage	Start with 1 gram per 15 lbs of body weight daily, divided into 3 doses. When relief is achieved, reduce the dosage to 1 gm per 40 lbs of body weight daily.	Treats pain and inflammation. Aids in repairing joints and bones.

**Herbs**

Alfalfa contains all the minerals essential for bone formation, and may be helpful for arthritis. It can be taken in

capsules or in whole, natural form. Kelp also contains essential minerals and is good for thyroid function.

❑ Boswellia, an Ayurvedic herb, is important for reducing inflammation. It is made from frankincense (*Boswellia serrata*). It also helps to restore blood vessels around inflamed connective tissue. Choose a product standardized to contain 150 milligrams of boswellic acids per tablet or capsule. Boswellia can also be used topically, in cream form, to relieve pain.

❑ The boswellic acids, a group of acids associated with *Boswellia serrata* resin, work to inhibit an enzyme called 5-lipoxygenase (5-LOX), which is instrumental in the synthesis of leukotrienes. The herbal preparation 5-Loxin contains AKBA, the most potent of the boswellic acids. It is a potent anti-inflammatory agent used successfully in the treatment of arthritis pain.

❑ Cat's claw is helpful for relieving arthritis pain. Feverfew and ginger also are good for pain and soreness.

*Caution:* Do not use cat's claw during pregnancy. Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

❑ Ginger is a powerful antioxidant that has anti-inflammatory effects. The active component is gingerol. Ginger inhibits pain-producing prostaglandins.

❑ The hot peppers known as cayenne (capsicum) contain a compound called capsaicin that relieves pain, apparently by inhibiting the release of substance P, a neurotransmitter responsible for communicating pain sensations. Capsaicin can be absorbed through the skin. Mix cayenne powder with enough wintergreen oil to make a paste and apply it to painful joints, or use cayenne peppers in a poultice. (See USING A POULTICE in Part Three.) This may cause a stinging sensation at first, but with repeated use, pain should diminish markedly. Cayenne can also be taken in capsule form (Cool Cayenne from Solaray is a good source).

❑ Du Huo Jisheng Wan is an herbal Chinese patent medicine that has proven to be beneficial for arthritis sufferers.

❑ Joint Care from Himalaya Herbal Healthcare is an Ayurvedic herbal combination formula designed to support joint health.

❑ Nettle leaf is used in Germany for its anti-inflammatory properties. Nettle leaf extract inhibits TNF-alpha and IL-1 beta, which are pro-inflammatory signaling molecules. TNF is prominent in triggering inflammation, and IL is involved in cartilage and bone destruction. The prescription drug etanercept (Enbrel), prescribed for rheumatoid arthritis, acts by suppressing the TNF-alpha.

❑ Nexrutine is an herbal extract of the phellodendron tree (*Phellodendron amurense*). This tree has been a resource in traditional Asian medicine for more than 1,500 years. Developed by Next Pharmaceuticals, Inc., Nexrutine is an anti-inflammatory used for natural pain management. It is

uniquely suited for the treatment of arthritis pain due to its operational mechanisms. The COX-2 enzyme is inhibited, thus blocking one of the main pain pathways at the source. Additionally, its use does not cause blood platelets to stick together, thus reducing the cardiovascular risk associated with popular COX-2 inhibitors. No stomach problems were observed in trials. The usual dosage is 250 to 500 milligrams three times daily.

*Caution:* Do not use Nexrutine while pregnant or lactating. It is not intended for use by children.

❑ Noni, known as "the sacred plant" to Polynesian peoples in the South Pacific, has been used for more than 2,000 years for pain, arthritis, and other health problems.

❑ Olive leaf extract is good for infectious arthritis. Used for thousands of years by people living in the Mediterranean, it is said to be nature's safe and effective antibiotic. Natural compounds such as oleuropein in the leaf act as powerful germ killers capable of destroying microbes that can cause arthritis. There are reportedly no adverse side effects.

❑ Turmeric contains curcumin, which has anti-inflammatory and pain-relieving properties. It is good for inflammatory conditions such as arthritis. The recommended dose is 600 milligrams daily.

❑ Willow bark is also good for pain and inflammation.

❑ Borage seed oil in a dosage of 1,800 milligrams per day may be effective in pain control. However, fish oil has a better mix of fatty acids to reduce TNF and COX-2.

❑ Other beneficial herbs include brigham tea, buchu leaves, burdock root, celery seed, corn silk, devil's claw tea, parsley tea, and yucca.

## Recommendations

❑ Eat more sulfur-containing foods, such as asparagus, eggs, garlic, and onions. Sulfur is needed for the repair and rebuilding of bone, cartilage, and connective tissue, and it also aids in the absorption of calcium. Other beneficial foods include fresh vegetables (especially green leafy vegetables, which supply vitamin K), nonacidic fresh fruits, whole grains, oatmeal, brown rice, fish, soybean products, and avocados. Be sure to include these foods in your diet. Also, tart red cherries can relieve pain and inflammation. Eat about twenty cherries each day. If you can't find fresh cherries, the frozen variety is fine.

❑ Consume foods containing the amino acid histidine, including rice, wheat, and rye. Histidine is good for removing excess metals from the body. Many people with arthritis have high levels of copper and iron in their bodies.

❑ Eat fresh pineapple frequently. Bromelain, an enzyme found in pineapple, is excellent for reducing inflammation. To be effective, the pineapple must be fresh, as freezing and canning destroy enzymes.

❑ Eat some form of fiber, such as ground flaxseeds, oat bran, or rice bran, daily.

- Reduce the amount of fat in your diet. Do not consume milk, dairy products, or red meat. Also avoid caffeine, citrus fruits, paprika, salt, tobacco, and everything containing sugar.
- Avoid the nightshade vegetables (peppers, eggplant, tomatoes, white potatoes). These foods contain a substance called solanine, to which some people, particularly those suffering from arthritis, are highly sensitive. Solanine interferes with enzymes in the muscles, and may cause pain and discomfort.
- If you use ibuprofen or other nonsteroidal anti-inflammatory drugs (NSAIDs), avoid sodium (salt), which causes water retention. Spread doses of these medications throughout the day, take them only after eating, and take an antacid an hour after taking the drug. Ask your health care provider about a protective agent to take along with the NSAID, especially if you are over sixty-five or have had previous gastrointestinal bleeding.
- Do not take iron supplements, or a multivitamin containing iron. Iron supplementation is suspected of being involved in pain, swelling, and joint destruction. Consume iron in foods instead. Good sources include blackstrap molasses, broccoli, Brussels sprouts, cauliflower, fish, lima beans, and peas.
- Boron is important as a trace mineral. It can be found naturally in noncitrus fruits such as plums, red grapes, apples, pears, and avocados, as well as in legumes and nuts. It can also be found in red wine and coffee. Dried fruits contain a much higher amount of boron than do fresh fruits. For instance, fresh plums contain 0.45 milligrams per 100 grams, but the same weight in dried prunes (about a dozen) contains 2.15 mg of boron. The body's boron requirements may be as high as 9 to 12 milligrams per day although most people naturally consume only about 1 to 2 milligrams in the diet.
- For relief of pain, try using cold gel packs. These retain cold for long periods when frozen. Place them on inflamed joints. Alternate with applications of heat.
- Hot tubs and baths may provide relief. Raw lemon rubs and hot castor oil packs are also extremely beneficial. To make a hot castor oil pack: place castor oil in a pan and heat but do not boil it. Dip a piece of cheesecloth or other white cotton material into the oil until the cloth is saturated. Apply the cloth to the affected area and cover it with a piece of plastic that is larger in size than the cotton cloth. Place a heating pad over the plastic and use it to keep the pack warm. Keep the pack in place for one-half to two hours, as needed.
- In the morning, take a hot shower or a bath to help relieve morning stiffness.
- Take free form amino acids regularly to help repair tissue.
- Check for possible food allergies. Many sufferers of neck and shoulder pain have found relief when they eliminate certain foods. Allergies trigger inflammation and can

aggravate arthritic symptoms, especially those of rheumatoid arthritis.

- Consider having a hair analysis to determine the levels of toxic metals in your body. Lead levels have been found to be higher than normal in some arthritis sufferers. (See HAIR ANALYSIS in Part Three.)
- Spend time outdoors for fresh air and sunshine. Exposure to the sun prompts the synthesis of vitamin D<sub>3</sub>, which is needed for proper bone formation.
- Get regular moderate exercise. Exercise is essential for reducing pain and retarding joint deterioration. Regular activity that does not put stress on affected joints, but that strengthens surrounding bones, muscles, and ligaments, is valuable for many types of arthritis. Bicycle riding, walking, and water exercises are good choices. Avoid weight-bearing or impact exercises.
- If you are overweight, lose the excess pounds. Being overweight can cause and aggravate osteoarthritis.

### Considerations

- If the blood is too acidic, the cartilage in the joints may dissolve. The joints lose their normal smooth sliding motion, bones rub together, and the joints become inflamed, causing pain. (See ACIDOSIS under ACID/ALKALI IMBALANCE in Part Two.)
- Etanercept (Enbrel) is a drug used to treat rheumatoid arthritis. It apparently blocks the action of tumor necrosis factor (TNF) alpha, an infection-fighting protein linked to inflammation. However, this drug does affect the immune system and has been tied to a number of cases of serious infection including tuberculosis. The drug's manufacturer, Amgen, now adds a warning to the packaging label informing doctors about the infections.
- Researchers at Jefferson Medical College in Philadelphia have identified a possible genetic component of osteoarthritis. They found that some individuals have a defect in the gene that instructs cartilage cells to manufacture collagen, an important protein in connective tissue. As a result, the collagen in these individuals' joints is more prone to wear down, depriving the bones of their protective cushion.
- In one study, people with rheumatoid arthritis were found to have lower blood levels of folic acid, protein, and zinc than healthy persons. The researchers concluded that drugs prescribed for arthritis had brought about biochemical changes in the subjects' bodies, increasing their need for certain nutrients.
- Eating deep-sea fish, which are rich in eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), helped relieve the symptoms of rheumatoid arthritis in a study conducted by Charles Dinarello, M.D., of the Tufts University School of Medicine in the mid-1990s. Albany Medical College researcher Joel M. Kremer conducted a similar study

published in the *American Journal of Clinical Nutrition*, in which people with rheumatoid arthritis were given daily doses of a fish oil concentrate and twenty were given a placebo. After fourteen weeks, the groups were switched. The people taking the fish oil reported only about half as many tender joints as the placebo group. The fish oil also slowed the onset of fatigue.

❑ Omega-3 essential fatty acids found in fish oil may alleviate symptoms of rheumatoid arthritis by suppressing the immune system reaction that causes joint inflammation. Numerous studies over the past ten years have shown that people with rheumatoid arthritis have fewer tender and swollen joints and less morning stiffness after several months of taking large doses of fish oil supplements (2.5 to 5 grams a day) with meals. Using 3 grams of omega-3s from fish oil combined with 9.6 grams (about 2 teaspoons) of olive oil was more effective than fish oil alone at relieving symptoms associated with rheumatoid arthritis. Patients experienced less stiffness in the morning, less joint pain throughout the day, and better right handgrip strength.

❑ Bromelain has been shown to improve recent mild knee pain. Patients had a greater sense of well-being and were more mobile. A dose of 400 milligrams a day of bromelain worked better than a dose of 200 milligrams per day.

❑ Gamma-linolenic acid (GLA), an omega-6 fatty acid, may ease symptoms of rheumatoid arthritis by suppressing the production of prostaglandins that trigger inflammation. Evening primrose oil and borage seed oil contain GLA.

❑ The immunosuppressant drug cyclosporine, which is used in transplant patients to prevent rejection of the transplanted organ, is being used as a treatment for a variety of autoimmune diseases, including rheumatoid arthritis. Using the ointment form of cyclosporine apparently lessens the potentially hazardous side effects this drug has when administered by mouth or by injection, such as kidney damage and reduced resistance to infection. It has been found that cyclosporine improves pain and inflammation for many people who use it.

❑ Chlamydia, the organism responsible for many cases of urethritis, has been linked to a form of arthritis that affects young women. In nearly half of the women with unexplained arthritis tested in one study, chlamydia was found in the joints. Seventy-five percent had elevated levels of antibodies to chlamydia in their blood.

❑ Most chiropractors and osteopaths advise women to avoid high-heeled shoes because they place a greater compressive pressure on the knees than flat or low-heeled shoes, which may eventually lead to arthritis of the knees. The higher the heel, the greater the force.

❑ Silicone gel breast implants and other silicone prostheses may cause arthritis-like symptoms, such as swelling of joints, contractures, fever, chronic fatigue, and pain. Silicone has also been known to trigger such severe autoimmune diseases as scleroderma and lupus. Some women

have seen arthritic symptoms disappear after having the implants removed but this is not true in all cases.

❑ Women who breast-feed are less likely to develop rheumatoid arthritis than women who don't. Dr. Elizabeth Wood Karlson of Brigham and Women's Hospital in Boston used data from the Nurses' Health Study to explore the contribution of hormonal factors on subsequent development of arthritis. Women who breast-fed for a total of twelve to twenty-three months during their lifetime had a 30 percent risk reduction. Those who breast-fed for at least twenty-four months had a 50 percent risk reduction.

❑ In one laboratory study, injections of a protein called anti-TGF-B banished painful joint swelling in 75 percent of the subjects, according to Dr. David Pisetsky of the National Arthritis Foundation. This protein destroys TGF-B, a chemical produced by the body in response to infection that causes inflammation and triggers swelling in the hands and feet.

❑ Cosamin from Nutramax Laboratories may help the joints and ligaments. (See Manufacturer and Distributor Information in the Appendix.)

❑ Dimethylsulfoxide (DMSO), a by-product of wood processing, is a liquid that can be applied topically to relieve pain, reduce swelling, and promote healing.

*Caution:* Only pure DMSO from a health food store should be used for the treatment of arthritis. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

❑ Arthritic pain and inflammation may respond to treatment with honeybee venom. The venom contains a powerful anti-inflammatory substance and also acts as an immune system stimulant. It is administered by injection.

*Caution:* You should not use this product if you are allergic to bee stings.

❑ Nonsteroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen (found in Advil, Nuprin, and numerous other products), indomethacin (Indocin), and piroxicam (Feldene) are commonly prescribed for relief of arthritis pain. Unfortunately, these drugs also can have side effects. About 1 percent of people who take NSAIDs on a regular basis develop stomach ulcers or experience severe gastrointestinal bleeding. As many as 200,000 cases of gastrointestinal bleeding, including 10,000 to 20,000 deaths, could be occurring each year in the United States as a result of nonsteroidal anti-inflammatory drugs prescribed for arthritis. These drugs can also cause kidney or liver damage when used in large doses and when used long-term.

❑ Misoprostol (Cytotec) and ulcer drugs like ranitidine (Zantac) and sucralfate (Carafate) might help prevent the development of ulcers associated with NSAIDs.

❑ Diclofenac sodium (Voltaren), a drug often prescribed for arthritis, has many serious potential side effects and may cause liver problems in some cases. People who take it should be monitored very closely. If this medication is prescribed, the physician should perform a blood liver enzyme study.

❑ For some forms of arthritis, drugs such as hydroxychloroquine (Plaquenil) and gold compounds (Ridaura) may be prescribed.

❑ For some individuals, the ulcer drug sucralfate (Carafate) may give the same relief as aspirin and other anti-inflammatory drugs without damaging the stomach lining.

❑ Acetaminophen (sold as Tylenol, Datril, and others) may be a better medication for osteoarthritis than ibuprofen. Acetaminophen is relatively safe and inexpensive, although if it is taken in excessive amounts or in combination with alcohol, this drug can cause liver damage.

❑ Kawasaki syndrome is an infectious disease that can cause symptoms of arthritis in children, accompanied by conjunctivitis; fever; a red rash on the body; a swollen, red tongue; and/or red or purplish red discoloration and swelling of the palms of the hands and the soles of the feet. The cause of this disorder is not known. It primarily affects children under five years of age. Most children recover, but some, unfortunately, suffer permanent heart damage.

❑ Lyme disease can mimic arthritis, causing many of the same symptoms. (See LYME DISEASE in Part Two.)

❑ Another autoimmune disease that often manifests itself as arthritis is systemic lupus erythematosus (Lupus). For reasons unknown, the body produces antibodies that act against its own tissues. (See LUPUS in Part Two.)

❑ In its early stages, ulcerative colitis can cause symptoms like those of arthritis. Because this may occur before there are any abdominal symptoms, it can lead to misdiagnosis and delayed treatment. (See ULCERATIVE COLITIS in Part Two.)

❑ More information about arthritis is available from the Arthritis Foundation ([www.arthritis.org](http://www.arthritis.org)). (See Health and Medical Organizations in the Appendix.)

❑ See also GOUT in Part Two and PAIN CONTROL in Part Three.

## ASTHMA

Asthma is a lung disease that causes obstruction of the airways. It is an overreaction of the body's own immune system usually caused by exposure to an allergen, a substance that the body perceives as foreign and dangerous.

During an asthma attack, spasms in the muscles surrounding the bronchi (small airways in the lungs) constrict, impeding the outward passage of air. Asthma sufferers often describe this plight as "starving for air." Typical symptoms of an asthma attack are coughing, wheezing, a feeling of tightness in the chest, and difficulty breathing. An attack can last for a few minutes or several hours.

The spasms characterizing an acute attack are not the cause of the disorder, but a result of chronic inflammation and hypersensitivity of the airways to certain stimuli. An attack can be triggered if a susceptible individual is exposed to an allergen, but irritants, infection, stress, exercise, or use of aspirin, ibuprofen, naproxen sodium, or other NSAIDs—or even rapid changes in weather and humidity—can trigger an attack.

There are two forms of asthma: allergic and nonallergic, although the two often occur together. Common asthma-provoking allergens include animal dander, cockroach allergens, pollens, mold, chemicals, drugs, dust mites, environmental pollutants, feathers, food additives (such as monosodium glutamate or sulfites such as sodium metabisulfite), seafood, dairy products, nuts, yeast-based foods, fumes, mold, and tobacco smoke. But any kind of allergen can precipitate an asthma attack. Factors that can trigger nonallergic asthma attacks include adrenal disorders, anxiety, temperature changes, exercise, extremes of dryness or humidity, fear, laughing, low blood sugar, and stress. A respiratory infection such as bronchitis can also provoke an attack. Whatever the particular instigator, the bronchial tubes swell and become plugged with mucus. This inflammation further irritates the airways, resulting in even greater sensitivity. The attacks become more frequent and the inflammation more severe.

Asthma can be difficult to diagnose conclusively. Its symptoms may resemble those of other diseases, such as emphysema, bronchitis, and lower respiratory infections. To distinguish asthma from other conditions, a physician may recommend blood tests, chest X-rays, and spirometry (a procedure that measures air breathed into and out of the lungs). If not treated properly, bronchial asthma can lead to pulmonary emphysema. However, with prompt diagnosis and appropriate treatment, serious danger from asthma should be preventable.

Cardiac asthma is a condition that causes the same symptoms as other types of asthma, but is caused by heart failure. Intrinsic asthma, a less common form of the disease, which generally appears during adulthood, is often associated with other respiratory diseases such as bronchitis or sinusitis, and tends to appear during upper respiratory viral infections. People who suffer from intrinsic asthma are usually vulnerable to changes in weather, exercise, emotional stress, and other factors related to inner feelings. However, 10 percent of adults with asthma remain symptomatic despite treatment with high-dose inhaled steroids and long-acting beta2 agonists.

A hereditary link to asthma was discovered in late 1999 by two Berkeley, California, researchers who spliced human genes into mice and determined that asthmatic activity could be diminished by slowing the activity of two particular genes. The value of the research, they said, centered on the fact that scientists now have an opportunity to develop a medicine to prevent asthma, rather than merely treat its symptoms.

This genetic-based research milestone in asthma preven-

tion arrived at an important juncture. Medical scientists are growing increasingly alarmed over what they consider to be an epidemic rise in the number of new asthma cases each year. Asthma now affects 16.2 million people, 6.7 million of whom are children, according to the Centers for Disease Control (CDC). Children under age sixteen, particularly those living in urban areas, and adults over the age of sixty-five are most likely to suffer from asthma. Eighty percent of children get their first asthma symptoms before age five. It is the third leading cause of hospitalization for children, and the number-one cause of school absenteeism. The cause of asthma's continued rise over the years has researchers scratching their heads and looking at a wide spectrum of possible causes, including pollution, global warming, food additives, genetics, toxins, and allergens. Recently it has been discovered that large increases in the number of asthma sufferers in the American Southwest, the Caribbean, and Central American regions seem to have been brought on by drought-caused sub-Saharan dust and mold spores being swept across the Atlantic by prevailing winds—winds that have recently changed due to the effects of global warming. Asthma specialists speculate that rising levels of environmental pollution also lead to higher incidences of asthma. Asthma epidemics related to atmospheric contamination—situations in which dust and chemical particles are abundant, especially in enclosed environments—are well known. Occupational exposure to certain substances, such as urethane and polyurethane, used in the adhesives and plastics industry, along with rubber epoxy resins from paint, textile cleaner fumes, dry-cleaning chemicals, and others also may be major risk factors. Obesity has recently been linked to the development and severity of asthma in adults and children.

The dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve years old, reduce the dose to one-half the recommended amount. For children under six years old, use one-third of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Fish oil	1,000 mg twice daily, before meals.	A source of essential fatty acids needed for production of anti-inflammatory prostaglandins.
Pantothenic acid (vitamin B <sub>5</sub> )	50 mg 3 times daily.	The antistress vitamin.
Selenium	100 mcg daily.	Blood levels are low in asthmatics.
Vitamin C with bioflavonoids	1,500 mg 3 times daily. <i>Caution:</i> If you have a history of kidney stones or hemochromatosis, do not take vitamin C at this dosage level.	Needed to protect lung tissue and keep down infection. Also increases air flow and fights inflammation.

Zinc lozenges	Do not take over 100 mg daily.	Can shorten an attack or halt one before it becomes severe.
<i>Very Important</i>		
Betaine hydrochloride with pepsin	As directed on label, or as prescribed by physician.	Combats malabsorption problems leading to "leaky gut syndrome."
Coenzyme Q <sub>10</sub>	100 mg daily.	Has the ability to counter histamine.
Magnesium plus calcium	750 mg daily. 1,500 mg daily.	May stop the acute asthmatic episode by increasing the vital capacity of the lungs. Has a dilating effect on the bronchial muscles. Use chelate or aspartate forms.
Multivitamin and mineral complex with selenium and vitamin B <sub>12</sub>	As directed on label. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily. 2000 mcg daily	Necessary for enhanced immune function. Use a high-potency formula. A powerful destroyer of free radicals created from air pollutants.
<i>Helpful</i>		
Bee pollen	Start with a few granules at a time and slowly work up to 2 tsp daily.	Strengthens the immune system. Use raw crude pollen, preferably produced within 10 miles of your home. <i>Caution:</i> Bee pollen may cause an allergic reaction in some individuals. Discontinue use if a rash, wheezing, discomfort, or other symptom occurs.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Promotes detoxification of dangerous substances from the immune system.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label twice daily.	Improves oxygenation in lung tissue.
Glucosamine sulfate or N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Important for regulation of mucous secretions of the respiratory tract.
Kelp	2,000–3,000 mg daily for 21 days, then reduce to 1,000–1,500 mg daily.	For minerals in balanced amounts.
L-cysteine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>5</sub> and 100 mg vitamin C for better absorption.	Repairs lung tissue and reduces inflammation. (See AMINO ACIDS in Part One.)
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Powerful antioxidants and anti-inflammatories.

S-Adenosylmethionine (SAME)	As directed on label.	Reduces stress and eases depression. Promotes a sense of well-being. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Urban Air Defense from Source Naturals	As directed on label.	Contains many of the necessary nutrients listed in this table, including vitamins A, C, and E, plus herbs and minerals.
Vitamin D	600 IU daily.	Needed for repair of tissues.

**Herbs**

Asthma-X5 from Olympian Labs is an herbal combination formula containing coleus forskohlii, feverfew, ginger, green tea, licorice root, lobelia, Mormon tea, schisandra berries, and skullcap. The recommended dosage is 500 to 1,000 milligrams, three times daily. For best results, use for about eight weeks.

*Cautions:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding. Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

ClearLungs from RidgeCrest Herbals is a Chinese herbal formula designed to reduce inflammation and mucus, opening up the airways to the lungs and promoting free breathing. Take 2 capsules twice daily.

Lobelia extract is helpful during an asthma attack; it is a bronchial-soothing muscle relaxant and expectorant.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Boswellia, an Indian herb (also known as frankincense), in studies was shown to reduce asthma symptoms and reduce the number of attacks.

Mullein oil is said to be a powerful remedy for bronchial congestion. The oil stops coughs, unclogs bronchial tubes, and helps clear up asthma attacks. Users say that when they take it in tea or fruit juice, the effect is almost immediate.

Pau d'arco acts as a natural antibiotic and reduces inflammation. Drink 3 cups of pau d'arco tea daily.

Proponents of the East Indian mind-body-earth philosophy called Ayurveda recommend the following herbs for people with asthma: vasaka (*Adhatoda vasica*) relieves cough, bronchitis, and other asthmatic symptoms; boswellia (*Boswellia serrata*), to relieve pain and inflammation; and tylophora (*Tylophora indica*) for respiratory relief. Sabinsa Corporation is a good source of these Ayurvedic herbs.

Other herbs beneficial for asthma include echinacea, licorice root, and slippery elm bark tablets. Licorice root, ginger root, and elderberry open up the respiratory tract.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

**Recommendations**

Homeopathic uses of belladonna have been shown to relax the bronchioles in the lungs, which alleviates the wheezing symptoms in an asthma attack.

Black cumin seed oil (*Nigella sativa*) has been a primary treatment for allergies in the Middle East. The best seeds come from Egypt. These seeds contain more than one hundred different chemicals, including essential fatty acids. The seeds can be used to make tea by simply pouring a cup of hot water over about 1 tablespoonful of the seeds and letting the mixture steep for about ten minutes, then straining. Keep the tea covered until you are ready to drink it so as not to lose the aroma. Capsules are also available that contain the cold-pressed oil.

*Caution:* Do not use this product if you are pregnant. Skin exposure to undiluted oil can cause irritation in sensitive individuals.

Eat a diet consisting primarily of fresh fruits and vegetables, nuts, oatmeal, brown rice, and whole grains. The diet should be relatively high in protein, low in carbohydrates, and contain no sugar. (See HYPOGLYCEMIA in Part Two for suggestions.) A diet rich in whole grains and fish has been shown to protect against asthma in children. Consuming one component of soy—the isoflavone genistein—was associated with better lung function in patients with asthma. Soy-based foods such as soy milk and tofu would provide this nutrient, unless you suspect that it is worsening your symptoms.

Include garlic and onions in your diet. These foods contain quercetin and mustard oils, which have been shown to inhibit an enzyme that aids in releasing inflammatory chemicals.

Include “green drinks” in your program. Kyo-Green from Wakunaga is excellent. Take it three times a day, one-half hour before meals.

Avoid gas-producing foods, such as beans, brassicas (broccoli, cauliflower, and cabbage) and large amounts of

bran, or take an enzyme complex. Gas can irritate an asthmatic condition by putting pressure on the diaphragm.

Do not eat ice cream or drink extremely cold liquids. Cold can shock the bronchial tubes into spasms.

Use a juice fast, a fast using distilled water and lemon juice, or a combination of both for three days each month to help rid the body of toxins and mucus. Growing children should not fast. (See FASTING in Part Three.)

Eat lightly—a large meal can cause shortness of breath by making the stomach put pressure on the diaphragm. If you are overweight, lose weight; symptoms should improve. Eating margarine, in particular, was associated with an increased risk for developing asthma as an adult. Margarine is rich in oleic acid, but it is not known why this may precipitate asthma. If you must use it, use it sparingly.

Use an elimination diet to see if certain foods aggravate the asthmatic condition. Common culprits include alfalfa, corn, peanuts, soy, eggs, beets, carrots, colas, cold beverages (which may cause bronchial spasm), dairy products (including milk and ice cream), fish, red meat (especially pork), processed foods, salt, spinach, chicken and turkey, white flour, and white sugar. (See ALLERGIES in Part Two.) It is a common belief that milk increases mucus production in the upper and lower respiratory tract. This goes back to the twelfth century and was first proposed by Dr. Moses Maimonides. Traditional Chinese medicine also supports this notion. However, there is no evidence that milk exacerbates symptoms of asthma. And eliminating dairy products makes it hard to obtain adequate vitamin D, calcium, and magnesium without supplementation.

We all need exercise to become and remain healthy. If you find exercise can induce an asthma attack, try taking 2,000 milligrams of vitamin C one hour before your workout. Recent studies showed that those who took vitamin C prior to their workouts suffered no coughing, wheezing, or shortness of breath. However, people at risk for kidney stones or hemochromatosis (an iron-absorption disorder) should not take vitamin C at this dosage level.

If exercise produces an asthmatic response, check your salt intake. According to one report, people with asthma who eat high-sodium diets (4,000 milligrams daily) have more difficulty breathing while exercising and immediately afterward than those who habitually consume far less sodium (1,500 milligrams daily). Ask your doctor what sodium level is right for you.

If you use aspirin or any other nonsteroidal anti-inflammatory drugs (NSAIDs), do so with caution. Painkillers such as aspirin, ibuprofen (Advil, Nuprin, and others), naproxen (Naprosyn and Aleve), and piroxicam (Feldene) account for over two-thirds of drug-related asthmatic reactions, with aspirin causing over half of these. Experts don't know why one can take these medicines and others cannot. Studies have shown that around 20 percent of adults are

prone to drug-induced attacks. Chemotherapeutic agents and antibiotics also can induce asthma reactions.

Keep an ongoing list of things that trigger your asthmatic responses and then avoid them as best as you can. Also, try keeping a diary of your symptoms, medications, and so on. It can be very helpful to you and your doctor in creating and maintaining your best asthma management program.

Apply castor oil packs to the back and around the lung and kidney areas. To make a castor oil pack, place castor oil in a pan and heat but do not boil it. Dip a piece of cheesecloth or other white cotton material into the oil until the cloth is saturated. Apply the cloth to the affected area and cover it with a piece of plastic that is larger in size than the cotton cloth. Place a heating pad over the plastic and use it to keep the pack warm. Keep the pack in place for one-half to two hours, as needed.

Practice methods to relieve stress. Stress and strong emotions like worry and fear can trigger an asthma attack. (See STRESS in Part Two.)

Avoid furry animals, the food additives BHA and BHT, FD&C Yellow No. 5 food dye, tobacco and other types of smoke, and the amino acid tryptophan.

If you suspect that dust mites are causing your asthma symptoms, try to get rid of the microscopic bugs. There are vacuum cleaners on the market that destroy these mites. An application of benzyl benzoate powder (such as X-MITE from AllerGuard) will eliminate mites for two to three months. One pound of this powder treats approximately 150 square feet of carpeting or fabric. If local pharmacies don't carry the powder, you can order it from AllerGuard Corporation. (See Manufacturer and Distributor Information in the Appendix.)

Consider removing carpeting, at least in the bedroom, to help keep dust mites, germs, and bacteria from aggravating asthma. Covering mattresses in plastic casings and washing sheets in hot water at least once a week can be helpful, too.

### Considerations

Until relatively recently, even with a good nutritional plan, the only sure way to avoid an allergic attack was to avoid the irritant that caused it. Today, treatment for asthma includes the use of anti-inflammatory and bronchodilating medications. The anti-inflammatories can halt inflammation quickly, but only temporarily, and there are side effects to using these drugs over long periods. Most medications stimulate the sympathetic nervous system and can produce anxiety, nervousness, insomnia, and dry or cotton mouth. Additionally, they can cause blood pressure to rise and, over the long term, can contribute to kidney and liver damage.

A treatment has been approved that differs completely from current asthma medications. Instead of treating the

symptoms, the medication goes to the source of the problem—the allergic reaction itself. Omalizumab (Xolair) is a drug that is designed to bind to the circulating antibodies in the blood, which decreases the number of antibodies that are available to bind to mast cells. This ultimately inhibits the mast cell's release of the chemicals that cause the inflammatory response of asthma. Thus, the first preventive medication is available for those adults and adolescents (aged twelve and up) with moderate to severe persistent asthma, especially those whose symptoms have not been adequately controlled by the use of inhaled corticosteroids. This is not a replacement for existing corticosteroid treatment, and any such replacement must be done under a physician's control. However, it is surely a step in the right direction.

❑ Life-threatening cases of asthma diagnosed as *status asthmaticus* require immediate hospitalization, and sufferers may have to remain hospitalized for days.

❑ People with asthma may be deficient in certain nutrients, such as vitamin B<sub>6</sub> (pyridoxine), vitamin C, magnesium, manganese, and selenium, as well as in the enzyme glutathione peroxidase. People with asthma often have lower than normal levels of gastric hydrochloric acid, which is needed for proper digestion. Dr. Jonathan Wright, a noted nutritionist, claims excellent results using a combination of gastric acid replacement therapy (usually in the form of betaine hydrochloride) and supplementation with vitamin B<sub>6</sub>, vitamin B<sub>12</sub>, and magnesium for treatment of asthma.

❑ According to *Nutrition Health Review*, strong feelings of anger, anxiety, and depression may be an important cause of asthma attacks. Unfortunately, many of the drugs used to control and alleviate asthma cause jittery nerves, mood swings, and insomnia. Other usual triggers include stress, acid reflux, smoking, and respiratory infections.

❑ Many people with asthma are sensitive to the food additives known as sulfites. Many restaurants use sulfiting agents—including sodium bisulfite, potassium metabisulfite, potassium bisulfite, and sulfur dioxide—to prevent discoloration and bacterial growth in green salads, cut and sliced fruit, frozen shellfish, and other foods. (See Sulfite Allergies on page 190 for additional information.)

❑ Beta-blocking medications, used to treat high blood pressure, can constrict the bronchial muscles and cause life-threatening problems for a person with asthma.

❑ Ozone, sulfur dioxide, nitrogen dioxide, cigarette smoke, carbon monoxide, hydrocarbons, nitrogen oxide, and photochemical substances are air pollutants that can trigger asthma attacks.

❑ Inhaling a muscle-relaxing medication such as albuterol from a bronchodilator can relieve an acute asthma attack immediately by opening the bronchial tubes. Bronchodilators do not treat the underlying problem.

❑ The FDA has approved new versions of the albuterol sulfate HFA metered dose inhaler (MDI) for asthma and other obstructive lung diseases. Unlike the older version of

Ventolin, the new inhaler uses an alternative propellant called hydrofluoroalkane (HFA) rather than the traditional ozone-reducing chlorofluorocarbons (CFCs) used previously. There are now four HFA-propelled inhalers (ProAir, Proventil, Ventolin, and Xopenex) approved for use in the United States. Proventil HFA was approved in 1996. Although they have all been shown to be effective, there are some differences among the products. Talk to your health care provider to find the right one for you.

❑ Researchers at Cornell University studied children aged four through sixteen years who were part of the Third National Health and Nutrition Survey. It was found that the antioxidants beta-carotene and vitamin C were associated with a very significant reduction in asthma prevalence. An increase in selenium intake also was associated with a similar decrease in asthma prevalence. In this study, it was found that vitamin E had little or no association with asthma.

❑ A corticosteroid has been approved for young children with asthma. Budesonide inhalation suspension (Pulmicort Respules), a synthetic hormone, is designed for use once or twice daily to prevent asthma attacks, but is not used to treat acute attacks. Acute attacks are still best handled by a fast-acting bronchodilator. The drug is generally well tolerated, but side effects can include respiratory infection, coughing, and congestion.

*Caution:* Inhaled corticosteroids can have an effect on growth in children, and the effect on eventual adult height is not known.

❑ A sustained-release form of the drug theophylline, sold under the brand name Theo-Dur Sprinkle, has been used with good results. For children, this medication can be administered by opening a capsule and sprinkling the contents on a soft food such as applesauce. Theophylline has side effects, such as producing a rapid heartbeat and/or insomnia in some users. Some doctors believe that inhaled drugs or topical treatments are safer than asthma pills because they are drawn directly into the bronchial tubes and lungs.

❑ Researchers at Harvard University and the U.S. Environmental Protection Agency (EPA) have discovered that people with asthma who drink coffee and other caffeine-containing drinks generally have one-third fewer symptoms than those who do not. This is most likely due to the action of the caffeine, which has a dilating effect on the bronchial airways.

❑ A study reported in the *Journal of Allergy and Clinical Immunology* suggested that taking salmon oil capsules before each meal and eating fish three times weekly may be beneficial for asthma.

❑ The Air Supply personal air purifier from Wein Products is a miniature unit that is worn around the neck. It sets up an invisible pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants) in the air. It also eliminates vapors, smells, and harmful volatile compounds in the air.

❑ Regular exercise is beneficial, but exercise can also trigger an acute attack in some individuals. No one is sure why this is, but it has been speculated that inhaling lots of cool, dry air while working out aggravates the respiratory system. Running, for example, induces many more asthma attacks than swimming. One way to control exercise-induced asthma is to wear a mask that retains heat and moisture and limits the effects of breathing cold, dry air.

❑ Zanamivir (Relenza), an antiviral drug used for the treatment of influenza, can have a detrimental side effect on asthma sufferers. The U.S. Food and Drug Administration notes that it should be used with caution by anyone with asthma or chronic lung disease, and if a person with asthma does take this drug, he or she should have emergency bronchodilator therapy readily available. Interestingly, although the FDA granted clearance for the drug to be marketed, an FDA advisory panel voted against approval, noting that it considered the drug's overall effectiveness as negligible.

❑ A study conducted by North Dakota State University found that people with asthma and arthritis markedly improved their health simply by setting aside time to write. Of the seventy patients participating in the one-month study, 47 percent showed definite improvement, as opposed to only 24 percent who showed improvement without writing. The researchers concluded that putting your thoughts and observations on paper relieves stress and eases the mind.

❑ Children with asthma experience much more successful treatment through mind and body control training, according to numerous recent studies. Asthma specialist Richard Firshein, D.O., based in New York City, uses a technique in which children are taught not to panic when they realize an asthma attack is approaching. He calmly guides their thought processes to focus on images and smells that please them; like the warm sun, hot dogs, or a favorite pet. At the same time, he helps them bring their breathing under control. This helps them feel less helpless and afraid. Adults too can benefit from this calming technique.

❑ Goose feathers can cause and aggravate lung ailments.

❑ The NIOX Nitric Oxide Test System can measure how well anti-inflammatory drugs may be working. The test is administered by a doctor.

❑ For names and addresses of organizations that can provide further information about this disorder, see Health and Medical Organizations in the Appendix.

## ATAXIA

See under RARE DISORDERS.

## ATHEROSCLEROSIS

See ARTERIOSCLEROSIS/ATHEROSCLEROSIS.

## ATHLETE'S FOOT

Athlete's foot (*tinea pedis*) is a common fungal infection that thrives in an environment of warmth and dampness. The fungi live off the dead skin cells and calluses of the feet, especially on the skin between the toes, but can get under the fingernails as well. Symptoms include inflammation, burning, itching, scaling, cracking, and blistering. Some people, such as those with compromised immune systems, seem more susceptible to developing it.

The fungus that causes athlete's foot spreads rapidly when antibiotics, drugs, or radiation destroy beneficial bacteria. It is especially prevalent and highly contagious in warm, damp places such as gyms and swimming pool locker rooms.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Colloidal silver	Apply topically as directed on label.	A natural antibiotic and disinfectant. Destroys fungi, viruses, and bacteria. Promotes healing.
Kyo-Dophilus from Wakunaga	As directed on label.	Contains acidophilus and aged garlic extract. Beneficial in treating fungal disease.
<i>Very Important</i>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Aids in destroying fungus.
<i>Important</i>		
Vitamin B complex	As directed on label.	Needed for healthy skin. Use a yeast-free, high-potency formula. A sublingual form is best.
Vitamin C plus bioflavonoids	3,000–10,000 mg 3 times daily, in divided doses.	Reduces stress and promotes immune function. Use a buffered form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Inhibits fungus and stimulates the immune system.
<i>Helpful</i>		
Aerobic 07 from Aerobic Life Industries	9 drops in a glass of water twice daily. Also apply a few drops directly on affected areas and let dry.	Supplies oxygen to the cells, killing germs and harmful bacteria.
Essential fatty acids (Ultimate Oil from Nature's Secret)	As directed on label.	Promotes healing of skin disorders.
Vitamin A plus beta-carotene	25,000 IU daily for a month, then reduce to 15,000 IU. If you are pregnant, do not exceed 10,000 IU daily.	Needed for healing of tissues and stimulation of the immune system.
Vitamin E	200 IU daily.	An antioxidant that promotes healthy skin. Use d-alpha-tocopherol form.

## Herbs

- Drink 3 cups of pau d'arco tea daily. Pau d'arco tea also can be used topically. Prepare a strong pau d'arco tea, using 6 teabags to 2 quarts of warm water. Add 20 drops of Aerobic 07 from Aerobic Life Industries. Soak your feet in this mixture for fifteen minutes three times daily for quick relief.
- For a natural remedy, cut raw garlic into tiny pieces (or into slivers, wrapped in gauze) and wear them in your shoes for a few days. The garlic will be absorbed into the skin. Also dust your feet with garlic powder. There are effective non-prescription antifungal drugs available, but for those who want a natural remedy garlic works just as well.
- Bathe your feet daily in a half-and-half mixture of vinegar and water. Dry them thoroughly and apply pure, unprocessed oil, such as olive oil, to the infected area. Or, soak your feet in a solution of 2 teaspoons of salt in a pint of warm water for ten minutes. Repeat this treatment daily until the condition clears up.
- As an alternative footbath, add 20 drops of tea tree oil to a small tub of water, and use this to soak your feet for fifteen minutes three times daily. After soaking your feet, dry them thoroughly and dab a few drops of undiluted tea tree oil on the affected area. Tea tree oil is a powerful natural antifungal agent.
- To help ease the redness, cracking, and itching of athlete's foot, rub the oils of myrrh and lavender into your feet at bedtime. Be sure to wash your hands well afterward to avoid spreading the fungus to your fingernails.
- Olive leaf extract is an excellent, safe natural healer of microbial infections.

## Recommendations

- Keep your feet dry. After bathing, dry carefully between your toes. Make sure to use each towel only once before laundering. Wear absorbent socks made of cotton.
- Air your shoes out and change socks daily. Wash socks, towels, and anything that comes into contact with the infected area in very hot water, with chlorine bleach added if possible.
- Take care to protect your feet from direct contact with floors in communal areas such as locker rooms. Wear shoes or slippers in such places. Do not share shoes, socks, towels, or anything else that comes into contact with the feet. Wear well-ventilated shoes such as sandals, leather shoes, or sneakers with holes that allow your feet to breathe. Do not wear shoes made of rubber or vinyl material. Try not to wear the same shoes every day, and be sure to change wet shoes immediately.
- If the condition doesn't clear up in four weeks, if there is pus in the blisters or in the cracked skin, if a fever develops, or if there is swelling in the foot or leg, see your health care provider. Severe cases may require medical attention.

## Considerations

- Several over-the-counter antifungal drugs called azoles are considered among the best treatments for athlete's foot. These include clotrimazole (in Lotrimin AF), miconazole (Micatin, Zeabsorb-AF), and undecylenic acid (Cruex, Desenex). A newer antifungal medication called terbinafine (Lamisil) cream is also available and is completely effective.
- Athlete's foot can become complicated by a fungal toenail infection (see NAIL PROBLEMS in Part Two). Keep the toenails clean, but do not use a metal file, which can damage the nail and give the fungus a place to grow. If the toenails become thick and discolored, see a podiatrist.
- Those with recurrent fungal infections of the feet often have a fungal infection in the groin area. Both areas must be treated simultaneously. To prevent transmission of the foot fungus to the groin area, put clean socks on before putting on your underwear when dressing.
- See also CANDIDIASIS and FUNGAL INFECTION in Part Two.

## ATTENTION DEFICIT DISORDER (ADD)/ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD)

Attention deficit hyperactivity disorder (ADHD), or attention deficit disorder (ADD) with hyperactivity, is the newest name given to a group of disorders of certain mechanisms in the central nervous system. With the long list of names this disorder has been given over the years, it can be confusing as to exactly what the criteria are for a diagnosis of ADHD or ADD. In the fourth edition of its *Diagnostic and Statistical Manual of Mental Disorders* (DSM-IV), the American Psychiatric Association describes three different categories of ADHD—ADHD inattentive, ADHD hyperactive-impulsive, and a third category that is a combination of the two. For the sake of simplicity, we will use the term ADD when referring to the inattentive form without hyperactivity, and ADHD for the hyperactive-impulsive and combined forms.

According to the Centers for Disease Control and Prevention (CDC), about 7.8 percent of children between four and eighteen years of age were reported to have a history of ADHD and about 56 percent of those were taking medications for the disorder. Three times as many boys are diagnosed with ADHD, but the condition is increasingly being diagnosed in girls as well, according to Nora Galil, M.D., a psychiatrist in private practice in Washington, D.C.

Although primarily thought of as a childhood disorder, ADD/ADHD can be found in adults as well. Experts estimate that 4 percent of adults aged eighteen to forty years of age may be affected, but only 11 percent of them were treated. Medical experts continue to debate whether children can expect to outgrow the symptoms. Some studies have shown a significant decline in ADHD symptoms as a person ages. Others estimate that between 30 and 70 percent of children with ADHD will carry some symptoms

into adulthood. According to Russell Barkley, Ph.D., a professor of psychiatry at SUNY Upstate Medical University, ADHD is a more complex disorder in adults. It manifests itself not so much as problems with the ability to pay attention or impulse control, but a problem of self-regulation. Without this self-control, an adult's ability to do tasks is impaired, because not only must the tasks be done, but they have to be scheduled, organized, and placed in proper perspective. The condition can lead to marital conflicts, substance abuse, and financial problems. Infidelity is common because ADHD adults easily become bored with things—including spouses.

The disorder causes a variety of learning and behavioral problems, often making it difficult not only for the affected individual, but for the entire family. Although the ADD/ADHD child is often labeled as having a learning disability, the child usually is of average or above-average intelligence and is also highly creative.

Factors that have been linked to the development of ADD/ADHD include anxiety, allergies, smoking during pregnancy, hyperinsulinemia, oxygen deprivation at birth, environmental stress or pollutants, artificial food additives, injury, infection, lead poisoning, and prenatal trauma. Recent research suggests that watching too much television, with its fast-paced visual images, may permanently rewire the developing brain and cause ADHD-like symptoms. This is especially true in the first two or three years of life. ADHD is also hereditary. Each sibling of a child with ADHD has about a 20 percent chance of having it too, and 15 to 20 percent of parents of affected children also have the disorder.

In recent years, more emphasis has been placed on the role of diet in ADD/ADHD. Many people with these conditions react to certain preservatives, dyes, and salicylates in foods. These items can throw off the balance in the chemistry of the brain, often producing undesirable changes in behavior. A low-protein diet may be a contributing factor. Though the topic has been hotly debated for decades, studies have definitively shown that food additives do play a major role in hyperactivity.

There is no single test to determine if a person has ADHD. A specialist makes the diagnosis by comparing a person's behavior pattern against a set of criteria established by the American Psychiatric Association. These criteria are as follows:

1. The person has either six inattention symptoms or six hyperactivity and impulsiveness symptoms.

Symptoms of inattention include:

- Does not pay close attention to details or makes careless mistakes.
- Has trouble keeping attention on activities.
- Does not seem to listen when spoken to.
- Does not follow through on instructions and fails to finish tasks.
- Has difficulty organizing tasks and activities.

- Avoids, dislikes, or is reluctant to do tasks requiring sustained mental effort.
- Loses things necessary to do tasks or activities.
- Is easily distracted.
- Is forgetful in daily activities.

Symptoms of hyperactivity and impulsiveness include:

- Fidgets with hands or feet or squirms in his or her seat.
  - Leaves his or her seat at times when remaining seated is necessary.
  - Feels restless or, as a child, inappropriately runs about or climbs excessively.
  - Has difficulty taking part in leisure activities or quiet play.
  - Is "on the go" or acts as if driven.
  - Talks excessively.
  - Blurts out answers before questions have been completed.
  - Has difficulty awaiting his or her turn.
  - Interrupts conversations or intrudes on others' activities.
2. Symptoms continue for at least six months and are more frequent and severe than normal.
  3. Symptoms cause significant damage to social, academic, or work function.
  4. Some damage to function occurs in at least two settings, such as home, work, or school.
  5. Some damaging symptoms occur before age seven.
  6. The symptoms are not due to another disorder.

The ADD child may be harder to diagnose than the ADHD child because the hyperactivity is more obvious than the inattentiveness. However, the procrastination, difficulty in concentrating, and inability to start or finish projects that are characteristic of the disorder can have damaging effects that can last through adulthood. ADHD produces hyperactive, restless, impatient, and impulsive behavior.

Despite this, children with ADHD can have the ability to pay attention and complete assignments, often spending hours doing things that interest them. Adults with ADHD seem to constantly be going and getting things done, but they often grow impatient easily and have a tendency to lose their tempers quickly. The combined form of ADD/ADHD can be the most debilitating. Children with this type of the disorder often have low self-esteem, are impatient, do not follow rules or act responsibly, are often clumsy, think that they are always right, do not want to accept change, and do not adapt well.

With the enormous increase in the number of recently diagnosed cases of ADD and ADHD, many researchers feel that it is being overdiagnosed. It is difficult to diagnose accurately because many of the symptoms appear in normal, healthy children at many times during childhood. In fact,

more than 60 percent of parents suspect that their child has ADD or ADHD at some point during the child's upbringing.

What may merely be creativity or a high energy level can be misdiagnosed as ADD or ADHD. A diagnosis of ADD/ADHD should be made by a team of specialists who are experts in the disorder, and it is wise to get a second opinion if your child is diagnosed as having ADD or ADHD. Be careful about jumping to medications. While medications are certainly helpful, a study released in the *Journal of the American Medical Association (JAMA)* discussed safety concerns and the rising number of two- to four-year-old children who are now on medications.

A better approach would be to consider nutritional and dietary measures. However, if you or your child are responding to medication, then the supplements below should be used in addition. Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Calcium and magnesium	As directed on label, at bedtime.	Has a calming effect.
Kyolic EPA from Wakunaga	As directed on label.	Provides essential fatty acids and helps to maintain eye and brain function. Restores proper fatty acid balance.
Gamma-aminobutyric acid (GABA)	750 mg daily.	Calms the body much in the same way as some tranquilizers, without side effects or danger of addiction. (See AMINO ACIDS in Part One.)
Multivitamin and mineral complex	As directed on label.	All nutrients are needed for equilibrium within the body. Use a liquid form such as Nature's Plus gel-capsules for best absorption.
Pycnogenol or grape seed extract	As directed on label.	Powerful antioxidants offering cellular protection for the body and brain.
Quercetin	As directed on label.	Prevents allergies from aggravating symptoms.
S-Adenosylmethionine (SAME)	As directed on label.	Aids in relieving stress and depression. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
<i>Helpful</i>		
Acetylcholine	As directed on label.	Can improve memory and ability to pay attention.

Attend from Växa International	As directed on label.	A nutritional combination designed to address the specific dietary and neurochemical deficiencies thought to occur in people with ADD/ADHD. Can be used by both children and adults.
Dimethylaminoethanol (DMAE)	As directed on label.	Aids in concentration by improving nerve impulse transmission in the brain. May also produce antidepressant effects. <i>Caution:</i> This supplement should be used by adults only. Do not give it to a child.
L-cysteine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Take this amino acid if a hair analysis reveals high levels of metals. (See AMINO ACIDS in Part One.)
Pedia-Calm from Olympian Labs	As directed on label.	A combination formula for hyperactive children that includes phosphatidyl serine, phosphatidyl choline, cephalin, phosphoinositides, DMAE, and GABA. It can be taken in capsule form or sprinkled on food.
Phosphatidyl serine	As directed on label.	May aid in balancing neurotransmitters in the brain; also may alleviate depression.
Vitamin C with bioflavonoids	Adults and children over twelve: 1,000 mg 3 times daily. Children under twelve: 500 mg 3 times daily.	An anti-stress vitamin.
Zinc	As directed on label.	Many ADHD children are zinc-deficient. Zinc is important for metabolism of relevant neurotransmitters, fatty acids, and melatonin, and indirectly affects dopamine metabolism, which is thought to be involved with ADHD. Take in addition to the multivitamin and mineral complex. Do not exceed a total of 100 mg daily (or, for children, the appropriate fraction of 100 mg) daily from all supplements.

### Herbs

If you are giving herbs to a child, be sure to adjust the dosage for age as recommended by the manufacturer.

Bacopin from Sabinsa Corporation, an extract of the Ayurvedic herb bacopa (*Bacopa monniera*), is a good memory enhancer.

Ginkgo biloba is helpful for brain function and concentration.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Ginseng or mullein oil may be helpful for memory.

**Caution:** Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Valerian root extract has been used for this disorder with dramatic results and no side effects. Mix the alcohol-free extract in juice (as directed on the product label according to age) and drink the mixture two to three times a day.

Other herbs that may be beneficial for hyperactivity include catnip, chamomile, gotu kola, hops, kava kava, lemon balm, licorice, lobelia, oats, passionflower, skullcap, St. John's wort, thyme, and wood betony.

**Cautions:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

## Recommendations

Include in the diet all fruits and vegetables (except for those containing salicylates, listed on this page), plus breads, cereals, and crackers that contain only rice and oats.

Include cold-water fish such as tuna (limit to one serving per week), salmon, and herring in your diet. These are all good sources of omega-3 fatty acids and docosahexaenoic acid (DHA), which is an essential fatty acid that is thought to be vital for brain development and is often deficient in those with ADD/ADHD. Another omega-3, eicosapentaenoic acid (EPA), is also effective. In one study, children who took a very large dose of EPA plus DHA (up to 16 grams a day) showed improved behavior and less hyperactivity and inattention. Another fat, evening primrose oil, may also improve behavior in children.

Follow a high-protein diet, similar to the one prescribed for hypoglycemia. (See HYPOLYCEMIA in Part Two.) Proteins are needed to supply the body with amino acids. Some researchers are studying the similarities between hypoglycemia and ADD/ADHD. It is possible that a large number of ADD/ADHD diagnoses are in actuality hypoglycemia in

disguise. The symptoms are so similar it is difficult to separate them. A low-carbohydrate, high-protein diet, particularly at breakfast, should assist in reducing symptoms if it is truly hypoglycemia.

Be sure that your child is getting his or her carbohydrates from foods that contain complex carbohydrates and cut down on simple carbohydrates. Complex carbohydrates can be found in fresh vegetables, fresh fruits, beans, and natural whole grains. They provide dietary fiber and have only a third of the calories found in fats and simple carbohydrates. Simple carbohydrates, such as glucose, fructose, and galactose, are found in all forms of sugars, some juices, and in processed and refined grains (not whole grains).

Limit dairy products if you notice behavioral changes after they are consumed. Dairy foods have been known to cause behavioral problems in some ADHD/ADD sufferers. Make sure that growing children get calcium, magnesium, and vitamin D from other sources like soymilk or supplements.

Remove from the diet all forms of refined sugar (simple carbohydrates) and any products that contain it. Also eliminate junk food and all foods that contain artificial colors, flavorings, monosodium glutamate (MSG), yeast, or preservatives; processed and manufactured foods; and foods that contain salicylates. Certain foods naturally contain salicylates. These include almonds, apples, apricots, all berries, cherries, cucumbers, currants, oranges, peaches, peppers, plums, prunes, and tomatoes. A group of investigators published results in a major medical journal showing that neither sugar nor aspartame (an artificial sweetener) has any effect on behavior in children with ADHD. However, others have found that food additives like artificial colors and the preservative sodium benzoate increase hyperactivity in children without ADHD. The implication is that food additives might also affect children with ADHD.

Do not consume any of the following: apple cider vinegar, bacon, butter, candy, catsup, chocolate, colored cheeses, chili sauce, corn, ham, hot dogs, luncheon meat, margarine, meat loaf, milk, mustard, pork, salami, salt, sausage, soy sauce, tea, and wheat.

Do not use antacid tablets, cough drops, perfume, throat lozenges, or commercial toothpaste. Use a natural toothpaste from a health food store.

Avoid carbonated beverages, which contain large amounts of phosphates. Phosphate additives may be responsible for hyperkinesia (exaggerated muscle activity).

High levels of phosphorus and very low calcium and magnesium levels (which can be revealed through a hair analysis) can indicate a potential for hyperactivity and seizures.

Meat and fat also are high in phosphorus.

Limit exposure to television, video and electronic games, and loud music. Instead, encourage outdoor physical activity or activities to expand creativity.

- ❑ Consider trying cognitive-behavioral therapy. This can often alleviate or eliminate many of the behavior problems caused by ADHD/ADD.
- ❑ Use an elimination diet to identify foods that may be causing or aggravating symptoms. (See ALLERGIES in Part Two.)

### Considerations

- ❑ When you are dealing with this disorder, it is best to think of the diet as feeding the brain rather than the stomach. Many researchers believe that if the contributors are removed from the diets of the patients and the right nutritional supplements are added, numerous symptoms often disappear, and medications used to treat ADD/ADHD (some of which can cause serious side effects) can often be eliminated.
- ❑ Not every dietary supplement has been tested in children with ADHD. However, acetyl L-carnitine is one that has been tested and was shown to be of no benefit.
- ❑ A hair analysis to rule out heavy metal intoxication is important. Lead and copper have both been linked to behavioral problems. (See HAIR ANALYSIS in Part Three.)
- ❑ Family- or allergy-related problems can elicit ADD/ADHD-related behaviors. It is important to explore this possibility with your specialist.
- ❑ A strong link has been established between learning disabilities and juvenile crime.
- ❑ The prescription medication methylphenidate (Ritalin) has become the most commonly prescribed medication to ease hyperactivity. Researchers are discovering, however, that this medication has many potentially serious, long-term side effects including decreased appetite, weight loss, insomnia, slowed growth, increased heart rate, increased blood pressure, a period of increased irritability and intolerance at the onset of use, and the possibility of developing Parkinson's disease. Adverse reports have been released in recent years warning parents of the possible side effects of Ritalin—with some reports even comparing it to cocaine.
- ❑ Other prescription medications often prescribed include dextroamphetamine (Dexedrine, a stimulant that produces calming effects equivalent to Ritalin), pemoline (Cylert, a stimulant that has been restricted by the FDA to use as a secondary medication because it can cause liver failure), methamphetamine (Desoxyn), an amphetamine and dextroamphetamine combination (Adderall), and tricyclic antidepressants (if depression is suspected). Various side effects, some of them serious, have been reported with all of these medications. Some of these drugs are available in time-released versions to reduce side effects and increase efficacy.
- ❑ Due to the many potentially harmful side effects of the medications available for ADD/ADHD sufferers, a growing number of parents and health professionals are turning to all or a combination of the following as a way to reduce,

and even possibly eliminate, the symptoms of ADD/ADHD: alteration of diet, vitamin and mineral supplementation, herbal remedies, counseling, and the love and support of family, teachers, and friends. Many believe that medicating the problem is merely masking the symptoms without getting to the root of the problem.

- ❑ Homeopathic remedies, taken in small doses, may be helpful in relieving certain symptoms of ADD/ADHD. *Gelsemium* can help to relieve anticipatory anxiety, and *Ignatia* can help to alleviate anger or temper tantrums.
- ❑ Researchers who performed five-hour oral glucose tolerance tests on 261 hyperactive children found that 74 percent displayed abnormal glucose tolerance curves, suggesting a connection between hyperactive behavior and the consumption of sugar.
- ❑ Some studies have found that many children with ADD/ADHD have high levels of toxic by-products of yeast and other harmful bacteria in their urine. The use of probiotics (supplements that add beneficial bacteria to the body, such as acidophilus) can help to alleviate this problem.
- ❑ Studies indicate that administration of gamma-aminobutyric acid (GABA) decreases hyperactivity, as well as tendencies toward violence, epilepsy, mental retardation, and learning disabilities.
- ❑ More and more evidence is showing that those with ADD/ADHD are at greater risk for depression, alcoholism, restlessness, difficulties with careers and relationships, and antisocial behavior as adults.
- ❑ Parents of children with ADD or ADHD often have a very difficult time dealing with the behavioral problems of their children. These parents deserve a lot of credit. It is important to remember, though, that the children deserve a lot of credit, too. When things seem as though they are getting out of control, it can be helpful to remember that a child with ADD or ADHD is dealing with a physiological disability. Although they desire to please and want to be good, their minds can go in and out of overload without their control. Because of this, they often feel confused and ashamed, and they can eventually develop low self-esteem. When problems arise, it is important to explain to them what they did wrong, and why it was wrong, in a calm, one-on-one fashion whenever possible. These children need a great deal of love, support, and encouragement from everyone around them—but most of all, from their parents.
- ❑ Ask your health care provider to help you find a professional who specializes in treating people with attention deficit disorders, or seek a referral through one of the resource organizations that deal with these disorders. (See Health and Medical Organizations in the Appendix.)

### AUTISM OR AUTISM SPECTRUM DISORDER

Autism is not a disease. It is a little-understood developmental brain disorder. Autism (sometimes called "classical

autism”) is the most common condition in a group of developmental disorders known as the autism spectrum disorders (ASDs). Autism is characterized by impaired social interaction, problems with verbal and nonverbal communication, and unusual, repetitive, or severely limited activities and interests. How autistic individuals are affected by the disorder varies widely. In fact, the variety of autistic-like disorders has necessitated the creation of the term Autism Spectrum Disorder, or ASD, to be used instead of the older term “autism,” which really describes only the most severe form of the disorder. Other ASDs include Asperger’s syndrome, Rett syndrome, childhood disintegrative disorder, and pervasive developmental disorder not otherwise specified (usually referred to as PDD-NOS). People with severe cases display self-injurious, aggressive, and unusual behaviors. The mildest forms may appear, at least to the layperson, to be a personality disorder, possibly associated with a learning disability. While experts estimate that only three to six children out of every thousand will have autism, ASD affects approximately 1 out of every 150 children in the United States, according to the Centers for Disease Control. Researchers estimate that as many as 560,000 individuals in the United States between the ages of zero and twenty-one have an ASD.

In spite of more than fifty years of research into the varying manifestations of autism and ASD and the families affected by it, the disorder continues to mystify doctors, psychologists, and scientists. It is clear that more children than ever before are being classified as having autism spectrum disorders (ASDs). But it is unclear how much of this increase is due to changes in how we identify and classify ASDs in people, and how much is due to a true increase in prevalence. By current standards, ASDs are the second most common serious developmental disability after mental retardation/intellectual impairment, but they are still less common than other conditions that affect children’s development, such as speech and language impairments, learning disabilities, and attention deficit/hyperactivity disorder (ADHD).

Males are three times more likely to have the disorder than females. Recent studies suggest that some people have a genetic predisposition to ASD. It is estimated that families with one child with ASD have a 2 to 8 percent chance of having a second child with ASD.

Someone with ASD might at first appear to be mentally retarded or hard of hearing. But caregivers stress that it is important to distinguish ASD from other conditions. Physically, individuals with ASD do not appear different from others but exhibit marked differences in behavior from a very early age. ASD is usually diagnosed in early childhood (before the age of three) and is characterized by a marked unresponsiveness to other people and to the surrounding environment. While most babies love to be held and cuddled, infants with ASD may appear indifferent to love and affection, or may be overly agitated, crying most of the time they are awake. Children with ASD may not be

able to form attachments to others in the way most children do and seem to withdraw into themselves. Many exhibit various unpredictable and unusual behaviors that can range from constant rocking, feet-pounding, or sitting for long periods of time in total silence. Some experience bursts of hyperactivity that include biting and pounding on their bodies.

According to the National Institute of Neurological Disorders and Stroke, the criteria used to diagnose ASD include the following:

- Absence or impairment of imaginative and social play.
- Impaired ability to make friends with peers.
- Impaired ability to initiate or sustain a conversation.
- Stereotyped, repetitive, or unusual use of language.
- Restricted patterns of interests that are abnormal in intensity or focus.
- Apparent inflexibility with regard to changes in routine or rituals.
- Preoccupation with parts of objects.

Many children with ASD have learning disabilities and are often mentally disabled. Speech development is usually delayed and in many cases is absent or limited to nonsensical rhyming or babbling. Some children with ASD appear to have lower than normal intelligence, others seem to fall into the normal range, while some are highly intelligent. Unlike those with other ASDs, children with Asperger’s syndrome typically do not have problems with language or intellectual disability. To be accurately diagnosed with ASD, a child must be observed by a skilled professional, because diagnosis is difficult for a practitioner with limited training or exposure to ASD. Specialists suggest a multidisciplinary team that would include, for example, a neurologist, a psychologist, a developmental pediatrician, a speech/language therapist, and a learning consultant.

Individuals diagnosed as autistic savants attract a great deal of attention from the media and general public. Many movies, television reports, and newspaper articles highlight the extraordinary skills of these individuals, most particularly in the areas of mathematics, art, music, and memory. Such an individual might, for example, be able to multiply and divide large numbers or calculate square roots with little hesitation, paint like Rembrandt without ever having a drawing lesson, memorize an entire phone book, or be capable of reciting the birth date of every person he or she has ever met. Less than 1 percent of the general population is capable of such feats, but the incidence of such abilities is 10 percent in individuals who are autistic. No one knows why this occurs. One speculation is that autistic people have incredible concentration abilities and can focus complete attention on a specific area of interest.

The cause of ASD is unknown. Some experts believe that it is a result of a neurological imbalance or malfunction

that renders the autistic individual painfully oversensitive to external stimuli. Many researchers believe that ASD may be the result of genetics and/or some environmental factors, such as certain viruses or chemicals. Researchers are also studying how brain function differs in autistic individuals.

Some theories suggest that brain development may have been interrupted in the early fetal stages in people who develop ASD. Other studies reveal a possible signaling problem within the brain. It is known that ASD is not caused by parental neglect or actions as was once believed.

At one time there was some concern that there was a link between the MMR (measles-mumps-rubella) vaccine or the vaccine preservative thimerosal (ethyl mercury) and the onset of ASD. A report released in May 2004 by the Institute of Medicine (IOM) Immunization Safety Review Committee has concluded that there is no such link. A group in Denmark found the same thing. It must be noted that the National Autism Association disagrees to this day and believes there is some type of link. Whatever the truth might be, since 1999 drug companies have either removed or reduced significantly the amount of thimerosal in their vaccines, just as a precautionary measure. Whether to vaccinate your child is a very personal decision. You need to weigh the unknown risks against the risks of contracting any of the communicable diseases covered by the vaccines. In addition, most public schools will not allow children who have not been immunized to attend school. In some communities, you can petition to allow your child to enter school without immunizations.

Research continues to try to find the biological basis for ASD. The emergence of brain-imaging tools such as computerized tomography (CAT), positron emission tomography (PET), single photon emission computed tomography (SPECT), and magnetic resonance imaging (MRI) has allowed researchers to examine, in detail, portions of the brain never before seen in living people. In fact, instead of being able to single out one area of the brain that is affected, it looks as if many major brain structures are implicated in ASD. These include the cerebellum, the cerebral cortex, the limbic system, the corpus callosum, the basal ganglia, and the brain stem. Other research has focused on neurotransmitters such as serotonin, dopamine, and epinephrine. Evidence now points to genetic factors as the cause of ASD, a theory that has been strengthened by twin and family studies, which suggest an underlying genetic vulnerability. Recent neuroimaging studies have shown that abnormal brain development, beginning in an infant's first months, appears to be a contributing cause. This has resulted in a "growth dysregulation hypothesis" that holds genetic defects in brain-growth factors to be responsible.

Unless otherwise specified, the following recommended dosages are for persons over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half the recommended

dose, and for a child under six years old, use one-quarter of the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium	1,500 mg daily. 1,000 mg daily.	Essential for normal brain and nervous system function.
Choline	500–2,000 mg daily.	Improves brain function and circulation to the brain. Use under professional supervision.
Coenzyme Q <sub>10</sub>	As directed on label.	Improves brain function.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	100 mg daily.	An oxygen carrier to the brain. Important for normal brain and nervous system function.
Iron	Only with a physician's recommendation.	In one study, 77% of children with autism were iron deficient. Sleep improved with iron supplementation.
Kyolic Neuro Logic from Wakunaga	As directed on label.	Contains elements essential for quick assimilation of brain nutrients. Enhances neuron function.
S-Adenosylmethionine (SAMe) (SAMe Rx-Mood from Nature's Plus)	As directed on label.	Critical in the manufacture of many body components, especially brain chemicals. A natural antidepressant. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin)	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. Do not exceed this amount.	Essential for normal brain and nervous system function. A sublingual form is recommended.
and niacinamide	300 mg daily.	Improves circulation. Helpful for many psychological disorders. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure. Aids circulation. <i>Caution:</i> Do not substitute niacin for niacinamide. Niacin can be toxic in such high doses.
and pantothenic acid (vitamin B <sub>5</sub> ) and vitamin B <sub>6</sub> (pyridoxine)	500 mg daily. 50 mg 3 times daily. Do not exceed this amount except at the direction of a physician.	Helps reduce stress. Deficiencies have been linked to autism.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	A powerful free radical scavenger.
<i>Helpful</i>		
L-glutamine and	500 mg each daily, on an empty stomach. Take	Amino acids needed for normal brain function. (See AMINO

L-phenylalanine and L-tyrosine and taurine	with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	ACIDS in Part One.) <i>Caution:</i> Do not take phenylalanine if you are pregnant or nursing, or suffer from panic attacks, diabetes, high blood pressure, or PKU.
Melatonin	2–3 mg daily for adults, 1 mg or less daily for children, taken 2 hours or less before bedtime. If this is not effective, gradually increase the dosage until an effective level is reached.	Helpful if symptoms include insomnia.
Methylsulfonylmethane (MSM)	As directed on label.	Increases alertness, mental calmness, the ability to concentrate, and energy.
Multivitamin and mineral complex with vitamin A and natural beta-carotene and selenium and zinc	As directed on label. 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily. 200 mcg daily. 50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	All nutrients are needed in balance. Use a high-potency formula.
RNA and DNA	200 mg daily. 100 mg daily.	To aid in repairing and building of new brain tissues. <i>Caution:</i> Do not take this supplement if you have gout.
Vitamin D	400 IU daily.	Protects against muscle weakness and is involved in regulation of heartbeat.

## Herbs

Ginkgo biloba is a powerful free radical destroyer that protects the brain. It also improves brain function by increasing circulation to the brain. Take it in capsule or extract form as directed on the product label, three times daily.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

## Recommendations

Eat a high-fiber diet consisting of 50 to 75 percent raw foods, including large amounts of fruits and vegetables plus brown rice, lentils, and potatoes. For protein, eat beans and legumes, fish, raw nuts and seeds, skinless white turkey or white chicken breast, tofu, and low-fat yogurt.

Eliminate alcohol, caffeine, canned and packaged foods, carbonated beverages, chocolate, all junk foods, refined and processed foods, salt, sugar, sweets, saturated fats, soft drinks, and white flour from the diet. Avoid foods that contain artificial colors or preservatives. Avoid fried and fatty foods such as bacon, cold cuts, gravies, ham, luncheon meats, sausage, and all dairy products except for low-fat soured products.

- Omit wheat and wheat products from the diet.
- Drink steam-distilled water.
- Get regular moderate exercise.
- Use an elimination diet to test for food allergies, which can aggravate the condition. (See ALLERGIES in Part Two.)
- Have a hair analysis test to rule out heavy metal poisoning. (See HAIR ANALYSIS in Part Three.)
- Try to improve blood oxygen supply to the brain with deep breathing exercises. Hold your breath for thirty seconds each half hour for a thirty-day period. This promotes deeper breathing and helps to increase oxygen levels in the tissues of the brain.
- Do not go without food. Eating frequent small meals daily is better than eating two or three large meals.

## Considerations

In the medical sense, there is no cure for the differences in the brain that result in ASD. However, researchers are finding better ways to understand the disorder and help people cope with the various symptoms. Some symptoms can lessen as the child ages and others disappear altogether. With appropriate intervention, many behaviors can be changed for the better, even to the point that the affected individual may, to the untrained eye, seem perfectly normal. The majority of people with ASD continue to display some symptoms throughout their lives.

The onset of puberty can be a difficult time for autistic children. Many experience more frequent and severe behavioral problems, and about 25 percent of those afflicted begin to experience seizures during puberty. This is believed to be the result of hormonal changes.

During adulthood, appropriate living arrangements for people with ASD vary depending on the severity of each individual case. While those who are only mildly affected may be able to live on their own, other options can include living in a group home or residential home, or living with parents. For those who are severely affected, an institutional setting may be the only choice. While some autistic adults are unable to adapt to a regular lifestyle, others graduate from college, have careers, form relationships, and marry.

Allergies and food sensitivities are beginning to receive more attention than ever before, because research and case studies are beginning to suggest that they contribute to certain behaviors.

Researchers have also detected the presence of abnormal protein levels in the urine of autistic individuals. It is thought this protein may be due to the body's inability to break down certain dietary proteins into amino acids. These proteins are gluten (found in wheat, barley, oats, and other foods) and casein (found in human and cow's milk). However, some argue that not all cow's milk is potentially harmful. In New Zealand, milk from a certain breed of cows with

a genetic makeup called A2 seems to not exacerbate symptoms of autism. Many parents of autistic children have removed these foods from their children's diets and have, in many cases, observed positive changes in health and behavior. Research strongly suggests that many autistic people are sensitive to dairy products and certain foods eaten most often in the spring and summer. These foods include strawberries and citrus fruits, which can affect an autistic individual's sensitive immune system. Doctors have noted that a variety of problems—including headaches, nausea, bed-wetting, appearing "spaced out," stuttering, excessive whining and crying, aggression, and depression—can be magnified by these food products. Such a reaction can be almost immediate or appear up to thirty-six hours after the suspect food is eaten. Besides eliminating problem foods, increasing the amount of vitamins such as vitamin C may reduce allergy and sensitivity symptoms. (See ALLERGIES in Part Two.)

Some children have benefited from a ketogenic diet. This is a diet that is very high in fat and nearly devoid of carbohydrate. Given that it is a tricky diet to follow, it must be done under a doctor's supervision. In one study, after six months children between the ages of four and ten improved in the standard rating tool used, called the Childhood Autism Rating Scale.

Children may benefit from taking vitamin B<sub>6</sub> and magnesium, as well as other nutrients vital to biochemical reactions in the body. One theory is that these children may have leaky gut syndrome and are unable to absorb nutrients from their diets efficiently. In studies of autistic children, a significant number have been found to have gastrointestinal disorders, including celiac disease and other food intolerances. Allergy induced Autism (AiA), a British support group and charity for autism, notes that some children with autism in England are taking enzymes to help them digest food more easily. Gastrointestinal disturbances are common in autism, especially abnormal stool consistency. A group at the University of Pennsylvania found the incidence to be 54 percent in a group of children aged three to eight years. These children consumed adequate calories and carbohydrate and about twice the RDI for protein.

Elevated serum and tissue copper levels may be a factor in autism and other mental problems, as may excessive exposure to lead and mercury. Even low-level lead exposure in young children has been associated with impaired intellectual development and behavior problems.

Children aged five to seventeen years with autism benefited from 1.5 grams a day of the omega-3 fatty acids EPA and DHA, in an equal ratio. After six weeks, behavior improved for self-injuries, aggression, and tantrums.

Infants and toddlers whose diets consist largely of processed baby foods need supplemental vitamins and minerals to ensure that all of their nutritional needs are met. Nutritional deficiencies are a factor in many psychological disorders.

The prognosis for autistic children is difficult to pre-

dict. There have been documented cases of apparent recovery from autism, usually after adolescence. Some children seem to progress well only to inexplicably regress. Many become marginally self-sufficient and independent. However, most autistic individuals ultimately need lifelong care of some type.

See also HYPOGLYCEMIA and HYPERACTIVITY in Part Two.

For further information about autism, see Health and Medical Organizations in the Appendix.

## BACKACHE

Nearly 80 percent of adults in the United States are affected by back pain at some point in their lives, most often in the lower back. It can be either acute or chronic. Acute pain starts suddenly and is usually the result of misusing the body in some way.

Chronic backache keeps recurring and can be brought on by almost any movement, for no particular reason. It is one of the most common reasons for hospitalization. A variety of problems in the muscles, tendons, bones, ligaments, or an underlying organ, such as the kidneys, may also cause backaches. Attempting to move or lift heavy objects is said to be the primary cause of back problems in the United States, sometimes because of damage done to a spinal disk.

For many years, it was assumed that most back pain was the result of spinal degeneration or injury, especially damage to the intervertebral disks. These structures are located between the vertebrae and act as cushions. Each disk consists of a tough, fibrous outer layer surrounding the soft interior, which provides the cushioning. With the ordinary wear and tear of living, the disks show signs of aging, and may be injured. When a disk begins to degenerate, a strain—even something as small as a sneeze—can cause the disk to rupture, or herniate, allowing the soft interior material to protrude out of the disk and press against the spinal cord. This situation is sometimes erroneously referred to as a slipped disk.

Herniated disk, prolapsed disk, and slipped disk are all names for the same problem, and are usually found in the lumbar region of the back (the lower back). A herniated disk can result in severe intermittent or constant back pain, particularly if it presses on the sciatic nerves and causes a condition known as sciatica. The sciatic nerves are responsible for transmitting all signals from the lower body. They are the longest nerves in the body, and any pressure on them, typically by a disk protruding from the vertebrae, results in a shooting pain, usually in the leg and foot. Some people experience a debilitating numbness that renders them almost incapable of walking; others experience only a tingling sensation in the toes or numbness in the foot or leg. Infrequently, if the lower part of the spinal cord is inflamed, people may experience loss of bladder or bowel control.

It is difficult to pinpoint disk disease as the cause of most cases of back pain. That is because many adults past

the age of forty—whether they experience back pain or not—can be shown to have some degree of disk degeneration. Further, in many instances, disk degeneration and even herniation do not produce any symptoms.

Simple muscle strain is another leading cause of back pain. Although symptoms may come on suddenly and can be acutely painful, this is actually a problem that develops over a long period of time. When muscles contract, lactic and pyruvic acids are produced as by-products of muscular activity. It is the presence of lactic acid in the muscles that produces the familiar sensation of muscle fatigue following strenuous activity. If high levels of these acidic by-products accumulate in the muscles, they cause irritation that can eventually turn into pain and interfere with the normal conduction of electrical impulses in the muscle tissue. This results in a phenomenon called delayed-onset muscle soreness (DOMS).

Fibrositis, a rather ill-defined soreness of the neck, trunk, and shoulders caused by inflammation of connective tissue, may also account for a number of backaches. This usually happens in older people, and is thought more likely to occur because of stress, tension, allergies, or fibromyalgia rather than from any particular injury.

Lumbago is a traditional term for muscle pain in the lower back, near the pelvis.

Backaches during pregnancy are commonplace. The abdominal muscles stretch because the uterus is getting bigger and the back muscles are becoming shorter and tighter. Coupled with this, your spine has to support additional weight, so your posture may change and backaches can result.

Most cases of back pain also have an important psychological component, usually a deep-seated emotional or stress-related problem. Other contributors can include poor posture, improper footwear and walking habits, improper lifting, straining, calcium deficiency, slouching when sitting, and sleeping on a mattress that is too soft. Kidney, bladder, and prostate problems, female pelvic disorders, and even constipation may produce back pain. Chronic conditions that can cause back pain include arthritis, rheumatism, bone disease, and abnormal curvature of the spine. Fractures are rarely the cause of back pain. The two biggest factors are likely being overweight and living a sedentary lifestyle.

Because the great majority of back pain cannot be explained—and is not due to protruding disks, arthritis, osteoporosis, poor posture, or any other discernible illness—it is always advisable to take back problems seriously and have them checked out.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium	1,500–2,000 mg daily.	Needed for strong bones. To assure absorption, use a mixture of 3 different forms: calcium carbonate, calcium chelate, and calcium aspartate.
and		

magnesium and vitamin D	700–1,000 mg daily. 400 IU daily.	Works with calcium. Use magnesium chelate form. Aids absorption of calcium and magnesium.
DL-Phenylalanine (DLPA)	Take daily every other week, as directed on label.	This natural amino acid helps to alleviate pain. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or suffer from panic attacks, diabetes, high blood pressure, or PKU.
Multivitamin and mineral complex with vitamin A and natural beta-carotene	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily.	To supply a balance of nutrients important in formation and metabolism of bone and connective tissue, and needed for healing.
Silica	As directed on label, 3 times daily.	Supplies silicon, which improves calcium uptake.
Vitamin B <sub>12</sub> or vitamin B <sub>12</sub> injections	2,000 mcg daily. As prescribed by physician.	Aids in calcium absorption and digestion. Use a lozenge or sublingual form. Requires visit to doctor.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Required for protein synthesis and collagen formation. Promotes a healthy immune system. Works in balance with zinc and vitamin C to form elastin, and is needed for healthy nerves.

**Important**

Boron	3 mg daily. Do not exceed this amount.	Improves calcium uptake. Take boron only until healed, unless you are over age fifty.
Chondroitin sulfate (CS) and bovine cartilage or shark cartilage and glucosamine sulfate	As directed on label. As directed on label. As directed on label. As directed on label.	Studies have shown these are important components of many body tissues, including bones and connective tissue.
Free form amino acid	As directed on label.	Essential in bone and tissue repair.
L-proline	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Heals cartilage and strengthens muscles and tissues. (See AMINO ACIDS in Part One.)
Manganese	2–5 mg daily. Take separately from calcium.	Aids in healing cartilage and tissue in the neck and back. Use manganese gluconate form.
Methylsulfonylmethane (MSM)	As directed on label.	Aids with inflammation.

S-Adenosylmethionine (SAME)	As directed on label.	Methionine derivative. Eases arthritic pain. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
-----------------------------	-----------------------	--

**Helpful**

Essential fatty acids from fish oils	As directed on label. Take with meals.	Needed for repair and flexibility of muscles.
Glucosalage S04 (Extra Strength) from Olympian Labs	As directed on label.	To supply glucosamine, an important component of many body tissues, including bones and connective tissue. Contains several nutrients listed in this table plus enzymes. Children under twelve, see chart p. 232
Flex Able Chewable Wafers from Amerifit	As directed on label.	A chewable glucosamine and chondroitin formula that provides joint health.
Multienzyme complex with bromelain and pancreatin	As directed on label. Take with meals.	To aid digestion and relieve muscle tension and inflammation.
Vitamin B complex	As directed on label 3 times daily.	Needed for repair and to relieve stress in the back muscles. Use a high-stress formula high in vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> .
Vitamin C with bioflavonoids	3,000–10,000 mg daily.	Essential for formation of collagen, which holds the tissues together. Needed for repair of tissues. Relieves tension in the back area.

**Herbs**

- Arth-X from Trace Minerals Research is a formula containing herbs, sea minerals, calcium, and other nutrients for the bones and joints.
- Other herbs recommended for backache include alfalfa, burdock, oat straw, slippery elm, and white willow bark. They can be taken in capsule, extract, or tea form. White willow bark, containing salicylic acid, is particularly helpful. Also, arnica, a homeopathic remedy, may prove useful as well.

**Recommendations**

- Avoid all meats and animal protein products until you are healed. Animal protein contains uric acid, which puts undue strain on the kidneys that can contribute to back pain. Do not eat gravies, oils, fats, sugar, or rich or highly processed foods.
- Follow a fasting program. (See FASTING in Part Three.)
- When pain hits, immediately drink two large glasses of water. This often gives relief within minutes. Muscle ache and back pain is frequently connected to dehydration. The body needs a minimum of ten 8-ounce glasses of water

daily to keep acidic wastes from building up in muscles and other tissues.

- If pain follows an injury or sudden movement, apply ice for the first forty-eight hours, and then apply heat. Rest on a firm bed. When getting up, roll to your side, draw your knees up, push up to a sitting position, and stand by pushing up with your legs.
- To relieve back muscle pain, soak in a very warm bath or apply a heating pad directly to your back. Be careful not to set the heat too high, however.
- Rhus toxicodendron*, a homeopathic remedy, is helpful in relieving stiffness. Take it as directed.
- Once the acute pain has subsided, doing exercises to strengthen the abdominal muscles may help to prevent recurrences; these muscles help to support the back. Sit-ups are good for this purpose. Always do sit-ups with your knees bent, not with your legs flat on the floor.
- When sitting, try to keep your knees a little higher than your hips and keep your feet flat on the floor. Placing your feet on a pillow or other support to hold this position might be helpful.
- When carrying things on your shoulder, switch the weight to the other side from time to time. Carrying heavy shoulder bags may produce neck, back, and shoulder pain.
- Learn to recognize and reduce stress. Relaxation techniques can be very helpful.
- Always push large objects; never pull them.
- Wear comfortable, well-made shoes. The higher the heels of your shoes, the greater the risk of backache.
- Move around. Do not sit in the same position for long periods of time.
- Never lean forward without bending your knees. Lift with your legs, arms, and abdomen—not with the muscles of the small of your back. Avoid lifting anything heavier than twenty pounds. If you must work close to the ground, squat down so that you avoid bending at the waist.
- Do not sleep on your stomach with your head raised on a pillow. Instead, rest your back by lying on your side with your legs bent, so that your knees are about an inch higher than your hips. Sleep on a firm mattress with your head supported on a pillow. If your mattress is not firm enough, place a board between the box spring and the mattress.
- Maintain a healthy weight and get regular moderate exercise. A lack of exercise can cause back pain. Activities that are good for the back include swimming, cycling, walking, and rowing. Find one that you like and commit to doing it regularly. Avoid the following activities if you have back problems:
  - *Baseball, basketball, football.* The quick responses needed for these sports involve sudden twisting and jumping motions.

- *Bowling.* Lifting a heavy weight while bending and twisting puts strain on the back.
- *Golf.* The twisting motion involved in the swing, and the body's tendency to bend forward at the waist, are stressful to the lower back.
- *Tennis.* Playing tennis puts strain on the back due to the quick "stop-and-go" action of the game.
- *Weightlifting.* This sport is potentially the most damaging because it places great strain on the lower portion of the spine and back.

If pain lasts longer than seventy-two hours, if pain radiates into the legs, or if other symptoms such as unexplained weight loss occur, consult your health care provider. If your backaches are chronic, look for a physician who specializes in backs—and who does not rush to recommend surgery. Get a second opinion if surgery is recommended.

If your back pain also involves a high temperature or weight loss, or if you have a past history of cancer, bowel or bladder control problems, any numbness in the groin or lower back, or loss of feeling in the legs or feet, see your doctor.

If you have pain in one side of the small of your back, feel sick, and have a fever, see your physician immediately.

If pain follows an injury and is accompanied by sudden loss of bladder or bowel control, if you have difficulty moving any limb, or if you feel numbness, pain, or tingling in a limb, call for medical help immediately. You may have damaged your spinal cord.

### Considerations

People seeking professional advice about back pain face a bewildering array of generalists and specialists to choose from. Complex back problems are rapidly becoming a specialty. For alternative treatment of back pain, you can try any of the following types of therapy:

- Acupuncture has the backing of the World Health Organization for the treatment of back pain. (See PAIN CONTROL in Part Three.) However, new data questions its efficacy. In a large study of over six hundred patients with back pain, some patients were given an actual acupuncture treatment while others received a simulated one. Patients reported the same symptom relief regardless of which procedure they received.
- Chiropractic is conducted by professionals who are licensed to perform spinal manipulation and who may recommend nutritional and/or lifestyle changes. It primarily involves the use of high-velocity manipulations of the neck and back to correct problems. According to a 1994 report issued by the U.S. Agency for Health Care Policy and Research, spinal manipulation may be the most effective

tive treatment for acute back pain. Chiropractors are not medical doctors and therefore cannot prescribe drugs or perform surgery. A good chiropractor should be willing to recommend a medical doctor if necessary.

- Kinesiology can sometimes alleviate back problems. By testing muscle response, practitioners can pinpoint the origin of the pain and use various methods, including gentle manipulation, to treat it.
- Magnet therapy is gaining ground in some quarters. A magnetic mattress pad has been developed, and some people have found relief from chronic back pain after sleeping on it for only a short time. Experiments have shown that magnet back support has proven useful for golfers.
- Massage therapy involves different techniques like muscle kneading and compression to lessen tension in the muscles. This increases circulation and helps the body flush out cellular debris, which speeds tissue repair and aids in healing back problems. (See MASSAGE THERAPY under PAIN CONTROL in Part Three.)
- Orthopedic surgery is performed by medical doctors who prescribe medication (painkillers, muscle relaxers, anti-inflammatory drugs), bed rest, and physical therapy for some cases of back pain. Since these doctors can perform surgery, they may be more likely to recommend it than other practitioners.
- Vertebroplasty, for vertebral compression fractures, has offered relief for some people. In this outpatient procedure, a needle inserted through the skin into the affected vertebra fills the vertebra with a cement-like substance called methylmethacrylate, and when this substance hardens (in about fifteen to twenty minutes), it offers support to an otherwise weak part of the backbone.
- Osteopathy, or osteopathic medicine, is based on the belief that most diseases are related to problems of the musculoskeletal system. The musculoskeletal system is made up of the nerves, muscles, and bones—all of which are interconnected and form the body's structure. Osteopaths (D.O.s) can prescribe drugs and perform surgery in many states, but because of their philosophy of treatment, they often try manipulation or physical therapy first.
- Physiatry is nonsurgical physical medicine and rehabilitation for patients who have been disabled as a result of a disease, disorder, or injury. Physiatrists, also known as doctors of physical rehabilitation medicine, are medical doctors who treat back pain by the use of various physical therapies, lifestyle changes, and back braces, which promote healing by reducing the load on the spine. Physiatrists are not licensed to perform surgery, and are less likely than other doctors to hospitalize their patients. They have a good record for treating back problems, including low back pain and herniated disks.

- Physical therapy focuses on improving joint and spine mobility and muscle strength. Physical therapists are not medical doctors, and are strictly limited to physical therapy.

There is a theory that backache may be caused by repressed rage. This may be something to consider pursuing with a psychiatrist or other mental health professional.

Bed rest makes little difference with sciatica. Both the long-term and short-term consequences of sciatica remain the same whether you observe complete rest or continue your usual routine.

With signs of rapidly progressive nerve damage (increasing weakness in a leg, or loss of bladder or bowel function), back surgery moves high on the list of options. It must also be considered when pain is unremitting or getting worse. Surgery always entails a degree of risk; there is always the chance of permanent damage and impaired mobility.

According to U.S. government data, only 1 percent of those who suffer from back pain appear to benefit from surgery. Back surgery is useful only for problems in four broad categories:

1. Disk displacement (a protruded or “slipped” disk).
2. Painful (and abnormal) motion of one vertebra in relation to another.
3. Narrowing of the spine around the spinal cord itself from overgrowth of bone (spinal stenosis).
4. Some cases in which misalignment of one vertebra with another (spondylolisthesis) leads to pain.

In the past, removing a damaged disk and fusing a section of the spine was a major surgical procedure. Up to one year was required for recovery from this surgery. A procedure called minimal access spinal technologies (MAST) allows the operation to be performed through small incisions that do not even cut through muscle tissue. Someone who absolutely requires surgery should investigate this option. Recovery time is in the days-to-weeks range rather than months-to-years.

X-rays are often considered a routine part of back pain diagnosis, yet only a few back conditions show up on X-rays. If muscle strain or a herniated disk causes the pain, an X-ray will do little to aid the diagnosis, since disks, muscles, and ligaments are all soft tissues. X-ray exposure bears special hazards for pregnant women.

With imaging procedures such as computerized tomography (CAT) and magnetic resonance imaging (MRI), disks can be seen. However, Dr. Richard A. Deyo, of Oregon Health and Science University, notes that 20 to 30 percent of people with back pain have herniated disks that are not the source of their discomfort. If these disks show up during imaging procedures, a person may end up having surgery for a condition that, while present, is not really the cause of his or her pain.

If pain comes after lifting something heavy, after coughing, or after unusually heavy exercise, and the pain prevents you from moving or shoots down one leg, you may have a herniated disk.

Epidemiological studies in the United States, as well as studies of smoking and nonsmoking pairs of twins in Scandinavia, have shown that smoking aggravates problems in the disks.

See *under* PREGNANCY-RELATED PROBLEMS in Part Two.

See *also* PAIN CONTROL in Part Three.

**BAD BREATH**

See HALITOSIS.

**BALDNESS**

See HAIR LOSS.

**BEDSORES**

Bedsore, also known as pressure sores, are deep ulcers that form when pressure is exerted over bony areas of the body for long periods of time, restricting circulation and leading to the death of cells in the underlying tissue. They are most commonly found on the heels, buttocks, hips, sacrum, and shoulder blades.

As their name implies, they tend to occur during periods of prolonged bed rest, although wheelchair users also may develop bedsores. People who suffer from bedsores are usually deficient in many nutrients, especially protein, zinc, and vitamins A, E, B<sub>2</sub> (riboflavin), and C, and they often have a high bodily pH. (See ACID/ALKALI IMBALANCE in Part Two.)

Anyone who is confined to a bed, chair, or wheelchair due to illness is at risk for developing bedsores, which can range from mild to severe. Patients who are defined as being clinically malnourished (this is a physician diagnosis that you can ask about) are at greater risk of developing bedsores. Low scores on two important blood tests—cholesterol and albumin—are often indicative of who will develop bedsores. An area of reddening skin that doesn’t go away, even after pressure is relieved, is an indication of a developing bedsore, as is local swelling and/or hardening of the tissue. Severe bedsores can require surgery for removal of dead tissue.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Essential fatty acids (flaxseed oil, primrose oil, and salmon oil)	As directed on label.	Needed for proper cell reproduction.
or Ultra Omega-3 Fish Oil from Health From The Sun	One or two capsules with each meal daily.	Prevents moisture loss and promotes healing.

Vitamin E	200 IU daily.	Improves circulation.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in healing of tissues.
plus copper	3 mg daily.	Needed to balance with zinc.
<b>Important</b>		
Free form amino acid	As directed on label.	To supply protein needed for healing.
Vitamin B complex	100 mg of each major B vitamin twice daily, with meals (amounts of individual vitamins in a complex will vary).	Needed to reduce stress and for healing.
plus extra vitamin B <sub>12</sub>	2,000 mcg twice daily.	Use a lozenge or sublingual form.
Vitamin C	3,000–10,000 mg daily, in divided doses.	Aids in healing, improves circulation, and enhances immune function.
Vitamin D	400–1,000 IU daily.	Essential for healing. Lack of exposure to sunshine increases the need for this nutrient.
<b>Helpful</b>		
Calcium and magnesium	2,000 mg daily. 1,000 mg daily.	Needed for the central nervous system and to keep bones from softening through disuse.
Carotenoid complex	As directed on label.	Repairs bedsores by improving skin tissue.
Colloidal silver	Apply topically as directed on label.	A natural antibiotic. Destroys bacteria, viruses, and fungi. Protects against infection and promotes healing.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Has a natural antibiotic effect; protects against infection.
Kelp	500–1,000 mg daily.	Provides necessary minerals.
Panoderm I from American Biologics	Apply topically as directed on label.	A natural antioxidant skin moisturizer and cleanser that contains squalene, an unsaturated carbohydrate from shark liver oil.
Vitamin A	50,000 IU daily for 1 month, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for healing of skin tissue. Use an emulsion form for easier assimilation.

## Herbs

- Herbal ointments should be applied to closed wounds only. Open wounds should always be treated by a qualified health care practitioner or physician.
- Aloe vera gel, ointment, or cream can be applied topically to bedsores.
- Calendula cream, gel, or ointment can be applied topically to an affected area. Use as directed on the label.
- Comfrey ointment or Calendula Ointment, from Nature-Works, can be used externally.

*Note:* Comfrey is recommended for external use only.

Goldenseal, myrrh gum, pau d'arco, and suma, taken in tea or extract form, are beneficial for bedsores. Buckwheat tea and lime flower tea are also helpful.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Mix equal amounts of goldenseal powder or extract and vitamin E oil with a small amount of honey to make a paste, and apply the mixture to the sores as necessary. This mixture gives fast relief and helps the healing process. Alternate this with raw honey, vitamin E cream, and aloe vera gel.

## Recommendations

Eat a simple, well-balanced diet with plenty of raw, fresh fruits and green and yellow vegetables to ensure a good supply of vitamins, minerals, and phytonutrients. Patients usually don't get enough protein so it is important to focus on increasing its intake.

Essential fatty acids (EFAs) have been shown to play an integral role in the health of the skin. Taken internally or applied externally as a lotion (only to closed, well-healed wounds), they help maintain the integrity and elasticity of the skin, as well as preventing a loss of moisture, which leads to dry and scaly skin. Excellent sources of EFAs are natural vegetable oils such as canola, corn, olive, safflower, and soy oils; wheat germ; edible seeds, such as pumpkin, sesame, and sunflower; and fish oils—especially cod-liver oil.

Consume liquids around the clock, even if you are not thirsty. Use steam-distilled water, herbal teas, and sugar-free juices. Liquids are important in keeping the colon clean and the bladder functioning properly.

Eliminate animal fats, fried foods, junk foods, processed foods, and sugar from the diet.

Use ground flaxseeds, oat bran, psyllium husks, or Aerobic Bulk Cleanse (ABC) from Aerobic Life Industries to provide fiber. Fiber absorbs dangerous toxins and helps prevent constipation.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Make sure that the bowels move every day. On days when the bowels do not move, use an enema. (See ENEMAS in Part Three.)

Give immediate attention to lowering the body's pH level to 5.5 or lower to prevent bacteria in the sores from multiplying. Place 2 to 3 teaspoons of apple cider vinegar in a glass of water, add a little honey, and sip this with meals. (See ALKALOSIS under ACID/ALKALI IMBALANCE in Part Two for additional suggestions.)

Take the following measures to prevent development of bedsores:

- Prevention of bedsores is based on limiting the time an area of the body is subjected to pressure. Do not let an immobilized individual stay in one position for long—move him or her to alternate positions every two hours.
- Keep the skin dry, including thorough drying after bathing.
- Inspect pressure points daily for reddening or other signs that a sore may be developing.
- If the person can sit up, have him or her do so three to four times daily, or use pillows as a prop.
- Give a sponge bath daily using warm water and a mild herbal or vitamin E soap. Do not use harsh soaps.
- Gently but firmly massage pressure points and other affected areas once daily to increase circulation.
- Give frequent alcohol rubs to stimulate circulation and prevent blood vessels from closing up. Use isopropyl (rubbing) alcohol on cotton balls or sterile gauze to apply. As an alternative, witch hazel can be used.
- Allow as much light and fresh air into the bedridden person’s room as he or she can tolerate.
- Have the individual wear loose-fitting clothing made from all-natural materials. Cotton is best because it allows air to penetrate to the skin. Pay attention to clothing construction as well. Avoid items with seams, gathers, or other features that may press on sensitive areas.
- Keep the bed clean, dry, and tidy. Lying on wrinkled bed linens can lead to bedsores.

**Considerations**

- A good diet is very important and makes bedsores less likely to develop. Maintaining adequate protein and calories is key.
- People who suffer from bedsores are usually seriously deficient in many nutrients, especially zinc and vitamins A, E, B<sub>2</sub> (riboflavin), and C. A good multivitamin and mineral supplement should be taken every day. A simple diet with plenty of fresh fruits is recommended. Vitamins A and E in moderation are useful in healing bedsores. Vitamin C acts as an anti-inflammatory and is generally good for the health of the skin and blood vessels.
- Although most bedsores can be prevented, once formed, they can be kept in check if you regularly examine the affected areas, keep the skin clean and dry, and relieve any pressure on sensitive areas. If mobility is limited, you can use special foam, gel, or air cushions to relieve this pressure. Also, make sure that anyone with limited mobility gets turned on a regular basis.
- Special air mattresses are available that help to decrease the pressure on sensitive areas when a person has to lie in one position for long periods of time. Anatomically

shaped cushions can be used to help distribute the weight more evenly, along with special pads designed specifically for heels and elbows.

- Special absorbent foamlike bandages can be used for persistent bedsores to reduce the pressure on sensitive areas and help promote healing.
- Dimethylsulfoxide (DMSO) is also helpful for promoting healing. It is applied topically directly to the affected area once the skin has covered over the wound.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

**BED-WETTING**

Bed-wetting, known in the medical community as enuresis, is the act of urinating in bed habitually and involuntarily at night when asleep. Bed-wetting is common in early childhood. It is uncommon in early adulthood but frequent among older adults. The causes are often unknown. The most popular theories center on the roles of behavioral disturbances, very sound sleeping, the consumption of too much liquid before bedtime, dreaming about using the rest room, food allergies, heredity, stress, nutritional deficiencies, and psychological problems (one of the most common factors in young adults).

In children under the age of five or so, the most common cause of bed-wetting is simply the size of the bladder; it is often too small to hold enough urine to last through the night every single night. This type of bed-wetting is usually outgrown. Occasional bed-wetting by older children usually stops spontaneously by the teenage years. An underlying illness such as a urinary tract infection or diabetes may also result in bed-wetting. It is wise to rule out the possibility of underlying medical problems before proceeding with any other form of treatment. Some children’s hospitals have special clinics just to deal with this issue.

Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve years old, use one-half of the recommended dose, and for a child under six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Free form amino acid	As directed on label.	Helps to strengthen bladder muscle. Use a product made from a vegetable source.

Important		
Calcium and magnesium	1,500 mg daily. 350 mg daily.	To aid in controlling bladder spasms.
Helpful		
Multivitamin and mineral complex with vitamin B complex with iron	As directed on label. Only with a physician's recommendation	Aids in relieving stress and supplies all needed nutrients.
Potassium	99 mg daily.	Aids in balancing sodium and potassium in the body.
Vitamin A or cod liver oil and vitamin E	As directed on label. If you are pregnant, do not exceed 10,000 IU daily. As directed on label. 200 IU daily.	To aid in normalizing bladder muscle function. Use d-alpha-tocopherol form.
Zinc	10 mg daily for children; 80 mg daily for adults. Do not exceed these amounts.	For improved bladder function. Also enhances the immune system.

## Herbs

For bed-wetting, try using buchu, corn silk, oat straw, parsley, and/or plantain. Take these herbs before 3:00 P.M. so that they have time to work before bedtime.

## Recommendations

Consume more foods that are high in vitamin B<sub>2</sub> (riboflavin) and vitamin B<sub>5</sub> (pantothenic acid), including bee pollen, brewer's yeast, soaked nuts, and spirulina.

*Cautions:* Both bee pollen and brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Do not drink liquids within thirty minutes of bedtime.

See your health care provider for food allergy testing. Bed-wetting is often caused by food allergies. Omit cow's milk, which is highly allergenic, from your diet. Also eliminate from the diet carbonated beverages, chocolate, cocoa, cooked spinach, refined carbohydrates (including junk food), rhubarb, and products containing caffeine or food coloring.

Bed-wetting in children has been shown to cause low self-esteem, attention deficit, or behavioral problems and is best treated with sympathy and understanding. Do not spank or scold a child for bed-wetting. This only complicates the problem. Instead, give rewards for not wetting the bed.

## Considerations

We know of several cases of bed-wetting (among children and adults) that were relieved within a matter of days when supplements of certain nutrients were supplied.

Among these were magnesium, vitamin B<sub>2</sub>, and pantothenic acid. In addition, all allergy-causing foods were removed from the diet, and a protein supplement was added. Good supplements include soy powder, whey powder, and egg white powder.

Supplemental magnesium is especially helpful for certain people. Magnesium citrate is one of the better forms to use, since the body can readily assimilate it. Too much magnesium produces diarrhea, so be careful when using it for children.

Behavior modification techniques have proved useful in some cases, especially with children. One technique involves the use of an alarm that goes off as soon as the individual starts to wet the bed. Over time, this is believed to help a child respond to the body's cues and wake up when he or she needs to urinate during the night.

The National Kidney Foundation hotline (888-925-3379) can provide information and a list of physicians in your area who are experienced in treating this condition.

## BEE STING

There are numerous stinging insects in the United States, and not all of them are bees. Hornets, yellowjackets, wasps, spiders, and some species of ants can also inflict painful wounds. In some people, honeybee and yellowjacket stings can cause more serious reactions than the stings of hornets and wasps. When an insect stings, it injects venom through a stinger into the victim. Bees generally leave their stingers behind at the sting site; wasps most often do not. Usually, a stinging insect attacks because it is trying to protect itself, or its territory, from danger. This is why a person who stumbles on a beehive may end up receiving multiple stings from the hive's residents.

Most stings cause localized swelling, redness, and acute pain that may throb or burn. This is a reaction to the insect's venom. However, some people are highly allergic to insect venom, and if they are stung, a very severe reaction can occur. Symptoms of an allergic reaction include difficulty swallowing, hoarseness, labored breathing, weakness, confusion, severe swelling, and a feeling of impending disaster. People who are highly allergic to insect stings can experience anaphylactic shock, which can lead to unconsciousness and, in extreme circumstances, death. Anaphylactic shock can cause symptoms such as bluish skin; coughing; difficulty breathing; dizziness; hives; nausea; severely swollen eyes, lips, or tongue; stomach cramps; and wheezing.

Unless otherwise indicated, the following recommended dosages are for people over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use half of the recommended dose. Children under six years old should receive only one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Calcium	1,500 mg daily.	Helps relieve pain. Use calcium gluconate form.
O <sub>2</sub> Spray from Earth's Bounty	As directed on label.	Helps the healing process.
Pantothenic acid (vitamin B <sub>5</sub> )	500 mg daily.	Acts to inhibit allergic response.
Vitamin C with bioflavonoids	10,000 mg within the first hour. Then 5,000–25,000 mg daily in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Protects the body from allergens and moderates the inflammatory response.
Vitamin E	Slit capsule and apply oil topically to the sting site.	Promotes healing. Use d-alpha-tocopherol form.

## Herbs

Poultices made from comfrey and white oak bark and leaves can ease pain and promote healing. Lobelia poultice and plantain poultices or salve are also beneficial.

*Note:* Comfrey is recommended for external use only.

Take echinacea and/or goldenseal in tea or capsule form to boost immune function. Goldenseal is a natural antibiotic and functions well as a poultice. It reduces inflammation and prevents infection.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Juniper tea cleanses the venom from your internal system, and can also make an excellent external poultice when the berries are crushed and applied to the sting.

Drink as much yellow dock tea as you can, or take 2 capsules of yellow dock every hour until symptoms are relieved.

## Recommendations

If you are stung, immediately and carefully remove any stinger left in the skin. Do not pull the stinger out with your fingers or tweezers. Instead, gently scrape it out. A sterilized knife is best for this purpose, but you can use your fingernail or the edge of a credit card if nothing else is available. Be careful not to squeeze the stinger or the attached venom sac as this may inject more poison into the skin. Afterward, wash the area and rinse thoroughly. If you have ever had an allergic reaction to a sting in the past, seek emergency medical attention immediately. Life-threatening allergic reactions can come on suddenly and progress very quickly. If

you have no history of insect allergy, no medical treatment is needed, but do remain alert for symptoms of a developing allergic reaction. Reactions can occur within minutes or hours, and they can happen the first time or the thousandth time you are stung by a bee.

If you are aware that you are highly allergic and prone to anaphylactic shock, carry an emergency kit containing a premeasured dose of epinephrine. You must obtain the kit by prescription, and your doctor should show you how to administer the epinephrine. Any allergic reaction to a sting should be taken seriously because, no matter how slight, the reaction may prove to be more serious in a second incident. Call 911 at once.

If you are not highly allergic, once the stinger has been removed and the area cleansed, try one or more of the following home remedies to ease pain and swelling:

- Make a paste by adding a bit of cool water to baking soda, a crushed aspirin, or a crushed papaya enzyme tablet, and apply the mixture to the sting.
- Charcoal tablets, available in health food stores, can be used as a poultice. Empty 2 capsules, add 6 drops of liquid alcohol-free goldenseal extract to make a paste, then smooth on a sterile gauze pad and place on the sting area. This will absorb the poisons and prevent infection. Use only charcoal recommended for internal use.
- Apply an ice compress to the sting area a few minutes every two hours for the first day after you've been stung. Not only will you reduce the swelling and pain from the sting, but you will also be stopping the spread of venom.
- Apply lavender oil to the sting area to reduce inflammation and pain.
- Crush plantain leaves and squeeze out the juice. Apply this extract directly to the sting. Within thirty minutes, the pain and swelling should be greatly reduced.
- Other remedies to consider include: Rubbing toothpaste on the sting (its cooling effect can make the sting area feel better); applying calamine lotion to the area, or rubbing a meat tenderizer containing papain (an enzyme) on the sting can also ease the pain.
- If you have been stung on the foot or leg, elevate it for about half an hour after removing the stinger.

Use *Apis mellifica*, a homeopathic remedy, to reduce inflammation and pain if the sting area is very swollen and red. *Ledum palustre*, a homeopathic remedy, reduces inflammation from stings, and is the most commonly used medication for insect stings and snakebite.

## Considerations

Aspirin or ibuprofen, taken every four hours, is helpful for pain and inflammation.

- Take an oral antihistamine and/or anti-itch medication, such as cortisone cream or Benadryl liquid, tablets, or cream to relieve itching caused by the sting.
- A venom extractor is available that fits inside a pocket or purse. If you get stung, it produces a vacuum that sucks the venom out within two minutes. The end of the extractor can also be used to remove a honeybee stinger.
- Taking large doses of vitamin C has been known to reduce the severity of bee stings.
- To avoid bee stings, wear plain, light-colored clothing. Also avoid wearing clothing that is flowered or dark colored; perfume, suntan lotion, hair spray, or anything scented; shiny jewelry; and open sandals or loose-fitting clothes.
- To protect yourself if you are highly allergic to bee stings, wear long-sleeved shirts and long pants when you are outdoors and near bees and wasps.
- When a yellowjacket is squashed, its body releases a chemical that causes other yellowjackets in the area to attack. If you are near a nest, hundreds of individuals can swarm you. It is better to leave the area fast than to swat at these insects.
- See also INSECT ALLERGY and INSECT BITE in Part Two.

## BINSWANGER'S DISEASE

See under RARE DISORDERS.

## BIPOLAR MOOD DISORDER (FORMERLY KNOWN AS MANIC-DEPRESSIVE DISORDER)

*Bipolar mood disorder* is a variant of classic depression. It typically begins as depression and then develops into alternating periods of depression and mania. A person with severe bipolar disorder may go from feeling unrealistically (and dangerously) invincible and elated to being overwhelmed with misery and despair, even suicidal. Some of the symptoms of bipolar disorder are changes in sleep pattern, withdrawal from society, extreme pessimism, a sudden loss of interest in and failure to finish projects that were started with enthusiasm, chronic irritability, sudden attacks of rage when crossed, loss of inhibition, and changes in sexual behavior that may range from a complete loss of sex drive to sexual excess. It is estimated that less than 2 percent of the population of the United States suffers from some form of this disorder.

The course of bipolar disorder is highly variable. Both mania and depression can vary in severity, and the length of the cycles, from depression to mania and back again, can occur over the course of a few days or over many months—even, in some cases, years. Low self-esteem and feelings of hopelessness characterize the depressive phase. A person experiencing depression may lack motivation to do anything, even to get out of bed. Some people simply sleep for weeks, withdraw from social activities, avoid relationships with others, and become unable to work. Others may seem to be living normal lives—going to work, interacting with others—but inwardly feel a deadening sadness and are unable to experience genuine pleasure.

The periods of mania often start suddenly and without warning. Some people experience what is called *hypomania*, excitement that does not necessarily appear to be a sign of mental illness—just great enthusiasm and energy. Others experience *full-blown manic psychosis*, in which they have seemingly boundless energy and are ceaselessly active and easily distracted. They may not want to rest or sleep for twenty-four hours or more. Mental activity is sharply accelerated, and delusions of grandeur, persecution, or invincibility are not uncommon. Most people in this condition seem to be utterly elated for no apparent reason, but some become unreasonably irritable and hostile. They may even have hallucinations. Despite all this, a person experiencing full-blown mania generally believes that he or she is functioning at peak efficiency.

The cause of this disorder is not well understood, but there are several theories as to its origin. It may be triggered by extreme stress. Heredity may be a factor in some cases. Some researchers believe that early experiences, such as the loss of a parent or other early childhood trauma, play an important role. Others believe that the manic phase is used (unconsciously) as a kind of psychological compensation for the depression that otherwise engulfs the individual. Biological factors are also possible. There is evidence that intracellular sodium increases during the mood swings of bipolar disorder, then returns to normal after recovery. It is also known that in depressed individuals, brain chemicals called monoamines are depleted.

The symptoms of some childhood psychological disorders such as attention deficit disorder (ADD), attention deficit hyperactivity disorder (ADHD), conduct disorder, and schizophrenia can be similar to those of mania, so a thorough examination is needed to avoid misdiagnosis. It is not uncommon for children who are diagnosed with psychotic depression to be diagnosed with bipolar disorder as adults.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended dose. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label twice daily, on an empty stomach.	To supply protein, needed for normal brain function and to combat depression.
L-tyrosine	500 mg twice during the day and again at bedtime. Take with water or juice on an empty stomach. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Important in treating depression. Stabilizes mood swings. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug.
Taurine	500 mg 3 times daily, on an empty stomach.	Deficiency can result in hyperactivity, anxiety, and poor brain function.
Vitamin B complex injections or liver extract injections plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> injections or vitamin B complex plus extra vitamin B <sub>12</sub>	2 cc twice a week or as prescribed by physician.  As prescribed by physician. ½ cc twice a week or as prescribed by physician.  1 cc twice a week or as prescribed by physician. 100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 1,000–2,000 mcg daily, on an empty stomach.	To supply B vitamins essential for normal brain function and a healthy nervous system. All injectables can be combined in a single injection.      Use a hypoallergenic formula. A sublingual form is best.  Important in making myelin, the substance of which the sheaths covering the nerves are made. Use a lozenge or sublingual form.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Protects the brain cells. Use zinc gluconate lozenges or OptiZinc for best absorption.  Needed to balance with zinc.
<b>Important</b>		
Lithium	As prescribed by physician.	A trace mineral that alters the manic-depressive cycles, producing greater mood stability. Available by prescription only.
<b>Helpful</b>		
Essential fatty acids (Kyolic-EPA from Wakunaga)	As directed on label.	Important for improved cerebral circulation and blood pressure stability.
5-Hydroxytryptophan (5-HTP)	As directed on label.	Increases the body's production of serotonin. Note: Do not use this supplement with other antidepressants.
Multivitamin and mineral complex with calcium and magnesium	As directed on label. 1,500 mg daily. 750 mg daily.	Mineral imbalances may cause depression. Use a high-potency formula.  Has a calming effect; enhances sleep if taken at bedtime.

Nicotinamide adenine dinucleotide (NADH)	As directed on label.	Enhances production of dopamine and serotonin.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	To aid in brain function and to protect the immune and nervous systems.

## Recommendations

- Eat a diet consisting of vegetables, fruits, nuts, seeds, beans, and legumes. Whole grains and whole-grain products are recommended, except for those that contain gluten, which should be consumed in moderation only. (See CELIAC DISEASE for more information on a gluten-restricted diet.) Eat white fish and turkey twice a week.
  - Eat fish that are high in omega-3 fatty acids. Tuna, salmon, mackerel, and herring are good choices. Omega-3 fatty acids may stabilize mood swings and have effects similar to those of the medication lithium.
  - Consume no sugar or products containing sugar (read food product labels carefully). Also avoid alcohol, dairy products, caffeine, carbonated beverages, and all foods with colorings, flavorings, preservatives, and other additives.
  - Be aware that food allergies may aggravate mood swings. Use an elimination diet to find which foods may be causing problems, and eliminate them from the diet. (See ALLERGIES in Part Two.)
  - Take high doses of B-complex vitamins, approximately 100 mg of each major B vitamin three times daily (amounts of individual vitamins in a complex will vary). The B complex is very important for all mood disorders. Use injections (under a doctor's supervision) or a sublingual form for best absorption. Persons with bipolar disorder do not absorb the B-complex vitamins easily, and often have deficiencies of these vitamins.
  - Avoid choline and the amino acids ornithine and arginine. These substances may make symptoms worse.
  - Do not take any drugs except for those prescribed by your doctor.
  - Establish and maintain a regular routine for your daily activities. A lack of sleep can trigger a relapse.
  - As much as possible, avoid situations that cause stress, such as a turbulent relationship or a difficult working environment. Stress is a major contributor to serious problems for people with bipolar disorder.
- Considerations**
- Injections of vitamin B<sub>12</sub> and megadoses of the B vitamins often bring about an improvement. The B vitamins have a lithium-like effect on the brain.
  - Amino acids, especially taurine and tyrosine, are important in the treatment of this disorder.
  - The trace minerals lithium carbonate and lithium citrate are known to alter the period of the rhythmic cycling

of the brain, and help to even out the moods in persons with bipolar disorder. Lithium drugs' most important role is to prevent and decrease the occurrence of manic episodes. It is usually taken by mouth in capsule, tablet, or liquid form. The side effects of lithium drugs can include diarrhea, drowsiness, edema, frequent urination, kidney dysfunction, nausea, slight hand tremors, stomach cramps, thirst, thyroid enlargement, weight gain, and worsening of skin conditions such as acne and psoriasis. Toxic levels of lithium in the blood can cause blurred vision, confusion, muscle twitching and weakness, nausea, slurred speech, tremors, and vomiting. Lithium levels can be elevated to dangerous levels by changes in the diet, strenuous exercise, surgery, or illness, especially influenza. If you must take lithium drugs, try to keep your weight at a regular level and avoid crash dieting, as lithium levels are elevated by sudden weight loss. Keep your physician informed of any of the above-mentioned circumstances to avoid an imbalance in your dosage. Lithium drugs should not be taken by people with severely impaired kidney function. Make sure you take the drug with food and drink 10 to 12 glasses of water a day.

- Lithium orotate, a form of lithium, is also available.
- Food is known to increase the bioavailability of the antipsychotic drug ziprasidone (Geodon). In one study, researchers found that eating at least 500 calories per meal (but not as many as 1,000 calories) was sufficient to obtain maximum absorption of the drug. It didn't matter how much fat was included. This sort of diet made up of 500 to 600 calories per meal with 30 percent of the calories from fat is healthy and should help to avoid weight gain, which often happens with antipsychotic medications. In fact, weight gain is the second most common reason that people stop using antipsychotic drugs. In another study, patients taking the drug olanzapine (Zyprexa) ate 500 fewer calories each day and jogged 30 minutes three times a week, and were able to lose weight and reported that the drug remained effective. If you are not taking your medication for fear of weight gain, speak to your health care professional about seeing a dietitian to help you manage your weight.
- For those who cannot tolerate lithium, doctors may prescribe an anticonvulsant drug such as divalproex (Depakote). An antidepressant, such as Paroxetine (Paxil) or bupropion (Wellbutrin), may be prescribed for depressive episodes. To control acute manic episodes, the antipsychotic medications risperidone (Risperdal) and olanzapine (Zyprexa) are available. Other drugs include benzodiazepines such as diazepam (Valium) and MAOI antidepressants such as phenelzine sulfate (Nardil) and tranylcypromine sulfate (Parnate), but these aren't used as often because they are less effective. Electroconvulsive therapy (ECT) is sometimes used as a final choice to treat bipolar disorder. Today the treatment is much gentler than in the past and it is being recommended by some physicians.

- Psychotherapy and self-help support groups are very helpful in the treatment of bipolar mood disorder.
- According to an article in *The New England Journal of Medicine*, individuals with depression and bipolar disorder appear to be hypersensitive to the neurotransmitter acetylcholine. Therefore, choline should not be taken in a dose that exceeds the amount in a multiple vitamin.
- Bipolar mood disorder may be aggravated by an overgrowth of yeast in the intestinal tract and by nutritional deficiencies. Food allergies, such as an allergy to wheat products, and the consumption of large amounts of caffeine and/or refined sugar, can make symptoms worse.
- Certain systemic disorders can cause depression, including Alzheimer's disease, diabetes mellitus, encephalitis, hyper- and hypothyroidism, multiple sclerosis, and Parkinson's disease. Any depression diagnosis should be made only after a thorough physical examination to rule out an underlying illness.
- See also DEPRESSION in Part Two.

## BITE

See BEE STING; DOG BITE; INSECT ALLERGY; SNAKEBITE; SPIDER BITES (AND SCORPION STINGS).

## BITOT'S SPOTS

See under EYE PROBLEMS.

## BLADDER INFECTION (CYSTITIS)

The kidneys, ureters, bladder, penis, and urethra all play a part in filtering and expelling waste material (urine) from the body. Cystitis (an infection of the bladder), urethritis (an infection of the urethra), and acute pyelonephritis (a kidney infection) are more common in women. All of these conditions can also occur in men, and may be a sign of serious underlying conditions such as problems with the prostate gland. Urethritis in the male is most often contracted as a result of sexual contact. Many conditions affecting the kidneys, bladder, or urethra are described as urinary tract infections, or UTIs, and most UTIs are concentrated in the bladder and urethra.

Bladder infections are characterized by an urgent desire to empty the bladder. Urination is typically frequent and painful; even after the bladder has been emptied, there may be a desire to urinate again. The urine often has a strong, unpleasant odor, and may appear cloudy. Children suffering from bladder infections often complain of lower abdominal pain and a painful burning sensation while urinating. There may be blood in the urine. While cystitis itself is usually more of an annoyance than a serious health problem, it can lead to kidney infection if left untreated.

Urinary tract infections are responsible for more than 8

million doctor visits each year. Between 80 percent and 90 percent of urinary tract infections are caused by *Escherichia coli*, a bacterium that is normally found in the intestines. Chlamydia may also cause bladder problems.

Both women and men suffer from bladder infections. In women, bacteria introduced by means of fecal contamination or from vaginal secretions can gain access to the bladder by traveling up through the urethra. Cystitis, pyelonephritis, and urethritis occur much more frequently in women than in men because of the close proximity of the anus, vagina, and urethra in females, and also because of the short length of the female urethra. This allows for relatively easy transmission of bacteria from the anus to the vagina and urethra, and thus to the bladder. In males, bacteria can reach the bladder either by ascending through the urethra or by migrating from an infected prostate gland. While bladder infections are relatively common in women, in men they may signal a more serious problem, such as prostatitis. Men should seek the advice of a physician to determine an exact diagnosis.

The possibility of developing a bladder infection can be increased by many factors, including pregnancy, sexual intercourse, the use of a diaphragm, and systemic disorders such as diabetes. The risk of cystitis is also increased if there is a structural abnormality or obstruction of the urinary tract resulting in restriction of the free flow of urine, or if past infections have resulted in a narrowing of the urethra. Bladder cancer, a condition more common among men than women, can often cause bladder infections. (See under CANCER in Part Two.)

Interstitial cystitis (IC) is a potentially debilitating disorder affecting 52 to 67 out of 100,000 women in the United States. Men can develop a similar condition called nonbacterial prostatitis or prostatodynia. IC is a chronic condition characterized by a combination of uncomfortable bladder pressure, bladder pain, and sometimes pain in your pelvis, which can range from mild burning or discomfort to severe pain. The severity of symptoms caused by IC often fluctuates, and some people may experience periods of remission. Because symptoms are similar to those of other disorders of the bladder and there is no definitive test to identify IC, doctors must rule out other treatable conditions before considering a diagnosis of IC. The most common of these diseases in both sexes are urinary tract infections and bladder cancer. Although there's no treatment that reliably eliminates interstitial cystitis, a variety of medications and other therapies offer relief.

Unless otherwise specified, the dosages recommended in this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

## Urinary Tract Infection Self-Test

An FDA-approved home testing kit is available to help determine if you have a urinary tract infection. Bayer Multistix 7 and Multistix 10 SG reagent strips, and Roche Chemstrip 2LN, Chemstrip 6, 7, 8, 9, or 10SG are available in drugstores. All of the preceding test for the presence of leukocytes, or white blood cells (pus), which indicates infection. The pharmacist may have to order them if they are not in stock.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic and immune enhancer.
Vitamin C plus bioflavonoids	4,000–5,000 mg daily, in divided doses. 1,000 mg daily.	Produces antibacterial effect through acidification of urine. Important in immune function.
<i>Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach. Also use 1 tbsp in 1 qt warm water as a douche.	Needed to restore "friendly" bacteria. Especially important if antibiotics are prescribed.
Calcium and magnesium	1,500 mg daily. 750–1,000 mg daily.	Reduces bladder irritability. Aids in the stress response and works best when balanced with calcium. Use magnesium chelate form.
Multivitamin and mineral complex with vitamin A with carotenoids	10,000 IU daily. 15,000 IU daily.	Needed for essential balanced vitamins and minerals. Use a high-potency, hypoallergenic form.
N-acetylcysteine	500 mg twice daily, on an empty stomach.	A potent detoxifier that neutralizes free radicals.
Potassium	99 mg daily.	Replaces potassium lost as a result of frequent urination.
Vitamin B complex	50–100 mg of each major B vitamin twice daily, with meals (amounts of individual vitamins in a complex will vary).	Necessary for proper digestion. High doses are necessary if antibiotics are used.
Vitamin E	200 IU daily.	Combats infecting bacteria. Use d-alpha-tocopherol form.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Important in tissue repair and immunity. Needed to balance with zinc.

## Herbs

☐ Cranberry is one of the best herbal remedies for bladder infections. Quality cranberry juice produces hippuric acid in the urine, which acidifies the urine and inhibits bacterial growth. Other components in cranberry juice prevent bacteria from adhering to the lining of the bladder. Drink 1

quart of cranberry juice daily. Purchase pure, unsweetened juice from a health food store. If pure cranberry juice is not available, cranberry capsules can be substituted. Always take these with a large glass of water. Avoid commercial cranberry juice cocktail products. These contain relatively little pure cranberry juice (less than 30 percent in some cases) and have high-fructose corn syrup or other sweeteners added.

- Birch leaves are a natural diuretic and reduce some of the pain associated with bladder infections.
- Dandelion tea or extract acts as a diuretic and liver cleanser, and aids in relieving bladder discomfort.
- Hydrangea is good for stimulating the kidneys and flushing them clean.
- Diuretics help to cleanse the system. By promoting the release of fluids from the tissues, diuretics also help to relieve the false sensations of urgency that are characteristic of cystitis. Combinations of the herbs listed above are often most effective in flushing the kidneys and helping to reduce the urgent need to urinate.
- Fresh blueberries are a very effective antioxidant. Anthocyanidins are present in the blue pigment, and may prove as useful as cranberries in preventing urinary tract infections. The herb bilberry, a type of blueberry, is also good.
- Buchu is good for a bladder infection accompanied by a burning sensation upon urination.
- Goldenseal is good for bladder infections if there is bleeding, and is most effective as an herbal antimicrobial agent.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Kidney Bladder formula from Nature's Way and Kidney Blend SP-6 from Solaray are herbal formulas that have a diuretic effect and reduce bladder spasms. Take 2 capsules twice daily.
- Marshmallow root increases the acidity of urine, inhibiting bacterial growth. Drink 1 quart of marshmallow root tea daily. It helps to strengthen and cleanse the bladder.
- Bearberry (*Uva ursi*, a type of cranberry), used in small amounts and diluted with other herbal teas, acts as a mild diuretic and antiseptic. It is effective against *E. coli*.
- Other beneficial herbs include burdock root, juniper berries, kava kava, echinacea flower root, stinging nettle, cleavers plant, yarrow, barley water, herbal teas, and rose hips.

*Cautions:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbitu-

rates, antidepressants, and antipsychotic drugs. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

## Recommendations

- Drink plenty of liquids, especially cranberry juice. (See *under Herbs*, above.) Drink at least one 8-ounce glass of water every hour. This is extremely beneficial for urinary tract infections. Steam-distilled water is preferable to tap water.
- Include celery, parsley, and watermelon in your diet. These foods act as natural diuretics and cleansers. Celery and parsley juice or extract can be purchased at a health food store or made fresh at home if you have a juicer.
- Avoid citrus fruits; these produce alkaline urine that encourages bacterial growth. Increasing the acid content in urine inhibits the growth of bacteria. (See *ACIDOSIS under ACID/ALKALI IMBALANCE* in Part Two for a list of acid-forming foods.)
- Stay away from alcohol, caffeine, carbonated beverages, coffee, chocolate, refined or processed foods, and simple sugars. Chemicals in food, drugs, and impure water have an adverse effect on the bladder.
- Perform a one- to three-day cleansing fast. (See *FASTING* in Part Three.)
- Take 2 teaspoonfuls of whey powder or 2 acidophilus tablets or capsules with each meal. This is especially important if antibiotic therapy is required.
- Take a twenty-minute hot sitz bath twice daily. Hot sitz baths help to relieve the pain associated with cystitis. Bath-erapy from Queen Helene, a product that can be found in health food stores or online, is excellent. Or you can add one cup of vinegar to a sitz bath (or to shallow bathwater) once a day. A woman should position her knees up and apart so that the water can enter the vagina. Alternate this with a bath made with two cloves of crushed garlic or an equivalent amount of garlic juice. (See *SITZ BATH* in Part Three.)
- Use acidophilus douches as recommended under *Nutrients*, above. If cystitis is associated with vaginitis, alternate this with apple cider vinegar douches.
- Avoid taking excess zinc and iron supplements until healed. Taking over 100 mg of zinc daily can depress the immune system; bacteria require iron for growth. If a bacterial infection is present, the body stores iron in the liver, spleen, and bone marrow in order to prevent further growth of the bacteria.
- Do not delay emptying the bladder. Making sure that you urinate every two to three waking hours—"voiding by the clock"—can help.
- Keep the genital and anal areas clean and dry. Women should wipe from front to back after emptying the bladder

or bowels, should empty the bladder before and after exercise and sexual intercourse, and should wash the vagina after intercourse. Diaper wipes are soothing, sanitary options to clean oneself.

- Wear white cotton underwear; nylon underwear should be avoided.
- Change into dry clothes as soon as possible after swimming; avoid sitting around in a wet bathing suit.
- Do not use “feminine hygiene sprays,” packaged douches, bubble baths, tampons, sanitary pads, or toilet paper containing fragrance. The chemicals these products contain are potentially irritating.
- If you suffer from frequent urinary tract infections, use sanitary pads rather than tampons.
- If urination is painful but harmful bacteria cannot be found, discontinue use of all types of soaps and use only water to cleanse the vaginal area. Some people are sensitive to soap; an all-natural soap from a health food store is recommended.
- If there is blood in the urine, consult your health care provider. This can be a sign of a more serious problem that warrants medical attention.

### Considerations

- Optimal immune function is important in both fighting and preventing all bacterial disorders.
- Caffeine causes the muscles around the bladder neck to contract, and can produce painful bladder spasms.
- Habitually retaining the urine in the bladder for long periods increases a woman’s risk of urinary tract infection, and may increase the risk of bladder cancer.
- Shrinkage of urethral and vaginal membranes, which most commonly occurs after menopause as a result of a reduction in the amount of estrogen in the body, can increase the tendency to develop bladder infections. Urethral dilation helps stretch a contracted urethra.
- Food allergies often cause symptoms that mimic bladder infections. Food allergy testing can determine which foods are causing the allergic reaction. (See ALLERGIES in Part Two.)
- Using aluminum cookware may cause cystitis symptoms.
- Cadmium, a toxic metal, may cause urinary problems.
- If you suffer from inconsistent bladder control, consider sacral nerve stimulation, a new implant designed to treat bladder problems. This small device sends electronic signals to the nerves connected to the bladder, which helps prevent incontinence and dramatically improves quality of life.
- Women who suffer from frequent urinary tract infections are forced to stay on a continued regimen of low-dose antibiotics to prevent recurrence. Researchers from the University of Michigan announced in 2009 that they had

developed the first effective vaccine to prevent urinary tract infection (UTIs). Those who would benefit from a vaccine are people who are resistant to antibiotics, those who are allergic to antibiotics, or those who experience side effects that preclude them from using antibiotics for UTIs.

- Antibiotics and analgesics may be necessary treatments for cystitis, especially for persistent and/or painful infections. Beware of resorting to them too often, however. Antibiotics disturb the normal internal flora, and may actually promote recurrent infections by promoting the development of antibiotic-resistant strains of bacteria. In fact, because antibiotics have been widely prescribed over many years, there are many types of bacteria (estimates run from 50 to 80 percent) that are now resistant to common antibiotics, such as sulfa drugs and tetracycline. This forces doctors to resort to more powerful and potentially more dangerous antibiotics that pose a greater risk of adverse reactions and side effects. For most bladder infections, a natural approach to treatment is often effective, but if a severe condition persists beyond a day or two, consult your health care provider.
- Recurrent cystitis may be a sign of a more serious problem, such as bladder cancer, an anatomical anomaly, or immune deficiency. Cystoscopy, a simple visual examination of the bladder, is indicated.
- An oral medication, pentosan (Elmiron), is the only oral drug approved by the Food and Drug Administration specifically for interstitial cystitis (IC).
- In one study, one gram of quercetin improved symptoms of interstitial cystitis. In another study, 300 mg of quercetin helped women feel better and they scored better on a standardized test of symptoms. Both studies of quercetin used a blend of quercetin, chondroitin sulfate, and sodium hyaluronate.
- See also KIDNEY DISEASE, PROSTATITIS, and VAGINITIS in Part Two.
- For sources of additional information about bladder infections, see Health and Medical Organizations in the Appendix.

### BLEPHARITIS

See under EYE PROBLEMS.

### BLOOD PRESSURE PROBLEMS

See HIGH BLOOD PRESSURE.

### BLOOD SUGAR PROBLEMS

See DIABETES; HYPOGLYCEMIA.

### BOIL

Boils, referred to as *furuncles* by medical professionals, are round pus-filled nodules on the skin that result from infec-

tion with *Staphylococcus aureus* bacteria. The infection begins in the deepest portion of a hair follicle, or in an oil-producing sebaceous gland, and works its way up to the skin's surface. Poor nutrition, illness that has depressed immune function, diabetes mellitus, poor hygiene, and the use of immunosuppressive drugs are common contributing factors.

This disorder is common, especially among children and adolescents. Boils often appear on the scalp, buttocks, face, or underarms. They are tender, red, and painful, and they appear suddenly. Symptoms that a boil may be forming include itching, mild pain, and localized swelling. Within twenty-four hours, the boil becomes red and filled with pus. Fever and swelling of the lymph glands nearest the boil may occur.

Boils are contagious. The pus that drains when a boil opens can contaminate nearby skin, causing new boils, or can enter the bloodstream and spread to other body parts.

A carbuncle is a cluster of boils that occurs when the infection spreads and other boils are formed. The formation of a carbuncle may be an indication of immune depression.

Without treatment, a boil usually comes to a head, opens, drains, and heals in ten to twenty-five days. With treatment, symptoms are less severe and new boils should not appear.

Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under six years old, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Colloidal silver	Apply topically as directed on label.	A natural antibiotic and disinfectant. Destroys bacteria, viruses, and fungi. Promotes healing.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic that potentiates immune function.
Kyo-Green from Wakunaga	As directed on label.	To aid in cleansing the bloodstream and reducing infection.
<i>Very Important</i>		
Proteolytic enzymes	As directed on label. Take on an empty stomach.	Speeds up cleansing process at infection sites.
Vitamin A	75,000 IU daily for 1 month, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Antioxidants necessary for proper immune system function. Use emulsion forms for easier assimilation and greater safety at high doses.
and carotenoid complex	As directed on label.	<i>Caution:</i> Do not take this supplement if you are pregnant or nursing.

Vitamin C with bioflavonoids	3,000–8,000 mg daily, in divided doses.	Powerful anti-inflammatory and immune system stimulant.
Vitamin E	200 IU daily.	A powerful antioxidant. Use d-alpha-tocopherol form.
Zinc	50 mg daily	Aids in healing and enhances the immune system.
<i>Helpful</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	Important for oxygen utilization and immune function. Works well with coenzyme Q <sub>10</sub> in ridding the body of impurities.
Kelp plus multimineral complex	2,000–3,000 mg daily, in divided doses. As directed on label.	To supply balanced minerals. Use a high-potency formula.
Raw thymus glandular	500 mg daily.	Stimulates the immune system. (See GLANDULAR THERAPY in Part Three.)
Silica or oat straw	As directed on label.	Supplies silicon, which reduces inflammatory reaction. See under Herbs, below.

### Herbs

Burdock root, goldenseal, olive oil extract, and pau d'arco are all natural antibiotics that help to rid the body of infections and toxins.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Dandelion, burdock root, and milk thistle cleanse the bloodstream and the liver.

Echinacea and goldenseal help to cleanse the lymph glands.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Flax and fenugreek, simmered together and mashed into a pulp, can be used as a compress.

Oat straw, taken in tea form, supplies silica, which has an anti-inflammatory effect.

Onion poultices are good for boils. Apply pieces of onion wrapped in a piece of cloth—not directly to the area. (See USING A POULTICE in Part Three.)

Red clover acts as a natural antibiotic and is good for bacterial infections. It cleanses the liver and the bloodstream.

- Suma boosts the immune system.
- Tea tree oil compresses act as an antiseptic. Add 9 to 10 drops of the oil to 1 quart of warm water. Soak a clean cloth in the warm liquid and apply to the boil. The tea tree oil can be left on the boil for thirty minutes or more, and may be applied three or four times a day.

### Recommendations

- Use a cleansing fast to clear the system and rid the body of toxins that may cause boils. (See FASTING in Part Three.)
- To relieve pain and help to bring the boil to a head, apply moist heat three or four times a day. Wet a clean towel or sterile gauze pad with warm water and apply it to the boil. Place a heating pad or a hot water bottle on top. Do this for twenty minutes three or four times a day. Use a clean towel or fresh piece of gauze each time to prevent spreading the infection. Warm Epsom salts baths are also good.
- Do not cover a boil with an adhesive bandage, but do avoid irritation, injury, or trauma to the affected area. To avoid sweating, do not exercise or engage in strenuous activity until the boil heals.
- Keep the skin clean. Wash the infected area several times a day and swab it with antiseptic. You can also apply honey directly to the boil. Vitamin A and E emulsion, applied directly on boils, is helpful. Clay packs and/or chlorophyll are also good. Both of these can be found in health food stores. Apply them directly to the boil with a sterile gauze pad.
- Charcoal capsules made into a paste and applied to the boil will help draw out the infection. Break open 2 capsules of charcoal and mix with just enough water to make the paste.
- Belladonna*, a homeopathic remedy, helps reduce swelling and inflammation. Another homeopathic remedy, *Calcarea sulphurica*, is useful if a boil has opened and is draining but is not healing properly.
- If a boil is very large, persistent, or recurrent, consult your physician. Surgical incision and drainage may be necessary. Severe cases may require bed rest.

### Considerations

- Boils may be symptomatic of a more serious infection within the body. They should always be treated with care, especially if they are accompanied by other symptoms, such as a fever or a poor appetite.
- Boils should not be squeezed or punctured prematurely. In very serious cases, boils may need to be incised by a doctor.
- A doctor may prescribe an oral antibiotic. These drugs have side effects, however. It is best not to use them unless other measures fail.

- The area around a draining boil (especially on the face) may be protected with a prescribed antibiotic cream to help prevent complications such as septicemia or meningitis.
- Over-the-counter antibiotic ointments are ineffective for boils and should be avoided.

### BREAST CANCER

The human breast is a gland that contains milk ducts, lobes, fatty tissue, and a network of lymphatic vessels. Cancerous tumors can arise in virtually any part of the breast and are most often detected when a woman feels a lump. In general, cancerous lumps are firm, never go away, and are usually (though not always) pain-free. The vast majority of breast lumps are not cancerous (many are cysts or fibroid masses), but there is no way to tell without a professional's examination. A lump that seems to be growing or that does not move when pushed may be cancerous or may simply be caused by normal fibrocystic changes during the menstrual cycle. A biopsy is required to identify the lump. Breast cancer can also cause a yellow, bloody, or clear discharge from the nipple.

People tend to think of breast cancer as a single entity, but there are actually different types of the disease. The most common types of breast cancer include the following:

- *Ductal carcinoma in situ (DCIS)*. This is a condition that most doctors consider to be breast cancer at its earliest stage. DCIS is a cancer contained within the milk ducts. The rate of this type of cancer has increased dramatically over the past twenty-five years. Fortunately, the survival rate for DCIS is nearly 100 percent. However, having DCIS can increase the risk of developing invasive breast cancer.
- *Invasive ductal carcinoma (IDC)*. This is a cancer that arises in the lining of the milk ducts and infiltrates (invades) the surrounding breast tissue. Approximately 80 percent of all cases of breast cancer are infiltrating ductal carcinomas.
- *Lobular carcinoma in situ (LCIS)*. This condition begins in the milk-making glands but does not go through the wall of the lobules. Although not a true cancer, having LCIS increases a woman's risk of getting cancer later. For this reason, it's important that women with LCIS make sure they have regular mammograms.
- *Invasive lobular carcinoma (ILC)*. This cancer starts in the milk glands or lobules. It can spread to other parts of the body. About one out of ten invasive breast cancers is of this type.
- *Inflammatory Breast Cancer (IBC)*. A rare and aggressive form, it accounts for about 1 to 3 percent of all breast cancers. In this type of cancer, a tumor arises in the lining of the milk ducts and, as it grows, it plugs the lymphatic and blood vessels. The skin thickens and turns red, and the breast becomes extremely tender and looks infected. This type of cancer spreads very quickly due to

the rich blood and lymph vessel supply associated with the inflammatory reaction.

Unusual types of breast cancer include phyllodes tumor, angiosarcoma, osteosarcoma, metaplastic breast cancer, adenoid cystic carcinoma, and Paget's disease of the breast. There are also rare subtypes of invasive ductal carcinoma—tubular, mucinous, medullary, and papillary.

Cancer of the breast is the most common cancer among women (other than skin cancer), and is the second leading cause of cancer death (following lung cancer) for women in the United States. The American Cancer Society estimates that in 2009 about 192,000 women were diagnosed as having breast cancer, and about 40,000 women die of it each year. The lifetime risk of developing breast cancer for American women is one in eight. The chance of dying from breast cancer is about one in thirty-five. Breast cancer death rates are going down, which is probably the result of finding the cancer earlier and improved treatment. Surveys suggest that it is the health problem most feared by women, but if breast cancer is detected early, the five-year-and-beyond survival rate is very high—about 95 percent. Right now there are about two and a half million breast cancer survivors in the United States.

There is probably no single answer as to what causes breast cancer. Researchers believe, however, that the female sex hormone estrogen is the most likely culprit in many cases of breast cancer. (Although not all breast cancers are related to estrogen.) Estrogen promotes cellular growth in the tissues of the breasts and reproductive organs, and cancer is a disorder of unrestrained cellular growth. Moreover, some of the known risk factors for breast cancer include onset of menstruation before age nine, menopause after age fifty-five, having a first child after age forty, and having no or few children. One thing all of these risk factors have in common is that they result in the breasts being exposed to more estrogen for longer periods.

Currently, research does not point clearly to environmental factors (such as exposure to pesticides and other pollutants) as a possible factor in the development of breast cancer. However, research on the effects of pesticides is ongoing, and there are many health care professionals who advise avoiding these substances as much as possible, as their effects may mimic those of estrogen in the body.

There may be a link between obesity and an increased risk of developing breast cancer, especially for women over fifty years of age. However, this is a complex issue. The risk appears to vary depending on whether a woman has been obese since childhood, or if she gained the excess weight during adulthood. A study reported in the journal *Cancer* found that women who gained more than twenty-two pounds since their teenage years doubled their chances of getting breast cancer. The increased risk posed by obesity may also be linked to estrogen. Obese women tend to have higher levels of estrogen in their bodies than thin women do. A study conducted in Mexico found that eating lots of carbo-

hydrates raises the risk of getting breast cancer. In another study, the same was found for French women. The postmenopausal women who consumed more rapidly absorbed carbohydrates (high-glycemic-load carbohydrates) and who were overweight with a large waist circumference as a result of fat on the abdomen had a greater breast cancer risk.

There are conflicting reports as to whether eating a high-fat diet is linked to an increased risk of breast cancer. The largest study including nearly 50,000 postmenopausal women found no significant effect of dietary fat intake on the development of breast cancer. However, for women who already have breast cancer, a low-fat diet that results in weight loss has been shown to protect against a recurrence of the disease. The women in this study consumed about 22 percent of their calories from fat and lost about six pounds. Many physicians believe fat intake is among the highest risk factors. They argue that if a woman eats a diet high in fat and low in fiber her body produces more estrogen. Fiber from cereal and fruits appears to reduce the chances of getting breast cancer. Although it is possible for a woman to get breast cancer at any age, the disease is most common in women over forty, especially postmenopausal women.

Heredity is a factor in breast cancer as well; there are certain types of the disease that clearly run in families. Researchers estimate that only 5 to 10 percent of breast cancers occur in women with a clearly defined genetic predisposition for the disease. Hereditary cancers usually develop before the age of fifty. A Danish study of more than 100,000 women found that each 2.2-pound (1-kilogram) rise in birth weight was associated with an increase in breast cancer risk of some 9 percent. Another study showed that 10-pound babies had triple the incidence of breast cancer later in life than their peers who weighed in at between 5.5 and 7.7 pounds. Researchers theorize that faster growth in the womb might somehow "program" breast cells to multiply faster and raise the odds of having them turn cancerous.

Men also can get breast cancer, but they account for less than 1 percent of breast cancer cases. However, while it occurs less frequently, breast cancer in men usually is diagnosed at a later, and therefore more serious, stage because neither physicians nor their patients tend to suspect it. Every year in the United States fewer than 2,000 men are diagnosed with breast cancer—and 400 die from it. Cure rates are, in general, the same for men as they are for women.

It is important to detect breast cancer in its earliest and most curable stage. Making healthy changes in diet and lifestyle, examining your breasts regularly (*see* BREAST SELF-EXAMINATION, below), and having regular mammograms can increase your chances of avoiding or, if need be, overcoming breast cancer.

### Breast Self-Examination

It is important to examine your breasts each month past age twenty, at the same point in your menstrual cycle, preferably the first week after your menstrual period ends. Do not ex-

amine them during your menstrual period. Before the period, a woman's breasts may swell and become tender or lumpy. This usually decreases after the period. The breasts also become larger and firmer during pregnancy, in preparation for breast-feeding. Familiarize yourself with the normal feel of your breasts so that you can detect any changes such as enlargement of a lump. A woman who is accustomed to the way her breasts feel is better able to notice subtle changes. Any changes in your breasts should be reported to your health care provider, and a professional should recheck you if you have any doubt concerning your examination. Since men also can get breast cancer, they can benefit from self-examination as well. The following is the recommended procedure for breast self-examination:

1. While standing and looking in the mirror, raise your hands over your head and press them together. Notice the shape of your breasts. Place your hands on your hips, apply pressure, and look for irritation or dimpling of the skin, nipples that seem to be out of position, one breast that looks different from the other, swelling in a portion of the breast, nipple pain, an inward curve of the nipple, a discharge from the nipple (other than breast milk), or red scaling or thickening of the skin and nipples.
2. Raise one arm above your head. With the other hand, firmly explore your breast. Beginning at the outer edge, using a circular motion, gradually work toward the nipple. Take your time when examining the area between the nipple and the armpit, and feel the armpit as well. You have lymph nodes in the armpit; they move freely and feel soft, and are not painful to the touch. Look for lumps that are hard and not mobile. Cancers are often attached to underlying muscle or the skin. When you have finished examining one breast, repeat this on the other side.
3. Lie down on your back and repeat step 2. Lumps may be more easily detected in this position. Also, squeeze each nipple gently to check for blood or a watery yellow or pink discharge.

In addition to monthly self-examination, the American Cancer Society recommends that women between the ages of twenty and thirty-nine have their breasts examined by a physician every one to three years. After age forty, the exam should be performed every year. Women should get their first mammogram by age forty, then have one every year along with their yearly exam.

The program recommended below is designed for women who have been diagnosed with breast cancer as well as for women who want to increase their odds of avoiding breast cancer.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub>	100 mg daily.	Improves cellular oxygenation. There is mounting evidence supporting the theory that coenzyme Q <sub>10</sub> reduces the risk of breast cancer.
Colostrum (Colostrum Plus from Symbiotics or Colostrum Prime Life from Jarrow Formulas)	As directed on label.	Promotes accelerated healing and boosts the immune system.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Improves cellular oxygenation.
Essential fatty acids (Kyolic-EPA from Wakunaga, black currant seed oil, borage oil, flaxseed oil)	As directed on label.	Needed for proper cell reproduction.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Enhances immune function.
Germanium	200 mg daily.	A powerful immunostimulant that improves cellular oxygenation, deterring cancer growth.
Melatonin	3–50 mg at bedtime.	Blocks estrogen-receptor sites on breast cancer cells.
Multimineral complex with calcium and magnesium and potassium and zinc	2,000 mg daily. 1,000 mg daily. 99 mg daily. 50 mg daily.	Essential for normal cell division and function. Use a comprehensive formula that contains all major minerals and trace elements but that is iron-free. Good for strengthening immunity
Multivitamin complex	As directed on label. Take with meals.	All nutrients are needed for nutritional balance. Do not use a sustained-release formula or a formula that contains iron.
Natural beta-carotene or carotenoid complex (Betatene)	10,000 IU daily. As directed on label.	A powerful antioxidant that destroys free radicals.
Proteolytic enzymes (Inf-zyme Forte from American Biologics)	2 tablets between meals (to reduce inflammation) and 2 tablets with meals (to aid digestion). When taking them with meals, it is best to take them with protein foods.	Powerful free radical scavengers. Reduce inflammation.
plus multiple enzyme complex	As directed on label.	To aid in digestion.
Selenium	200–400 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Protects the immune system by preventing the formation of free radicals, which can damage the body. It has also been found to function as a preventive against the formation of certain types of tumors, including breast tumors.

Superoxide dismutase (SOD)	As directed on label.	Destroys free radicals. Consider injections (under a doctor's supervision).	L-cysteine and L-methionine and glutathione plus	As directed on label. As directed on label. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To detoxify harmful substances. (See AMINO ACIDS in Part One.)
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin) and choline	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg daily. Do not exceed this amount.	To improve circulation, build red blood cells, and aid liver function; necessary for normal cell division and function.  Involved in the regulation of enzyme and hormone production. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.	Taurine Plus from American Biologics	As directed on label.	Functions as foundation for tissue and organ repair. Use the sublingual form.
plus vitamin B <sub>12</sub> and folic acid	2,000 mcg daily. 400–800 mcg daily.	To prevent anemia and aid in proper digestion and absorption of nutrients. Consider injections (under a doctor's supervision). If injections are not available, use a sublingual form such as Superior Source supplements from Continental Vitamin.	Pycnogenol	As directed on label.	A powerful antioxidant.
plus brewer's yeast	As directed on label.	Aids in reducing estrogen production. A source of B vitamins.	Raw glandular complex plus raw thymus glandular and raw adrenal glandular	As directed on label. As directed on label. As directed on label.	To stimulate glandular function, especially the thymus, the site of T lymphocyte production. (See GLANDULAR THERAPY in Part Three.)
Vitamin C with bioflavonoids plus extra quercetin	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.) 400 mg 3 times daily or as directed on label.	Powerful anticancer agent.	S-Adenosylmethionine (SAME)	As directed on label.	Aids in stress-relief, relieves depression, eases pain, and produces antioxidant effects. Has been found to inhibit growth of breast cancer cells in laboratory tests. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
Vitamin D	As directed on label.	Inhibits cell division and growth. Low levels of vitamin D have been linked to higher breast cancer rates.			
Vitamin E	200 IU daily.	Deficiency has been linked to breast cancer. Also aids in hormone production and immune function. Use an emulsion form for easier assimilation and greater safety at higher doses. Blocks free-radical damage in fatty breast cells. Use d-alpha-tocopherol form.			
<b>Important</b>					
Maitake	4,000–8,000 mg daily.	Inhibits the growth and spread of cancerous tumors. Also boosts immune response.			
<b>Helpful</b>					
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	To replenish "friendly" bacteria in the colon. Contains powerful anti-carcinogenic compounds. Breaks down metabolites of estrogen. Use a nondairy formula.			
Aerobic O7 from Aerobic Life Industries	As directed on label.	Antimicrobial agents.			
Kelp or seaweed	1,000–1,500 mg daily. As directed on label.	For mineral balance.			
L-carnitine	As directed on label.	Protects the skin after mastectomy and/or radiation treatment. Use a form derived from fish liver (squalene).			

## Herbs

Astragalus root and echinacea enhance immune function. These herbs are best used in a rotating fashion, for no more than seven to ten days in a row.

*Cautions:* Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Drink herbal teas such as bilberry, burdock root, ginger, green tea, peppermint, and red clover instead of regular tea.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Black cohosh, chasteberry, red clover, and turmeric are herbs that are high in phytoestrogens. Phytoestrogens are forms of estrogen that are much weaker than the body's estrogens, but that are capable of blocking the stronger, more damaging estrogens (they can fit into the same receptors in breast cells that estrogens can, thus preventing the estrogen's ability to dock there). Phytoestrogens also expand the length of the menstrual cycle, possibly lowering the lifetime exposure to estrogen.

**Caution:** Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Burdock root, dandelion root, milk thistle, and red clover all protect the liver and aid in cleansing the bloodstream.

Red clover is often used to help with menopausal symptoms such as hot flashes. It contains isoflavones, which are hypothesized to protect against breast cancer. In one study, red clover did not increase mammographic breast density and had no effect on hormones, which are thought to promote breast cancer. Conventional hormone replacement increases breast density, so red clover may offer a natural alternative. However, other studies have found red clover to act like estrogen and therefore not be appropriate for women with some forms of breast cancer.

Chaste tree berry (also known as vitex), ginseng, and soy extracts may inhibit the growth of breast cancer cells.

**Caution:** Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Curcumin (the yellow pigment found in turmeric) is the chief ingredient of curry. It is a powerful anti-inflammatory and protects against inflammatory calcium loss from our bones.

Calcium D-glucarate is a botanical extract found in grapefruit, apples, oranges, broccoli, and Brussels sprouts. Scientists are discovering that it appears to protect against cancer and other diseases via a different mechanism than antioxidants such as vitamin C, carotenoids, and folic acid. These vitamin antioxidants work by neutralizing toxic free radical damage in the body. There are, however, other mechanisms by which the human body can detoxify itself. Glucuronidation is a detoxification process that occurs when toxins or carcinogens are combined with water-soluble substances, thus making them more easily removed from the body. D-glucarate has been shown to support this process by inhibiting an enzyme called beta-glucuronidase.

Rosemary extract is a powerful antioxidant that helps to remove estrogens and may inhibit breast cancer development.

Lycopene may reduce the risk of breast cancer.

Sulphoraphane, from broccoli sprout extract, has been shown to stimulate the body's production of detoxification enzymes that help eliminate xenoestrogens. It is also a powerful antioxidant.

Green tea extract, which contains catechins and flavonoids, may be protective against estrogen-dominant breast cancer.

**Caution:** Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Garlic is known to be a cancer-preventing nutrient.

Ginkgo biloba enhances circulation and brain function.

**Caution:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Licorice root aids in maintaining proper organ function.

**Caution:** Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Silymarin, an antioxidant extract of milk thistle, has shown promise for fighting breast cancer. It also protects the liver.

The following combination of herbs was shown to have no effect on reducing breast cancer risk: *Curcuma longa*, *Cynara scolymus*, *Rosmarinus officinalis*, *Schisandra chinensis*, *Silybum mariunum*, and *Taraxacum officinalis*.

## Recommendations

Eat a high-fiber diet based on fresh fruits and vegetables, plus grains, legumes, raw nuts (except peanuts) and seeds, and soured products such as low-fat yogurt. Very important are the cruciferous vegetables, such as broccoli, Brussels sprouts, cabbage, and cauliflower, and yellow/orange vegetables, such as carrots, pumpkin, squash, sweet potatoes, and yams. Eat vegetables raw or lightly steamed. For grains, use unpolished brown rice, millet, oats, and wheat. Eat whole grains only. If at all possible, consume only organically grown foods. Pesticides and other chemicals have been linked to breast cancer (they may mimic the effect of estrogen on the body).

Include soy foods in your diet. Diets high in fiber and soy foods are associated with a lowered risk of breast cancer. Some good sources of soy include fresh soybeans, tempeh, soymilk, soy nuts, tofu, and soy powder. However, if you have breast cancer check with your doctor before consuming soy because it may have a stimulating effect on breast tumors.

Include in your diet fresh apples, cherries, grapes, plums, and all types of berries.

Eat onions and garlic, or take garlic in supplement form.

Lignins are a class of phytoestrogens (plant estrogens) that seem to reduce breast cancer risk. These substances are found in seeds (especially flax), whole grains, berries, fruits, vegetables (especially broccoli and sprouts), and nuts.

Make sure your diet provides adequate amounts of essential fatty acids (EFAs). Omega-3 EFAs (found in fish and flaxseed) and omega-9 EFAs (found in olive oil) lower cancer risk. Eating salmon weekly and tuna three times a week will provide a good amount of EFAs. Processed fish

oil supplements are also a good idea, but avoid cod liver oil, as its levels of vitamin A and D are too high. Fish oil has been reported to possibly slow tumor growth. Flaxseed oil or flaxseeds can be sprinkled onto food.

❑ Make a daily juice using a combination of fresh organic broccoli, cauliflower, carrots, kale, dark leafy greens, and an apple. These are high in phytochemicals such as indole-3-carbinol (I-3C) and help to combat breast cancer. The phytochemical I-3C has been shown to detoxify xenoestrogens via the liver and to even reverse abnormal Pap smears.

❑ Limit your intake of fatty, charred, or grilled foods, which have been linked with a higher risk of cancer.

❑ Drink spring or steam-distilled water only, never tap water. Also drink fresh homemade vegetable and fruit juices. Drink fruit juices in the morning and vegetable juices in the afternoon.

❑ If you consume meat, poultry, and dairy products, select organic, hormone-free products. These foods could contain residues of estrogenic hormones that are given to animals in order to promote growth. Well-done red meat has been linked to a higher risk for breast cancer in some studies. Unsweetened low-fat yogurt is an acceptable source of protein.

❑ Do not consume any alcohol, caffeine, junk foods, processed refined foods, saturated fats, salt, sugar, or white flour. Studies have shown that women who ate the most carbohydrates overall (62 percent or more of their total caloric intake) were more than twice as likely to have breast cancer as those eating fewer carbohydrates. Not all carbohydrates are necessarily bad, though. The greatest risk comes from sucrose (table sugar) and fructose (found in most nondiet soft drinks). Obviously, avoiding refined sugars and soft drinks will have a beneficial effect.

❑ Take extra fiber daily. Fiber keeps toxic wastes from being absorbed into the bloodstream. Psyllium husks are a recommended source. The colon must be kept clean, and the bowels must move daily for healing. (See COLON CLEANSING, ENEMAS, and FASTING in Part Three.)

*Note:* Always take supplemental fiber separately from other supplements and medications.

❑ Do not take supplements containing iron unless your doctor says you need it for anemia or other reasons. Iron may be used by tumors to promote their growth.

❑ If you experience itching, redness, and soreness of the nipples, especially if you are not currently breast-feeding, seek evaluation by a physician. These can be symptoms of Paget's disease.

❑ If you are undergoing treatment for breast cancer and find yourself feeling depressed or frightened, try to keep in mind that when medications (especially chemotherapy drugs) are stopped, you will probably start to feel better and to look at things in a different light. Think about all the women, including many celebrities and public figures,

who have had breast cancer and have gone on to have fulfilling lives and careers. Thousands of women who have had breast cancer are living happy, normal lives.

## Considerations

❑ Mammograms can detect small tumors and breast abnormalities up to two years before they can be felt, when they are most treatable. A mammogram should be scheduled within the first fourteen days of your menstrual cycle, when the breasts are less likely to be swollen. You should not use any antiperspirant, deodorant, or powder on the day of the test, as it can interfere with the reading.

❑ Women, especially premenopausal women under age forty, who ate sport-caught fish had nearly double the risk of developing breast cancer than those who did not eat any sport-caught fish. Those women who ate Great Lakes-caught fish had a 74 percent greater risk. Carcinogens, which tend to concentrate in fish flesh, may be the cause. These carcinogens include halogenated hydrocarbons, such as PCBs, DDT, and PBBFs.

❑ Magnetic resonance imaging (MRI) with equipment specifically designed for imaging the breast can be used to evaluate a suspected rupture of a silicone gel-filled breast implant. Even though these are no longer being used, except in clinical studies, many thousands of women still have them. Physicians usually recommend removal of a ruptured implant, regardless of whether it is silicone-filled or a newer saline-filled type.

❑ A study showed that women who used aspirin at least four times a week for at least three months were almost 30 percent less likely to develop estrogen- or progesterone-related breast cancer than those who did not use aspirin. Published in the *Journal of the American Medical Association* in May 2004, the study was led by researcher Mary Beth Terry, Ph.D., and Alfred Neugut, M.D., Ph.D., of Columbia University. Researchers suspect aspirin works by interfering with estrogen production.

❑ One technique may cut down on unnecessary biopsies when dealing with implants, dense breast tissue, and high-cancer-risk patients. The alternative to the mammogram is the MRI, and this is used in most of the cases stated above because mammograms are more likely to miss cancer in these women. However, the MRI has a problem in that it "red flags" a lot of spots that turn out to be benign after biopsy. A newer version of MRI software, called CAD-stream, in conjunction with a dye injection, has shown promising results. In one study at the University of Washington School of Medicine, it missed no cancers and ruled out half of the "red flags" as benign, thus avoiding a biopsy in each case.

❑ There had been a great rise in the use of hormone-replacement therapy (HRT) in past years. This consists of a combination of synthetic estrogen and progestin, and was

designed to help combat the symptoms of menopause (bone loss, night sweats, hot flashes, and so forth). A study reported in the *Journal of the American Medical Association* uncovered some serious problems with the use of this type of therapy. In fact, the study was ended after only five years (it had originally been scheduled to run 8.5 years) because women in the treatment group had a 26 percent increased risk of invasive breast cancer. The study also found that the women who took HRT were 29 percent more likely to have a heart attack and 41 percent more likely to have a stroke. The risk of getting gallbladder and liver disease was also higher, as was the risk of developing blood clots. There is enough clear evidence that the risks of HRT far outweigh any benefits. The millions of women who took or are taking HRT should consider using nutrients to detoxify their bodies of the cancer-causing estrogens and gradually weaning themselves off the therapy. However, some women can benefit from HRT to manage menopausal symptoms. The doses used today are lower and the hormones are prescribed for a limited time, making HRT much less risky today than it once was.

❑ Postmenopausal women who took the drug Letrozole experienced a reduction in breast cancer recurrence of 43 percent as opposed to 13 percent of women on a placebo. Letrozole is proposed as a drug to be used in conjunction with tamoxifen, which is the current post-cancer treatment. Tamoxifen blocks the production of estrogen, but becomes ineffective after five years or so. Letrozole, on the other hand, suppresses production of estrogen and is to be used after a period of tamoxifen treatment. The study results were so persuasive that the study was stopped early, which is a normal protocol, so that all participants could benefit from treatment with Letrozole. Studies on a similar drug, exemestane, showed similar results. Exemestane is sold under the brand name Aromasin.

❑ The connection between exercise and cancer is a fairly new area of research. Some studies suggest that getting regular exercise in youth might give lifelong protection against breast cancer. Even moderate physical activity as an adult may lower breast cancer risk. A study published in the *Journal of the American Medical Association* followed almost 75,000 women aged fifty to seventy-nine as part of the Women's Health Initiative Cohort Study. The study found that women who engaged in the equivalent of 1.25 to 2.5 hours of brisk walking per week had an 18 percent lower risk of getting breast cancer as compared to inactive women over the five-year study period. Women who engaged in up to 10 hours of similar exercise realized a small decrease in risk over and above the 1.25 to 2.5 hour group. Although not part of the study, outdoor exercise where you are getting some (but not too much) sun exposure also raises vitamin D levels.

❑ Most of the newest research on breast cancer focuses on the finding that low levels of vitamin D are associated with a greater risk. Some have proposed that very high

doses of vitamin D (2,000 IU) and small amounts of sunlight exposure will reduce breast cancer risk by 50 percent. However, 2,000 IU exceeds the upper limit of safety set by the DRIs. During puberty, maintaining adequate vitamin D levels was shown to be important to protect against developing breast cancer later in life. The best sources of vitamin D are cow's milk, soymilk, and supplements. Some exposure to the sun with sunblock is also advised. Premenopausal women who had the highest intake of vitamin D and calcium had the lowest risk of breast cancer. Again, these women would benefit from cow's milk, soymilk, and calcium and vitamin D supplements.

❑ Relaxation techniques such as writing, meditation, yoga, or massage therapy can aid in battling breast cancer.

❑ There is a clear link between alcohol consumption and an increased risk of breast cancer. A study reported in *The New England Journal of Medicine* stated that consuming as few as three alcoholic drinks a week increases the potential for breast cancer by 50 percent. In a European study of more than 274,000 women, thirty-five to seventy-five years of age, recent (within six years) alcohol intake increased the risk of breast cancer. However, when the study looked at alcohol intake over a lifetime, it showed no effect on breast cancer risk. The American Cancer Society (ACS) estimates that those who have two to five drinks daily increase their risk to about 1.5 times that of women who drink no alcohol. The ACS recommends that you limit the amount you drink to two drinks, two times a week.

❑ A test from Genomic Health of Redwood City, California, could be helpful to patients who have early breast cancer and must make treatment decisions. The test looks at twenty-one different genes thought to play a role in developing cancerous cells, using them as predictors as to whether a tumor would return after initial treatment. The thrust of the test is to predict whether or not chemotherapy is necessary in individual cases. While it is a promising tool, many doctors are skeptical about trusting such an experimental procedure without further studies to confirm its value. The test is being marketed under the name OncotypeDX.

❑ There is great debate about whether or not fat intake has an effect on the risk of developing breast cancer. (For women who already have breast cancer, lowering fat intake seems to lessen the risk of recurrence of the disease.) The National Women's Health Network urges all women to cut their total fat intake to 20 percent of total calories. Saturated fats should account for no more than 5 percent of calories.

❑ The largest women's health study ever done, the Women's Health Initiative Cohort Study, had 162,000 participants. Some findings taken from the study that were recently presented at an American Society for Reproductive Medicine conference indicated that taking birth control pills during reproductive years was *not* as harmful as

was once thought. In fact, the study indicated a lower risk for heart attack, stroke, high blood pressure, and other related cardiovascular disease (CVD) problems. The overall risk reduction for CVD was 8 percent, and a bonus was a risk reduction of 7 percent regarding any type of cancer. Researchers believe the type of hormones, and when they are taken in life, seems to be what makes them helpful at one point and harmful at another.

Frequent exposure to medical X-rays has been linked to an increased risk for breast cancer.

Early or prolonged use of permanent dark hair dyes has been linked to breast cancer.

Testing methods for breast cancer are increasing the likelihood of catching it early. Minimally invasive breast biopsies (MIBBs) can be performed with virtually no recovery time. Ultrasounds and high-resolution ultrasounds offer a safer alternative to X-rays, and can provide sharp digital pictures. Magnetic resonance imaging can create a three-dimensional image and can be useful in detecting ruptures in silicone breast implants.

A computerized mammogram scanner may increase the likelihood that a woman's cancer can be cured by calling a radiologist's attention to a suspicious area on a mammogram. The computer software analyzes the content of mammograms and highlights, or "red flags," suspicious areas on the images after the radiologist has done the initial evaluation. The device has been shown to improve a radiologist's detection rate from about 80 cancers out of 100 to 88 out of 100.

For some women digital X-rays are better able to detect tumors than film mammography. The results of the Digital Mammographic Imaging Screening Trial (DMIST) indicate that only women who fit in any of the following three categories would benefit from digital mammography instead of film mammography: under age fifty (regardless of level of breast tissue density); of any age, with heterogeneously (very dense) or extremely dense breast tissue; or pre- or perimenopausal women of any age (defined as women who had a last menstrual period within twelve months of their mammograms). According to the results, women who fit all of the following three categories would *not* benefit from digital mammography instead of film mammography: over age fifty; those who do not have dense or heterogeneously (very dense) breast tissue; and those who are no longer menstruating.

A method of detecting if cancer has spread to the lymph nodes, called sentinel node biopsy, allows doctors to pinpoint the first lymph node into which a tumor drains (the sentinel node), and remove only the nodes most likely to contain cancer cells.

If you have a personal family history of breast cancer, you may want to consider genetic testing. Over half of women with certain genetic mutations develop breast cancer by the age of seventy. With the discovery of two "breast

cancer genes" (BRCA1 and BRCA2), gene therapy is receiving more attention. This research is still in its infancy, and much more investigation in this area needs to be done. These genes are hereditary, so if one sister has the gene, other sisters and their mother might want to consider getting tested. A woman who has inherited a harmful mutation in BRCA1 or BRCA2 is about five times more likely to develop breast cancer than a woman who does not have such a mutation. Also, consider what you are going to do with the information. Some women opt to get prophylactic mastectomies after testing positive for a breast cancer gene even if they don't have cancer. Genetic testing can determine whether you have a genetic mutation, but it cannot predict whether you will develop breast cancer. Talk to your doctor if you are considering genetic testing. It is expensive, insurance companies do not always cover it, and if your results are positive, insurance companies may choose to deny you coverage.

People with breast cancer have been found to have lower than normal levels of vitamin E and the mineral selenium, two important antioxidants that work together to neutralize free radicals. Selenium has been shown in lab studies to kill tumors and protect healthy tissue. Research has also shown that people with cancer of the lung, bladder, breast, colon, and skin all have lower than normal levels of vitamin A.

It has been difficult to evaluate whether or not DHEA may prevent breast cancer because studies have yielded conflicting evidence on this point. A stronger, natural descendant of DHEA is 7-keto DHEA. Unlike DHEA itself, 7-keto DHEA is not converted into testosterone or estrogens in the body. It may be a safer alternative to DHEA in combating breast cancer.

Low levels of vitamin B<sub>12</sub> have been linked to an increased risk of breast cancer.

Studies have shown that genistein, found in soy, inhibits new tumor growth, slowing the growth of existing cancer.

Pro Fem progesterone cream from Life Extension Foundation is a natural progesterone cream that can be applied to the breast for direct absorption through the fat under the skin. Progesterone may help reduce the risk of breast cancer, but check with your physician first, as this is a bioactive substance and may interfere with other hormones in the body.

*Caution:* Pregnant women and nursing mothers should not use this product.

Raloxifene (Evista), a drug similar to tamoxifen, has been found in two clinical trials to be at least as effective in the prevention of breast cancer, without the increased risk of uterine cancer linked to tamoxifen. In 2007, the FDA approved raloxifene for reducing the risk of invasive breast cancer in postmenopausal women with osteoporosis and in postmenopausal women at high risk for invasive breast cancer.

□ Epirubicin (Ellence) is a chemotherapy drug that can be used to combat early-stage breast cancer that has spread to the lymph nodes.

□ Capecitabine (Xeloda) is a drug approved for use in women with advanced breast cancer for which no acceptable alternative treatments are available. It was given accelerated approval, an early approval process applied to some drugs that are used to treat life-threatening conditions. This drug is specifically for patients whose tumors are resistant to other treatments. In studies, the drug measurably shrank some patients' tumors. Possible side effects include diarrhea, nausea, vomiting, fatigue, painful inflammation of the mouth, and painful rash and swelling of the hands and feet.

□ Capecitabine (Xeloda), taken orally, and docetaxel (Taxotere), an intravenous drug, have been approved by the FDA to be used in combination to treat advanced cancer. This is to follow treatment with an anthracycline-containing therapy such as doxorubicin (Adriamycin). Doctors limit anthracycline-containing treatments to life-threatening situations. The FDA approved the drug combination after a study of 511 cancer patients demonstrated improvements in overall response rates, lengths of time before the disease worsened, and survival rates. Capecitabine and docetaxel individually are associated with side effects including gastrointestinal symptoms, nausea, vomiting, and painful inflammation of the mouth. If side effects occur it may be necessary to reduce dosages or to interrupt or discontinue treatment. Dosages also may have to be modified for people with impaired kidney function. Drug interaction between capecitabine and coumarin-derivative anticoagulants (Coumadin) may cause serious bleeding and must be carefully monitored.

□ Doctors once believed that extensive surgery could control the spread of breast cancer. However, they now believe that cancer cells may break away from the primary tumor during surgery and spread through the bloodstream, even in the earliest stages of the disease. These cells cannot be felt by examination or seen on X-rays or other imaging methods, and they produce no symptoms. Adjuvant therapy—the use of drug treatment after surgery—can be used to kill these hidden cells. Your health care provider can make recommendations as to whether or not adjuvant therapy is needed in your individual situation. If surgery is recommended, get a second opinion. Drugs approved by the FDA to improve the chances of successfully treating breast cancer include:

- Paclitaxel (Taxol), which is used for both treatment of metastatic or advanced breast cancer and prevention of relapses and which a recent large study indicated was more beneficial when given once a week rather than once every three weeks (the previous standard treatment).
- Tamoxifen (Nolvadex).
- Trastuzumab (Herceptin), an immunotherapy regimen that can be used alone if other drugs have been unsuccessful,

or as a first-line treatment in combination with other drugs.

- Anastrozole (Arimidex) can be used in place of tamoxifen and it has fewer side effects. Anastrozole works by shutting down the hormone estrogen at the source.
- Lapatinib (Tykerb), which targets the HER2 protein and is approved for use in advanced breast cancer. Lapatinib is reserved for women who have already tried trastuzumab and their cancer has progressed.
- Bevacizumab (Avastin), which in 2008 was approved by the FDA as a treatment for late-stage breast cancer.

In addition, cyclophosphamide (Cytoxan) and doxorubicin (Adriamycin), with or without fluorouracil (Adrucil), may be used to treat breast cancer. Chemotherapy treatment is given in cycles, followed by recovery periods. Depending on how far the cancer has spread, treatments can last from three to six months.

□ Fentanyl (Actiq) is a drug that may be prescribed for people in severe pain. It is a narcotic drug that is more potent than morphine and comes in a flavored sugar lozenge form.

□ After surgery, analysis of the tumor is done to determine the type of cancer and to test for the presence of a substance called estrogen-receptor protein, to determine whether the cancer is estrogen-dependent. If the tumor is found to be estrogen-dependent, tamoxifen may be an alternative to conventional chemotherapy.

□ Most women with breast cancer have some type of surgery, depending on the stage of the breast cancer. Options for the surgical treatment of breast cancer have expanded greatly in the past couple of decades. Surgical treatment now emphasizes breast conservation—preserving the breast when possible. Some of the treatment options in breast surgery include:

- *Lumpectomy*, also known as segmental mastectomy or tylectomy. The tumor and a small amount of surrounding tissue are removed. This is the least extensive type of breast cancer surgery. In most cases, a lumpectomy is followed by several weeks of radiation, which is an integral part of breast-conserving treatment.
- *Quadrantectomy*, also known as partial mastectomy. The quadrant of the breast in which the tumor was found is removed, including some skin and the lining of the chest muscle below the tumor.
- *Simple mastectomy*. The entire breast is removed and a sample of the underarm lymph nodes is taken.
- *Modified radical mastectomy*, also known as total mastectomy. The entire breast and all underarm lymph nodes are removed. The lining over the chest muscles may also be removed.
- *Radical mastectomy*, also known as the Halsted radical mastectomy. The entire breast, all the axillary (underarm)

lymph nodes, and the underlying chest muscle are removed. This procedure was once the standard in breast cancer surgery, but today, women with breast cancer rarely undergo this type of surgery because doctors believe that a modified radical mastectomy is just as effective.

- *Bilateral prophylactic mastectomy.* This type of surgery is done in a small percentage of women who are at particularly high risk for breast cancer. In this procedure, both healthy breasts are removed to prevent breast cancer from forming. This is most often performed on women who have an inherited genetic defect that increases their risk of getting breast cancer to 85 percent by the age of seventy. Researchers at the Mayo Clinic have found that this procedure may reduce the risk of developing the disease by almost 90 percent, and deaths due to breast cancer by over 80 percent.

No single procedure can be recommended as ideal for all individuals. A woman and her surgeon must base their decision on the patient's medical status and her particular concerns. Her choice may be influenced by emotional considerations, finances, access to care, body image, and personal beliefs. Depending on the type of surgery that is done, there is the option of having breast reconstruction later.

□ A technique called rotating delivery of excitation off resonance (RODEO) MRI-guided laser lumpectomy soon may be available to treat breast cancer without surgery, radiation, or chemotherapy. The outpatient procedure uses magnetic resonance imaging with lasers that destroy early-stage cancers.

□ In any type of breast cancer surgery, some or all of the underarm lymph nodes may be removed. This is done to check for possible spread of the cancer. If the cancer has spread to the lymph nodes, postoperative therapy may include radiation, chemotherapy, or hormonal therapy. Radiation is always required after a lumpectomy or quadrantectomy to ensure that no more cancer cells remain.

□ After surgery, women are usually advised to avoid moving or carrying heavy objects, to wear loose-fitting clothes and gloves, and to avoid overexposure to the sun. Some women whose lymph nodes are removed during breast cancer surgery have a problem with swelling of the arm, or lymphedema, on that side due to an accumulation of lymphatic fluid. This is not unusual. It can develop just after surgery, or months or even years later, and can be brought on by an injury to (or overuse of) the arm or an infection. To reduce the risk of developing lymphedema, do not have any blood work, chemotherapy, or blood pressure work done on the affected arm. Certain arm exercises are usually prescribed to keep the arm from becoming stiff and to assist in healing. If there is any unusual swelling, redness, or pain in the hand or arm, this should be evaluated by a physician.

□ Hospitals offer some women the opportunity to have a mastectomy on an outpatient basis. In one study, 4 percent

of women who had outpatient surgery required later breast reconstruction, whereas 13 percent of women who had an inpatient procedure later required breast reconstruction. Only a surgeon can decide which method is best for you.

□ Biopsies that are less invasive now can be done using a fine needle aspiration (removing cells from a breast lump) and stereotactic core biopsies (which uses a bigger needle that a computer guides to remove suspicious tissue seen on a mammogram).

□ Combining an MRI with automatic tissue excision and collection (ATEC) allows for a nonsurgical biopsy for many women, particularly those with high-density tissue that masks suspicious lumps when taking a mammogram. This is basically a vacuum-assisted biopsy, and where the suspicious lump is under about 2 cm (about  $\frac{3}{4}$  inch) it can be completely excised. Once the needle is removed, a simple Band-Aid is sufficient to cover the entry mark.

□ Postmenopausal women who drink too much wine are at a higher risk for breast cancer. Moderate drinkers have a much lower (12 percent) risk of developing the disease. A study, conducted at Lund University in Sweden, found that the break point was only 1.5 glasses of wine per day. Moderate drinkers averaged less than that consumption per day.

□ Even when treatment is initially successful, breast cancer returns in one out of three cases. New drugs, treatment regimens, and better diagnostic techniques have improved the outlook for many, and are responsible, according to the ACS, for a decline in breast cancer death rates.

□ For agencies and organizations that can provide more information and services for people with breast cancer, see HEALTH AND MEDICAL ORGANIZATIONS in the Appendix.

## BREAST-FEEDING-RELATED PROBLEMS

Breast-feeding, or lactation, is the natural way in which the mother of a newborn can feed her child instead of relying on cow's milk or artificial infant-formula preparations. A woman's breasts are ideally suited for the task of feeding a baby, and nursing provides many benefits to both mother and baby that bottles and formulas do not. For example, mother's milk is much easier to digest, prevents constipation, lowers the incidence of food allergies, and protects the baby from many infectious diseases. Nursing also promotes healthy oral development, satisfies suckling needs, and enhances bonding between mother and child. Breast-feeding is beneficial to the mother in that it reduces the chance of hemorrhaging from the placental site, gives the mother an opportunity to rest, and encourages the uterus to contract, returning it to its pre-pregnant size.

Women who breast-feed are less likely to develop rheumatoid arthritis than women who don't. Dr. Elizabeth Wood Karlson from Brigham and Women's Hospital in Boston used data from the Nurses' Health Study to explore the contribution of hormonal factors on subsequent devel-

opment of arthritis. Women who breast-fed for a total of twelve to twenty-three months during their lifetime had a 30 percent risk reduction. Those who breast-fed for at least twenty-four months had a 50 percent risk reduction. Besides giving an infant more resistance to bacteria and illness and creating a closer bond between the mother and child, the benefits of breast-feeding include higher brain development.

Some studies have found breast-fed infants to have higher IQs as adults, on average, than formula-fed infants, and to have achieved higher academic levels in adult life. In an eighteen-year study conducted on 1,000 children, it was shown that polyunsaturated fatty acids, particularly the docosahexaenoic acid (DHA) contained in mother's milk, boosted intellectual (neural) development. DHA is considered essential for a baby's development. Formula-fed babies now receive DHA, and while the mother passes a large amount of DHA on to the infant in the last trimester of pregnancy, a baby fed with formula will continue to ingest this most important developmental nutrient. Data is conflicting as to the merits of supplementing DHA in infant formula during the first year of life. Early studies showed that babies were more alert early on, but that non-supplemented babies caught up by age four. Once infants begin eating regular foods they need the other important omega-3 fat, EPA. This comes from fish.

A study of 2,200 Australian children shows that infants who are breast-fed for at least the first four months of life are significantly less likely to develop asthma, wheezing, or respiratory allergies by the age of six. A mother's milk also prevents *Clostridium difficile*, the intestinal bacteria that causes serious colon inflammation and diarrhea in adults, from binding to the cells of the baby's intestinal walls.

Many infants are fed formulas, either for medical reasons or because the mother cannot or chooses not to breast-feed. No woman should feel inadequate or badly about not being able to breast-feed. Many more children today are born premature, which makes breast-feeding more difficult. Also, more multiple births are occurring, again limiting a mother's ability to successfully breast-feed.

In breast-feeding, as with anything else that is new and unfamiliar, problems may occur. This section offers explanations and solutions to the most common breast-feeding problems.

### Engorgement

This is a temporary problem that most commonly occurs between two to five days after childbirth. It is caused by a combination of the increased blood supply to the breast and the pressure of the newly produced milk, resulting in the swelling of the tissues in the breast. A low-grade fever may be present; the breasts feel full, hard, tender, and tight; and the skin of the breasts is hot, shiny, and distended. You do not need engorgement in order to nurse. Seek medical attention immediately to determine if you have engorged breasts or mastitis (*see below*).

### Recommendations

- Give your baby short, frequent feedings. A feeding schedule of every one and a half to two hours day and night should be maintained while engorgement lasts.
- Express milk between feedings to relieve pressure.
- Apply moist heat for thirty minutes preceding each feeding, and massage the breast during feedings to help get the milk flowing.
- Do not use nipple shields, as they can confuse the baby's sucking pattern, damage nipples, reduce stimulation of the breast, and decrease the milk supply.
- To prevent engorgement, feed your baby on demand and without delay, and allow unrestricted suckling time.
- Do not skip or delay feedings during the day or night. Do not give your baby any formula or sugar water, and allow the baby to empty each breast completely at each feeding.
- The American Academy of Pediatrics (AAP) recommends that newborns nurse eight to twelve times every twenty-four hours until the baby is satisfied, usually ten to fifteen minutes on each side.

### Mastitis (Breast Infection)

If a plugged duct is not taken care of, mastitis can result. Acute mastitis is an infection and swelling of the breast, usually occurring as a result of bacteria (most often *Staphylococcus aureus*) entering the nursing mother's breast through cracks or fissures in the nipple. Mothers are most vulnerable to acute mastitis in the first few weeks of nursing because cracks in the nipple develop more often during this time. Soreness and redness in the breast; fever; yellow, puslike secretions from the nipple; general tiredness; and flulike symptoms are indicators of this problem. In fact, in a nursing mother, all flulike symptoms should be considered a breast infection until proven otherwise. A mother who has a high fever, in addition to the aforementioned symptoms, should see a doctor.

### Recommendations

- Drink plenty of fluids.
- Get plenty of rest.
- Air-dry the nipples after nursing to prevent cracking. If the nipples do crack, you can coat them with breast milk, or apply aloe vera juice after they dry to help them heal. You can also apply heat with a hot water bottle or heating pad before and after nursing, or use a heat lamp with a regular 100-watt bulb for a few minutes after nursing in order to heal cracks and prevent infections. Place the lightbulb twelve to eighteen inches from the breast—not so close as to cause discomfort.
- Your doctor may advise you to stop breast-feeding until the infected breast heals. If so, use a breast pump to prevent the breast from becoming engorged.

Remember to always wash your hands before and after breast-feeding to remove germs, and always wash the breast and nipple area afterward.

### Considerations

Most of the minor infections heal by themselves in a few days, but often the pain is significant and may get in the way of feeding your baby, so seeking medical help is best. More severe ones can heal in about a week if treated with antibiotics.

Your health care provider may prescribe antibiotics that can be taken by a nursing mother.

In rare cases, a breast infection results in a breast abscess, in which the sore breast fills with pus. An abscess may have to be incised to allow drainage. This procedure is performed in a physician's office. If an abscess develops, milk should be hand-expressed (massaged) from the infected breast and discarded. Breast-feeding should continue on the uninfected breast until the abscess is healed.

### Plugged Duct

Incomplete emptying of the milk ducts by the baby, or wearing a tight bra, can cause a plugged duct. Soreness and a lump in one area of a breast is an indication of this problem.

### Recommendations

Check the nipple very carefully for any tiny dots of dried milk, and remove them by gentle cleansing. Together with frequent nursing on the affected breast, this should allow the duct to clear itself within twenty-four hours.

Massage the breasts with firm pressure, from the chest wall toward the nipple, to stimulate milk flow.

Alter the position of the baby on the nipple so all the ducts are drained.

Make sure you offer the affected breast first, when the baby's sucking is strongest.

### Sore Nipples

Sore nipples are usually caused by improper nursing positions and nursing schedules, or incorrect sucking by the baby. They can also be caused by infection, most commonly with the fungus *Candida albicans*.

### Recommendations

Nurse on the least sore side first. However, if both breasts are sore, hand-express (massage the breast) until letdown occurs and milk is readily available to the baby.

Make sure that the baby's jaws exert pressure on the least tender spots. Do not pull away when the baby is about to begin feeding. Learn to relax.

Massage your breasts from base to tip to prevent engorgement. Do this during the final weeks of your pregnancy and continue through postpartum.

If cracked nipples accompany soreness, apply aloe vera gel to the nipples to alleviate pain and promote healing. Also, aloe vera (fresh), calendula, marshmallow, and slippery elm are soothing when used in paste form as a poultice, or as wet tea bags, and applied to sore nipples.

Apply avocado oil, calendula ointment, lanolin, and olive oil (separately or in combination) to the breasts to help prevent soreness during pregnancy and while breast-feeding. Wash thoroughly before allowing the baby to breast-feed.

To prevent sore nipples, feed your baby frequently to avoid having a baby who is overly hungry bite down roughly on the nipple. Be sure your baby's mouth takes in as much of the areola (the dark area of the nipple) as possible. The baby shouldn't make slurping noises when feeding.

Change nursing positions often to rotate the pressure of the baby's mouth on the breast, and learn to break suction correctly. Between feedings, keep the nipples dry. Expose them to sunlight and air. Do not wash them with soap, alcohol, or petroleum-based products, which can wash away their natural protection. Instead, you can apply a little colostrum on the nipple and let it air dry.

If the pain is severe and persists despite these measures, it may be a sign of a candida infection. (See FUNGAL INFECTION in Part Two.) Consult your health care provider.

### Nutritional Health While Nursing

The following supplements are beneficial for nursing mothers. After a discussion with your health care provider, you may decide to supplement your diet with these vitamins and minerals.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply needed protein. Soy protein and free-form amino acids are better sources than animal protein.
<i>Helpful</i>		
Bifido Factor from Natren	½ tsp daily, between meals.	For mother. Boosts immune system and provides necessary "friendly" bacteria. Use only unchilled water in preparation.
and LifeStart from Natren	¼ tsp daily, added to water or juice.	For babies over 6 months. Use only unchilled water in preparation.
Calcium and magnesium	1,000–1,500 mg daily. 500–750 mg daily.	Needed by both mother and baby. Use chelate forms. Do not use bone meal or dolomite, as these may contain lead.

Multivitamin and mineral complex with vitamin B complex plus extra folic acid and vitamin C and vitamin D and iron and manganese	As directed on label.  400 mcg daily. 3,000 mg daily. 400 IU daily. As directed by physician. 2 mg daily.	All nutrients are needed by both mother and baby. Use a high-potency formula. Needed for production of milk and to relieve stress. Note: Do not take calcium and manganese together, as they compete for absorption.
--	---	---

## Herbs

- Any of the following herbs can be beneficial for the nursing mother: alfalfa, blessed thistle, dandelion, fennel, and raspberry.
- Nettle leaf has a tonic effect and contains iron, in addition to many other nutrients.
- The following herbs decrease milk supply, and should be avoided until a woman is no longer nursing: black walnut, sage, and yarrow.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

## Recommendations

- Eat plenty of brewer's yeast, eggs, nuts and seeds, and whole grains. Raw foods should be plentiful in the diet.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

- A mother's milk is a nearly perfect food. However, it is low in vitamins A, D, and C. A nursing mother should maintain a balanced diet, but can also benefit from taking prenatal multivitamins and nutritional supplements like calcium, vitamin D, and fish oil. Discuss the need for supplements with your health care provider.
- Despite the conflicting data, if you need to supplement your infant's diet, use infant formula with DHA (docosahexaenoic acid) and ARA (arachidonic acid). Babies under six months should not have anything but water, breast milk, and infant formula—unless otherwise recommended by the child's pediatrician.

## Considerations

- The UCLA Medical School has reported that mother's milk kills a tiny parasite (*Giardia lamblia*) that can cause intestinal disease in children.
- In recent studies, mothers who consumed garlic increased their babies' desire for milk, and the babies nursed longer. Garlic is good for both the mother and the infant. Kyolic from Wakunaga is an ideal way to consume garlic since it is odorless and is therefore more "sociable."

Since breast milk is produced from protein drawn from either your diet or the protein stored in your body, you should consider increasing your protein intake, especially during postpartum weight loss. Studies show you will lose body fat, but not muscle. Make sure you get some exercise and do not overeat calories from fat and carbohydrate.

The American Academy of Pediatrics (AAP) published a revised version of their 1998 guidelines urging women to breast-feed their infants. This restates their position that breast milk is the foundation of good infant nutrition. They recommend that newborns receive nothing other than breast milk for the first six months, meaning no juices, fluorides, iron, or vitamins. This will reduce the risk of obesity later in life. More information can be found at <http://aap-policy.aappublications.org>.

Dr. Ruth Lawrence, author of *Breastfeeding: A Guide for the Medical Profession*, says that, depending on the mother's wishes, breast-feeding should continue for at least a year, along with other foods as they are introduced, and even longer if the mother feels it is best for her and her child.

More than 90 percent of pregnant women take prescription or nonprescription drugs, or use social drugs (tobacco, alcohol) at some time during pregnancy. Some drugs are essential for health, but none should be used without consulting with your health care provider. Drugs can affect the fetus by causing direct damage such as abnormal development, altering placental function, and causing the uterus to contract prematurely. The FDA has classified drugs according to the degree of risk they pose for the fetus. Some are highly toxic and are never used (such as thalidomide). Sometimes safer drugs can be substituted for ones that are more toxic. For example, penicillin is a relatively safe antibiotic. Most antidepressants appear to be safe during pregnancy. Some drugs that cause the most problems during pregnancy include:

- antianxiety drugs (diazepam)
- antibiotics (chloramphenicol, kanamycin, nitrofurantoin, tetracycline)
- anticoagulants (heparin, warfarin)
- anticonvulsants (phenobarbital, phenytoin)
- antihypertensives (ACE inhibitors, beta-blockers, diuretics)
- mood-stabilizing drugs (lithium)
- NSAIDs (aspirin, ibuprofen, naproxen)
- thyroid drugs (methimazole, radioactive iodine)
- vaccines with live virus (vaccine for German measles, and measles, mumps, polio). The H1N1 and regular flu shots are OK.

In a study of new mothers, those who were trained and sent home from the hospital with a breast pump were

found to breast-feed their infants longer than those who were given no pumps.

Breast-fed babies may have a lower risk of becoming sick from several diseases later in life. For example, one study found breast-fed babies were less likely to get meningitis between the ages of five and ten. A Chinese study found that breast-feeding reduced the risk of lymphoma by 31 percent. Another study found that breast-feeding reduced the number of earaches in the first two years of life—even if the baby was only breast-fed for three months.

Breast milk contains high amounts of inositol, a B vitamin that plays a crucial role in survival and infant development.

Women who undergo reduction mammoplasty (breast-reduction surgery) and subsequently become pregnant can retain the ability to lactate and nurse. However, in one study, only 35 percent of such women breast-fed successfully, whereas 65 percent either did not breast-feed or discontinued nursing for various reasons. It was not disclosed whether any of these women were actually unable to secrete sufficient amounts of milk to nurse their babies. Women who are considering breast-reduction surgery should nevertheless consider this if they wish to have children later on and hope to breast-feed.

Included among AAP recommendations to hospitals, pediatricians, and mothers are the following:

- Even if the baby and mother are hospitalized, breast-feeding should continue unless the mother is required to take a medication that could be harmful to the breast-feeding infant. If so, breast-feeding should only be stopped temporarily, until the mother's body no longer contains traces of the medication(s).
- Private areas for breast-feeding mothers should be provided by all hospitals.
- Breast pumps should be provided to breast-feeding mothers in hospitals.
- Insurance companies should be encouraged to provide breast-feeding services and supplies as part of coverage policies.

There are resources available to help women learn to breast-feed successfully and overcome any problems that arise. Certified lactation consultants are practitioners who specialize in this area. Your health care provider or the facility where you give birth should be able to give you a referral.

La Leche League is another valuable resource for the breast-feeding mother. This is an organization of nursing women that can serve as both an educational resource and a support group. Consult your local telephone directory for the chapter nearest you, or contact La Leche League International. (See Health and Medical Organizations in the Appendix.)

## BRONCHITIS

The lungs are among the body's largest organs. The air we breathe enters our bodies through the trachea (windpipe), which connects with the bronchi, the breathing tubes that lead into the alveoli (air sacs) in the lungs. In the lungs, air is exchanged for carbon dioxide.

Doctors use the term chronic obstructive pulmonary disease (COPD) to describe lung damage caused by emphysema or chronic bronchitis. Emphysema hurts the lung's air sacs, while bronchitis injures the airway tubes. Both diseases make it hard for the lungs to take in enough oxygen. Oxidative stress worsens COPD, so antioxidants may help improve symptoms. However, in one study, use of a potent antioxidant, 600 milligrams of N-acetylcysteine, had no effect on preventing the deterioration of lung function and preventing exacerbation of symptoms in patients with COPD.

Bronchitis is an inflammation or obstruction in the bronchial tubes. This inflammation results in a buildup of mucus, along with coughing, fever, pain in the chest and/or back, fatigue, sore throat, difficulty breathing, and, often, sudden chills and shaking. Bronchitis occurs mostly in the winter and usually starts as a cold.

Bronchitis can be either acute or chronic. Acute bronchitis is usually caused by an infection, which can be bacterial, viral, chlamydial, mycoplasmal, or caused by a combination of agents. It typically follows an upper respiratory tract infection, such as a cold or influenza. Most cases of acute bronchitis are self-limiting, with full recovery in a matter of weeks. In some cases, however, the condition can lead to pneumonia. This is more likely to occur in those who also have a chronic respiratory disease or other debilitating health problem.

Chronic bronchitis results from frequent irritation of the lungs, such as from exposure to cigarette smoke, air pollutants, or other noxious fumes, rather than from infection.

Allergies may also be the cause of chronic bronchitis. As chronic bronchitis diminishes the exchange of oxygen and carbon dioxide in the lungs, the heart works harder in an attempt to compensate. Over time, this can lead to pulmonary hypertension, enlargement of the heart, and, ultimately, heart failure.

Chronic bronchitis is one of the most common diseases seen by allergists, otolaryngologists, and primary care physicians. Specialists in occupational medicine have long known that an adverse environment produces a vulnerability to respiratory infections. Climatic factors and epidemics of viral infections also increase the risk. Among people who live or work in unhealthy environments, shortness of breath is frequently aggravated by dampness and cold, exposure to dust, humid weather, or even minor respiratory infections.

More women than men develop chronic bronchitis. The disease is more prevalent in those age forty-five years and older. According to the Centers for Disease Control and

Prevention (CDC), in 2006 an estimated 740 Americans died from results of chronic and unspecified bronchitis. The COPD family of lung disorders is the fourth leading cause of death, and it is predicted that by the year 2020 COPD diseases will become the third leading cause of death.

Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve years old, use one-half of the recommended dose, and for a child under six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Pycnogenol	As directed on label.	Removes dangerous substances and protects the lungs. A powerful antioxidant.
Quercetin-C from Ecological Formulas or Activated Quercetin from Source Naturals	500 mg 3 times daily. As directed on label.	For allergic bronchitis. Has an antihistaminic effect. Contains quercetin plus bromelain and vitamin C for increased absorption.
Vitamin A plus natural beta-carotene or carotenoid complex (Betatene)	20,000 IU twice daily for 1 month; then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 50,000 IU daily. As directed on label.	As directed on label. For healing and protection of all tissues. Needed for protection and repair of lung tissue.
Vitamin C with bioflavonoids (including rutin)	3,000–10,000 mg daily, in divided doses.	Enhances immune function and reduces histamine levels. Use a buffered powder form.
<b>Very Important</b>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	For improved circulation and breathing. Works well with coenzyme Q <sub>10</sub> and removes dangerous substances from the body.
Methylsulfonylmethane (MSM)	As directed on label.	Clinical tests have shown that this improves lung problems such as bronchitis, pneumonia, emphysema, cysts, or damage due to heavy smoking.
Proteolytic enzymes with bromelain	As directed on label. Take between meals.	Helps reduce inflammation.
Vitamin E	200 IU daily. Take with 50–100 mg vitamin C.	Powerful free radical scavenger and oxygen carrier. Needed for healing of tissues and improved breathing. Use d-alpha-tocopherol form.
Zinc lozenges	One 15-mg lozenge 5 times daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for repair of all tissues.

### Important

Chlorophyll	As directed on label, 3 times daily.	To improve circulation, and to keep tissues free of toxic substances. Use a liquid or tablet form.
and "green drinks" (fresh wheatgrass juice or Kyo-Green from Wakunaga)	As directed on label.	To supply chlorophyll and important nutrients.
Garlic (Kyolic from Wakunaga)	2 tablets 3 times daily, with meals.	A natural antibiotic that reduces infection and detoxifies the body.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Activates many enzymes needed for healing.

### Helpful

Magnesium plus calcium	500 mg daily. 1,000 mg daily.	Acts as a bronchodilator. Use chelate or aspartate form. Needed to balance with magnesium.
Maitake extract or shiitake extract or reishi extract	As directed on label. As directed on label. As directed on label.	Mushroom extracts that boost immunity and fight viral infection.
Multivitamin complex	As directed on label.	All nutrients are needed in balance for healing.
N-Acetylcysteine (NAC) plus L-arginine and L-lysine and L-ornithine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. 500 mg twice daily, on an empty stomach. 500 mg twice daily, on an empty stomach. 500 mg twice daily, on an empty stomach.	Protects and preserves the cells. A sulfur-bearing amino acid that lessens the viscosity of bronchial mucus, making it easier to expel. (See AMINO ACIDS in Part One.) Aids in liver detoxification. Needed for protein synthesis to aid in healing. Also aids in destroying serious viruses. Lowers blood ammonia levels, which can be increased by respiratory illness.
Raw thymus glandular	500 mg twice daily.	Needed to protect and enhance immune function. (See GLANDULAR THERAPY in Part Three.)
Silica	As directed on label.	Acts as an anti-inflammatory, reduces mucus flow, and reduces coughing.

### Herbs

Herbal medicine has proven to be very effective in the treatment of bronchitis. The following treatment plans may be helpful in alleviating some of the symptoms common to bronchitis. Rather than using only one of the herbs listed below, alternate among several to get all of their healing benefits.

American and Siberian ginseng are especially good for the lungs. They clear bronchial passages and reduce inflammation.

**Cautions:** Do not use American ginseng if you have high blood pressure, or are pregnant or nursing. Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

Astragalus, myrrh, olive oil extract, and pau d'arco are natural antibiotics.

**Caution:** Do not use astragalus in the presence of a fever.

Black radish, chickweed, elderberry, ginkgo biloba, lobelia, and mullein improve lung and bronchial congestion and circulation.

**Cautions:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Boneset contains immunostimulatory polysaccharides that are good for inflammation of the mucous membranes.

**Caution:** Do not use boneset on a daily basis for more than one week, as long-term use can lead to toxicity.

Boswellia, bromelain, cayenne, ginger, and peppermint can aid in reducing inflammation.

Bronc-Ease from Nature's Herbs is an excellent herbal formula. It relieves congestion, coughing, and irritation.

Expectorant herbs such as cayenne, elecampane, horehound, hyssop, and mullein have been effective in clearing congestion.

Coltsfoot, slippery elm bark, and wild cherry bark soothe the throat and are good for a cough.

Cordyceps is an herb used in Chinese medicine to restore the yin and yang connection between the lungs and the kidneys. It is said to contain inhibitor substances that attack damaged lung cells and may slow down the degeneration of the lung. Bai qian (*Cynanchum stautoni*), another Chinese herb, aids in coughing up the sputum obstructing the bronchial passageways.

Echinacea, licorice, and Siberian ginseng are good for building up the immune system.

**Cautions:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

Echinacea and goldenseal help to fight viruses and bacteria and boost the immune system. At the first sign of illness, put ½ dropperful in your mouth. Hold it there for ten minutes, then swallow. Do this every three hours until

symptoms are relieved (but not for longer than one week at a time). Be sure to use the alcohol-free extracts.

**Cautions:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Inhaling the vapors of eucalyptus leaves helps to relieve respiratory problems. To use eucalyptus as a steam inhaler, boil a quart of water, remove the boiling water from the stove, and add 6 to 8 drops of eucalyptus extract. Place a towel over your head and breathe in deeply through the nose, holding your breath for as long as is comfortable.

Fenugreek is good for reducing the flow of mucus.

Ginkgo biloba leaf is a free-radical fighter that is especially good for the lungs.

**Caution:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Goldenseal has antibiotic properties and is good for all conditions involving inflammation of the mucous membranes of the bronchial tubes, throat, nasal passages, and sinuses. In addition to taking goldenseal orally, you can place a cloth soaked with a strong goldenseal tea under a hot water bottle. Place 3 wet goldenseal tea bags on each lung under the soaked cloth.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Gumplant (*Grindelia squarrosa*) is an expectorant and antispasmodic.

Iceland moss is good for mucus congestion.

A massage with essential oil of lavender is good for bronchitis. Also, to relieve congestion, put 4 drops of lavender oil, alone or combined with eucalyptus and lemon oils, in a pot of steaming water. Hold your head, covered with a towel, over the steaming pot and inhale the vapors.

**Caution:** Lavender oil is not to be taken internally.

Lobelia may be rubbed directly on the chest to aid in breathing. It can also be used as an expectorant.

**Caution:** Use with caution, as too much may induce vomiting. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath

should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Lomatium (*Lomatium dissectum*) has been used by Native Americans to treat bronchitis. Lomatium acts in reducing mucus in the lungs and has an antibacterial effect.

Lung Tonic from Herbs, Etc., is a combination of many organic herbs designed to support the lungs.

Lungwort leaves are rich in vitamin C and quercetin and make an effective treatment for coughs and mucus.

Thyme strengthens the lung tissue. It can be used for children with lung ailments.

Omega-3 fatty acids are clearly associated with a reduction in chronic bronchitis.

### Recommendations

Include garlic and onions in your diet. These foods contain quercetin and mustard oils, which have been shown to inhibit lipoxygenase, an enzyme that aids in releasing an inflammatory chemical in the body. Garlic is also a natural antibiotic.

Drink plenty of fluids. Pure water, herbal teas, and soups are all good choices.

Avoid mucus-forming foods such as dairy products, processed foods, sugar, sweet fruits, and white flour; also avoid gas-producing foods such as beans, cabbage, cauliflower, and so on. Substitute soy milk for dairy foods to get adequate calcium and vitamin D. One epidemiological study showed the more vegetables eaten the less bronchitis.

Do not smoke, and avoid secondhand smoke. Cigarette smoke is very harmful. If you have chronic bronchitis, little improvement can be expected unless the irritating substances that cause the mucus to clog the air passages are eliminated.

It is not correct to assume that chronic bronchitis is a smoking-based disorder as commonly believed. *Helicobacter pylori* is an infection associated with chronic bronchitis.

Add moisture to the air. Use a humidifier, a vaporizer, or even a pan of water placed on a radiator. Clean everything frequently to prevent the growth of bacteria.

Rest in bed in the early stages, when fever is present. Once fever subsides and you are feeling better, alternate periods of rest with periods of moderate activity to prevent secretions from settling in the lungs.

Apply warm, moist heat, or a hot water bottle over the chest and back before bedtime to aid in sleeping and reduce inflammation. It is also good to rub eucalyptus oil on your chest first.

To aid recovery, blow up a balloon a few times daily.

Supplement your diet with vitamin C.

Do not use a cough suppressant if you have bronchitis.

Do not swallow mucus.

If persistent and/or severe coughing, difficulty breathing, high fever, lethargy, weakness, wheezing sounds, and/or chest pains develop, consult your health care provider. These may be signs of developing pneumonia. (See PNEUMONIA in Part Two.)

If you are hospitalized, at first you will need to rest in bed, with a few pillows to keep you sitting up a little. This will help your breathing. Do not lie flat. You may also need oxygen at this time. It is administered either by a mask or nasal prongs. Blood will also be drawn to test for oxygen content.

### Considerations

Diet, nutrition, and environment all play important roles in any respiratory disease. A healthy household environment can make respiratory problems easier to control.

Scientists have found many nutrients that make the lungs and bronchioles stronger and, therefore, better able to fight off infections. Many of these nutrients also make the lungs less sensitive to the air particles that can sometimes trigger bronchitis.

For people who are unable to cough up sputum, bronchoscopy may be recommended. This is a procedure in which a flexible tube is inserted to examine the bronchial tree. It can be done simply for the sake of a visual examination, to suction out congestion, to remove foreign bodies, or even to biopsy (sample) tissue from the bronchial tubes for the purpose of identifying the infecting organism.

If bronchitis does not clear up in a reasonable amount of time, a chest X-ray may be recommended to rule out lung cancer, emphysema, tuberculosis, or other conditions that can cause similar symptoms.

It is not unusual for people with chronic respiratory disorders to be taking a variety of medications—inhalers, antianxiety medications, even diuretics—to help them breathe. Exercise is important; it helps one to breathe more efficiently and to tolerate daily activities.

If bacteria are the cause of acute bronchitis, treatment with antibiotics may be necessary to cure the infection and to prevent pneumonia from developing.

To prevent chronic lung disease in infants, doctors often prescribe the steroid dexamethasone to reduce inflammation.

*Caution:* A long-term study found that this common steroid treatment for premature babies can damage their brains and stunt their growth.

A common treatment for bronchitis is a bronchodilator. If you use a bronchodilator, do not inhale more than the prescribed dose, as larger doses may cause side effects, including nervousness, restlessness, and trembling. Before using an inhaler, discuss with your doctor possible side effects and warning signs of dangerous reactions. Your doctor should be aware of any personal health concerns you have, such as a possible pregnancy; a medical problem, such as diabetes, hypothyroidism, or a seizure disorder; a

history of drug use; adverse reactions to drugs; or current use of other over-the-counter or prescription drugs.

❑ The Air Supply personal air purifier from Wein Products is a small unit worn around the neck. It sets up an invisible pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants) in the air. It also eliminates vapors, smells, and harmful volatile compounds in the air. The Air Supply is a very useful item when traveling, especially on a long flight when the air becomes stale.

❑ See also ASTHMA; EMPHYSEMA; HAY FEVER; PNEUMONIA; and SINUSITIS in Part Two.

## BROWN-SEQUARD SYNDROME

See under RARE DISORDERS.

## BRUISING

A bruise occurs when the tissues underlying the skin become injured. The skin is not broken, but the delicate capillaries (small blood vessels) below the skin's surface rupture, and blood drains out into the surrounding area.

The blood seeps into the layers of the skin, resulting in pain, swelling, and "black-and-blue marks"—discoloration that starts out red, then turns dark and bluish, and finally may become a yellowish color as the blood under the skin is absorbed.

Body parts often become bruised after banging into hard objects. This is normal. There are other factors that do not involve a trauma to the skin that can cause bruising.

People who do not eat enough fresh, uncooked foods to supply the body with needed nutrients are prone to easy bruising. Nutritional deficiencies, especially in vitamin C, or blood-clotting disorders can make the blood vessel walls very thin and delicate, causing them to rupture with even the slightest amount of pressure, such as leaning against a table or having someone grab you firmly with his or her hand. Unexplained or easy bruising can be related to heavy smoking or menstruation, or it can be an indication of an underlying health condition, including allergies, anemia, cancer, hemophilia, infections, obesity, myelocytic leukemia, and abnormal platelet function caused by a liver or kidney disorder. Any condition where blood platelet levels are too low may result in excess bruising. Most yearly physical exams should measure platelet number. If you are concerned, you can check with your doctor to learn what your number is.

Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters the recommended amount. For a child between six and twelve years old, use one-half the recommended dose, and for a child under six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Multivitamin and mineral complex with zinc	As directed on label.	Needed to strengthen skin and reduce bruising.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Helps to prevent bruising by supplying oxygen to the injured cells and strengthening capillary walls.
Vitamin K or alfalfa	As directed on label.	Necessary for blood clotting and healing. See under Herbs, below. <b>Caution:</b> Check with your physician first.
<i>Important</i>		
Inositol hexaphosphate (IP <sub>6</sub> ) (Cell Forté with IP-6 from Enzymatic Therapy or IP6 from Jarro Formulas)	As directed on label.	A powerful antioxidant. Prevents blood clots.
Vitamin E	200 IU daily.	Powerful antioxidant. Also improves circulation in body tissues and prolongs the life of red blood cells. Fights cellular aging by protecting cell membranes. Use d-alpha-tocopherol form.
<i>Helpful</i>		
Coenzyme Q <sub>10</sub>	60 mg daily.	Essential for construction and reconstruction of body cells.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	100 mg daily.	Improves oxygen metabolism in the cells and tissues.
Iron fumarate from (Floradix)	As directed by physician. Take with 100 mg vitamin C for better absorption.	To correct deficiencies. <b>Caution:</b> Do not take iron unless anemia is diagnosed.
Iron + Herbs from Salus Haus)	As directed on label.	A natural iron supplement.
Multienzyme complex plus proteolytic enzymes	As directed on label. Take with meals. As directed on label. Take between meals.	To prevent inflammation in bruised areas.
Pycnogenol or grape seed extract	As directed on label.	Potent antioxidants for protecting skin tissue.
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Aids in protecting the tissues.
Vitamin D plus calcium and magnesium	400–800 IU daily. 2,000 mg daily. 1,000 mg daily.	To help protect the skin. Needed for blood cell formation.

## Herbs

- Alfalfa supplies beneficial minerals and vitamin K, which is needed for healing. Take it in tablet form as directed on the product label.
- Bluebottle, buchu, and comfrey root have all been known to reduce the swelling, pain, and discoloration of bruising in some people. Make a tea from them and place a terry cloth towel that has been soaked in the tea over the bruised area for twenty minutes at a time, two or three times daily.
 

*Caution:* Comfrey is recommended for external use only.
- An ointment made by adding one part ground cayenne pepper to five parts melted Vaseline has been used successfully in China and Taiwan for treating bruises. Mix the combination well and cool. Apply it once every one or two days.
- Dandelion and yellow dock are good sources of iron.
- Oil of oregano, applied topically, has had some positive effects on healing bruises.
- Fresh parsley leaves, crushed and applied directly to the bruise, are known to ease discoloration within a few days.
- Wild pansy can be applied externally to treat a bruise.
- Other beneficial herbs include bilberry, black walnut, garlic extract, and rose hips.

## Recommendations

- To minimize bruising, as soon as possible after an injury, place an ice pack on the bruised area and keep it in place for twenty to thirty minutes. This stops the bleeding by constricting the blood vessels. If the bruise is severe, you may wish to further treat the injured area with an ice pack every two to three waking hours for twenty-four to forty-eight hours, and then switch to fifteen minutes of heat, three times daily. The injured area should also be elevated above heart level, if possible, to allow blood to flow away from the injured area and minimize the bruise.
- If you have a bruise in an area of the body that requires a moldable ice pack, fill a plastic bag or a rubber surgical glove with a solution of two parts water and one part rubbing alcohol and put it in the freezer. The bag will be pliable and conform to your body, and it won't "sweat" like most ice packs do. This would be an ideal ice pack for a black eye. Another excellent ice pack for the eye, or any area, is a bag of frozen peas! They conform to any injured area and can be used over and over again. Be sure to set this bag of peas aside for use as an ice pack only; you should not consume the peas after they have been thawed and refrozen.
- To reduce the pain, swelling, and discoloration of a black eye, immediately apply cold compresses and an ice pack to the injury. Unfortunately, if the discoloration has set in before the ice bag has been applied, there will be little hope of lightening the bruise.

- Rub a sterile cotton ball soaked with distilled witch hazel on an injury to stop the swelling.
- To reduce discoloration and soreness, try applying shredded raw potato directly to the injury for about an hour.
- Eat a lot of fresh, uncooked foods—people who do not eat enough of these can be prone to easy bruising.
- Eat an abundance of dark green leafy vegetables, buckwheat, and fresh fruits. These foods are high in vitamin C and bioflavonoids, which help to prevent bruising. Dark leafy greens such as broccoli, Brussels sprouts, cabbage, kale, and spinach are also good sources of vitamin K, which is necessary for blood clotting and healing.
- Eat plenty of products rich in zinc, such as chicken, eggs, soybeans, and wheat germ. Zinc is important for strengthening blood vessel walls and aids in blood clotting.
- Try taking vitamin C with bioflavonoids if you find you are bruising very easily, as a deficiency in these often causes easy or unexplained bruising.
- Do not take aspirin or ibuprofen (Advil, Nuprin, and others) for pain, as these can worsen the discoloration due to their blood-thinning qualities. Instead, take acetaminophen (such as Tylenol) as directed on the label.
- Do not take any nonsteroidal anti-inflammatory drugs (NSAIDs). If bruising is frequent, consult your health care provider.

## Considerations

- Bruising that is accompanied by swollen and/or bleeding gums can be an indication of a deficiency in vitamin C, folic acid, or riboflavin.
- Studies show that people with vitamin C deficiencies bruise more easily than others, probably because their blood vessels are generally weaker. Other studies have shown that vitamin C can actually reduce the time it takes for the discoloration to fade.
- A "black eye" is actually a bruise in the cheek, eyebrow, and/or eyelid area. An impact hard enough to cause a black eye can also cause damage to the eye itself. If your eye has swollen shut, it should not be forced open or pressed on in any way. Blurry vision or "seeing double" should prompt you to see an ophthalmologist, who may prescribe an antibiotic and/or an eye patch to protect the eye while healing.
- If a bruise does not begin to heal within a week, you may want to have your doctor examine it.
- Some people can bruise as a result of taking medications that can interfere with normal blood clotting, including local anesthetics, prescription anticoagulants, antidepressants, antihistamines, aspirin, cortisone, and penicillin. If you are taking any of these medications and find that bruises are appearing without any reason, you should contact your doctor, who may change or discontinue your medication.

If you have bruising underneath the fingernails, this may be an early indication of skin melanoma. Consult your doctor.

## BRUXISM

Bruxism, or bruxomania, is the medical term for tooth-grinding. This usually occurs during sleep, often without the person being aware of it (although family members may be). It can also occur when a person is awake, as a way of releasing tension. Over time, chronic tooth-grinding can result in loosened teeth with damage to the supporting bones in the jaw and receding gums. The teeth may be pushed out of line, and the bite may need adjusting. Eventually, tooth loss can occur. Long-term tooth-grinding can cause temporomandibular joint (TMJ) syndrome. This usually occurs in the muscles, joints, and disks of the jaw, and may cause pain while chewing. (See TMJ SYNDROME in Part Two.)

Bruxism can develop if the teeth are sensitive to heat and cold. Stress, allergies, and nutrient deficiencies are often the cause of tooth-grinding, which can also involve blood sugar levels.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Calcium and magnesium	1,500–2,000 mg daily. 750 mg daily.	Deficiencies have been linked to tooth-grinding.
Vitamin B <sub>5</sub> (pantothenic acid)	500 mg twice daily.	Reduces stress.
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Necessary for proper nerve function. Use a high-stress formula.
<b>Very Important</b>		
Vitamin C with bioflavonoids	3,000–5,000 mg daily.	Potentiates adrenal function; acts as an antistress vitamin.
<b>Helpful</b>		
Chromium	200–400 mcg daily.	Helps to normalize blood sugar levels. Use chromium picolinate form. Hypoglycemia is often linked to this disorder.
L-tryosine	As directed on label.	An amino acid that reduces stress.
Melatonin	As directed on label.	Aids restful sleep and may reduce tooth-grinding. Not recommended for anyone under 30, or for long-term use.
Multivitamin and mineral complex plus raw adrenal glandular	As directed on label. As directed on label.	All nutrients are needed to reduce stress. To support adrenal function. (See GLANDULAR THERAPY in Part Three.)

S-adenosylmethionine (SAME)	As directed on label.	Reduces stress and acts as an antidepressant. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Don't give to a child under twelve.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Helps to support the immune system and reduce stress.

## Recommendations

Adopt a hypoglycemic diet that is high in fiber and protein and includes plenty of fresh vegetables and high-fiber fruits, plus legumes, raw nuts and seeds, skinless white turkey or chicken, broiled fish, and whole grains. Consume starchy vegetables and very sweet fruits in moderation only. Eat six to eight small meals spread evenly throughout the day rather than two or three large meals. Hypoglycemia, related to low adrenal function, is often the cause of bruxism. (See HYPOGLYCEMIA in Part Two.)

Do not consume alcoholic beverages. Alcohol often makes the problem worse.

Avoid fast foods, fried foods, processed foods, red meat, refined sugar, saturated fats, and all dairy products except for yogurt, kefir, and raw cheese. Also avoid all foods with artificial flavors, colors, preservatives, and other chemicals.

Do not eat anything sweet within six hours of going to bed. If you are hungry, have a light protein-and-fiber snack.

As much as possible, avoid stress. Learn stress management and relaxation techniques. (See STRESS in Part Two.)

Take supplemental calcium and pantothenic acid as directed under Nutrients, above. Calcium is often effective for treating involuntary movement of muscles.

Consider having a hair analysis done to determine if you have any mineral imbalances, such as abnormal levels of sodium and potassium. (See HAIR ANALYSIS in Part Three.)

See ALLERGIES in Part Two to rule out any food allergies that may be the problem.

## Considerations

Dentists sometimes recommend a type of plastic mouth guard that is worn over the teeth for people with bruxism. This does not cure the problem, but it can help to prevent future tooth damage.

*Belladonna*, a homeopathic remedy, is known to be an effective treatment for this condition.

Biofeedback is helpful for overcoming bruxism in some cases. (See BIOFEEDBACK under PAIN CONTROL in Part Three.)

## BULIMIA

Bulimia nervosa is an eating disorder characterized by episodes of uncontrolled binge eating, often involving extremely large amounts of high-calorie foods, followed by one or more of the following: induced vomiting or the use of laxatives, diuretics, or enemas; and/or obsessive exercising to “purge” the body of the food eaten during the binge. The binge/purge episodes vary in frequency, from a few times a week to several times daily. The length of the bingeing can range from several minutes to an hour or two.

Usually the person doing the bingeing feels out of control—a sense of not being able to stop eating until he or she is completely full—then is so immediately overwhelmed and shamed by the sense of fullness that he or she feels the need to get rid of the food just consumed. The binge eating and purging are usually carried out in secret—an indication of a serious medical and psychological problem with potentially dangerous complications.

Some of the many serious problems bulimia can lead to include anemia, depletion of fluid balance, electrolyte imbalances, erratic heartbeat, hypoglycemia, infertility, internal bleeding, kidney or liver damage, malnutrition, cessation of the menstrual cycles, mental fuzziness, loss of muscle and bone mass, a low pulse rate and blood pressure, a ruptured stomach or esophagus, stones in the salivary glands, tooth and/or gum erosion, ulcers, and a weakened immune system. Also, if the fat content in a woman’s body drops to too low a level, the body will not produce enough estrogen, which can result in destruction of bone tissue and an increased risk of osteoporosis. Due to extreme weight loss, extreme exercise, starvation, and/or lack of needed vitamins and minerals, the body can turn to using muscle mass as an energy source—a very serious side effect that few with eating disorders are aware of. Eventually, life-threatening problems can result, including cancers of the breast, bowel, esophagus, or reproductive organs; kidney or liver damage; and finally, cardiac arrest.

According to the National Association of Anorexia Nervosa and Associated Disorders, there are 8 million men and women with eating disorders in the United States, and this number is on the rise. Bulimia affects many more women than men (although the number of men with this disorder is increasing), and it does not discriminate on the basis of age, sex, or social status. In today’s society, we are constantly bombarded with the message that the thinner you are, the better you look. Our role models are mostly actors/actresses, musicians, and models who set standards of beauty that are difficult or impossible for most people to attain.

Although people may develop an eating disorder because they want to look and feel better about themselves, the opposite is usually the result. People with bulimia can become consumed with their weight, have a distorted image of their figures, and feel disgusted with themselves for not having what they think of as the “perfect body.” Other

typical psychological implications can include extreme anger at anyone they believe is trying to interfere, anxiety, depression, fear of being found out, isolation, loneliness, and obsessive-compulsive behavior. People with bulimia may also exhibit other extreme behavior, such as alcohol or drug abuse, credit card abuse, or shoplifting. They usually spend an exorbitant amount of money on food, sometimes using money meant for paying bills or other necessities to buy certain foods, and they may also bypass social or work-related obligations for an opportunity to binge.

Although there is no known cause of eating disorders, many believe that bulimia may result from one or a combination of psychological, biological, and societal factors.

Some studies of families and twins suggest that heredity may also play a role. Psychologically, food has offered us pleasure, comfort, solace, and security from the moment we are born. Episodes of bingeing are commonly stress-related, and they may be an attempt to manage emotions by focusing attention away from unpleasant or uncomfortable emotional problems. Many individuals who suffer from this disorder come from families in which they were subjected to physical or sexual abuse. In some families, substance abuse is also a factor. Many women started their first binge because of real or imagined male rejection. Others are perfectionists and overachievers with high standards, but low self-esteem.

In particular, if a woman’s basic emotional needs were not met in childhood, she may come to believe that her problems would be resolved if only she were attractive (that is, thin) enough, and this obsession leads to bulimia.

There are indications of possible physiological elements in this disorder, as well. For example, people with eating disorders tend to have a type of chemical imbalance similar to one found in people with clinical depression. Both have high levels of adrenocorticotrophic hormone (ACTH), produced by the pituitary gland, which inhibits T cell function and thereby depresses immunity. People who suffer from bulimia may also have low levels of the neurotransmitter serotonin, which can lead to cravings for simple carbohydrates—common binge foods. Some researchers have found bulimia to be associated with right temporal disturbance in the brain.

Unlike people with anorexia, whose self-starvation eventually becomes obvious, those with bulimia can hide the disorder for long periods, even years, because their weight is usually in the normal range (some are even overweight, depending on the frequency and length of the bingeing episodes) and the bingeing and purging are done in secret.

Physical signs of bulimia may be swollen glands in the face (resulting in a “chipmunk” appearance) and neck; erosion of the enamel of the back teeth; broken blood vessels in the eyes or face; constant sore throat; inflammation of the esophagus; and hiatal hernia. All of these are the consequences of induced vomiting. Sometimes emboweled spoons or sticks used to induce vomiting have to be surgically removed. If laxative abuse is part of the picture, dam-

age to the bowel, rectal bleeding, and perpetual diarrhea may result. Laxative use also washes potassium and sodium from the body, which can result in electrolyte imbalances that may lead to dehydration, muscle spasms, and, eventually, cardiac arrest.

Other signs of bulimia can include bad dreams, bad breath, constantly cold feet and hands, dizziness, excess facial and body hair, fainting, hair loss, mental fuzziness, muscle fatigue, dry skin, yellowish or grayish skin, extreme weakness, and premature wrinkles.

People with bulimia often feel extremely guilty about their behavior, which is why they may successfully hide the disorder for years, even from their spouses and children. Trips to the bathroom after meals, the sudden disappearance of large quantities of food, frequent dental visits, scrapes and abrasions on the hands and knuckles, and mood changes may be hints that something is wrong.

Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters the recommended amount. It is important for anyone with this condition to seek medical help.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Multivitamin and mineral complex with carotenoids and potassium and selenium	As recommended by physician. Take with meals.  99 mg daily.  200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	The bulimic syndrome results in severe vitamin and mineral deficiencies. Extremely high doses are needed because nutrients pass rapidly through the gastrointestinal system and are poorly assimilated. Do not use a sustained-release formula.
Zinc	50–100 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Necessary in protein metabolism; aids the sense of taste and increases the appetite. May aid in easing depression and anxiety, and facilitating weight gain. Deficiencies are common in people with this disorder. Needed to balance with zinc.
plus copper	3 mg daily.	
<i>Important</i>		
Acidophilus	As directed on label. Take on an empty stomach so it can pass quickly to the small intestine.	Stabilizes intestinal bacteria. Protects the liver.
Calcium and magnesium	1,500 mg daily, at bedtime. 750 mg daily.	Has a calming effect and replaces lost calcium stores. Relaxes smooth muscles and has a bronchodilating effect.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Can streamline metabolism, ease depression and fatigue, and increase energy. Supports adrenal glands, processes fats, and removes toxins from the body. Can also boost the immune system and improve overall physical and mental processes.
and		

Coenzyme Q <sub>10</sub>	60–100 mg daily.	Protects the heart muscle and aids in circulation.
Kyolic-EPA from Wakunaga	As directed on label.	Restores proper fatty acid balance. Needed by all bodily cells.
5-Hydroxy L-tryptophan (5-HTP from Solaray)	As directed on label.	Improves low levels of serotonin commonly associated with bulimia.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To counteract protein deficiency, a serious problem in bulimia. Free form amino acids are more readily available for use by the body than other protein forms.
Gamma-amino-butyric acid (GABA) compound plus Ester-C with bioflavonoids	As directed on label.  3,000 mg daily.	Relieves stress and aids in nerve building.  Promotes healthy tissues and collagen growth.
Gamma-oryzanol (GO)	60 mg daily.	Aids in calorie use and muscle growth.
S-adenosylmethionine (SAME)	As directed on label.	Aids in stress relief and depression, eases pain, and produces antioxidant effects. Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Essential for all cellular functions.
Vitamin B <sub>12</sub> injections	1 cc 3 times weekly or as prescribed by physician.	Needed for the digestion of foods and the assimilation of all nutrients, including iron. Injections (under a doctor's supervision) are best.
or vitamin B <sub>12</sub>	As directed on label.	If injections are not available, use a lozenge or sublingual form.
Vitamin C with bioflavonoids	5,000 mg daily, in divided doses.	Necessary for all cellular and glandular functions.
<i>Helpful</i>		
Bio-Strath from Nature's Answer or brewer's yeast	As directed on label 3 times daily.  Start with 1 tsp daily and work up to the amount recommended on label.	For increased strength and energy. Aids in tissue repair and increases the appetite. Contains the B vitamins and other necessary nutrients. A good source of B vitamins. <i>Caution:</i> Discontinue use if any allergic reactions occur.
Iron (Floradix Iron + Herb from Salus Haus)	As directed on label, 3 times daily.	A natural source of iron that is easily assimilated. <i>Caution:</i> Do not take iron unless anemia is diagnosed.
Kelp	2,000–3,000 mg daily.	Supplies essential minerals, especially iodine.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label.  Take with meals and between meals.	Important for proper digestion and absorption of nutrients.

Silica	As directed on label.	Aids in the growth of collagen and new body tissue.
Vitamin D	600 IU daily.	Needed to aid in calcium uptake and prevent bone loss, which can lead to tooth loss.
Vitamin E or ACES + Zn from Carlson Labs	200 IU daily.  As directed on label.	Necessary for tissue repair and a powerful antioxidant. Use d-alpha-tocopherol form. To supply a combination of antioxidants.

## Herbs

- Burdock root, milk thistle, and red clover are good for cleansing the bloodstream and protecting the liver.
- Ginger Dry Extract from Sabinsa Corporation helps in digestion.
- Licorice is good for glandular function.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- A combination of high-potency royal jelly and angelica tea, taken once daily, has shown good results.
- St. John's wort is a good antidepressant and helps to reduce cravings.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

## Recommendations

- While healthier eating behaviors are being established, a well-balanced, high-fiber diet is essential. Eat as many vegetable proteins and complex carbohydrates as possible.
- Consume no sugar in any form. Avoid junk foods, heavy starches, and white flour products. Be aware that you may experience withdrawal symptoms such as anxiety, depression, fatigue, headache, insomnia, and/or irritability for a time after you eliminate sugar from the diet.
- Instead of the standard three meals a day, eat smaller, more frequent portions. It may help to control both feelings of fullness and hunger pains. Above all, don't go hungry. This only adds to your craving for food. Breakfast is especially important.
- Keep a variety of healthy snacks around you, both at work (or school) and at home, and make them readily available for when you feel a hunger pang.
- Chew your food slowly and well. Stop eating as soon as you feel uncomfortable or as if you might have to purge.

Try keeping an eating journal with a price list of the foods you eat in it. This can sometimes help to break the bulimic chain. While seeing on paper what you have actually consumed will, no doubt, be overwhelming, it may make you realize exactly what you are doing and how much it is costing you financially. It can also help to note your surrounding circumstances (if you are alone, with someone, what you are doing at the time, and so forth) and how you feel before, during, and after you eat and/or purge. This will let you see how it happened, and how it made you feel. It can also help you to identify things that may trigger the pattern, such as certain foods, situations, or even people. Once these "trigger" elements have been identified, avoid them as much as possible.

Taking 5-hydroxy L-tryptophan (5-HTP) improves serotonin levels and can be helpful if low serotonin levels are associated with bulimia. Several studies have also shown it can reduce caloric intake and curb hunger. Blood testing for eosinophil levels every three months is suggested if taking high doses of 5-HTP (greater than 300 mg per day). HTP.Calm from Natural Balance and L-5-HTP from Solaray are good sources of 5-HTP.

Cravings can often trigger a binge. The first thing to remember is that cravings do not last long—from several seconds to ten or twenty minutes. When a craving hits you, you can do one of three things: grab a small, light snack (such as a carrot or grapefruit), distract yourself, or meet and defeat the craving head-on. To distract yourself, drink a full glass of water and then remove yourself from the area by taking a walk, going out somewhere, working on a hobby, or attacking a task that needs to be accomplished. After the task, reward yourself with a healthy snack.

Practice control with other things you do in excess, whether it is alcohol consumption, exercising, shopping, or anything else. The key to a higher self-esteem is for you to be in control of your life, not for something else to be in control of you.

Develop and maintain relationships with positive people who make you feel good about yourself and whom you admire. Anyone bad for your mental health is a waste of your time and feelings.

Practicing stress management can greatly assist anyone fighting bulimia. Regular, moderate exercise, deep breathing, meditation, visualization, and yoga are all excellent ways to relieve stress. They are also good for easing depression.

## Considerations

It is wrong to categorize bulimia as "just a food addiction," as its roots are tied to many other factors that vary from case to case, including low self-esteem and psychological, biological, and societal factors.

□ The most successful treatment plans for bulimia include a psychologist (who can help assess the psychological implications of the person's disorder) and a physician (to evaluate and monitor his or her physical state). Long-term treatment may be needed to improve self-esteem and ensure that the person is mentally and physically able to recover.

□ Cognitive-behavioral therapy (CBT) and nutritional therapy are the preferred first treatments for bulimia. The drugs used for bulimia are typically antidepressants known as selective serotonin reuptake inhibitors (SSRIs). A combination of CBT and SSRIs is very effective if CBT is not effective alone.

□ According to researchers at the National Institute of Mental Health (NIMH) and Duke University, lack of a hormone that controls appetite may be the reason those with bulimia fail to feel full. For these people, eating a meal apparently does not stimulate adequate production of the hormone cholecystokinin-pancreozymin (CCK), which is found in the small intestine and the brain. They have to keep eating, and bingeing, in order to feel satisfied. However, more research is needed to determine whether this is the cause behind the majority of cases of binge eating.

□ According to an article published in *The Harvard Mental Health Letter*, women with diabetes who are bulimic often lose weight after a binge by reducing their doses of insulin. This can damage eye tissue and raise the risk of diabetic retinopathy, which can lead to blindness.

□ A study conducted at the University of Iowa College of Medicine and the University of Wisconsin found that reducing weight as part of athletic training may lead to bulimia. A survey of seven hundred high school wrestlers found that 2 percent were involved with binge eating followed by vomiting, fasting, excessive exercise, or the use of laxatives to avoid weight gain.

□ For sources of additional information about eating disorders and treatments, see Health and Medical Organizations in the Appendix.

## BURNS

A serious burn on the skin is one of the most traumatic injuries that the body can sustain. The skin is the body's largest organ, and one of its most complex. Among other things, it helps to regulate temperature and it serves as the first line of defense against infection.

There are three basic classifications of burns on the skin, each varying in severity. First-degree burns affect only the outer layer of the skin, causing redness and sensitivity to the touch. Sunburn is usually a first-degree burn. Second-degree burns extend somewhat into underlying skin layers, and are characterized by redness, blistering, and acute pain. In third-degree burns, the entire thickness of the skin

and possibly underlying tissues, such as muscle, are destroyed. The skin may be red, or it may be white or yellowish, or leathery and black. There is usually little or no pain because the nerves in the skin are severely damaged.

About 40,000 Americans are hospitalized for burn treatment each year, approximately 60 percent to the 125 specialized burn treatment centers, and 40 percent to the nation's other 5,000 hospitals. About 4,000 of these people die, according to the American Burn Association. As large as they are, these figures represent a significant decline in the number of incidents, and the severity of burn injuries, in the past twenty-five years, partly due to advances in treatment that lessen the initial shock and prevent fluid loss and infection. Doctors have also improved their techniques for surgically removing burned tissues from the wound as soon as possible and for subsequently transferring new skin grafts to the damaged area(s). In addition, specialized nutrition focusing on specific nutrients has been developed and shown to improve recovery and speed the healing process for both minor and serious burns.

The following nutrients are important for healing once appropriate local treatment has been administered. Choose a multivitamin that contains the trace minerals copper, selenium, and zinc to promote faster healing. Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For a child between twelve and seventeen years old, reduce the dose to three-quarters the recommended amount. For a child between six and twelve years old, use one-half the recommended dose, and for a child under six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Colloidal silver	Apply topically as directed on label.	A natural antibiotic and disinfectant. Promotes healing. For severe burns, use spray form.
Free form amino acid	As directed on label.	Important in the healing of tissues.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Important for tissue repair. Promotes healing. Natural antibiotic.
Potassium	99 mg daily.	Needed to replace potassium lost from burns.
Vitamin A	100,000 IU daily for 1 month, then reduce to 50,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for tissue repair. Use an emulsion form for easier assimilation and greater safety at high doses.
plus natural beta-carotene or carotenoid complex (Betatene)	As directed on label.	An antioxidant and precursor of vitamin A.

Vitamin B complex  plus extra vitamin B <sub>12</sub>	100 mg of each major B vitamin daily, with meals (amounts of individual vitamins in a complex will vary). 1,000 mcg twice daily.	Important in the healing of skin tissue.  Needed for protein synthesis and cell formation. Use a lozenge or sublingual form.
Vitamin C with bioflavonoids	10,000 mg immediately after a burn; 2,000 mg 3 times a day thereafter until healed.	An antioxidant that is essential in the formation of collagen; promotes the healing of burns.
Vitamin E	200 IU daily. Also open a capsule and apply the oil directly to the scar once healing has begun.	Needed for healing and to prevent scarring. Use d-alpha-tocopherol form.
Zinc	30 mg 3 times daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for healing of tissues.

#### Important

Essential fatty acids (Kyolic-EPA from Wakunaga, flaxseed oil, fish oil, or primrose oil)	As directed on label.	Omega-3 fats in fish oil have been shown to promote healing.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Needed for tissue elasticity. Provides antioxidant protection at the cellular level. Speeds healing.

#### Helpful

Calcium and magnesium and vitamin D	1,500 mg daily. 750 mg daily. 400 IU daily.	Promotes healthy skin. Loss of body fluids increases the need for magnesium. Needed for calcium uptake.
Coenzyme Q <sub>10</sub>	100 mg daily.	Helps circulation and healing of tissue.
Germanium	200 mg daily.	Enhances circulation and healing of tissue.
Inf-zyme Forte from American Biologics	As directed on label. Take between meals.	Reduces inflammation.

## Herbs

Aloe vera pulp, gel, or liquid can be applied to the burn as needed to relieve pain and to speed healing.

Bayberry, black or green tea, blackberry leaves, sumac leaves, sweet gum, and white oak bark contain tannic acid, which has been used in clinics for surface burns that have begun to heal. These herbs can be used as teas and as wet compresses.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Calendula, applied topically to the burned area as a gel or ointment, is effective as an anti-inflammatory agent and antiseptic.

An herbal compress made with comfrey leaf and wheat germ oil can be applied to the burn to help soothe the pain.

*Caution:* Comfrey is recommended for external use only.

Apply fresh ginger juice or strong black tea to the burned area, using cotton balls or a compress.

Goldenseal can be taken in pill or extract form, or used in a poultice and applied to the burned area. It is a natural antibiotic that helps to prevent infection.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Tea tree oil is effective for minor burns, primarily as an antiseptic and to help soothe the burned area. It is safe for both children and adults. Apply topically to the burned area.

## Recommendations

If you suspect a third-degree burn, see your physician at once or go to the emergency room of the nearest hospital. Do not attempt to treat the injury, do not remove clothing that is stuck to the burned area, and do not put ice or water on the burn. A third-degree burn requires professional treatment.

Cool a first- or second-degree burn at once to reduce pain and swelling. Immerse the area in cool running water, or use ice-filled bags and cool compresses for a minimum of ten minutes. While cooling the burn, remove rings, wristwatches, belts, or anything else that could constrict the injured area once it begins to swell. Also take away any loose clothing that has not adhered to the burned area.

To remove hot tar, wax, or melted plastic from the skin, use ice water to harden the heated substance.

After a minor burn has been cooled, apply aloe vera gel or a product such as Solarcaine Aloe Extra Burn Relief Gel, which contains aloe vera, to ease pain and promote healing.

*Caution:* Do not put oils, greasy ointments, or butter on burns. Do not break blisters.

While your body is recovering from a burn—especially a second- or third-degree burn—change your diet to provide a high intake of protein (at least 100 grams) and vitamin- and mineral-rich foods, up to 2,500 calories per day. These are needed for tissue repair and healing. During convalescence you may not be as active as usual and will probably require about 500 fewer calories than usual. However, it is more important to focus on getting adequate protein and nutrient-dense foods rather than worry about calories.

- Watch for signs of infection, odor, pus, or extreme redness in the area of the burn. Protect the injury from exposure to sun. Stay away from soil and avoid digging in the garden or sitting on the grass until the skin is completely healed.
- Drink plenty of fluids throughout the healing phase. Potassium juice and green drinks are recommended for fast tissue repair. (See JUICING in Part Three.)
- Glutamine has been shown to hasten recovery after a burn injury by boosting immune function and strengthening the intestinal tract.
- Arginine may help hasten burn healing, especially when coupled with fish oil.
- Keep burn injuries elevated to minimize swelling and promote healing. This is especially important for burns on the hands, legs, or feet.
- Keep the burn lightly covered to minimize the chance of bacterial infection.
- After the burn has cooled down, try adding 1 tablespoon of powdered vitamin C to 1 quart of cool water and spraying it on the burn site. This has been found to enhance healing. Or try using cool clay poultices. (See USING A POULTICE in Part Three.)
- If infection starts to set in, see your physician.

### Considerations

- Hygiene is very important when dealing with any type of burn.
- For third-degree burns, your doctor may prescribe silver sulfadiazine cream (Silvadene).  
*Caution:* Reactions to silver sulfadiazine are rare, but they can occur.
- Severe burns are often preventable. Make sure that your home or apartment has working smoke alarms on each floor. If the home is large, you will need several around the house. Every January 1, change the batteries in each alarm. If the bedrooms are on the second floor, make sure there is a rope or rope ladder available near a window that can be used in case of a fast-moving fire. When staying at a hotel, locate the nearest fire exits.
- Don't ever smoke while pumping gas; if someone else is, urge them to put the cigarette out, tell the attendant, or leave immediately. Never use gasoline in place of kerosene or for removing head lice. Gasoline is extremely volatile and should never be used indoors.
- A medically supervised program for a more serious burn or for a burn in a sensitive location may include the use of antibiotics, debridement to remove dead tissue, hydrotherapy to loosen dead skin, and physical therapy or splinting to prevent contractures (permanent muscular contractions).
- Severe burns often need to be treated with skin grafts to help restore the damaged skin. Healthy upper-layer skin

from another part of the body can be transplanted to the burned area, but people with large burns often do not have enough of their own skin for transplanting. There are several biotechnological companies that make an artificial skin from collagen, a fibrous protein, and this serves as a scaffold to help promote growth of new skin cells and blood vessels, and also to temporarily protect the wounded area. Cadaver skin can also be used as a temporary cover until you can grow more of your own skin to harvest.

- A study on the effects of high-dose vitamin C therapy for third-degree burns that was reported in the *Journal of Burn Care and Rehabilitation* concluded that people with serious burns should immediately begin taking vitamin C (see under Nutrients, above).
- See SUNBURN in Part Two.
- See also PAIN CONTROL in Part Three.

### BURSITIS

Bursitis is an inflammation of a bursa. The bursae are small sacs filled with lubricating fluid that are located between tendons and bones in various places in the body. They help to promote muscular movement by cushioning against friction between bones and other tissues. An inflamed bursa causes pain, tenderness to the touch of the affected body part, and limitation of motion. There may be redness and swelling as well.

Bursitis can be caused by injury, chronic overuse, reactions to certain foods, airborne allergies, or calcium deposits. Tight muscles also may lead to bursitis.

Calcified bursitis occurs when scar tissue develops in the bursa because an original injury was left untreated. The bursae in the hip and shoulder joints are most often affected.

Epicondylitis or epitrochlear bursitis, affecting the arm, is often called "tennis elbow" or "frozen shoulder." Tennis elbow may start as a small tear in the tendon, and is more likely to occur in people whose jobs require repeated tight gripping of an object. Occupational bursitis is not uncommon and is known by old, familiar names such as "housemaid's knee," "policeman's heel," or the "beat knee" or "beat shoulder" of coal miners.

Trochanteric bursitis is inflammation of the bursa in the hip. This may be caused by continual physical activity, by standing for a long time, or by a displacement of the hip. An aching pain that may radiate down the leg normally accompanies it. One of the most common foot ailments, the bunion, is actually a form of bursitis caused by friction; a tight-fitting shoe causes a sac on the joint of the big toe to become inflamed.

Tendinitis is closely related to bursitis, and the two are often confused. Tendinitis is the inflammation of the tendons, usually caused by strain. It is found most commonly in the shoulders, hips, Achilles tendons, or hamstrings.

Bursitis can affect anyone, at any age. However, older people, especially athletes and those who are overweight,

are more likely than others to get this ailment. Bursitis is usually characterized by a dull, persistent ache that increases with movement, whereas tendinitis typically causes sharp pain on movement, and rotation of the arm may be difficult if it is in the shoulder. This condition is often worse at night, and the pain usually extends from the top of the shoulder to just under the large shoulder muscle in the back. Tendinitis often affects people who routinely have to reach to perform certain activities, such as domestic workers and painters. Tendon inflammation may also result from calcium deposits that press against a tendon. Unlike tendinitis, bursitis is often accompanied by swelling and fluid accumulation.

Unless otherwise specified, the following recommended doses are for those over the age of eighteen. For children between twelve and seventeen years old, reduce the dose to three-quarters the recommended amount. For children between six and twelve years old, use one-half the recommended dose, and for children under six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium	1,500 mg daily.	Needed for repair of connective tissue.
	750 mg daily.	Needed to balance with calcium and for proper muscular function.
Free form amino acid	As directed on label. Take on an empty stomach.	Needed for healing of tendons and tissues.
Multienzyme complex with pancreatin	As directed on label. Take with meals.	To aid digestion. Use a formula with high amounts of pancreatin.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label. Take between meals. 2 tablets 2-3 times daily, between meals.	Contains a powerful anti-inflammatory substance.
Vitamin A plus natural beta-carotene or carotenoid complex (Betatene) plus selenium	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily. As directed on label. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Needed for tissue repair and immune function. Potent antioxidant and precursor of vitamin A.
Vitamin C with bioflavonoids	3,000-8,000 mg daily, in divided doses.	Reduces inflammation and potentiates immune function. Essential for the formation of collagen, a protein in connective tissue.
Vitamin E	200 IU daily.	An anti-inflammatory free-radical scavenger. Use d-alpha-tocopherol form.

Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Important in all enzyme systems and tissue repair. Needed to balance with zinc.
------------------	--	---

### Helpful

Boron	3 mg daily. Do not exceed this amount.	For better calcium absorption.
Coenzyme Q <sub>10</sub>	60 mg daily.	Good for circulation.
Glucosamine sulfate or N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Important for the formation of connective tissues.
Methylsulfonylmethane (MSM)	As directed on label.	Has therapeutic properties. Aids in pain relief and immune function.
Multivitamin and mineral complex	As directed on label.	Needed for tissue repair.
Pycnogenol or grape seed extract	As directed on label.	Powerful antioxidants and anti-inflammatories.
Silica	As directed on label.	Supplies silicon, necessary for repair of connective tissues.
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Important in cellular repair.
Vitamin B <sub>12</sub> injections or vitamin B complex	As prescribed by physician. As directed on label.	Needed for proper digestion and absorption of foods and for the repair of nerve damage. Injections (under a doctor's supervision) are best. If injections are not available, use a lozenge or sublingual form.

### Herbs

- Boswellia and bromelain both reduce inflammation.
- Meadowsweet and willow bark, combined in equal measure and taken three times daily, help with inflammation.

### Recommendations

- Go on a seven-day raw-food diet, followed by a three-day cleansing fast. (See FASTING in Part Three.)
- Eat no processed foods or any form of sugar.
- To relieve pain, use hot castor oil packs. Place castor oil in a pan and heat but do not boil it. Dip a piece of cheesecloth or other white cotton material into the oil until the cloth is saturated. Apply the cloth to the affected area and cover it with a piece of plastic that is larger in size than the cotton cloth. Place a heating pad over the plastic and use it to keep the pack warm. Keep the pack in place for one-half to two hours, as needed. Some physicians recommend ice packs.
- You may need to abstain from activity and get plenty of rest. When engaging in physical activity, do not push your-

self too hard or too long. If you are in pain, stop. Try to find activities that don't exacerbate the pain, such as walking.

❑ If you are overweight, begin a weight loss program.

### Considerations

❑ Treatment for bursitis involves removing the cause of the injury (controlled exercise of the affected area and/or immobilization and rest may be recommended for this), clearing up any underlying infection, and possibly surgically removing calcium deposits. Most treatment is dictated by the patient. If you are really in pain and can't stand it anymore, let your doctor know. Most doctors are waiting for a signal from you before they will advise more aggressive treatments.

❑ Applied topically, dimethylsulfoxide (DMSO), a by-product of wood processing, can relieve pain and reduce swelling. Always dilute 100 percent or 90 percent solutions down to 70 percent with water. The mixture will get hot, so allow it to cool first.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

❑ See also PAIN CONTROL in Part Three.

## CADMIUM TOXICITY

Cadmium is an inorganic metal that is naturally present in the environment. Like lead, cadmium accumulates in the body and has varying degrees of toxicity. Its half life is one to four decades in the human body, which means it's almost impossible to get rid of it once the body has absorbed it. Cadmium replaces the body's stores of the essential mineral zinc in the liver and kidneys. Not surprisingly, cadmium levels rise in people who have zinc deficiencies.

Cadmium is present in the environment in different chemical forms, such as cadmium sulfide, cadmium oxide, cadmium sulfate, cadmium carbonate, and cadmium chloride. It is used in the production of colored inks and dyes, as well as in many industrial applications, such as metal plating, engraving, and soldering. Cadmium is also used in plastics and in the production of nickel-cadmium (Ni-Cad) batteries, which are in widespread use in cell phones, portable computers, and in many toys. Trace amounts of cadmium are found in most foods. In shellfish, however, cadmium accumulates at a significantly higher level. Cadmium exposure from eating shellfish varies, depending on the origins of the shellfish. In other words, there is no way to know how much cadmium a specific clam or lobster

might have in its tissues. Other common sources of cadmium include drinking water, fertilizer, fungicides, pesticides, soil, air pollution, refined grains, rice, coffee, tea, and soft drinks. Dietary exposure to cadmium is estimated to be about 0.12 microgram to 0.49 microgram per kilogram (2.2 pounds) of body weight daily. This is *not* a recommendation, just the normal amount a person in modern society can expect to ingest. Intake of dietary cadmium should not exceed 7 micrograms per kilogram of body weight, per week, according to the World Health Organization. For a healthy male of about 80 kilograms (175 pounds) of body weight, that is only 560 micrograms per week, a very small amount indeed. (A microgram is one-millionth of a gram.)

Tobacco smoke also contains cadmium, and studies have shown that cigarette smokers have higher levels of cadmium in their bodies than nonsmokers. In one study, women who smoked were shown to have higher urinary cadmium levels than those who did not. Smoking a pack of cigarettes can add between 2 and 4 micrograms of cadmium to the body. You can also accumulate cadmium from secondhand smoke. Dangerous exposure to cadmium usually occurs through inhalation of fumes and dust. Cadmium in this form is extremely irritating to the lungs and can lead to such symptoms as headaches, chills, muscle aches, nausea, vomiting, and diarrhea. Cadmium is so hazardous the government has determined that for long-term workplace exposure to cadmium-contaminated dust and fumes, the level should be kept below 0.025 milligrams per cubic meter of air.

The human body can tolerate low levels of cadmium, but long-term chronic exposure can lead to serious health problems. In one study, lactating women with too much cadmium in their bodies were found to have low levels of calcium in their milk, which could impede the growth of the baby. Breast milk typically has very small amounts of cadmium—less than 1 microgram per liter—which is normal and has no impact on calcium absorption and thus no effect on the growth of the baby. Elevated levels of cadmium may result in hypertension (high blood pressure), a dulled sense of smell, anemia, yellow discoloration of the teeth, inflammation of the mucous membrane of the nose (rhinitis), joint soreness, hair loss, dry, scaly skin, and loss of appetite. Cadmium toxicity threatens the health of the body by weakening the immune system. It causes a decreased production of T lymphocytes (T cells), key white blood cells that protect the body by destroying foreign invaders and cancer cells.

Because cadmium is retained in the kidneys and liver (50 to 70 percent of accumulated cadmium is deposited in those organs), excessive exposure can lead to kidney disease and serious liver damage. Possible effects of intense cadmium exposure include emphysema, bone disorders such as osteoporosis and osteomalacia, cancer, and a shortened life span.

A blood test is the best method of determining acute cadmium toxicity. A urine test helps to determine the body's total burden of cadmium.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Alfalfa		See under Herbs, below.
Calcium and magnesium	2,000 mg daily. 1,000 mg daily.	Minerals that help rid the body of cadmium.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Aids in removing toxic substances from the body.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Helps to rid the body of cadmium. A potent detoxifier.
L-cysteine and L-lysine and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	These amino acids act as antioxidants; they protect the organs, especially the liver. (See AMINO ACIDS in Part One.)
Lecithin granules or capsules	2 tbsp 3 times daily, with meals. 2,400 mg 3 times daily, with meals. Take with vitamin E (see below) for better assimilation.	Protects all cells.
Rutin	200 mg 3 times daily. Take with 100 mg vitamin C.	Aids in removing high amounts of metals from the body.
Vitamin E	200 IU daily.	An antioxidant. Use d-alpha-tocopherol form, and use an emulsion form for easier assimilation.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed to restore zinc displaced by cadmium and to prevent cadmium levels from rising.
<i>Helpful</i>		
Copper	3 mg daily.	Works with zinc to remove cadmium deposits.
Iron or Floradix Iron + Herbs from Salus Haus	As directed by physician. Take with 100 mg vitamin C for better absorption. As directed on label.	To correct deficiency. Use ferrous fumarate form. <i>Caution:</i> Do not take iron unless anemia is diagnosed. Contains nontoxic, natural iron from food sources that is easily assimilated into the body.

**Herbs**

- Alfalfa contains chlorophyll and vitamin K, and helps to remove cadmium from the body. Take 2,000 to 3,000 milligrams in tablet form daily.
- Burdock root and red clover help to purify the bloodstream and stimulate the immune system.

- Milk thistle is very effective in protecting the liver. It also stimulates the production of new liver cells.

**Recommendations**

- Make sure that you include plenty of fiber and apple pectin in your diet. Eat pumpkin seeds and other foods that are high in zinc.

**Considerations**

- Chelation removes toxic metals from the body. (See CHELATION THERAPY in Part Three.)
- See also ENVIRONMENTAL TOXICITY in Part Two.

**CANCER**

The entire human body is made up of cells, each of which contains its own genetic material, or DNA—a long string of molecules that tells the cell what to do. In a healthy body, cells divide at a controlled rate so as to grow and repair damaged tissues and replace dying cells. This predetermined rate of cell division is what keeps our bodies healthy. If cells keep multiplying when new ones are not necessary, a mass of tissue called a growth, or tumor, is formed.

A tumor can be either benign or malignant. Benign tumors are not cancerous. They can occur anywhere in the body and generally do not pose a threat to health, do not metastasize (spread to other parts of the body), and do not grow back if removed. Malignant tumors are cancerous. They are usually serious and can be life-threatening. Malignant tumors grow uncontrollably, interfere with normal metabolic and organ functioning, and have the ability to metastasize and invade other tissues.

If a portion of a cell's DNA is damaged, the cell can become abnormal. When the abnormal cell divides, it forms new cells that contain a photocopy of the damaged genetic material. This is an ongoing process occurring constantly within our bodies. Most of the time, our bodies have the ability to destroy these abnormal cells and maintain a sort of cellular equilibrium. If a crucial portion of the DNA is destroyed, however, and the abnormal cells cannot be controlled any longer, cancer forms. All cancer cells have two things in common: they grow uncontrollably and they have the ability to metastasize. They can spread through the lymphatic system, the bloodstream, or avenues such as the cerebrospinal fluid (the watery cushion that protects the brain and spinal cord). The immune system generally does not recognize cancer cells as dangerous or foreign.

It is not known exactly what causes the cell damage that initiates the cancer process. The chain of events that leads to cancer is very complex, and each individual body reacts differently. A combination of genetic, behavioral, environmental, and lifestyle factors is believed to be involved in turning normal cells into abnormal cells, and abnormal

cells into cancer. There are also factors called inhibitors (such as certain vitamins and nutrients found in fruits and vegetables) that are believed to slow the process, while other factors, called promoters (such as smoking or eating a high-fat diet), can speed up the process.

Possible contributors to the development and growth of cancer can be divided into three categories—external, internal, and lifestyle. External factors include unhealthy workplace environments and exposure to air and water pollution, chemicals, pesticides, and herbicides. Internal factors include both genetics (heredity) and infections. Lifestyle factors are those we personally can most readily control. These are also the factors scientists believe account for the largest proportion of cancers. They include diet, smoking, drinking, and sun exposure. For example, persons who do not smoke but are exposed to cigarette smoke have significantly higher rates of lung cancer than nonsmokers who are not. Regular alcohol consumption increases the risk of mouth and throat cancers. A diet that is high in fat and low in fiber is associated with a greater risk of colorectal cancer and is a factor in breast and prostate cancer as well.

Cancer death rates are falling steadily, according to the American Cancer Society's (ACS) annual cancer statistics report, *Cancer Facts & Figures* (2009). The drop is driven in large part by better prevention, increased use of early detection practices, and improved treatment for cancer. Still, ACS researchers estimate that there were about 1,479,350 new cancer cases and about 562,340 cancer deaths in 2009. External and lifestyle factors account for 80 percent of cancer deaths in the United States. The following are the major factors that researchers say can contribute to developing cancer:

- Growing older
- Tobacco.
- Sunlight.
- Ionizing radiation.
- Certain chemicals and other substances.
- Some viruses and bacteria.
- Certain hormones.
- Family history of cancer.
- Alcohol.
- Poor diet, lack of physical activity, being overweight.

Many experts believe that what these risk factors have in common is that they increase the body's exposure to free radicals. They theorize that damage from free radicals is an important factor in causing the uncontrolled cellular growth that is characteristic of cancer. (See FREE RADICALS under ANTIOXIDANTS in Part One.) Others believe that factors such as cigarette smoking and poor dietary habits increase the risk of cancer because they impair the immune system.

While most researchers do not think stress brings on cancer directly, they do believe that it weakens the immune system, impairing the body's ability to destroy precancerous cells before they develop into cancer. By making ourselves aware of all of the factors that may promote or inhibit the development and growth of cancer, and by taking appropriate action, we can reduce our cancer risk.

There are more than one hundred different varieties of cancer. They have different causes, cause different symptoms, and vary in aggressiveness (the speed at which they spread). However, most types of cancer fall into one of four broad categories:

1. Carcinomas—cancers that affect the skin, mucous membranes, glands, and internal organs.
2. Leukemias—cancers of blood-forming tissues.
3. Sarcomas—cancers that affect muscles, connective tissue, and bones.
4. Lymphomas—cancers that affect the lymphatic system.

The classic early warning signs of cancer are:

- Unexplained weight loss.
- Fever.
- Fatigue.
- Pain.
- Skin changes.

For specific cancers:

- Change in bowel habits.
- Sores that do not heal.
- White patches inside the mouth.
- Unusual bleeding or discharge.
- Thickening lump in the breast or anywhere in the body.
- Indigestion or trouble swallowing.
- Recent change in a wart or mole.
- Nagging cough.

According to the American Cancer Society, 50 percent of all men and 33 percent of all women in the United States will develop some form of cancer at some point in their lives. The good news is that with the increasing information and treatment methods available today, millions of people are either living with, or have been cured of, cancer, and the risk of developing most types of cancer can be reduced by adopting a healthy lifestyle.

According to the Centers for Disease Control and Prevention (CDC), there are 11 million cancer survivors in the United States. A cancer survivor is defined as an individual who is still alive five years after his or her cancer diagnosis. Today, about 66 percent of cancer patients survive five

## Types and Warning Signs of Cancer

Knowing the warning signs and factors that increase the risk of developing different forms of cancer can save your life. The American Cancer Society estimates that of the more than 500,000 cancer deaths that occur in the United States, about one-third can be attributed to dietary factors, with another third being caused by cigarette smoking. Healthy lifestyle choices at any stage of life are a major step toward cancer prevention. Following are descriptions of some of the major types of cancer, including information about who is affected, what the symptoms are, how these diseases can be detected and diagnosed, and what you can do to reduce your risk of contracting them.

### Bladder Cancer

Bladder cancer is the fourth most common cancer in males, eighth most common in females, and fifth leading cause of cancer deaths in the United States. It is slightly more than three times as common in men than women and twice as common in Caucasians as in African-Americans. It is usually diagnosed later in life—nearly 90 percent of people with bladder cancer are over the age of fifty-five.

### Causes and Risk Factors

The cause of bladder cancer is not known. Smoking is the number-one factor associated with bladder cancer. Also linked to bladder cancer are exposure to certain chemicals, such as benzidines, aniline dyes, and naphthalenes; radiation exposure; heredity; possibly extremely high consumption of saccharin; a history of schistosomiasis (a tropical disease); chronic urinary tract infections or inflammation; and working in the dye, chemical, rubber, and leather industries.

### Signs and Symptoms

Often symptoms do not appear in the early stages. The first warning sign is usually blood in the urine. Other symptoms can be pain and burning with urination, increased frequency of urination, and difficulty urinating.

### Detection and Diagnosis

Bladder cancer can be detected by examining the bladder through a cystoscope, examining cells in the urine, or having intravenous pyelography (IVP, a special kidney X-ray) performed. Sometimes a large tumor can be detected through a rectal or vaginal exam. Researchers are studying a new screening test that detects telomerase, an enzyme produced by bladder tumors.

### Dietary and Nutritional Factors

Cruciferous vegetables such as broccoli, Brussels sprouts, cabbage, cauliflower, and kale have been credited with lowering the risk of bladder cancer due to their antioxidant and other cancer-fighting compounds. Eating the USDA-recom-

mended number of servings of fruits such as apples, berries, cherries, oranges, pears, and tomatoes may reduce the risk of cancer. Drinking a lot of liquids, especially pure water, helps to dilute carcinogens and increase urination, lessening the time any carcinogens in the bladder have to do any damage.

Taking vitamin A, beta-carotene, vitamin C, and a multi-vitamin have shown reductions in the risk of getting bladder cancer. Eat a diet rich in vitamin E that includes nuts and olive oil. Dimethylsulfoxide (DMSO) is an FDA-approved, nontoxic solvent that has been shown to aid in treatment.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

### Breast Cancer

See BREAST CANCER in Part Two.

### Cervical Cancer

The majority of cervical cancers grow gradually over several years with precancerous cells (dysplasia) existing previous to the cancer cells. If dysplasia is detected early enough and removed, cervical cancer can often be prevented. Cervical cancer was once one of the most common causes of cancer death for American women. However, the cervical cancer death rate declined by 74 percent between 1955 and 1992. The main reason for this change is the increased use of the Pap test. This screening procedure can find changes in the cervix before cancer develops. It can also find early cervical cancer in its most curable stage. The death rate from cervical cancer continues to decline by 4 percent a year.

A vaccine to prevent cervical cancer was made available in 2008 and is recommended for girls about the time they begin menstruation. The vaccine, Gardasil, has been approved by the FDA for use in the United States. There is a good chance that this cancer will be eradicated in the future if all women get vaccinated. However, use of the vaccine is associated with an unusually high rate of dizziness and blood clotting problems. More study is needed on the risks and benefits of this vaccine.

### Causes and Risk Factors

Most cervical cancers are associated with infection with human papillomavirus (HPV), which can be transmitted sexually. Associated risk factors include having had more than five complete pregnancies; first intercourse before age eighteen; unprotected sex; sexually transmitted infections, including HIV, HPV, and genital herpes; early childbearing; multiple sex partners; infertility; low socioeconomic status; smoking; and nutritional deficiencies.

## Signs and Symptoms

Cervical cancer usually causes no symptoms until it is advanced, which is why it is essential for women to have regular pelvic exams and Pap tests. It can cause bleeding between menstrual periods, bleeding after intercourse or douching, unusual discharge, painful menstrual periods, and heavy periods.

## Detection and Diagnosis

The presence of abnormal cells can be detected by a Pap test, followed up with a biopsy. Women should begin having annual pelvic exams and Pap tests when sexual activity begins, or at age eighteen (after three or more normal exams, your doctor may recommend decreasing the frequency of the exams unless you have had dysplasia or are at increased risk for other reasons). Screening for HPV is a method of early detection.

## Dietary and Nutritional Factors

A diet low in fatty meats (especially cold cuts), red meat, cheeses, and white bread, and high in soy products, fruits, dark green vegetables, tomatoes, whole grains, and yogurt offers the best dietary protection. Shiitake mushrooms are also a good source of protection.

If you do not consume three to five servings of fruits and vegetables daily, you should take vitamin C (500–1,000 milligrams daily), E, A, and beta-carotene (25,000–50,000 international units daily) in supplemental form. Folic acid, one of the B vitamins (400–800 micrograms daily), can not only aid in prevention, but it has been known to reverse precancerous changes in cervical cells.

## Colorectal Cancer

The large intestine is made up of the colon (the upper five to six feet) and the rectum (the last six to eight inches). This is where the last stage of digestion occurs and where solid waste is held until it is released. Colorectal cancer is the third most common cancer (not including skin cancer) in men and women in the United States. Mostly credited to an increase in screening for and removal of polyps, the incidence has been declining during the past decade.

Colon polyps are found in 10 to 20 percent of people over fifty years of age. If left untreated, 8 to 12 percent of polyps will become cancerous. If allowed to grow, a tumor can invade nearby organs. Once the disease enters the lymph nodes or bloodstream, it most often spreads to the liver. The American Cancer Society estimates that more than 146,000 Americans will be diagnosed with colorectal cancer in a given year, and just under 50,000 will die from the disease. It strikes men and women nearly equally. Colorectal cancer develops over a ten- to fifteen-year period and produces no symptoms until it is advanced. If the disease is detected early enough and the tumor has not metastasized, the survival rate is quite high. Patients who get screened and have a tumor that is entirely localized to the bowel have the greatest chance of surviving. However, with tumors that have spread to the liver, the five-year survival rate is less than 5 percent.

High blood levels of a protein linked to heart attacks might also be an early warning sign of colon cancer. The substance, C-reactive protein, is produced in the liver in response to infection anywhere in the body.

## Causes and Risk Factors

A genetic defect is connected with some forms of familial colon cancer. Other causes are not known. Risk factors associated with colorectal cancer include calcium deficiency; colorectal polyps; family history of colon cancer (Lynch syndrome); continued constipation and/or diarrhea; personal history of colon-related diseases or uterine or ovarian cancer, such as polyps, non-polyposis colon cancer, or inflammatory bowel disease; buildup of toxins in the colon; possibly diabetes; a diet high in saturated animal fat and low in fiber; high intake of charbroiled, burned, wood-smoked, or fried foods; obesity; smoking; alcohol consumption; and cancer in another part of the body. The consumption of white meat that has cooked at high temperatures and well-done red meat is associated with increased risk of rectal cancer among men. Many studies have shown that active people are not as likely to develop colon tumors as those who do not regularly engage in physical activity. Studies also show that women who eat diets high in beef, fats, desserts, and refined grains have an increased risk of colon cancer.

## Signs and Symptoms

Symptoms of colorectal cancer can include rectal bleeding; blood in the stool; changes in bowel habits (persistent diarrhea, gas pains, and/or constipation); persistent abdominal pain or bloating; anemia or significant weight loss; unusual paleness or fatigue; and ulcerative colitis.

## Detection and Diagnosis

Screening for colon cancer is the best way to detect polyps before they turn cancerous. During regular checkups (and annually after age forty), men and women should have a rectal exam. Beginning at age fifty, you also should have the first test listed below as well as either the second or third.

1. *Fecal occult blood test* (FOBT) and flexible sigmoidoscopy (if normal, repeat the FOBT yearly and the flexible sigmoidoscopy at 5-year intervals).
2. *Colonoscopy* (if normal, repeat at 10-year intervals).
3. *Virtual colonoscopy* is a computer-assisted method that allows doctors to visualize a person's colon in great detail. A small tube is inserted into the rectum and the colon is inflated with air. A CAT scan or MRI is then performed. A three-dimensional image of the colon is projected onto a computer screen and the physician analyzes the length of the colon looking for lumps that might be cancerous. The test is noninvasive, usually takes less than five minutes, and involves much less discomfort than conventional methods of examining the colon. Sedation is seldom required and the patient can go home immediately after the procedure.

In addition, a test kit for detecting blood in the stool can be purchased at most drugstores (see COLON CANCER SELF-TEST on page 292). For most people, polyps should never develop into colon cancer. Get regular colonoscopies so that precancerous polyps can be removed before they become cancer. If cancer develops, treatment is surgery and drugs such as chemotherapy with a long recuperation period.

### Dietary and Nutritional Factors

It was once believed that a high-fiber diet protects the colon by reducing the time any harmful carcinogens that are present in the stool are in contact with the intestinal wall. There have since been conflicting reports on this, but most health professionals still recommend a high-fiber, low-fat diet. A high-fat diet has a strong link with colon cancer.

Either a vegetarian diet or a diet low in red meat, alcohol, and refined foods and high in vegetables, fruits, soy, fish, whole-grain breads, and cereals, as well as low- or nonfat dairy products and lots of fruit and vegetable juices offers optimum dietary protection. Garlic, broccoli, cabbage, cauliflower, Brussels sprouts, citrus fruits, melons, and dark green, red, and yellow vegetables are recommended for their antioxidant and sulfur compounds. Studies show that aged garlic slows the rate of progression of established colon cancer cells. Tomatoes may lower risk. Consumption of chlorinated water has been linked to a greater incidence of colon cancer. Coffee has been reported to have positive effects on reducing colon cancer risk. Drink milk. Studies show that drinking two 8-ounce glasses of milk daily may reduce the risk of developing colorectal cancer by as much as 15 percent.

Beta-carotene, calcium (1,200 milligrams daily), selenium, and vitamins C and E, and the long-term use of a multivitamin containing folic acid (above 400 micrograms daily) have been linked to a reduced risk of colon cancer.

Lutein and zeaxanthin, two of the carotenoids, help to protect against colon cancer. They are found in dark green leafy vegetables such as spinach, collard greens, kale, mustard greens, and turnip greens.

Probiotics (which can be found in yogurt and supplements) may inhibit colon cancer. Low levels of vitamin D and, possibly, excessive iron intake, have been associated with an increased risk of colon cancer. Quercetin has been shown to have anticancer properties with respect to colon cancer.

### Endometrial Cancer

See under ENDOMETRIOSIS in Part Two.

### Esophageal Cancer

Esophageal cancers are three to four times more common in men than in women, and now as common in African-Americans as in Caucasians. Tumors in the esophagus usually occur in the middle or lower half of the esophagus. Esophageal cancer is one of the deadliest forms of cancer in the United States because symptoms usually do not occur before it is in advanced stages when there is little chance of recovery. Still, survival rates have been going up in recent years.

### Causes and Risk Factors

The cause or causes of esophageal cancer are not well understood. Risk factors include the use of tobacco and/or alcohol; age; personal history of Barrett's esophagus (a precancerous condition resulting from the reflux of stomach fluid into the bottom portion of the esophagus over an extended period of time), achalasia (constriction of the lower portion of the esophagus), tylosis (a very rare inherited disease that causes the overgrowth of skin on the palms of the hands and soles of the feet), or esophageal webs (small portions of tissue that stick out into the esophagus, often making it difficult to swallow); a high-fat diet; consumption of wood-smoked foods; previous ingestion of lye; and frequent heartburn. The risk generally rises with age. Those who smoke or drink heavily (or both) are at greatest risk. People with tylosis have nearly a 100 percent chance of developing esophageal cancer. Screening must begin at an early age for people with tylosis.

### Signs and Symptoms

Usually there are no symptoms until the cancer is in the advanced stages. When they develop, symptoms may include progressive dysphagia (difficulty swallowing), often with a feeling of something being stuck in the throat or chest; vomiting and vomiting of blood; bringing up excess mucus; and unintended weight loss.

### Detection and Diagnosis

See your doctor without delay if swallowing becomes even the slightest problem. Your doctor may use a barium X-ray and an endoscopic exam, or request a biopsy. A computerized tomography (CAT) scan or a newer procedure called an endoscopic ultrasound (an endoscope with an ultrasound probe) may also be ordered.

### Dietary and Nutritional Factors

A diet high in fruits (including tomatoes) and vegetables may decrease the risk of this form of cancer. Fish, berries, mushrooms, and Brussels sprouts are all good sources of omega-3 fatty acids, which offer protection. The consumption of salted, pickled, or moldy foods has been associated with an increased risk. Another risk factor may be the consumption of extremely hot or cold foods that cause physical damage to the esophagus.

Green tea contains a mechanism that inhibits esophageal cancer. Vitamins A and C, selenium, and riboflavin may help protect against esophageal cancer. Spirulina has been found in several studies to inhibit the growth of oral tumors.

### Laryngeal Cancer

The larynx (also known as the voice box) is the part of the respiratory tract between the pharynx and the trachea, containing the vocal cords. Cancer of the larynx affects more men than women. It usually strikes after the age of fifty. Most laryngeal cancers develop from squamous cells, the thin layer of cells that make up the lining of the larynx.

This type of laryngeal cancer usually begins as dysplasia and forms over a period of time—in fact, most of the precancerous cells go away on their own without treatment.

However, some of them form *carcinoma in situ* (CIS), the earliest form of cancer. Tumors located on the true vocal cords rarely spread because the connective tissues underneath do not contain lymph nodes, but tumors on other parts of the larynx are apt to spread early. Laryngeal cancer can be treated by radiation therapy, especially if diagnosed early, and by surgery to remove part or all of the larynx. If the larynx is completely removed, you must learn a new method of speech that involves the swallowing of air and bringing it up again. Some surgical techniques have been developed to reconstruct larynx tissue so that speaking can be returned to almost normal. One method that has worked for many people is the insertion of a prosthetic device.

### Causes and Risk Factors

Most cases of laryngeal cancer are associated with the prolonged use of tobacco and/or alcohol. Associated risk factors include chronic inhalation of fumes; frequent laryngitis or vocal straining; and an inherited predisposition.

### Signs and Symptoms

Possible symptoms of laryngeal cancer include a persistent cough; hoarse throat; swallowing difficulties, sometimes with a pain that radiates to the ear; persistent ear pain; chronic sore throat, sometimes so mild that it is hardly noticed; blood in saliva or sputum; unintended weight loss; and difficulty breathing.

### Detection and Diagnosis

Persistent symptoms such as those listed above should be evaluated by a doctor who specializes in the head and neck area, or an otolaryngologist. Most voice changes are not a sign of cancer, but it is better to be safe and see a doctor if you are hoarse for more than two weeks. Diagnosis is made by laryngoscopy (visual examination of the larynx by means of a scope) plus biopsy.

### Dietary and Nutritional Factors

The diet should be rich in fruits, vegetables, and foods containing vitamin A, the B vitamins, and retinoids. It is best to avoid alcohol.

If you are unable to acquire proper amounts of the above nutrients through diet alone, you should take supplements. Be sure that your total daily intake of vitamin A does not exceed 25,000 international units.

## Leukemia

Leukemia is any of a variety of diseases of the blood-forming tissues (bone marrow, lymph system, or spleen).

Leukemia involves the production of abnormal white blood cells that do not function like normal cells, do not mature properly, and do not die off in a normal fashion. Leukemia affects both children and adults, although certain forms

are most common in particular age groups. It is somewhat more common in Caucasians than in African-Americans.

According to the American Cancer Society, about 45,000 new cases of leukemia were diagnosed in the United States in 2008. There are four main types of leukemia:

1. *Acute lymphocytic leukemia* (ALL). ALL develops from cells in the bone marrow called *lymphocytes*. It accounts for slightly more than half of all cases of childhood leukemia. The most common type of cancer overall in children, it progresses rapidly.
2. *Acute myelogenous leukemia* (AML), also known as acute myeloid leukemia. AML develops from either granulocytes or monocytes (types of white blood cells). The chance of getting AML increases with age. However, children and adults of any age can develop AML. About one in five children with leukemia has AML. AML progresses rapidly.
3. *Chronic lymphocytic leukemia* (CLL). CLL develops from lymphocytes. The cells look mature but their function may not be normal. This disease occurs almost exclusively in adults, in whom it is the most common type of leukemia in adults. CLL progresses slowly.
4. *Chronic myelogenous leukemia* (CML). CML is another form of myeloid leukemia. It develops from granulocytes or monocytes. CML affects adults and is about half as common as CLL. It progresses slowly.

While there is no known cure, transfusions, chemotherapy, and bone marrow transplants are often effective treatments. Newer treatments include stem cell transplant, umbilical cord blood cell transplant, infusion of cell-specific antibodies, and biological therapy.

### Causes and Risk Factors

No one knows exactly what causes leukemia, but suspected causal factors include genetics, viruses, and exposure to certain toxic chemicals. Known risk factors include heredity, radiation exposure, chronic viral infections, age, Down syndrome, having a sibling with leukemia, exposure to human T-cell lymphotropic virus 1 (HTLV-1), use of commercial hair dyes, alkylating agents, certain cancer therapies, and environmental exposure to benzene (found in unleaded gasoline) or radon.

### Signs and Symptoms

Signs and symptoms of leukemia can include paleness; fatigue; shortness of breath when active; weight loss; repeated infections; excessive sweating; fever; easy bruising; slow-healing cuts; bone and joint pain; nosebleeds; swollen lymph nodes; increased susceptibility to infection; and an enlarged liver or spleen.

### Detection and Diagnosis

Leukemia is usually diagnosed by means of blood tests and, possibly, bone marrow biopsy.

## Dietary and Nutritional Factors

Soy products, which contain genistein and other isoflavones, may offer protection against leukemia. Good soy foods include tempeh, roasted soy nuts, soy powder protein, and miso. The bioflavonoid quercetin has been found in numerous studies to have anti-leukemia properties. Genistein has shown positive effects in destroying leukemia cells in laboratory tests. Low selenium levels have been associated with a greater risk.

Breast-fed babies have a reduced risk of contracting childhood leukemia than non-breast-fed babies.

## Lung Cancer

Lung cancer is the most common cause of cancer-related death in both men and women. The average age at diagnosis is sixty. There are two general types of lung cancer: small cell (or oat cell) lung cancer, which accounts for approximately 13 percent of all lung cancers, and non-small-cell lung cancer, which accounts for approximately 87 percent of lung cancers. Small cell lung cancer grows very rapidly and has a tendency to spread early to other parts of the body. This type of lung cancer is commonly found in smokers.

There are three main types of non-small-cell lung cancer: squamous cell carcinoma (the most common form of lung cancer), adenocarcinoma, and large cell carcinoma.

More than 200,000 new cases of lung cancer are diagnosed each year, and nearly 160,000 people die of the disease. If caught before it has spread to the lymph nodes or other organs, lung cancer has about a 50 percent survival rate. However, most cancers are not caught at an early stage because they do not generally produce early symptoms, making the all-around survival rate for lung cancer relatively low—about 3 percent—although it has been improving thanks to new diagnostics and drugs.

## Causes and Risk Factors

Smoking is the leading cause of lung cancer, and is thought to be responsible for 85 to 90 percent of cases. If you don't smoke, breathing in the smoke of others (called secondhand smoke) can increase your risk of developing lung cancer. A nonsmoker who lives with a smoker has a 20 to 30 percent greater risk of developing lung cancer, according to the American Cancer Society. Radon—a naturally occurring radioactive gas—is the second-leading cause of lung cancer, and the first among nonsmokers, according to the Environmental Protection Agency.

Other associated risk factors include marijuana use; exposure to asbestos, nickel, chromates, and radioactive materials; alcohol consumption; chronic bronchitis; history of tuberculosis; exposure to certain carcinogenic chemicals in the workplace, such as pesticides and herbicides; pollution; radon exposure; having had previous lung cancer; personal history of lung diseases caused by breathing certain minerals; tuberculosis; arsenic compounds; lung scarring from certain types of pneumonia; exposure to raw forms of talcum powders (not those found in household powders such as baby and facial powders); and deficiency (or excess) of vitamin A.

## Signs and Symptoms

Lung cancer can cause a persistent cough; sputum with blood; chest pain; shortness of breath; fatigue; hoarseness; unintended weight loss; loss of appetite; recurring bronchitis or pneumonia; fever for an unknown reason; new onset of wheezing; and swelling of neck and face.

## Detection and Diagnosis

If you have any persistent symptoms, see your doctor. Although many of these symptoms are often caused by other conditions, an examination is a crucial step in early detection. If your doctor does suspect lung cancer, he or she may order a series of imaging screenings, a study of a phlegm culture, a biopsy, a mediastinoscopy, a bronchoscopy, a bone marrow biopsy, and/or blood tests. There are also two diagnostic imaging tools that may be used in place of a biopsy: The Xillix LIFE-Lung Fluorescence Endoscopy System and Nofetumomab. Another imaging test, called NeoTect, may also aid in diagnosing cancer—possibly eliminating the need to have a biopsy done on a suspicious growth. A spiral CAT scan may eventually prove to be an effective lung cancer screening tool. However, it can trigger adverse side effects leading to decreased breathing function and death. Sixty percent of hospitals in the United States own spiral CAT machines, but for now they are mostly used *after* diagnosis for helping health care providers come up with a treatment plan. If you want to have this procedure, talk to your health care provider about the risks and benefits.

## Dietary and Nutritional Factors

A diet high in fruits (including tomatoes) and vegetables is associated with a greatly reduced risk of lung cancer.

Shiitake mushrooms contain lentinan, which may also offer protection.

Genistein, an antioxidant found in soybeans, may have an inhibiting effect on the growth of lung cancer cells.

Alpha-carotene, beta-carotene, and other carotenoids are believed by many researchers to aid in reducing the risk of lung cancer, although there is some evidence that beta-carotene may be linked to a higher rate of lung cancer and mortality in smokers, former smokers, and those subjected to exposure to asbestos in their working environments.

Vitamins C and E and beta-carotene all work together, and when taken together, the potential adverse side effects are counteracted. Selenium, lycopene, lutein, and glutathione have been associated with a reduced risk of lung cancer.

The B vitamins have also been associated with a decreased risk of lung cancer.

## Lymphoma

A key player in the body's immune system, the lymphatic system is made up of a circuitry of vessels that branch out and spread to all of the body's tissues—much like blood vessels do. Lymph nodes, found in the abdomen, chest, groin, neck, and underarms, are located along these ves-

sels. Other parts of the lymph system include adenoids, bone marrow, the spleen, tonsils, and thymus gland. The intestines, skin, and stomach also contain lymphatic tissue. Lymph is a colorless fluid that contains lymphocytes, which fight infection.

Cancer that develops within the lymphatic system is categorized as either *Hodgkin's disease* or *non-Hodgkin's lymphoma* (all other forms of cancers in the lymph system). In non-Hodgkin's lymphoma (NHL), the body's ability to fight off infection is significantly decreased because fewer than normal white blood cells are produced. In addition, the cancer can spread through the lymphatic vessels to other parts of the body. NHL can be low-grade (slow-growing), intermediate-grade, or high-grade. Both intermediate-grade and high-grade NHL are fast-growing and can be deadly within one to two years if left untreated.

Non-Hodgkin's lymphoma is the seventh most common cancer in the United States. The actual number of new cases has increased, but the increase is also due in part to better methods of detection. Although this type of cancer can develop at any age, older adults are at highest risk.

A Danish study revealed a suspected link between mononucleosis and Hodgkin's disease. Those who contract mononucleosis may have a higher risk of developing Hodgkin's disease, and the increased risk appears to last for two decades.

### Causes and Risk Factors

At least some cases of lymphoma are linked to a viral cause. In other cases, the cause is unknown. Risk factors include heredity; immune system dysfunction; exposure to herbicides, pesticides, or black hair dye; a diet high in red meat; AIDS; immune-depressing therapies; previous organ transplantation; benzene; and HTVL-1.

### Signs and Symptoms

Symptoms of non-Hodgkin's lymphoma vary, depending on the area of cancer growth. If cancer is in the abdomen, it can cause nausea, vomiting, and abdominal pain or enlargement; in the chest—shortness of breath and cough; in the brain—headaches, vision changes, and seizures; in the bone marrow—anemia; in the thymus—shortness of breath or feeling of suffocation, and coughing.

### Detection and Diagnosis

A biopsy can be done on lymphatic tissue to detect if there is any cancer present, and if so, what type. If any symptoms of non-Hodgkin's lymphoma are persistent, you should see your doctor for proper evaluation.

### Dietary and Nutritional Factors

The diet should be low in animal protein and fat and high in fiber. Alcohol should be avoided.

## Oral (Mouth) Cancer

Each year about 7,500 Americans die from oral cancer. It is twice as common in men as in women, although the incidence is rising in women.

Tumors in the oral cavity are not always malignant; however, some tumors can be precancerous. Oral leukoplakia is a precancerous condition of the mouth to which smokers and drinkers are particularly prone. People who have had cancer in the oral cavity are at greater risk of developing cancer in nearby areas and should have follow-up exams regularly throughout their lives.

### Causes and Risk Factors

Smoking and the use of chewing tobacco are the primary causes of oral cancer. According to the American Cancer Society, 90 percent of people with mouth and throat cancers use tobacco, and the risk of developing these cancers increases with the amount smoked or chewed and the duration of the habit. Other risk factors include irritants inside the mouth, such as a broken tooth or ill-fitting or broken dentures; excessive alcohol intake; chronic use of a mouthwash with high alcohol content; poor oral and dental hygiene; ultraviolet light exposure to the lips; vitamin deficiency; Plummer-Vinson syndrome; HPV; and immune system depression.

### Signs and Symptoms

While some oral cancers produce early symptoms, others do not until they are advanced. Symptoms may include a chronic sore of the mouth, tongue, or throat that does not heal; loss of feeling in the mouth or tongue; discolored patches in the mouth or throat area; swallowing difficulty or a feeling that something is stuck in the throat; mass in the cheek or neck; swelling or motion difficulty of the jaw; changes in the voice; and unintended weight loss. Cancer in the mouth has been known to disguise itself as another condition—even as a toothache.

### Detection and Diagnosis

Cancer in the mouth can be found early through recommended regular exams by the dentist or doctor. If cancer is suspected, your doctor will refer you to an otolaryngologist (head and neck specialist). The doctor may perform a complete head and neck exam, which may or may not include a biopsy. If it is likely that cancer is present, a panendoscopy will be done, which includes a complete, thorough exam performed under anesthesia.

A mouthwash containing a dye that helps dentists to see very small suspicious sores and ulcers is available, and it may be useful for people with a high risk for oral cancer.

### Dietary and Nutritional Factors

A diet low in fat and high in fruits (including tomatoes) and vegetables, with little or no alcohol consumption, is recommended. Omega-3 fatty acids, found in fish, berries, mushrooms, and Brussels sprouts, offer protection against oral

cancer. Fiber-containing foods, soy, and other legumes may also reduce the risk. A study published in the journal *Archives of Otolaryngology—Head and Neck Surgery* suggests that taking beta-carotene supplements may reverse oral leukoplakia.

Vitamin deficiencies have been associated with oral cancer. Spirulina has been found in several studies to inhibit the growth of oral tumors.

## Ovarian Cancer

Ovarian cancer is a deadly form of cancer—it kills more women than any other type of cancer of the reproductive system. If diagnosed and treated early, however, the survival rate is quite high—nine out of ten women treated will live longer than five years. Unfortunately, ovarian cancer is known as a silent disease—it produces no symptoms until it is in its later stages, so the death rate is also quite high. Of the 21,550 expected new cases in 2009, 14,600 women were expected to die.

Ovarian cancer is the second most common cancer of the female reproductive system. It affects approximately 1 in 71 American women at some point in their lives. The risk of developing ovarian cancer heightens past the age of forty and menopause further increases the risk.

### Causes and Risk Factors

The cause or causes of ovarian cancer are not known. Risk factors include not having gone through pregnancy and childbirth; exposure to asbestos or radiation; high dietary fat intake; the use of talcum powder in the genital area; personal history of breast, uterine, colon, or nonpolyposis colon cancers; family history of breast or ovarian cancer; HPV infection; early onset and/or late cessation of menstruation; obesity; and a diet high in saturated animal fat and low in fiber. Taking birth control pills has been known to reduce the risk of ovarian cancer by 50 to 60 percent.

### Signs and Symptoms

Often there are no obvious symptoms until the cancer is in its later stages of development. These symptoms may include enlargement of the abdomen, diarrhea or constipation, frequent urination, or in rare cases, vaginal bleeding.

### Detection and Diagnosis

Any enlargement of the abdomen or persistent digestive disturbances that cannot be explained by any other condition should prompt you to see a gynecologist for an exam. Women who have a family history of ovarian cancer may want to be tested for genes with which it has been associated. Routine pelvic exams can detect a hardened or enlarged ovary or an ovarian growth, while Pap smears are not very useful in detecting this. A tumor may also show up on a transvaginal ultrasound. A biopsy is needed to confirm any suspicions. There are blood tests to detect ovarian and other gynecological cancers in women who are at high risk. However, in women with an average risk, these tests have not proven to lower the chance of dying from ovarian can-

cer. Levels of lysophosphatidic acid (LPA), a substance found in the blood, seem to rise consistently in women who have ovarian cancer. This may provide a basis for a blood test.

### Dietary and Nutritional Factors

A diet that is high in fiber and low in saturated animal fats is a good defense against ovarian cancer. A diet high in folate intake may reduce the risk of ovarian cancer.

Quercetin has been found to have properties that protect against ovarian cancer. Low levels of selenium have been associated with a greater risk of ovarian cancer.

A study in Queensland, Australia, reported that women who drink more than one glass of red wine a day decrease their risk of developing ovarian cancer seven times over women who do not drink red wine.

## Prostate Cancer

See PROSTATE CANCER in Part Two.

## Skin Cancer

See SKIN CANCER in Part Two.

## Stomach Cancer

There were an estimated 21,130 new cases of stomach cancer in the United States in 2009, and about 10,620 people died from it. It is nearly twice as common in men as in women, and is more common among lower-income people. The risk of stomach cancer increases past the age of forty.

Stomach cancer is more common in other countries including Japan, Chile, and Austria, while stomach cancer in the United States is on the decline. It may be that high intake of raw fish in Japan contributes to the high gastric cancer rates in that country.

The stomach is divided into five portions, and cancer can develop in any of them. Depending on the location where the cancer develops, stomach cancer can produce different symptoms and different outcomes. Most researchers agree that stomach cancer develops gradually and is often preceded by the development of precancerous cells. Stomach cancer has the ability to spread in several ways: through the stomach lining to surrounding organs, through the blood or lymphatic system, or by extending into the esophagus or small intestine.

### Causes and Risk Factors

Some cases are probably a result of *Helicobacter pylori* (*H. pylori*) infection. In other cases, the cause is unknown.

Risk factors for stomach cancer include pernicious anemia; lack of hydrochloric acid and dietary fiber; high-fat diet; diet high in smoked, salted, or pickled foods; foods high in starch and low in fiber; tobacco and/or alcohol use; previous stomach surgery; chronic gastritis; stomach polyps; heredity; having type A blood; and a personal history of pernicious anemia or atrophic gastritis (a condition resulting in a reduction of gastric acid secretions).

## Signs and Symptoms

There are often no symptoms in the early stages. When they develop, symptoms can include indigestion, pain, and bloating after eating; pain in the stomach that cannot be relieved by antacids; vomiting after eating or vomiting blood; black or tarry stools; anemia; fatigue; and unintended weight loss.

## Detection and Diagnosis

If you are experiencing any of the symptoms listed above, it is important to see your doctor (especially if you are in a higher-risk category), even though many of the symptoms can be caused by other less-threatening conditions. If your doctor suspects stomach cancer, he or she may run several tests, including laboratory blood and fecal occult blood tests, an endoscopy, or a barium upper GI radiograph. A biopsy is needed for formal diagnosis. An endoscopic ultrasound is a newer method that can be used to see how far along the cancer is.

## Dietary and Nutritional Factors

A diet high in fruits (including tomatoes), vegetables, rice, pasta, and beans, with limited amounts of meat products, is a good defense. Broccoli, onions, garlic, and pineapple are high in sulfur compounds, which offer protection against stomach cancer. Also, you should keep your consumption of smoked, barbecued, pickled, or salt-cured foods to a minimum, and avoid alcohol and tobacco products.

Antioxidants are a strong defense against free radicals that can damage cells and, possibly, make them turn cancerous. Vitamins C and E, alpha-carotene, beta-carotene, selenium, and lycopene are good sources of protection.

## Testicular Cancer

Testicular cancer generally strikes men of younger ages—usually between the ages of twenty and thirty-five—and the chance of developing testicular cancer declines with age. It is more likely to occur in Caucasians than in African-Americans. The American Cancer Society estimates that about 8,400 new cases of testicular cancer will be diagnosed in the United States in 2009 and 380 men will die

from it. Because treatment is so successful, the risk of dying from testicular cancer is very low.

Tumors in the testicle tend to grow very rapidly—they can double in size in only twenty to thirty days. They can also spread quickly through the lymph nodes. For this reason, testicular cancer often spreads before diagnosis. The cure rate for testicular cancer is very high—over 95 percent—if it is detected early. Thankfully, new treatment methods can destroy even testicular cancers that have spread.

## Causes and Risk Factors

The cause of testicular cancer is not known. It is known that cryptorchidism (undescended testicles) substantially increases the risk, even if the condition is corrected by surgery. Other risk factors include inguinal hernia during childhood and a personal history of mumps orchitis.

## Signs and Symptoms

Symptoms of testicular cancer include a lump or lumps in a testicle; enlargement of a testicle; thickening of the scrotum; sudden collection of fluid in the scrotum; pain or discomfort in a testicle or in the scrotum; mild ache in the lower abdomen, back, or groin; enlargement or tenderness of the breasts; blood in the semen; and breast enlargement.

## Detection and Diagnosis

A monthly self-exam is the best way to detect testicular cancer early (*see* TESTICULAR CANCER SELF-TEST on page 292), especially for boys and men between the ages of fifteen and forty. Yearly examinations by a physician are suggested as well. If cancer is suspected after examination of a mass, your physician will request a testicular ultrasound. Ultimately, a biopsy is needed for complete diagnosis.

## Dietary and Nutritional Factors

A low-fat diet that includes generous helpings of fruits, vegetables, and grains is recommended. Tomatoes and watermelon are good sources of lycopene, which may protect against testicular cancer. Avoid high-fat foods and alcohol.

Vitamin E and other antioxidants may help reduce the risk. Some studies have suggested that vitamin A supplements may raise the risk.

years after being diagnosed, a rate that has been climbing since the 1970s, when only 50 percent lived that long. Sixty-one percent of survivors are age sixty-five and older. Seventy-five to eighty-five percent of childhood cancer survivors (90 percent with non-Hodgkin's lymphoma) are living five years after diagnosis.

Just as each of us looks different, each of our bodies has its own unique composition. What some of us react well to may cause an adverse reaction in others, which is why some treatments prove to be successful for some, but not

for others. This is why dietary wellness and prevention are so important. If we can keep our bodies healthy and avoid known cancer-causing agents, we have a good defense against ever getting cancer in the first place. And if you have cancer, it is imperative to maintain optimum health: If you go into battle unarmed, you don't stand much chance of winning; but if you go in with a full coat of armor, through the healthiest diet and nutrition, you have the best fighting chance to successfully conquer cancer.

The nutritional program and other recommendations

outlined in this section are designed for persons who have been diagnosed with cancer, as well as for those who wish to enhance their chances of avoiding this disease. In one survey, vitamin and mineral supplementation was found to be higher among patients with cancer or those who had recovered from it than the general population. About 50 percent of Americans use supplements, whereas 64 to 81 percent of cancer patients or survivors of cancer use them. If you take oral supplements, take them daily with meals (except for vitamin E, which should be taken before meals). Sometimes with certain cancers, such as of the intestines, where supplements are not adequately absorbed, it may be necessary to provide them intravenously. This should always be done under the supervision of a doctor.

**CANCER SELF-TESTS**

**Breast Cancer Self-Test**

See under BREAST CANCER in Part Two.

**Colon Cancer Self-Test**

A test kit can be purchased at most drugstores for detecting blood in the stool (an early sign of colon cancer). In one test, you simply drop a strip of chemically treated paper into the commode after a bowel movement. The paper will change to the color blue if blood is present in the stool.

If your test result is positive, take a second test in three days. If the second test is also positive, see your physician immediately. The presence of blood in the stool does not necessarily mean that you have cancer. The consumption of red meat or the presence of diverticulitis, hemorrhoids, polyps, ulcers, or an inflamed colon can all cause a positive test result. Only about 10 percent of those who test positive for blood in the stool have cancer. Women can get this test yearly at a gynecological examination; men can get it at their yearly physical exam. In any case, starting at age fifty, a colonoscopy is the best way to rule out colon cancer.

**Testicular Cancer Self-Test**

With the fingers of both hands, gently roll each testicle between the thumb and the fingers, checking for hard lumps or nodules. Be sure to include the epididymis (the ropelike portion) in your examination. Normally, testicles feel smooth and a little spongy. A mass will feel firm but not painful when pressed, unless there is bleeding inside the tumor. If you find a suspicious lump, see your physician. This test should be performed routinely by your physician at your yearly physical exam.

You will be better able to feel for lumps if you check for them after a warm bath or shower, when the scrotal skin is relaxed.

Unless otherwise specified, the doses recommended below are for persons over the age of eighteen. For children be-

tween twelve and seventeen years old, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for a child under six years old, use one-quarter the recommended amount. The nutritional suggestions are intended to help support your body while you have cancer. Most nutrients are not preventive or curative, and they will not reduce the size or impact of the cancer, except where noted.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub>	90 mg daily.	Improves cellular oxygenation plus
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Facilitates the repair of RNA and DNA. Supports the immune system's detoxification of many dangerous substances. Can streamline metabolism, ease depression and fatigue, and increase energy.
Colostrum (Plus Colostrum from Symbiotics [original and high-Ig formulas] or Colostrum Prime Life from Jarrow Formulas)	As directed on label.	Promotes accelerated healing and boosts the immune system.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Enhances oxygen utilization.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Enhances immune function.
Inositol hexaphosphate (IP <sub>6</sub> )	As directed on label.	Has powerful anticancer properties; possesses natural killer cell activity.
Melatonin	2-3 mg daily, taken 2 hours or less before bedtime.	A powerful antioxidant that also aids sleep.
Methylsulfonylethane (MSM)	As directed on label.	A powerful cancer prevention agent.
Selenium	200 mcg daily. Do not exceed a total daily intake of 800 mcg from all sources, including diet. If you are pregnant, do not exceed 40 mcg daily.	Powerful free radical scavenger and protector against cancer. Aids in protein digestion. <i>Caution:</i> Do not take supplemental selenium if you are pregnant or have heart, kidney, or liver disease.
7-Keto DHEA	As directed on label.	A metabolite of DHEA that possesses anticancer properties without being converted into testosterone or estrogens.
Superoxide dismutase (SOD)	As directed on label.	Destroys free radicals. Consider injections (under a doctor's supervision).

Vitamin A (Micellized Vitamin A and E from American Biologics)	50,000 IU daily for 10 days, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	People with cancer require higher than normal amounts of this antioxidant. Use an emulsion form for easier assimilation and greater safety at higher doses. Capsule forms put more stress on the liver. Enhances natural killer cell activity. Low beta-carotene levels have been especially associated with lung, bronchial, and stomach cancer. A powerful antioxidant and cancer-fighter. Use d-alpha-tocopherol emulsion form for easier assimilation and greater safety at high doses.
plus carotenoid complex with beta-carotene	As directed on label.	
plus vitamin E	200 IU daily.	

**Important**

Grifon Maitake D-fraction from Maitake Products	As directed on label.	A mushroom extract that contains D-fraction form of isolated beta-1, 6-glucan, a substance that prevents carcinogenesis and inhibits the growth of cancerous tumors. Also helps the body adapt to the stress of cancer treatments such as chemotherapy.
---	-----------------------	---

Shiitake extract or reishi extract	As directed on label.	Mushroom extracts with valuable immune-boosting and antitumor properties.
	As directed on label.	

**Helpful**

Acidophilus	As directed on label. Take on an empty stomach.	Has an antibacterial effect on the body. Use a nondairy formula.
-------------	---	--

Aerobic O7 from Aerobic Life Industries	As directed on label.	Contains antimicrobial agents.
---	-----------------------	--------------------------------

Chromium picolinate	At least 600 mcg daily.	Helps to build and maintain muscle mass. Useful if muscle atrophy exists.
---------------------	-------------------------	---

Grape seed extract	As directed on label.	A powerful antioxidant.
--------------------	-----------------------	-------------------------

Kelp or seaweed	1,000–1,500 mg daily.	For mineral balance and to help the body avoid damage resulting from radiation therapy.
	As directed on label.	

L-carnitine	As directed on label.	Protects against damage from free radicals and toxins. Use a form derived from fish liver (squalene).
-------------	-----------------------	---

Multienzyme complex	As directed on label, with meals.	To aid digestion. <i>Caution:</i> Do not give this supplement to a child.
---------------------	-----------------------------------	---

Multimineral complex with calcium and magnesium and potassium plus vitamin D <sub>3</sub>	2,000 mg daily. 1,000 mg daily. 99 mg daily. 400–600 IU daily.	Essential for normal cell division and function. Use a comprehensive formula that contains all major minerals and trace elements except iron.  Important for the prevention and/or treatment of several forms of cancer.
---	---	--

Multivitamin complex	As directed on label, with meals.	Do not use a sustained-release formula. Use a formula without iron.
----------------------	-----------------------------------	---

N-Acetylcysteine (NAC)	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To detoxify harmful substances and protect the liver and other organs. Has shown preventive effects against cancer. (See AMINO ACIDS in Part One.)
plus glutathione	As directed on label.	Essential for the functioning of the immune system. Found to be deficient in cancer patients. Can boost glutathione levels.
and lipoic acid	As directed on label.	

Omega-3 fatty acids (fish oil, flaxseed oil)	As directed on label.	Has antioxidant properties and may protect against, and prevent the spread of, cancer. Omega-3 fats from fish oil may attenuate muscle wasting (cancer cachexia).
--	-----------------------	---

Raw glandular complex plus raw thymus glandular and raw spleen glandular	As directed on label.	Stimulates glandular function, especially the thymus (site of T lymphocyte production). (See GLANDULAR THERAPY in Part Three.)
--	-----------------------	--

Taurine Plus from American Biologics	As directed on label.	Functions as foundation for tissue and organ repair. Necessary for white blood cell activation. Use the liquid or sublingual form.
--------------------------------------	-----------------------	--

Vitamin B complex	50 mg of each major B vitamin 3 times (amounts of individual vitamins in a complex will vary).	B vitamins that improve circulation, build red blood cells, and aid liver function.
plus extra vitamin B <sub>3</sub> (niacin)	100 mg daily. Do not exceed this amount.	<i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.

and choline plus vitamin B <sub>12</sub> and folic acid	500–1,000 mg daily. 1,000–2,000 mcg daily. 400–600 mcg daily.	To prevent anemia. Use a lozenge or sublingual form. Affects the repair of DNA. Has been linked to cancer protection.
---	---	---

**Herbs**

☐ Alternate the following in your cancer prevention or cancer therapy program: astragalus, birch, burdock root, cat's claw, chuchuhuasi (a rainforest herb), cranberry, dandelion, echinacea, fennel, green tea, licorice root, macela, milk thistle, parsley, pau d'arco, red clover, and suma.

*Cautions:* Do not use astragalus in the presence of a fever. Do not use cat's claw during pregnancy. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

❑ Spices such as cardamom, cayenne pepper, ginger, rosemary, sage, thyme, and turmeric have anticancer properties.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

❑ Dozens of studies show that astragalus is a potent cancer fighter as well as a powerful immune booster that increases your body's production of T cells, macrophages, and natural killer cells. In one study astragalus was able to restore immune function in 90 percent of the cancer patients studied. Also, in two other studies, cancer patients who received astragalus had twice the survival rate of those who received standard therapy.

*Caution:* Do not use astragalus in the presence of a fever.

❑ Cat's claw enhances immune function and has anti-tumor properties. Cat's Claw Defense Complex from Source Naturals is a combination of cat's claw and other herbs, plus antioxidant nutrients such as beta-carotene, N-acetylcysteine, vitamin C, and zinc.

*Caution:* Do not use cat's claw during pregnancy.

❑ Many people with external cancers, such as skin cancers, have responded well to poultices made from comfrey, pau d'arco, ragwort, and wood sage. (See USING A POULTICE in Part Three.)

*Caution:* Comfrey is recommended for external use only.

❑ Curcumin, an extract from the spice turmeric, is gaining attention for its antioxidant properties and its ability to protect against cancer. Laboratory studies indicate that curcumin has the ability to guard against many carcinogenic substances, and that it may inhibit the rapid cell division characteristic of cancer cells.

❑ Green tea, which has gained a lot of attention for its cancer-fighting properties, contains a substance known as epigallocatechin-3-gallate (or EGCG), which has been found by a Swedish research team to cut off blood vessels that feed cancerous tumors.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

❑ Modified citrus pectin has been shown to substantially inhibit the growth of cancer cells and is especially effective in combating skin and prostate cancers.

❑ Noni is a fruit resembling the pineapple. Research suggests it may be effective not only in blocking tumor growth, but also in inducing cancer cells to return to normal. Studies also show that noni stimulates the immune system.

❑ Ojibwa Herbal Tea, a Native American Indian herbal tea composed of sheep sorrel, burdock root, slippery elm bark, and turkey rhubarb root, reportedly has healing powers for battling cancer.

❑ Olive leaf extract enhances the immune system and has shown good results in fighting cancer.

❑ Rosemary is currently being studied as a form of cancer therapy due to its antioxidant, anti-inflammatory, and carcinogen-blocking effects.

❑ Ayurvedic herbs said to protect against cancer include boswellia (*Boswellia serrata*), green tea (*Camellia sinensis*), and haldi (*Curcuma longa*, known in English as turmeric).

❑ The Chinese patent medicine Dang Gui Longhui Wan (a traditional mixture of eleven herbs that is customarily prescribed for chronic myelocytic leukemia) contains indirubin, which is currently under study for its possible ability to control the division of cancer cells.

## Recommendations

❑ Eat a diet that includes grains, nuts, seeds, and unpolished brown rice. Millet cereal is a good source of protein. Eat wheat, oat, and bran.

❑ Eat plenty of cruciferous vegetables, such as broccoli, Brussels sprouts, cabbage, cauliflower, and spinach. Eat plenty of asparagus. Also consume yellow and deep-orange vegetables such as carrots, pumpkin, squash, and yams. Apples, berries (including blueberries, raspberries, and strawberries), Brazil nuts, cantaloupe, cherries, grapes, legumes (including chickpeas, lentils, and red beans), oranges, and plums all help to fight cancer. Most berries protect DNA from damage. Many of the plant pigments in red, yellow, orange, and blue fruits and vegetables are good sources of antioxidants. Green plants contain chlorophyll, which has been studied as a cancer fighter. Broccoli contains indole-3-carbinol (I-3-C), a compound known to eradicate many types of cancer cells on contact.

❑ Cook all sprouts slightly (except for alfalfa sprouts, which should be washed thoroughly and eaten raw).

❑ Eat onions and use garlic liberally, as it enhances the immune system and is a good cancer-fighter. Crushing garlic and then leaving it to rest for ten minutes before use seems to raise the levels of its cancer-fighting component, allyl sulfide. If you do not like the taste of garlic, take it in supplement form.

❑ Take ginger. Ginger suppresses nausea and therefore is an excellent treatment and preventive for the nausea and upset stomach that sometimes occurs with chemotherapy treatment. Ginger works best when taken with protein. In one study, the combination of the two resulted in a reduced use of medications for nausea and vomiting by cancer patients.

❑ Try to eat seven servings of whole-grain foods a day. Include at least five different types of grain foods in your diet each week.

❑ Eat ten raw almonds every day. They contain laetrile, which may have anticancer properties.

❑ Eat as many tomatoes and tomato-based products as you can. Lycopene, an antioxidant agent in tomatoes, protects

## Alternative Cancer Therapies

A growing number of people with cancer are now turning to alternative means of cancer treatment. Some of the available alternative therapies provide help by strengthening the body and controlling the side effects of conventional treatments. Other approaches, because of their gentle, noninvasive nature, may in some cases be preferred over, or used in tandem with, more orthodox treatments.

Although there are a large number of different alternative therapies, most of them do have common themes. For instance, many of them are based on the belief that a truly healthy body is less vulnerable to cancer. They emphasize that cancer develops as the result of a problem with the immune system or an imbalance in the body, either or both of which may allow the cancer to develop. Thus, they try to reduce or eliminate the underlying problem that allowed the cancer to take hold, and to activate the body's own inherent healing processes so that the body can heal itself.

Usually, alternative treatments are holistic in approach. This means that the goal is to treat the whole body, rather than just the area seemingly affected by the cancer. Cancer is seen as a systemic disease and treatment is individualized, depending on the particular person. Many alternative approaches also aim to treat the individual on a number of different levels, including physical, mental, spiritual, and emotional.

### Types of Alternative Treatments

Most of the alternative treatments used in cancer therapy fall into one of the following categories: biologic and pharmacological therapies, immunologic therapies, herbal therapies, metabolic therapies, mind-body therapies, and nutritional therapies. Although there is a certain amount of overlapping between categories—an immunologic therapy, for instance, may have nutritional components—these categories do serve to highlight the central focus of the many treatments and regimens that fall within them. Be aware, though, that the following discussion by no means mentions all of the individual therapies available. It is meant to familiarize you with the various approaches that may be used. Nor should this be seen as a recommendation for any of the following methods of treatment. The choice to seek alternative approaches of treatment for any illness must be made by the individual after a great deal of research and soul-searching. You may want to ask a conventional medical doctor and an alternative practitioner what the expected outcomes are based on the latest data. Do your research and find an experienced practitioner who can give you an informed and honest appraisal of your treatment.

### Biologic and Pharmacological Therapies

Biologic and pharmacological treatments include the off-label use of prescription drugs, hormones, complex natural products (such as extracts), vaccines, and other biological interventions not yet accepted in mainstream medicine. These therapies use biologic substances or nontoxic phar-

macological agents—nontoxic medications usually derived from biological sources, such as plants or human cells. Each of these treatments works in a different way.

Antineoplaston therapy, for instance, uses amino acid derivatives to inhibit the growth of cancer cells. Dr. Stanislaw Burzynski maintains that antineoplastons are part of the body's defense system and appear to be absent in people with cancer. He has been able to construct synthetic antineoplastons and administer them to cancer patients.

Another such treatment, shark cartilage therapy, is thought to work by blocking angiogenesis, the creation of new blood vessels required for tumor growth, and thus starve the tumor of needed nourishment.

Russian immunologist Dr. Valentin Govallo's VG-1000 theory, developed in the 1960s, is based on the belief that cancer results when a tumor evades and suppresses the immune system. Dr. Govallo believes that placenta extracts allow the immune system to readjust and attack the tumor that had escaped its attention in the first place. This method of treatment is called immuno-placental therapy.

The Revici method, developed by the late Dr. Emanuel Revici, is based on the premise that tumors are a result of an imbalance of lipids in the cells. After analysis of the tumor, the doctor delivers a compound into the tumor to establish the proper balance within the cells.

French physician Dr. Gaston Naessens developed a system of treatment known as 714-X treatment, which consists of injections of nitrogen-rich camphor and organic salts directly into the lymphatic system. The theory behind this treatment is that cancer cells excrete a poisonous compound that shuts down the immune system. The 714-X allows the immune system to reestablish itself and fight the cancer.

The National Institutes of Health's Office of Cancer Complementary and Alternative Medicine (OCCAM) also lists hydrazine sulfate, laetrile, and melatonin as pharmacological and biologic cancer treatments worth further study.

### Herbal Therapies

In these therapies, herbal remedies—probably the oldest forms of treatment in the world—are used to strengthen the body's ability to eliminate cancer cells. Hoxsey therapy, for instance, first tested in the 1920s, employs internal and external herbal preparations, along with diet, vitamin and mineral supplements, and psychological counseling, to strengthen the body and fight the cancer. Hoxsey's treatment proved to be too controversial for America, however, and the Hoxsey formula is now used for cancer treatment more often in Mexico than in the United States.

### Immunologic Therapies

Immunologic therapies are based on the belief that cancer develops because of a breakdown of the immune system. The aim of these therapies is to bolster those parts of the immune system that combat and destroy cancer cells. An example of the treatments in this category is that of the late

Dr. Josef Issels, who offered a comprehensive, nontoxic strategy for all types and stages of cancer to stimulate the body's immune system to attack cancer cells.

### Metabolic Therapies

These therapies are based on the idea that many factors cause the occurrence of cancer and that a multifaceted healing approach is required to eliminate the disorder. The therapies use detoxification, including colon cleansing, to flush out toxins; anticancer diets based on whole foods; and vitamins, minerals, and enzymes that further cleanse the body, repair damaged tissues, and stimulate immune function.

### Mind-Body Therapies

These treatments focus on the role that emotions, behavior, and faith play in recovery from illness. In the case of some therapies, counseling, hypnosis, biofeedback, or other techniques are used to promote greater emotional and spiritual well-being. In other therapies, the aim is to use mind-body techniques to actually change the course of the illness, possibly bringing the person into remission. For instance, Dr. O. Carl Simonton, with his Simonton Cancer Center, based in California, developed an imagery and visualization technique to help patients increase the effectiveness of their immune system. Yoga has become popular as part of this type of treatment. Dr. Barrie Cassileth of Memorial Sloan-Kettering Cancer Center in New York City has designed a series of complementary treatments for cancer patients. These include massage therapy, meditation, music therapy, imagery, and relaxation techniques. Dr. Herbert Benson at the Beth Israel Deaconess Medical Center in Boston has done the most research over thirty-five years on the mind-body connection in helping patients cope with disease including cancer.

### Nutritional Therapies

Therapies that focus on nutrition are perhaps the most popular alternative approach to cancer, especially since research began showing the link between diet and health.

Almost every alternative therapy includes an emphasis on diet as an important component of both prevention and, possibly, cure. For instance, studies have indicated that a high-fat diet increases the risk of cancer, while a low-fat diet that is rich in fiber, fresh fruits and vegetables, and whole grains actually helps the body to fight cancer. Three of the therapies that fall into this category are wheatgrass therapy, a diet based on wheatgrass and other raw foods; the macrobiotic diet, a traditional Japanese diet high in whole grains and vegetables; and the Moerman regimen, a meatless high-fiber diet that includes nutritional supplements.

### Choosing an Alternative Therapy

Unless you already have a specific therapy in mind, the first step in choosing one is to learn more about those that are

available. By visiting libraries and bookstores and contacting health organizations that focus on cancer, you should be able to find a number of comprehensive, up-to-date books that provide additional information about alternative treatments.

Once you have a better idea of the therapy or therapies that would best serve your needs, contact educational organizations and patient-referral services that provide information on these treatments. (See Part Three, REMEDIES AND THERAPIES, for further information about alternative treatments.)

When researching a particular therapy, try to get information from other people who have used that treatment. Some information organizations and some alternative clinics will provide lists of recovered patients whom you can call or write to. Focus on those people who have the same kind of cancer you have, and ask them what specific treatments they found helpful.

When screening alternative practitioners and clinics, ask what their success has been in treating your specific form of cancer. Keep in mind that a therapy that is effective against one type of cancer will not necessarily be effective against another. Ask to see supportive studies, documented cases, and patients' testimonials, and view all information with a healthy dose of skepticism. As much as possible, pin the practitioner down regarding what you can expect from the treatment—short-term improvement or long-term survival, for instance. Finally, consider whether the therapy fits in with your lifestyle, personality, and belief system. Be honest with yourself. Some therapies require a degree of commitment that you may not be willing to make. Others may require too much time, too much travel, or too much money to truly be feasible. However, if you have the fortitude and resources to follow an alternative method of treatment to overcome an illness, the rewards are priceless. It is worth checking to see if your health insurance will cover any part of your alternative medicine. Conventional and alternative (or secondary) treatments may be used together—one method of treatment does not necessarily preclude the other.

To get started, why not explore those endorsed by the American Cancer Association. These have worked for many cancer patients already.

- Acupuncture
- Aromatherapy
- Art therapy
- Biofeedback
- Labyrinth walking
- Massage therapy
- Meditation
- Music therapy
- Prayer and spirituality
- Tai chi
- Yoga

cells from oxidants associated with cancer. Eating a diet that includes plenty of tomatoes cuts the risk of cervical, lung, stomach, and prostate cancers. Preliminary reports suggest it may also prevent breast, colorectal, esophagus, mouth, and pancreatic cancers.

Eat a lot of tart cherries, both fresh and in pies, jams, and sugar-free juice. They contain anthocyanins, antioxidants that may help prevent cancer and heart disease.

Drink beet juice (from roots and greens), carrot juice (a source of beta-carotene), fresh cabbage juice, and asparagus juice often. Grape, black cherry, and all dark-colored juices are good, as are black currants. Also beneficial is apple juice, if it is fresh. Fruit juices are best taken in the morning, vegetable juices in the afternoon.

Drink spring or steam-distilled water only, not tap water. Increased levels of contaminants in public water have been associated with an increased rate of lung, bladder, and breast cancers, as well as leukemia.

Limit your consumption of dairy products. A little yogurt, kefir, or raw cheese occasionally is okay, but make sure that you are getting enough calcium, magnesium, and vitamin D from other foods or supplements. Calcium and vitamin D at levels slightly above the DRI have been shown to reduce the risk of all cancers in postmenopausal women. Since it is difficult to obtain these nutrients from food alone, it makes sense to take daily supplements, especially if you are eliminating dairy from your diet.

Do not consume any of the following: peanuts, junk foods, processed refined foods, saturated fats, salt, sugar, or white flour. Instead of table salt, use sea salt, kelp, or a potassium substitute. If necessary, a small amount of blackstrap molasses or pure maple syrup can be used as a natural sweetener in place of sugar. Use whole wheat or rye instead of white flour. Do not consume anything containing alcohol or caffeine.

Limit your intake of luncheon meats, hot dogs, or smoked or cured meats. Broiled fish or poultry are better choices. Fish is particularly important because it has not been associated with an increased risk of cancer, as beef has.

See FASTING in Part Three, and follow the program.

A green drink that is a good master cleanser combines the juice of 2 organic lemons, 2 tablespoons pure maple syrup, ¼ teaspoon cayenne pepper, 1 ounce fresh wheatgrass juice, and 1 quart of distilled water. If fresh wheatgrass is not available, powdered Sweet Wheat from Sweet Wheat, Inc. is a good substitute.

Take coffee enemas alternated with enemas made by adding 1 ounce of fresh wheatgrass juice to 1 cup of water. Do this daily to help the body eliminate toxins, if your gastrointestinal tract can handle it. Avoid enemas if you have colon cancer—an enema will hurt the inside lining of the GI tract. Wheatgrass enemas contain many nutrients and enzymes, and are used in many alternative clinics for can-

cer treatment. Also use cleansing enemas with lemon and water or garlic (Kyolic liquid) and water two or three times weekly. (See ENEMAS in Part Three.)

Do not take supplemental iron, unless your doctor has told you that you are anemic or require it for other reasons. If you are not iron deficient, the body naturally withholds iron from cancer cells to inhibit their growth. People with excessive iron in their blood have an increased risk of developing cancer. Excess iron may suppress the cancer-killing action of macrophages (cells that engulf and devour bacteria and other foreign invaders) and interfere with the activity of lymphocytes.

Use only glass or stainless steel cookware and wooden cooking utensils.

Get regular exercise. Cancer is less prevalent in physically active people. Exercise also helps to stave off depression and promotes oxygenation of the tissues.

Check the radon level in your home. Radon is a radioactive gas that occurs naturally within the earth's crust that has been classified by the Environmental Protection Agency (EPA) as a known carcinogen. Radon test kits are easy to find at hardware stores and are relatively inexpensive. If radon is found, sealing cracks and improving ventilation in the basement will usually improve the situation.

Because of potential low-level radiation leakage, avoid microwave ovens. Do not sit close to television sets—sit at least eight feet away. Also avoid X-rays.

Avoid chemicals such as hair sprays, cleaning compounds, waxes, fresh paints, and garden pesticides. Many chemicals promote the formation of free radicals in the body, which may lead to cancer. People with cancer can further weaken their immune systems by coming into contact with chemicals. The body then must expend energy trying to protect itself from the damaging chemicals instead of fighting the cancer.

Use a shower head that removes the chlorine from your water. A product called Showerwise from Waterwise will do this. (See Manufacturer and Distributor Information in the Appendix.)

Remove known and suspected carcinogens from your life and from your home. *Diet for a Poisoned Planet* by David Steinman (Running Press, 2006) provides information on the safety of our food, water, and the products we use every day.

Do not take any drugs except for those prescribed by your physician.

As much as possible, avoid stress. Learn relaxation and stress management techniques (such as meditation, visualization, deep breathing, and participation in support groups) to help you deal with those stresses you cannot avoid. (See STRESS in Part Two.)

## Considerations

❑ Many people with cancer have achieved good results with a macrobiotic diet.

❑ Some oncologists dissuade their patients from using dietary supplements when they are undergoing chemotherapy, radiation, or both, because of possible interactions. However, in a review of fifty clinical, peer-reviewed articles, involving over 8,000 patients, those who took supplements consistently had no problem with interactions. The nutrients most used by the cancer patients in this study were vitamins A, B complex, C, D, E, and K, selenium, cysteine, and glutathione. In a subset of these studies, survival was increased in those using supplements.

❑ If weight loss and muscle wasting are significant, you may have cachexia, which is associated with a high mortality, so early treatment is advised. More than 5 million people with a variety of diseases including cancer have this condition. It may be treatable with aggressive nutritional therapies such as intravenous or tube-feeding formulas.

❑ High doses of L-carnitine (6 grams a day for four weeks) were shown to increase energy levels and quality of life in patients with cancer.

❑ In a recent study, red meat and processed meats were associated with modest increases in cancer deaths, as well as death by any cause and death from heart disease. These findings were published in the prestigious medical journal *Archives of Internal Medicine*. The safest amount of red meat or processed meat was an average of ½ ounce per day. Thus, you can eat a serving (3 to 4 ounces) of these once a week without increasing your risk of developing cancer.

❑ Linoleic acid was once thought to be anti-carcinogenic, but a recent study suggests it is not. However, if you have been advised to lose weight, conjugated linoleic acid may be helpful. It helps to burn fat and induce a slow weight loss.

❑ German physician and cancer specialist Dr. Hans Nieper used fresh raw cabbage and carrot juice with excellent results. Dr. Nieper also used Carnivora, a substance derived from a South American plant, to fight cancer.

❑ New York-based immunologist Dr. Nicholas Gonzalez developed a cancer treatment regimen that has been studied by the National Institutes of Health that incorporates changes in diet, nutritional supplementation, and toxin-removal systems, including coffee enemas.

❑ Various types of mushrooms can be good sources of vitamin D, B<sub>1</sub> (thiamine), B<sub>2</sub> (riboflavin), B<sub>3</sub> (niacin), minerals, and amino acids. They have the ability to enhance the body's immune system T cells that seek and destroy cancer cells. Shiitake, zhu ling, enoki, reishi, and maitake mushrooms have all been reported to have anticancer properties.

❑ Exceptionally low cholesterol levels have been associated with an increased risk of dying from cancer, possibly because people with lower cholesterol levels tend to consume more polyunsaturated fats, which may increase cancer risk.

❑ The rates of breast cancer among some women of Asian-American descent, particularly Japanese Americans, may be approaching those of white women, according to new research. University of Southern California researchers examined the trends in Los Angeles County and reported their results in the *International Journal of Cancer*. Women living in Asian countries have some of the lowest breast cancer rates of any group in the world, in contrast to women in the United States, where rates are among the highest in the world. Much of this has been linked to differences in lifestyle factors such as diet, exercise, body weight, and choosing to have children later in life (or not at all). Ethnicity and national origin are among the strongest known predictors of breast cancer risk, the authors said. These factors are thought to affect a woman's risk even more than those associated with menstrual periods and childbearing. But breast cancer rates have risen sharply in recent years in some Asian countries such as Japan, where women have adopted more "Westernized" lifestyles. In fact, breast cancer is expected to soon become the most common cancer among women in Japan, the authors said.

❑ A daily dose of seven to ten servings of fruits and vegetables can reduce cancer risk by about 30 percent. Eating smaller amounts—5 servings a day—does not reduce the risk. In a study published in the *Journal of the American Medical Association*, women who had breast cancer and were in remission who ate 5 servings of fruits and vegetables a day did not have a reduced rate of recurrence of the disease. Still, many phytochemicals found in plant foods are currently being studied for anticancer properties, including:

- Lutein, one of the carotenoids, is under investigation as a possible anticancer nutrient. Good sources of lutein include dark, leafy greens and broccoli.
- Genistein and diadzein, two isoflavones found in soy, act as antioxidants and may protect against most forms of cancer, especially prostate cancer, breast cancer, leukemia, glioblastoma multiforme, and bladder cancer. Soy's soluble fiber reduces the risk of many digestive system cancers, such as colon and rectal cancer. The water-absorbing fiber may dilute intestinal carcinogens and usher them out of the body, as well as spur growth of bifidobacteria, the good bacteria that help prevent colon cancer. Mega Soy Formula from Prolongevity is a good supplement that contains a substantial amount of genistein and other isoflavones that help to fight cancer. Although they may reduce risk of cancer, because of their estrogen-like properties, isoflavones may actually increase the risk of some kinds of cancer. A new review says phytoestrogens may have both a protective role and a stimulatory role in breast cancer cell growth depending on several factors, including at what age they're consumed and whether they're consumed as food or as supplement. The report appeared in the September/October 2007 issue of *CA: A Cancer Journal for Clinicians*, a peer-reviewed journal of the American Cancer Society.

- D-glucaric acid, a phytochemical found in broccoli, Brussels sprouts, and cauliflower, has shown evidence in several clinical studies of reducing the incidence of cancers of the breast, lung, liver, and skin. D-glucaric acid is also available in supplement form combined with calcium (calcium D-glucarate).
- A four-year study conducted at the University of Illinois College of Medicine showed that high levels of antioxidants have a protective effect against cancerous tumors. However, there have been some mixed results from other studies. Alpha-tocopherol has been shown to protect against tumors, while in one study beta-carotene and vitamin A had no effect. In another study, large amounts of vitamin E had no significant effect, but seemed to trend toward *increasing* risk of prostate cancer.
- Calcium may prevent precancerous cells from becoming cancerous.
- Inositol hexaphosphate (IP<sub>6</sub>), a form of the B vitamin inositol, is gaining attention for its ability to aid in the prevention and treatment of cancer. It is found naturally in whole grains, beans, lentils, pork, veal, citrus fruits, and nuts. Evidence has shown that it may not only shrink tumors, but also prevent tumor growth.
- Niacin may play a major role in the prevention and treatment of cancer.
- The lower the serum concentrations of the mineral selenium, the greater the associated risk of several types of cancer, including leukemia, esophageal, lung, colorectal, prostate, breast, and ovarian cancers. However, according to the National Institutes of Health's Office of Dietary Supplements, the tolerable upper level for adults is 400 micrograms (mcg) per day. Selenium supplementation should be discussed with a physician. Dietary sources of selenium include Brazil nuts, tuna, flounder, pork, turkey, pasta, pinto beans, and navy beans.
- Studies have shown that supplementation of vitamins A, C, and E can decrease the effect of lipid peroxidation, or the oxidation of body fats, which leads to the creation of free radicals in the body.
- Research is under way to determine the effects of vitamin D on cancer. Early findings suggest that daily exposure to a limited amount of sunlight (a good source of vitamin D) may reduce the risk of breast, colon, and prostate cancers. If sunlight is not available all year round, taking a vitamin D supplement is just as effective.
- Gamma E Tocopherol from Prolongevity is a vitamin E supplement containing gamma-tocopherol, delta-tocopherol, alpha-tocopherol, and beta-tocopherol—all natural forms of vitamin E. This product offers powerful protection against dangerous free radicals.
- Nutritional supplements and better dietary habits offer great support to cancer patients who are receiving chemotherapy and/or radiation, or who are in remission. Taking shark liver oil prior to radiation therapy has been shown to protect healthy tissue against injury from the procedure. Shark liver oil contains alkyglycerols (AKGs), vitamins A and E, omega-3 fatty acids, trace minerals, and squalene. A study published in the *European Journal of Cancer* in 1997 reported that glutamine can reduce adverse side effects associated with chemotherapy.
- Some types of cancer are treated with chemotherapy, which can apparently cause cancer to go into remission. Cancer chemotherapy is the administration of highly toxic medications meant to kill cancer cells. Most chemotherapy medications destroy normal cells in the process, causing adverse side effects including hair loss, extreme nausea, vomiting, fatigue, weakness, sterility, and damage to the kidneys and heart. Certain nutrients may help the body avoid some of the damage done by this treatment, among them vitamin B<sub>6</sub> (pyridoxine), coenzyme Q<sub>10</sub>, glutathione, and vitamin C.
- In some cases, radiation therapy may be recommended. This involves aiming concentrated X-rays directly at a tumor to kill the cancerous cells. Radiation therapy too has unpleasant side effects, including fever, headache, nausea and vomiting, and loss of appetite.
- Moderate use of low-dosage aspirin may aid in killing tumor cells. *The New England Journal of Medicine* found that patients who had been treated for colorectal cancers had a lower rate of recurrence when they took a daily dose of aspirin and that aspirin reduces the growth of polyps in the colon that may lead to cancer. However, the Nurses' Health Study at Boston's Brigham and Women's Hospital came to the unexpected conclusion that women who take aspirin twice daily increased their risk of getting pancreatic cancer.
- Non-small-cell lung cancers, which account for most cases of lung cancer in the United States, may be treated with porfimer (Photofrin), gefitinib (Iressa), and gemcitabine (Gemzar) in combination with cisplatin. Paclitaxel (Taxol) taken in combination with the commonly used cancer drug cisplatin (Platinol) is still being investigated.
- Docetaxel (Taxotere) is a drug approved for treating non-small-cell lung cancer that does not respond to cisplatin-based chemotherapy.
- Doxorubicin (Adriamycin) is a potent chemotherapeutic drug used for treating many forms of cancer. Patients on this drug should avoid curcumin (turmeric).
- The genetically engineered virus ONYX-015 is designed to infect and kill cancer cells without harming healthy ones. It is under study. Other drugs undergoing testing as cancer therapies include:
  - Angiostatin and endostatin, promising anticancer agents that stop the growth of new blood vessels to feed tumors.
  - BR96-DOX, a drug that zeroes in on cancer cells, leaving the healthy cells alone. Its active ingredient is doxorubicin, a proven chemotherapy cancer-killing substance.
  - Hydrazine sulfate is a monoamine oxidase (MAO) inhibitor available as a dietary supplement that may help

offset the inability to eat, fatigue, weight loss, and muscle deterioration often associated with cancer. It also has been studied for over three decades as a treatment for cancer itself. Possible side effects include nausea and vomiting, tingling, loss of feeling, and inflammation of the nerves in the hands and feet, and irregularities in glucose level, alkaline phosphatase, and liver function tests have been reported. Dizziness, weakness, drowsiness, and itching may also occur.

- Interferon and interleukin-2 (IL-2) were the standard treatment for metastatic kidney disease. Now two drugs replace this therapy: sunitinib, which inhibits several cellular proteins that promote growth of blood vessels in tumors; and temsirolimus, which targets another cellular protein that regulates the growth of tumor cells.

❑ Two preventive vaccines have been approved for cancer. One prevents the hepatitis B virus, which can cause liver cancer. The other is a vaccine against the human papillomavirus (HPV) types 16 and 18, which are responsible for many cases of cervical cancer. Effective cancer treatment vaccines are under investigation, including one for non-Hodgkin's lymphoma and another for advanced non-small-cell lung cancer.

❑ Hyperthermia, a procedure in which body tissue is exposed to extremely high temperatures (up to 106°F), may be effective against tumor cells and can be used alone or in combination with radiation therapy and other therapies. Researchers believe that the heat may damage tumor cells or deprive them of the nutrients they need to live. It is important that hyperthermia is applied in a safe way under a physician's care.

❑ Conventional therapies (chemotherapy, radiation, and surgery) may not be as effective at fighting cancers of the lung, pancreas, liver, and bone, and advanced colon and breast cancers, as they are at fighting other types of cancer.

❑ The hormone dehydroepiandrosterone (DHEA) is believed by some to help prevent cancer by blocking an enzyme that promotes cancer cell growth. A form of DHEA, 7-keto DHEA, unlike DHEA itself, is not converted into testosterone or estrogens. It may be a better option for those at high risk for breast, endometrial, uterine, and prostate cancers. (See DHEA THERAPY in Part Three.) However, according to the American Cancer Society, available scientific evidence does not support claims that DHEA supplements are safe or effective for treating cancer. Caution is advised in their use in people who have cancer, especially types of cancer that respond to hormones, such as certain types of breast, prostate, and uterine cancer. People younger than thirty may run the risk of suppressing the body's natural production of DHEA if they take DHEA supplements.

❑ Studies have shown grape seed extract to not only enhance the development of normal cells, but also to inhibit abnormal cell growth.

❑ Research has shown hyperbaric oxygen therapy (HBOT) is effective when used in addition to conventional treatment for the prevention and treatment of osteoradionecrosis, a term for delayed bone damage caused by radiation therapy. There is also some evidence suggesting HBOT may be helpful as an additional treatment for soft tissue injury caused by radiation. However, there is no evidence that HBOT cures cancer. (See HYPERBARIC OXYGEN THERAPY in Part Three.)

❑ Research is ongoing regarding the anticancerous effects of the hormone melatonin, which is produced by the pineal gland. It has strong antioxidant effects and acts as a scavenger of free radicals that induce DNA damage. Melatonin may inhibit tumor growth by interaction with interleukin 2 (IL-2) and seems to have a beneficial effect particularly on endocrine tumors. The synthetic form is preferred since the natural form, recovered from animal pineal glands, could contain harmful viruses. Melatonin can be used to good effect on various types of tumors, under supervision of a physician. It seems to be effective in fighting cancers of the male and female reproductive system, breast, and prostate. Studies are still needed to determine the effects of long-term use of melatonin in supplement form. Some recent studies have found that people who work night shifts may be at increased risk for cancer, which could be linked to melatonin levels in the body. Study results regarding the effect of melatonin supplements on survival and quality of life in people with cancer have been mixed, and further research in this area is needed.

❑ In older studies shark cartilage has been shown to be helpful for certain types of cancer, including cancer of the breast, cervix, pancreas, and prostate, as well as Kaposi's sarcoma, a type of skin cancer. It suppresses angiogenesis (the development of new blood vessels), depriving cancerous tumors of nourishment and, often, causing them to shrink and die. Although some laboratory and animal studies have shown that some components in shark cartilage have the ability to slow the growth of new blood vessels, these effects have not been proven in humans. The few small clinical studies of shark cartilage products published more recently have not shown any benefit against cancer. Further clinical trials of the supplements and of a purified cartilage extract are currently under way.

❑ Shark liver oil is a rich source of alkylglycerols, chemicals that may have anticancer properties. Alkylglycerols are also found in human bone marrow and in breast milk. Other chemicals in shark liver oil being studied against cancer are squalamine and squalene.

❑ The single most avoidable cancer risk is smoking. Cigarette smoke is made up of more than 4,000 chemicals, including 43 that are known to cause cancer. It also contains the poisonous gases nitrogen oxide and carbon monoxide. Lung cancer was a rare disease until the twentieth century, when cigarette smoking became widespread. In 2009 there were an estimated 219,440 new lung cancer diagnoses and

159,390 deaths. Besides lung cancer, smoking can cause cancers of the cervix, kidney, pancreas, and stomach. The cancerous effects of smoking are multiplied by alcohol consumption, and the two are frequently used in combination. Research suggests that if you quit smoking when precancerous signs are found, damaged lung tissue may return to normal, oftentimes within five years. Statistics show that 1 out of 5 women diagnosed with lung cancer has never smoked, compared to 1 out of 10 men. Regular exposure to secondhand smoke can increase a nonsmoker's chance of getting cancer by 20 to 30 percent.

❑ There have been some claims that dairy products increase the risk of cancer. However, it is more likely that it is fat that is the problem, not milk. Almond, rice, and soy milk are good low-fat alternatives.

❑ A study published by the *American Journal of Epidemiology* has disproved suggestions that there is a link between lactose and/or galactose (sugars found in milk) and ovarian cancer.

❑ Obesity in men may cause or contribute to colon and rectal cancer; in women, it has been linked to gallbladder, cervical, uterine, and breast cancer. Overweight women are more likely to develop cancer of the uterine lining than other women and tend to do poorly if they develop breast cancer. Fat affects the level of sex hormones in the body. Hormones produced by the adrenal glands are converted into estrogen in fat tissue, so the greater the amount of fat present, the higher a woman's estrogen levels are likely to be. Estrogen stimulates cells in the breast and reproductive system to divide.

❑ Some people believe that fluoride (which is in toothpaste, tap water, and every product made with tap water) may be a risk factor for cancer.

❑ The incidence of leukemia among children who were breast-fed has been found to be significantly lower than that among bottle-fed children.

❑ A group of seventy-five Environmental Protection Agency (EPA) experts ranked pesticide residues among the top three environmental cancer risks.

❑ Men who undergo vasectomy do not increase their prostate cancer risk, according to researchers in the *Journal of the American Medical Association (JAMA)*. There had been some concern about vasectomies and prostate cancer because two 1990 studies reported an increased risk of prostate cancer after vasectomy.

❑ High-voltage power lines have been under study as a possible contributor to cancer. Researchers at the National Institute of Environmental Health Sciences (NIEHS) have reported that, while it is a possibility, it is not likely.

❑ Since women have been having Pap smears, the mortality rate for cervical cancer has dropped by more than 70 percent. However, Pap smears are not always accurate. Some tests show promise for improving the accuracy of Pap

tests. AutoPap is a computerized screening test designed to improve the Pap test's accuracy. ThinPrep is another variation on the Pap test. It utilizes a different method of collecting the cells that can make it easier to detect cell abnormalities. The FDA has approved an HPV DNA test that can detect the presence of human papillomavirus (HPV), which is associated with cervical cancer. Women over age thirty and who are at higher risk for cervical cancer may want to discuss these tests with their doctors. Research on other types of tests to detect cervical cancer is ongoing.

❑ Irritable bowel syndrome does not increase the risk of colon cancer.

❑ Men who receive either of two kinds of treatment for testicular cancer appear to be at increased risk for leukemia. A recent study highlighted those getting radiation treatment and Cisplatin, a standard cancer chemotherapy agent. The study also noted that the higher the dosage, the greater the risk. Researchers are quick to point out that the benefits of both treatments far outweigh the small increased risk of leukemia.

❑ Most people are unfamiliar with head and neck cancer, yet worldwide more than 500,000 people are diagnosed with these cancers every year. According to the National Cancer Institute (NCI), men are three times more likely than women to be diagnosed with head and neck cancer and almost twice as likely to die from their disease. Patients with head and neck cancer suffer a high mortality rate. Head and neck cancer does not include brain tumors. Treatment includes radiation therapy, which is often implemented following surgery. However, radiation therapy can cause adverse, even lethal, side effects. Lethal radiation necrosis (tissue death) in the brain is one potential side effect of radiation therapy. Also, stroke rates increase by five times in people who have undergone radiation therapy for head and neck cancer. Stroke is the official cause of death among many people who have had head and neck cancer who later die after radiation therapy treatments. For this reason, cancer cure statistics can be misleading. Even though radiation therapy may cure cancer, nonrelated cancer deaths seem to be a long-term side effect of radiation. Although more people with cancer are now living beyond five years after diagnosis, premature death can be a direct result of toxic therapies used to eradicate cancer. We do not recommend that people with head and neck cancer refuse radiation therapy, as it often buys years of extra life. They should, though, take extra precautions to reduce their risk of stroke. (See under **CARDIOVASCULAR DISEASE** in Part Two.)

❑ A small portion of colorectal cancers are known to be caused by inherited gene mutations. Hereditary nonpolyposis colon cancer is caused by changes in genes that normally help a cell repair faulty DNA. Cells must make a new copy of their DNA each time they divide into two cells. Sometimes errors are made in copying the DNA code. Cells usually have DNA repair enzymes, but some muta-

tions in these enzymes such as MLH1 may allow DNA errors to go uncorrected. These errors will sometimes affect growth-regulating genes, which may lead to cancer. Genetic tests are available that can detect gene mutations associated with some inherited gene mutations.

Cancer has been reported to be badly underdiagnosed. In one autopsy review of those found with malignancies, over half of the deaths were caused by undiagnosed cancer.

There are many hospitals, research centers, and treatment centers that specialize in cancer treatment. For a list of organizations that may be of assistance in obtaining information and/or treatment options, see Health and Medical Organizations in the Appendix.

See BREAST CANCER; PROSTATE CANCER; SKIN CANCER; and TUMORS, all in Part Two.

See also PAIN CONTROL in Part Three.

**CANDIDIASIS**

*Candida albicans*, a single-celled fungus, is always present in the genital and intestinal tracts. If it is present in disproportionate quantities, however, it can cause infection. Diaper rash, vaginitis, and thrush are some of the possible manifestations of candida infection.

Because candidiasis can affect various parts of the body—the most common being the mouth, ears, nose, toenails, fingernails, gastrointestinal tract, and vagina—it can be characterized by a wide array of symptoms. These include constipation, diarrhea, colitis, abdominal pain, headaches, bad breath, rectal itching, low libido, memory loss, mood swings, prostatitis, canker sores, persistent heartburn, muscle and joint pain, sore throat, congestion, nagging cough, numbness in the face or extremities, tingling sensations, acne, night sweats, severe itching, clogged sinuses, PMS, burning tongue, white spots on the tongue and in the mouth, extreme fatigue, vaginitis, kidney and bladder infections, arthritis, depression, hyperactivity, hypothyroidism, adrenal problems, and even diabetes. Symptoms often worsen in damp or moldy places, or after consumption of foods containing sugar and/or yeast. Because of its many and varied symptoms, this disorder is often misdiagnosed. Many of these symptoms can be related to other diseases, so a firm diagnosis is warranted.

When the candida fungus infects the mouth, it is called thrush. White sores form on the tongue and gums and inside the cheeks. In a baby, the white spots of oral thrush may resemble milk spots. Oral thrush in an infant can spread to the mother’s nipples by breast-feeding, and can lead to a situation in which mother and baby continually reinfect each other. Thrush may also infect a baby’s buttocks, appearing as diaper rash. Candida infection may also take the form of athlete’s foot or jock itch. Systemic candidiasis is an overgrowth of candida everywhere, through-

out the body. In the most severe cases, candida can travel through the bloodstream to invade every organ system in the body, causing a type of blood poisoning called candida septicemia. This condition almost always occurs in persons with serious underlying illnesses, such as advanced cancer or following a severe burn injury.

Candidiasis may affect both men and women; however, it is rarely transmitted sexually. It is most common in babies (an infected mother may pass the fungal infection to her newborn) and in persons with compromised immune systems, and as it proliferates the fungus releases toxins that weaken the immune system further. Other factors that increase the chances of contracting a yeast infection include pregnancy and the use of corticosteroid drugs.

Very often, people with candida infections also have food allergies. Oral thrush, athlete’s foot, ringworm, jock itch, fingernail or toenail fungus, and even diaper rash can develop as a result of the combination of food allergies and *C. albicans*. The symptoms of a food allergy or environmental sensitivity can also mimic those of candidiasis. To further complicate matters, some people with candidiasis go on to develop environmental sensitivities as well. Many cannot tolerate contact with rubber, petroleum products, tobacco, exhaust fumes, and chemical odors.

Yeasts, including candida, feed on sugar. If the body’s pH balance is upset for any reason, the friendly bacteria (such as lactobacilli) that normally metabolize sugars cannot thrive and do their job properly, and there is a risk of *Candida albicans* flourishing in this sugar-rich environment.

Some women find they suffer more yeast infections when using oral contraceptives or during pregnancy. This is most probably due to an increase in the amount of sugar (glycogen) in the vagina induced by changing hormone levels. Antibiotics, which kill beneficial bacteria along with the harmful ones, are another common cause of yeast infections.

It is said that infections such as candidiasis rarely occur in people with robust immune systems who eat a healthy diet that is low in sugar and yeast. The debate continues as to whether candidiasis exists in the body as the result, or the cause, of some immunologic diseases.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga) or Bio-Bifidus from American Biologics	As directed on label. Take on an empty stomach.	Fights candida infection. Use a nondairy formula.
	As directed on label.	Enhances cell function to destroy candida.

Caprylic acid (Caprystatin from Ecological Formulas)	As directed on label.	An antifungal agent that destroys the candida organism.
Essential fatty acids (black currant seed oil and flaxseed oil)	As directed on label.	Important in healing candidiasis and preventing the fungus from destroying cells.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Inhibits the infecting organism. For candida vaginitis, use Kyolic vaginal suppositories as directed on label.
Quercetin plus bromelain or Activated Quercetin from Source Naturals	500 mg twice daily, 30 minutes before meals. 100 mg twice daily, 30 minutes before meals. As directed on label.	Speeds healing and reduces the effects of food allergies and inflammation. Improves absorption of quercetin. Contains quercetin plus bromelain and vitamin C for increased absorption.
Vitamin B complex plus extra biotin and vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. 1,000–2,000 mcg daily.	B vitamins are required for all bodily functions, resistance to infection, and all enzyme systems. Important for brain function. Use a yeast-free formula. Consider injections (under a doctor's supervision). Needed for healthy skin. Important for digestion. Needed for metabolism of carbohydrates, fats, and proteins. Use a lozenge or sublingual form.

**Important**

Calcium and magnesium and vitamin D	1,500 mg daily. 750–1,000 mg daily. 400 IU daily.	Often deficient in people with this disorder. Use calcium citrate form. Needed to balance with calcium. Enhances calcium absorption.
-------------------------------------	---	--

**Helpful**

Coenzyme A from Coenzyme-A Technologies and Coenzyme Q <sub>10</sub>	As directed on label. 100 mg daily.	Removes toxins from the body. Improves tissue oxygenation.
Colostrum Plus from Symbiotics	As directed on label.	Powerful immune enhancer.
Colloidal silver	As directed on label.	Can aid in healing.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label. Take between meals, on an empty stomach.	Rebuilds damaged tissue. Use a sublingual form for best absorption.
Glutathione	500 mg twice daily.	Needed for brain function. Candida may impair brain function.
Grapefruit seed extract	As directed on label. Always dilute before use.	Rids the body of potentially harmful microorganisms.
L-cysteine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A potent antioxidant and free radical destroyer. (See AMINO ACIDS in Part One.)

Multivitamin and mineral complex with vitamin A and mixed carotenoids and selenium	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	All nutrients are needed for proper immune function and for repair of intestinal lining and all tissues; build resistance to infection. Choose a yeast-free formula that includes zinc and iron.
Orthrush from Ecological Formulas	Use as a mouth rinse or as a douche.	Aids in destroying candida.
Vitamin C with bioflavonoids	1,000 mg 3 times daily.	Builds up immunity and protects the body tissues from damage by the toxins released from candida. Use an esterified form.
Vitamin K	As directed on label.	To replace vitamin K balance upset by antibiotic use or overgrowth of bad candida.

**Herbs**

- Aloe vera juice has been shown to boost the white blood cells' ability to kill yeast cells.
- Kolorex Advanced Candida Care is a patented herbal formula from Forest Herbs Research (it is sold in the United States by Nature's Sources) containing extracts of the New Zealand herb horopito (*Pseudowintera colorata*) and aniseed. Horopito contains a strong antifungal agent called polygodial. Kolorex has been shown in laboratory experiments to be effective in controlling *Candida albicans*.
- Olive leaf extract with oleuropein is a powerful healer of microbial infections.
- Pau d'arco (also known as lapacho or taheebo) contains an antibacterial and antifungal agent; although it does have an alkaloid base, a small percentage of people may not benefit from its use. If you do not benefit from this tea, try clove tea instead. It is a good idea to alternate between the two, because clove tea has some benefits that pau d'arco does not have and vice versa. To make pau d'arco tea, boil 1 quart of distilled water with 2 tablespoons of herb for five minutes. Cool and store it in the refrigerator with the tea leaves in. Strain before drinking, if needed. Drink 3 to 6 cups daily.
- Some people who no longer respond to pau d'arco can benefit from maitake tea. It is a good alternative. While pau d'arco must be boiled, maitake is prepared as a regular tea. Resistant strains of candida develop rapidly due to genetic mutation. Rotating treatment programs is beneficial.
- Wild oregano oil is a potent antiseptic, powerful in killing a range of fungi.

**Recommendations**

- Eat vegetables, fish, and gluten-free grains such as brown rice and millet.

- Eat plain yogurt that contains live yogurt cultures. For vaginal candidiasis, apply natural unprocessed and unsweetened yogurt directly into the vagina or mix one small container of plain yogurt with an equal amount of water and use it as a douche once or twice daily until you see an improvement. You can also open two capsules of acidophilus and add the contents to a douche. This helps to inhibit the growth of the fungus. If symptoms persist, seek medical treatment.
- Take supplemental acidophilus or bifidus to help to restore the normal balance of flora in the bowel and vagina.
- Take some type of fiber daily. Oat bran or flaxseed is a good source.
- Drink distilled water only.
- Make sure your diet is fruit-free, sugar-free, and yeast-free. Candida thrives in a sugary environment, so your diet should be low in carbohydrates and contain no yeast products or sugar in any form.
- Avoid aged cheeses, alcohol, baked goods, chocolate, dried fruits, fermented foods, all grains containing gluten (wheat, oats, rye, and barley), ham, honey, nut butters, pickles, potatoes, raw mushrooms, soy sauce, sprouts, and vinegar.
- Eliminate citrus and acidic fruits such as oranges, grapefruit, lemons, tomatoes, pineapple, and limes from your diet for one month; then add back only a few twice weekly. Although they seem acidic, these fruits are actually alkaline-forming in the body, and candida thrives on them.
- Once a month, to replace "friendly" intestinal bacteria, use an *L. bifidus* retention enema until the infection is better. (See ENEMAS in Part Three.)
- Take only hypoallergenic supplements.
- To prevent infection, replace your toothbrush every thirty days. This is a good preventive measure against both fungal and bacterial infections of the mouth.
- Wear white cotton underwear, or at least make sure that the panty liner is cotton. Synthetic fibers lead to increased perspiration, which creates a hospitable environment for candida, and also trap bacteria, which can cause a secondary infection. Change underclothing daily.
- Do not use corticosteroids or oral contraceptives until your condition improves. Oral contraceptives can upset the balance of microorganisms in the body, leading to proliferation of *C. albicans*.
- Avoid household chemical products and cleaners, chlorinated water, mothballs, synthetic textiles, and damp and moldy places, such as basements.
- If you have chronic and/or unusually persistent candida infections, consult your health care provider. This may be a sign of an underlying illness such as diabetes or immune system dysfunction, which makes for an environment more conducive to the growth of yeast.

## Considerations

- All persons on long-term antibiotics or chemotherapy are at high risk for severe cases of candidiasis. Taking antibiotics also can cause a deficiency of vitamin K, which is manufactured by the "good bacteria" in the intestines. Eating plenty of leafy greens, alfalfa, strawberries, whole grains, and yogurt can restore the vitamin K balance.
- If a breast-fed baby develops oral thrush or a nursing mother develops a thrush infection of the nipples, both mother and baby should be treated to eradicate the infection, even if only one of them seems to be affected.
- Because there is no simple, accurate test for candida, it is difficult to determine if it is the cause of a baby's diaper rash.
- Allergy testing is advised for anyone with symptoms of candida infection. (See ALLERGIES in Part Two.)
- Medical treatment for vulvo-vaginal candidiasis may involve the use of antifungal medications such as butoconazole cream, clotrimazole vaginal tablets, miconazole cream or suppositories, nystatin vaginal tablets, tioconazole ointment or cream, or fluconazole oral tablets. Most of these preparations are now available over the counter under various brand names. We recommend that only women who have been diagnosed with candidiasis use these preparations. Unfortunately, the use of these agents, especially if chronic or repeated, can lead to the development of stronger strains of yeast that are drug resistant. Higher dosages are then required, which in turn further weaken the immune system. Many doctors no longer use nystatin or antibiotics because they weaken the immune system and can damage certain organs. Others prescribe them for short-term treatment only. If you treat yourself with over-the-counter medications and symptoms continue or recur within two months, it would be wise to seek medical advice.
- High levels of mercury in the body can result in candidiasis. Mercury salts inhibit the growth of the necessary "friendly" bacteria in the intestines. You may want to have a hair analysis done to determine the levels of toxic metals. (See HAIR ANALYSIS in Part Three.)
- Candida Forte from Nature's Plus is good for mild cases.
- Candidiasis may be related to hypoglycemia. (See HYPOGLYCEMIA in Part Two.)
- See also FUNGAL INFECTION and YEAST INFECTION in Part Two.

## CANKER SORES (APHTHOUS ULCERS)

Canker sores are small, white swellings that develop into ulcers. They can appear on the tongue, the lips, the gums, or the insides of the cheeks. A coagulated yellowish mixture of fluids, bacteria, and white blood cells then covers

the ulcers. The development of a canker sore may be preceded by a burning and tingling sensation.

Canker sores do not form blisters as cold sores (fever blisters) do. The herpes simplex virus type 1 causes the cold sore, commonly confused with the canker sore. The canker sore, on the other hand, is an inflammation, rather than an infection.

Canker sores range in size from as small as a pinhead to as large as a quarter. They appear suddenly and often leave suddenly, usually lasting from four to twenty days. Some experts believe that these painful mouth ulcerations are contagious, but others disagree. Canker sores occur most often in females. They can be triggered by any of a number of factors, including poor dental hygiene, irritation from dental work, food allergies, nutritional deficiencies, hormonal imbalances, viral infection, an underlying immunologic disease (such as HIV infection), trauma (such as that caused by biting the inside of the cheek or using a hard-bristled toothbrush), stress, and/or fatigue. They may result from an abnormal immune response to normal bacteria in the mouth. Canker sores are occasionally associated with Crohn's disease, which affects the bowels. Deficiencies of iron, lysine, vitamin B<sub>12</sub>, and folic acid have been linked to this disorder in some people.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus	As directed on label. Take on an empty stomach.	Aids in maintaining healthy balance of intestinal flora ("friendly" bacteria). Use a high-potency powdered form.
L-lysine	500 mg 3 times daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A deficiency may cause an outbreak of sores in and around the mouth. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take lysine for longer than six months at a time.
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50–100 mg 3 times daily. Do not exceed this amount.	B vitamins are basic for immune function and healing.  Deficiencies have been linked to mouth sores. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, and/or high blood pressure. An antistress vitamin necessary for adrenal function.
and vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>12</sub> and folic acid	50–100 mg 3 times daily.  1,000–2,000 mcg daily, on an empty stomach. 400 mcg daily.	Use a lozenge or sublingual form. Use a lozenge or sublingual form.

Vitamin C with bioflavonoids	3,000–8,000 mg daily, in divided doses.	Fights infection and boosts the immune system. Use a buffered form.
------------------------------	---	---

#### Important

Zinc lozenges	1 15-mg lozenge every 3 waking hours for 2 days. Do not exceed a total of 100 mg daily.	Enhances immune function and aids healing.
---------------	---	--

#### Helpful

Garlic (Kyolic from Wakunaga)	3 capsules 3 times daily.	Acts as a natural antibiotic and immunostimulant.
Iron	As prescribed by physician.	May be helpful if canker sores are related to iron deficiency. <i>Caution:</i> Do not take an iron supplement unless your physician finds that you are iron-deficient.
Multivitamin and mineral complex	As directed on label.	A balance of minerals is always important.
Vitamin A with mixed carotenoids	50,000 IU daily for 10 days, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. Also put a few drops of vitamin A oil directly on the affected area.	Speeds healing, especially of the mucous membranes. Use an emulsion form for easier assimilation.

### Herbs

Alfalfa, calendula, capsicum, comfrey, garlic, and peppermint are useful in the treatment of canker sores.

*Caution:* Comfrey is recommended for external use only. Do not take it internally.

Use burdock, goldenseal, pau d'arco tea, and red clover to cleanse the bloodstream and decrease infection.

*Cautions:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Goldenseal extract or tea tree oil, applied gently on the sore twice during the day and again at bedtime, helps to speed healing. To use these as mouthwashes, add 3 drops to 4 ounces of water. Add a drop or two to your toothpaste before brushing. Use alcohol-free goldenseal extract.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Red raspberry tea contains valuable flavonoids and is very helpful.

- Rockrose, also known as sun rose, used as a mouthwash, both heals and eases the pain of mouth sores.
- Wintergreen mouthwash is a good antiseptic. Wintergreen oil can be rubbed into the sores for temporary relief.

### Recommendations

- Eat plenty of salad with raw onions. Onions contain sulfur and have healing properties.
- Include in the diet yogurt and other soured products, such as kefir, cottage cheese, and buttermilk.
- Avoid sugar, citrus fruits, and processed and refined foods.
- Do not eat fish or meat of any kind for two weeks. The consumption of animal protein increases the body's acidity, which slows healing. Be sure to substitute vegetable proteins to meet your body's needs.
- Avoid chewing gum, lozenges, mouthwashes, tobacco, coffee, citrus fruits, and any other foods that you know trigger these sores.
- Consider trying the homeopathic remedies *Belladonna*, *Echinacea*, and *Borax*. These agents are commonly used in the treatment of canker sores.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- If you have repeated attacks of canker sores, check for nutritional deficiencies.
- To avoid getting canker sores, it is important to maintain a proper balance of minerals, acidity, and alkalinity in the body. (See ACID/ALKALI IMBALANCE in Part Two for the acid and alkaline self-test.) Have a hair analysis done to test for mineral levels. (See HAIR ANALYSIS in Part Three.)
- Do not take iron supplements unless your doctor prescribes them. Obtain iron from natural food sources.
- Consult your health care provider or dentist if you have a mouth sore that does not heal.

### Considerations

- Stress and allergies are probably the most common causes of open sores in the mouth.
- Some doctors prescribe mouthwashes that contain tetracycline, an antibiotic, for canker sores.
- If you get recurrent canker sores, your toothpaste may be the culprit. Try toothpaste that does not contain the detergent sodium lauryl sulfate. This is a detergent that may cause the mucous surfaces in the mouth to dry out, leaving them vulnerable to attack from acidic foods. Also, do not use the same toothbrush for longer than one month. When canker sores on the gum are healing, it is best to use a very soft toothbrush.

- The drug Zilactin is a gel-like ointment that is applied directly to the ulcer. It sticks to the canker sore and gives relief from irritating foods.
- See also COLD SORES in Part Two.

### CARDIOVASCULAR DISEASE

Cardiovascular disease (CVD) is a general term encompassing heart attack, stroke, and other disorders of the heart and blood vessel system. (Heart disease refers only to diseases of the heart and blood vessel system within the heart.) Cardiovascular disease is the leading health problem in the Western world. It is the number-one cause of death in the United States. An estimated 80 million Americans have heart and blood vessel disease, although many do not know it because they have no overt symptoms. Traditionally thought of as a disease primarily affecting men, cardiovascular disease is a growing problem for women. In fact, coronary heart disease, which causes heart attack, is the single leading cause of death for American women. It is responsible for the deaths of as many as 500,000 women a year in the United States. More women die from cardiovascular diseases than from all forms of cancer combined. Lower levels of estrogen during and after menopause are thought to increase a woman's risk for CVD. African-American woman are at greater risk than women of other ethnic backgrounds.

The arteries that supply blood to the heart are called the coronary arteries. If the heart's blood vessels narrow, the amount of blood they supply to the heart may be insufficient to provide the oxygen the heart needs. This oxygen deprivation is what causes a type of chest pain known as angina pectoris. A heavy, tight pain in the chest area characterizes angina, usually after some type of exertion. The pain usually recedes with rest.

If the coronary arteries that carry oxygen and nutrients to the heart muscle become obstructed, the flow of blood is cut off completely, and a heart attack, or myocardial infarction, can occur, resulting in damage to the heart muscle. Arteriosclerosis, or hardening of the arteries, and the presence of a thrombus, or clot, in a blood vessel are the most common causes of obstruction. Arteriosclerosis is responsible for most of the deaths resulting from heart attacks. Spasms of the coronary arteries can also result in a heart attack. A heart attack may feel as if someone is applying intense pressure to the chest. This pain may last for several minutes, often extending to the shoulder, arm, neck, or jaw. Other signs of heart attack include sweating, nausea, vomiting, shortness of breath, dizziness, fainting, feelings of anxiety, difficulty swallowing, sudden ringing in the ears, and loss of speech. The amount and type of chest pain vary from one person to another. Some people have intense pain, while others feel only mild discomfort. Many mistake the signs of a heart attack for indigestion. Some have no symptoms at all, a situation referred to as a "silent" heart attack.

Hypertension (high blood pressure) is often a precursor to heart problems. Hypertension is an extremely common form of cardiovascular disease. It usually results from a decrease in the elasticity or a reduction in the interior diameter of the arteries (or both), which may be caused by arteriosclerosis, defects in sodium metabolism, stress, nutritional deficiencies, and enzyme imbalances. Kidney disease, hyperthyroidism, disorders of the pituitary or adrenal glands, and heredity may be contributing factors. People considered to be at high risk are those with diabetes, those who smoke, or those who already have had a heart attack or stroke. Because it is essentially painless, especially in the early stages, many people don't even know they have it—hence the term “silent killer.” By the time hypertension causes complications that result in symptoms (such as rapid pulse, shortness of breath, dizziness, headaches, and sweating), the disorder is more difficult to treat. Untreated hypertension is the leading cause of stroke and also greatly increases the risk of heart attack, heart failure, and kidney failure. Treatment seeks to lower blood pressure to less than 140 mm Hg (millimeters of Mercury) systolic and less than 90 mm Hg diastolic for most people. Treatment for those with diabetes and chronic kidney disease aims to lower blood pressure to less than 130 mm Hg systolic and less than 80 mm Hg diastolic. For people aged fifty and older, systolic blood pressure may be a more important cardiovascular risk factor than diastolic pressure.

Other types of cardiovascular disease include heart failure, arrhythmias, and valvular disease. While a heart attack occurs because of an interruption in blood flow to the heart, heart failure is characterized by inadequate blood flow from the heart—the heart fails to pump enough blood to meet the body's needs. Symptoms include fatigue, poor color, shortness of breath, and edema (swelling due to the accumulation of fluid in the body's tissues), especially around the ankles.

Arrhythmias are disturbances in the normal rhythm of the heartbeat. There are different kinds of arrhythmias. Some are quite dangerous—even immediately life-threatening—while others may be merely annoying (or scarcely noticeable), and pose no particular danger.

Valvular disease is a term for disorders that impair the functioning of one or more of the heart's valves. It may be caused by congenital defect, or it may be the consequence of illness such as rheumatic fever or endocarditis (infection of the heart muscle). Mitral valve prolapse (MVP) is a condition in which the mitral valve, which controls blood flow from the left atrium to the left ventricle (the heart's main pumping chamber), protrudes too far into the left atrium while it is pumping. In many cases, this causes no symptoms at all, although some people experience occasional fatigue, dizziness, palpitations, and/or vague chest pain. Mitral valve prolapse also causes a distinctive sound that a skilled physician can identify by means of a stethoscope. This condition is now known to be rarer than was once thought. And for most of those who do have MVP, it is not thought to lead to severe complications.

Syndrome X (now known as metabolic syndrome) is characterized by a number of signs of overall poor health. People with metabolic syndrome are more likely to suffer strokes than other people. About 50 million Americans are estimated to have metabolic syndrome. That means they have at least three of the five common conditions associated with the syndrome: abdominal obesity, high blood sugar, high triglyceride levels, high blood pressure, and low HDL (“good”) cholesterol levels. While diabetes significantly increases the risk for stroke, it has been found that for people who have not been diagnosed with diabetes, having metabolic syndrome can be as powerful a risk factor. Some strokes could be prevented by correcting abnormalities associated with metabolic syndrome. The role of nutrition in achieving this is crucial.

Unfortunately, despite remarkable new technology for both diagnosis and treatment of heart-related conditions, the first sign of cardiovascular disease may be a life-threatening calamity. Disorders of the cardiovascular system are often far advanced before they become symptomatic. Some people who have heart attacks have no previous symptoms of heart trouble. According to a recent study, the blockages in arteries that can lead to a heart attack or sudden death appear to start forming early in life, in young adults and adolescents as young as age fifteen.

Cardiovascular disease is not an inevitable result of aging. Many preventive measures can be taken to avoid heart disease. Controllable factors that can contribute to heart disease include smoking, high blood pressure, excessive alcohol consumption, elevated serum cholesterol, stress, obesity, a sedentary lifestyle, and diabetes. Another big factor is not taking prescribed medications on a regular basis. You can alter your lifestyle to keep your heart healthy.

### Heart Function Self-Test

Your heart is the most important muscle in your body. A simple pulse test can help you determine how well your heart is functioning. The best time to check your pulse is first thing in the morning. The heart rate should be between 60 and 100 beats per minute. To take your pulse, place the first two fingers of your right hand between the bone and tendon of your left wrist. Count the beats for fifteen seconds, and then multiply by four to find the beats per minute. If your pulse remains rapid, consult your health care provider to rule out problems. A chronically high pulse rate is often a precursor of hypertension. Taken daily, this pulse test can forewarn you of oncoming illness, but a high pulse also could be caused by other health issues including being out of shape. Check with your health care provider.

As the most active muscle in the body, the heart requires proper nutrition. Poor nourishment has a profound effect on the heart, and research has shown that as people age, their eating habits get worse, thus increasing their risk of cardiovascular disease.

## Cardiovascular Risk Factors and Warning Signs

Following is a brief summary of known risk factors and warning signs of present or possible future cardiovascular problems, including stroke.

### Risk Factors

- High blood pressure.
- Heart disease, especially a type of arrhythmia (irregular heartbeat) called atrial fibrillation (AF).
- Smoking.
- Diabetes.
- High blood cholesterol.
- Obesity/poor diet.

### Warning Signs

- Numbness or weakness in face, arm, or leg.
- Difficulty speaking.
- Severe dizziness, loss of balance or coordination.
- Sudden dimness, loss of vision.
- Sudden intense headache.
- Brief loss of consciousness.

If any of the known risk factors apply to you, consult with your health care provider about ways to lower your risk. If you experience any of the warning signs listed above, seek medical attention at once.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub>	50–100 mg 3 times daily.	Increases oxygenation of heart tissue. Has been shown to prevent recurrences in individuals who have had a heart attack.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Can streamline metabolism, increase energy, support adrenal glands, process fats, remove toxins from the body, boost the immune system, and improve overall physical and mental processes.
Kyolic-EPA from Wakunaga or essential fatty acids (black currant seed oil, flaxseed oil, primrose oil, and salmon oil)	As directed on label.  As directed on label.	Reduces triglyceride levels in the blood.  Helps prevent hardening of the arteries. If you use a fish oil, use a product with vitamin E added to prevent rancidity.

L-arginine	As directed on label. Take with carbohydrates rather than protein, which inhibits absorption.	Improves blood flow.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Deficiency has been linked with heart disease. Destroys free radicals in the heart. Selenium supplements help reduce heart disease risk.
Vitamins B <sub>12</sub> , B <sub>6</sub> , and folic acid	400 mcg, 50 mg, 400 mg, respectively	These are needed for maintaining normal homocysteine and C-reactive protein levels and may help with cognition. C-reactive protein is a risk factor for developing diabetes.
Vitamin C with bioflavonoids and L-lysine	1,000 mg 3 times daily.	Extremely important as a regulator of high blood pressure.
Vitamin D	400–800 IU.	Do not exceed 1,000 IUs per day. Get your vitamin D levels in your blood checked. Reduces your risk of heart disease.
<b>Very Important</b>		
Calcium and magnesium	1,500–2,000 mg daily, in divided doses, after meals and at bedtime. 750–1,000 mg daily, in divided doses, after meals and at bedtime. Take with 50 mg vitamin B <sub>6</sub> .	Important in the proper functioning of the cardiac muscle. Use chelate forms. Vital for a healthy heart. Connected to over 300 enzyme actions controlling glucose, proteins, and fats.
Cardio Logic from Wakunaga	As directed on label.	Increases the oxygenation of heart tissue.
Heart Science from Source Naturals	1 tablet 3 times daily, on an empty stomach.	Contains antioxidants, cholesterol fighters, herbs, and vitamins that work together to protect the heart and promote cardiovascular function.
L-carnitine	500 mg twice daily, on an empty stomach. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Reduces fat and triglyceride levels in the blood. Increases oxygen uptake and stress tolerance.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 2,400 mg 3 times daily, with meals. Take with vitamin E (see below).	Acts as a fat emulsifier.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga and Kyo-Green from Wakunaga	2 capsules 3 times daily.  As directed on label.	Lowers blood pressure and thins the blood.  Concentrated barley and wheat-grass juice; contains nutrients needed for healing and prevention of heart disease.
Lycopene plus lutein	As directed on label. As directed on label.	Carotenoids that lower LDL (“bad”) cholesterol
Pantethine	As directed on label.	A derivative of pantothenic acid that reduces LDL cholesterol.

Phosphatidyl choline or lipotropic factors	As directed on label.	Reduces fat and triglyceride levels in the blood.
Pycnogenol	As directed on label.	Found to be more effective than aspirin in reducing buildup of plaques in the arteries, a major risk factor in heart disease.
<b>Important</b>		
Chitosan	As directed on label.	A polysaccharide derived from shellfish that has been shown to reduce blood cholesterol levels.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	50 mg 4 times daily.	Promotes the utilization of oxygen.
Kyolic Homocysteine from Wakunaga	As directed on label.	Contains aged garlic extract with vitamin B <sub>6</sub> , vitamin B <sub>12</sub> , folic acid, and betaine to support healthy homocysteine levels.
Lycopene	250 mg of tomato extract (Lyc-O-Mato)	Used to reduce blood pressure.
Potassium	99 mg daily.	Needed for electrolyte balance, especially if taking cortisone or blood pressure medication.
Red yeast rice (Cholestin from Pharmanex)	As directed on label.	Contains lovastatin, which has been proven to reduce cholesterol levels (synthetic lovastatin is often prescribed for this purpose).
Superoxide dismutase (SOD)	As directed on label.	A powerful antioxidant.
Taurine Plus from American Biologics	1,000 mg daily. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Helps stabilize the heartbeat and correct cardiac arrhythmias. An important antioxidant and immune regulator, necessary for white blood cell activation and neurological function. Use the sublingual form.
Vitamin E	Start with 100 IU daily and increase slowly, adding 100 IU until daily dosage is 200 IU.	Strengthens the immune system and heart muscle, improves circulation, and destroys free radicals. Use d-alpha-tocopherol form. <i>Caution:</i> Use this supplement only under the supervision of a physician.

**Helpful**

Copper	As directed by physician.	Deficiency may be linked to some heart problems.
Green tea extract	6 capsules a day (equal to 714 mg green tea polyphenols).	May help reduce the risk of heart disease by lowering the ratio of the good cholesterol to total cholesterol (a marker of heart disease risk). <i>Caution:</i> Contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea

Kelp	1,000–1,500 mg daily, with meals.	could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.
Melatonin	2–3 mg daily, taken 2 hours or less before bedtime.	A powerful antioxidant that may help prevent stroke and also aids sleep.
Multienzyme complex (Inf-zyme Forte from American Biologics) plus bromelain	As directed on label. Take between meals. 300 mg daily.	To aid digestion.
Octacosanol and/or wheat germ	As directed on label. As directed on label.	Improves endurance; relieves muscle pain.
Sea mussel	As directed on label.	A source of protein that aids in the functioning of the cardiovascular system.
Trimethylglycine (TMG)	As directed on label.	TMG converts homocysteine into methionine. SAME is a by-product of this conversion.

**Herbs**

Researchers have found that pomegranate juice not only seems to prevent hardening of the arteries by reducing blood vessel damage, but also may reverse the progression of atherosclerosis (plaque buildup). This may be due to the high antioxidant content of the juice, which is higher than that found in other fruit juices, including blueberry, cranberry, and orange. The results of this study appear in the *Proceedings of the National Academy of Sciences*.

Cordyceps, a Chinese herb, can slow the heart rate, increase blood supply to the arteries and heart, and lower blood pressure.

Ginkgo biloba can benefit the cardiovascular system by preventing the formation of free radicals. Take a ginkgo extract containing 24 percent ginkgo flavone glycosides.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Grape seed extract with oligomeric proanthocyanidins (OPCs) may lower high blood pressure, which can cause heart disease.

Consuming ¼ cup of tomato sauce or three medium-sized tomatoes per day can have a beneficial effect due to lycopene, a natural antioxidant. Harvard University researchers found that middle-aged women who consumed that amount of lycopene were 30 percent less likely to de-

## Healthy Cholesterol and Blood Pressure Levels

Two important measurements used in assessing cardiovascular health are blood fat (including cholesterol and triglycerides) levels and blood pressure. The tables below are approximate guides to both cholesterol and blood pressure levels. Keep in mind that both levels vary from person to

person, so it is always wise to have your blood pressure and cholesterol level checked by your physician on a regular basis. Also note that the values here reflect recent revisions in desirable levels.

### Cholesterol and Triglyceride Levels for People without Heart Disease (mg/dL)

Blood Lipid	Good	Borderline	High
Total cholesterol	200 or less	200–239	240 and above
LDL (“bad”) cholesterol	100 or less	100–159	160 and above
Triglycerides	150 or less	150–199	200 and above

The desirable level of HDL cholesterol (“good” cholesterol) is 60 mg/dL or above.

### Blood Pressure Levels for People without Heart Disease (HT=Hypertension)

Blood Pressure	Normal	Pre-HT	Stage 1 HT	Stage 2 HT
Systolic (when the heart contracts and pumps blood out)	120 or less	120–139	140–159	160 and higher
Diastolic (between beats, your heart fills with blood again)	80 or less	80–89	90–99	100 and higher

velop heart disease than women who got less lycopene. Patients with high blood pressure who were already taking medications to lower it achieved an even lower systolic (10 mmHg) and diastolic (5 mmHg) rate from a standardized tomato extract rich in lycopene.

- Hawthorn increases blood flow and lowers blood pressure.
- People with cardiovascular disease may benefit from suma tea. Take 3 cups of this herbal tea daily with ginkgo biloba extract as directed on the product label.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Other herbs and herbal products beneficial for cardiovascular disorders include barberry, black cohosh, butcher’s broom, cayenne (capsicum), dandelion, ginseng, SP-8 Heart Blend from Solaray, and valerian root.

*Cautions:* Do not use barberry during pregnancy. Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

### Recommendations

- If you experience any of the symptoms of a heart attack, call 911, and then contact your doctor or go immediately to the emergency room of the nearest hospital, even if symptoms last only a few minutes. Half of all heart attack deaths occur within three to four hours of the onset of the attack, so a person suffering from a heart attack requires immediate medical attention.
- Make sure your diet is well balanced and contains plenty of fiber. Some studies have found that among the sources of dietary fiber—cereal, vegetables, and fruits—the fiber from breakfast cereals appears to be the most beneficial.
- Eat fish several times a week. Fish is an extremely important food for those with heart disease. Eating fish has been shown to lower the risk of dying from heart disease by reducing arrhythmia in patients with the disease. It has also been shown to reduce the risk of developing heart disease in healthy people. If you don’t have heart disease and eat 2 to 4 servings of fish a week, you have a 15 percent lower chance of developing it. If you don’t like fish or don’t want to eat it, take fish oil capsules; supplementation was shown to be as effective. Patients with heart disease who took 1 gram of omega-3s (1 gram capsules usually have about one-third omega-3s, so they took about three capsules)

## Common Heart Problems and Procedures

If either you or a loved one has heart trouble, you can better understand and participate in treatment if you familiarize yourself with the following medical terms that may be used by your physician:

- **Aneurysm.** A spot in a blood vessel where the wall becomes thin and bulges outward as blood presses against it. If it ruptures, circulation is disrupted. Depending on the location of the aneurysm, the consequences of this can be grave. If detected in time, aneurysms can be repaired surgically in many cases.
- **Angina pectoris.** Pain or heavy pressure in the chest that is caused by an insufficient supply of oxygen to the heart tissue. This chest pain may be severe or mild and is usually associated with physical exertion and relieved by rest. It can be a warning sign of impending heart attack.
- **Angiogram.** A diagnostic picture produced by injecting into the heart and/or blood vessels a type of dye that is visible on X-ray. It may be done to diagnose valvular disease, blood vessel blockage, and other conditions.
- **Angioplasty.** A procedure in which a small balloon is inserted into a blocked or partially blocked artery and then inflated. This compresses the plaque on the vessel wall, widening the artery and allowing more blood to flow through it.
- **Aorta.** The main channel for arterial circulation; the large artery into which oxygenated blood is pumped by the heart.
- **Aortic atherosclerosis.** A systemic disease involving the heart, brain, aorta, and peripheral arteries. Blood tests have not traditionally been used to diagnose or to assess risk. Transesophageal echocardiography, a type of ultrasound test, and MRI (magnetic resonance imaging) have been used to identify plaque buildup. A blood test for the presence of C-reactive protein may be helpful. The C-reactive protein is a systemic biomarker for inflammation.
- **Aortic stenosis (AS).** A condition in which the aortic valve is narrowed, restricting blood flow from the heart into the aorta. It can result from congenital malformation of the valve or from damage, such as from rheumatic fever. Symptoms, which may begin in early childhood, include fainting, chest pain, and shortness of breath, especially with exertion.
- **Arrhythmia.** Disruption in the natural rhythm of the heartbeat caused by improper functioning of electrical system cells in the heart. There are different kinds of arrhythmias. Palpitations is a term that refers to the feeling of a pounding heartbeat, whether regular or irregular. Tachycardia is an abnormal increase in the resting heart rate; bradycardia is the opposite, an abnormally slow heart rate. Ectopic beats are premature beats (often felt as “skipped” beats). Flutter and fibrillation are situations in which the normal steady beating of the heart is converted by electrical error into a rapid twitching of the heart muscle. This ineffective functioning results in an insufficient supply of blood being carried to the body’s tissues.
- **Cardiac arrest.** Cardiac arrest occurs when the heart stops beating. When this happens, the blood supply to the brain is cut off and the person loses consciousness. A person in apparent good health who experiences cardiac arrest usually has unsuspected coronary artery disease.
- **Cardiomegaly.** The medical term for enlargement of the heart. If the heart is unable to function effectively, as in heart failure, or if there is too much resistance to the normal pumping of blood through the blood vessels, as in high blood pressure, the body attempts to increase the strength of the heart by increasing its size. Cardiomegaly is characteristic of a number of different heart disorders. It is also known as cardiac hypertrophy.
- **Cardiomyopathy.** Any of a group of diseases of the heart muscle that result in impaired heart function and, ultimately, heart failure. Cardiomyopathies are classified according to characteristic physical changes in the heart, such as enlargement of the heart, dilation of one or more of the heart’s chambers, or rigidity of the heart muscle. These disorders may be related to inherited defects or may be caused by any of a number of different diseases. Often, the cause is unknown.
- **Cardioversion.** A procedure used to correct arrhythmia, in which electrical current is applied to the heart to restore normal rhythm.
- **Carditis.** Inflammation of the heart muscle. This can result from infection or from an inflammatory response, as in rheumatic fever, and it can lead to permanent heart damage if not treated.
- **Carotid artery.** The major artery to the brain.
- **Catheterization.** A procedure sometimes used to diagnose the condition of the heart and/or circulatory system and, in some cases, to treat cardiovascular disease. A hollow, flexible tube called a catheter is inserted by means of a very fine flexible wire into a blood vessel somewhere in the body (usually the arm, neck, or leg), and from there is threaded through the blood vessel to the heart or other location being investigated. Catheterization can be used to detect (and in some cases to treat) arterial blockage, to discover malformations of the heart, and to study electrical conduction in the heart, among other things.
- **Claudication.** Cramplike pains in the legs as a result of poor circulation to the leg muscles. This usually occurs as a result of atherosclerosis.

- **Congenital heart defect.** A heart defect that is present at birth, though not necessarily inherited.
- **Congestive heart failure.** A condition of chronic heart failure that results in fluid accumulation in the lungs, labored breathing after even mild exertion, and edema (swelling) in the ankles and feet.
- **Coronary arteries.** The arteries that supply blood to the heart.
- **Coronary artery disease (CAD).** Atherosclerosis of the coronary arteries.
- **Echocardiogram.** A procedure in which ultrasound technology is used to form an image of the heart. It is used to detect structural and functional abnormalities, enlargement or inflammation of the heart, and other conditions.
- **Electrocardiogram (ECG or EKG).** A diagnostic test that tracks electrical impulses in the heart.
- **Embolism.** A circulatory condition in which a foreign object such as air, tissue, gas, or a piece of a tumor is transported around the body and becomes trapped in a blood vessel, obstructing the flow of blood.
- **Endoarteritis obliterans.** Inflammation of the arterial walls that narrows the passage and obstructs the flow of blood.
- **Endocarditis.** Inflammation of the endocardium, the membrane surrounding the heart muscle, usually as a result of bacterial infection. Endocarditis is not uncommon in persons with compromised immune systems, such as those with HIV and AIDS. It also can occur as a complication of surgery to replace defective heart valves. This disorder can result in permanent heart damage.
- **Fibrillation.** An irregular heartbeat characterized by a rapid twitching or vibrating of heart muscle rather than slow, steady beats. Atrial fibrillation can be episodic or chronic, even constant. Symptoms may include dizziness, light-headedness, and general weakness. Atrial fibrillation can cause blood to pool in the heart and subsequently shed clots, causing ischemic stroke. Ventricular fibrillation is a medical emergency that can lead rapidly to loss of consciousness and death. It most often is a complication of heart attack.
- **Gated blood pool scan.** A diagnostic test in which a small amount of radioactive tracer is injected to “tag” red blood cells, which are then tracked as they progress through the heart, creating a series of pictures that show the size and shape of the heart, the motion of the heart wall, and the heart’s pumping efficiently. The test can be done while you are resting or during exercise. It is also known as multi-unit gated analysis (MUGA).
- **Heart attack.** The medical term for a heart attack is myocardial infarction (MI). This refers to the formation of infarcts (areas of local tissue death or decay) in the myocardium (heart muscle). Infarction occurs when the blood supply to an area of the heart is cut off, usually as a result of a blood clot that blocks a narrowed coronary artery. Depending on the size and location of the areas affected, a heart attack may be described as mild or severe, but it always involves some irreparable damage to the heart.
- **Heart failure.** This disorder occurs when a damaged heart becomes unable to pump effectively, depriving the body’s tissues of adequate oxygen and nutrients to function properly. Heart failure can be either acute (short-term) or chronic, and has a variety of different causes.
- **Heart murmur.** A sound made by the heart that may or may not point to the existence of a heart condition. A diastolic murmur occurs between beats. A systolic murmur occurs during heart contractions.
- **Hematoma.** A collection of blood trapped in the skin, or in an organ, after a trauma or surgery.
- **Holter monitor.** A small device worn on the body that monitors the heart on a twenty-four-hour basis.
- **Hypertension.** High blood pressure.
- **Hypotension.** Low blood pressure.
- **Ischemic heart disease.** Ischemic heart disease is caused by obstruction of the blood flow to the heart, usually as a result of atherosclerosis. Ischemia (lack of sufficient oxygen) can lead to angina, cardiac arrhythmias, congestive heart failure, or a heart attack.
- **Magnetic resonance spectroscopy (MRS).** Used in conjunction with magnetic resonance imaging (MRI), an imaging test that can show areas of damaged heart muscle. It does this by measuring levels of creatine kinase MB, an enzyme that is severely depleted after a heart attack.
- **Mitral valve prolapse (MVP).** A condition in which the mitral valve, which controls blood flow from the left atrium and left ventricle, protrudes too far into the left atrium between beats. It may or may not cause symptoms, such as dizziness or palpitations. It is not considered dangerous. It may also be called Barlow’s syndrome.
- **Pericarditis.** Inflammation of the sac that surrounds the heart.
- **Phlebitis (or thrombophlebitis).** Inflammation of a vein, most often accompanied by a clot. This condition may be caused by trauma to the vessel wall, clots forming in the blood, infection, or long periods of immobility.
- **Positron emission tomography (PET) scan.** A diagnostic test that can be used to assess blood flow through the arteries to the heart.
- **Pulmonary stenosis (PS).** A condition in which the pulmonary valve is narrowed, restricting the flow of blood from the heart to the pulmonary artery, which carries blood from the heart to the lungs. This is most often a congenital defect. It causes a distinctive murmur and may or may not cause symptoms.

- **Rheumatic heart disease.** Damage to the heart caused by rheumatic fever, a complication of infection with group A streptococcus bacteria, the bacteria that cause strep throat. It causes scarring and contracture of heart valves, and can lead to arrhythmias and heart failure.
- **Stress test.** A diagnostic test used to assess blood flow to the heart. The first part of the test involves the injection of a radioactive imaging agent into the arm. About an hour later, the heart is photographed. In the second part of the test, an intravenous line is placed in the arm and an EKG reading is taken as the patient walks on a treadmill. When the heart is working at its hardest, the first part of the test is repeated. Also known as a myocardial perfusion stress test.
- **Stroke.** Interruption of blood flow to the brain. A hemorrhagic stroke occurs when there is bleeding in the brain; an ischemic stroke, which is more common, is caused by a clot that forms in a blood vessel that supplies the brain, or a clot that moves from another part of the body to the brain.
- **Thrombosis.** The formation of a clot in a blood vessel.
- **Troponin T test.** A blood test that can detect damage to heart muscle from a heart attack. It assesses levels of the protein troponin T, which is released into the bloodstream after a heart attack. This test can detect even the mildest “silent” heart attack.

of equal EPA and DHA had fewer deaths and admissions to the hospital for treatment of their heart disease. This amount of fish oil is safe and well tolerated, and it seemed to slow the progression of heart disease. If you take just one supplement, fish oil is the one to take. If you are a vegetarian, flax and soy oil are good sources.

Eat plenty of raw foods. For protein, eat broiled fish and skinless turkey and chicken, which are low in fat.

Include garlic and onions in your diet. They contain compounds that help to reduce serum cholesterol levels.

Eat plenty of fresh fruits and vegetables. An eight-year study of almost 40,000 men found that men who ate five or more servings of fruits and vegetables each day had a 39 percent lower risk of stroke than those who did not.

Add raw nuts (except peanuts), olive oil, pink salmon, trout, tuna, Atlantic herring, and mackerel to your diet. These foods contain omega-3 essential fatty acids.

Do not consume stimulants, such as coffee and black tea, that contain caffeine. Studies show that coffee increases stress hormones in the body, putting coffee drinkers at greater risk of heart disease. Also avoid tobacco, alcohol, chocolate, sugar, butter, red meat, fats (2 grams or less saturated fat per serving, particularly animal fats and hydrogenated oils), fried foods, processed and refined foods, soft drinks, spicy foods, and white flour products, such as white bread.

Drink steam-distilled water only, and get at least ten 8-ounce glasses every day. It is recommended that you drink at least 80 ounces of water a day. One study found that men who drank at least five glasses of water every day had a 51 percent lower risk of heart disease than those who did not. For women, the risk of heart disease was 35 percent lower.

Eliminate all known sources of sodium from your diet. Almost everything contains some sodium. Keeping consumption below 5 grams per day is a good target. Read all labels and avoid those food products that have “soda,” “so-

dium,” or the symbol “Na” on the label. These indicate that the product contains sodium. Some foods and food additives that should be avoided on a salt-free diet include:

- Monosodium glutamate or MSG (flavor enhancers such as Accent).
- Baking soda.
- Canned vegetables.
- Commercially prepared foods.
- Diet soft drinks.
- Foods with mold inhibitors.
- Foods with preservatives.
- Meat tenderizers.
- Saccharin (found in Sweet’N Low) and products containing saccharin.
- Some medicines and dentifrices (toothcare products).
- Softened water.

If you take an anticoagulant (blood-thinner) such as warfarin (Coumadin) or heparin, or even aspirin, limit your intake of foods high in vitamin K. Eating foods containing vitamin K increases the blood’s tendency to clot, so they should be eaten only in small quantities. Foods that are rich in vitamin K include alfalfa, broccoli, cauliflower, egg yolks, liver, spinach, and all dark green vegetables. To enhance the effect of anticoagulants, eat more of the following: wheat germ, vitamin E, soybeans, and sunflower seeds.

Learn everything about any drugs that have been prescribed for you. Know what to do in case of an emergency. Keep emergency and ambulance numbers easily accessible. If you have a heart condition, someone close to you should know what to do if cardiac arrest occurs. Make sure someone living with you knows how to do cardiopulmonary resuscitation (CPR) and mouth-to-mouth resuscitation. The American Red Cross and many local hospitals

## Quick Reference Guide: The Top Ten Healthiest Foods for Your Heart

When it comes to promoting a healthy cardiovascular system, not all foods are created equal. Following is a list of the top ten foods for heart health.

1. *Fresh fruit.* Fruit contains fiber, antioxidants, vitamins, and minerals.
2. *Beans and legumes.* Beans and legumes contain fiber and plant proteins that help to lower LDL ("bad") cholesterol levels.
3. *Fish.* The omega-3 essential fatty acids in cold-water fish help to lower LDL levels.
4. *Dark leafy greens.* Spinach, mesclun, Swiss chard, arugula, and other greens help to reduce levels of a blood enzyme implicated in heart disease.
5. *Avocados.* Avocados are rich in potassium, which helps to regulate heart rhythm and blood pressure, and monounsaturated fats, which lower LDL levels.
6. *Whole grains.* Fiber and B vitamins are their greatest assets.
7. *Nuts.* A good source of monounsaturated fats and minerals.
8. *Soy foods.* These are useful in keeping correct blood fat levels and are rich in phytoestrogens.
9. *Spices and herbs.* Fat is better digested with the help of the antioxidants and phytochemicals available in many herbs.
10. *Wheat germ and flax meal.* These are good for boosting your intake of fiber, vitamin E, and omega-3 essential fatty acids. Flax in the form of meal, seeds, or oil coupled with a high-fiber diet from whole-grain cereals, fruits, vegetables, and added dietary fiber such as wheat bran is the best for reducing the risk of developing coronary heart disease. In fact, a diet such as this is extremely low in saturated fat, which means that you can safely indulge in an egg a couple of times a week, or an occasional serving of red meat.

offer training in these techniques. Eighty percent of heart attacks occur at home, according to the American Heart Association.

Keep your weight down. Obesity is a risk factor for heart attacks and high blood pressure. Get regular moderate exercise. Because medical care has improved so much over the past thirty years, there is less of a chance of developing heart disease as a result of being overweight and

obese. Compared to obese patients in 1960 to 1962, obese patients in 1999 to 2000 had 21 percent lower cholesterol levels and 18 percent lower blood pressure.

When trying to lose weight, the so-called low-carb diets are easy to follow and produce fast weight loss, so many people like to use them to jump-start a weight reduction program. An important paper published in *The New England Journal of Medicine* showed that it is fine to follow a low-carb diet as long as the fat and protein come from vegetable sources. A low-carbohydrate diet naturally results in a low-glycemic-load diet as well. A high-glycemic-load diet nearly doubles the chances of developing heart disease.

If you are over thirty-five and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Avoid stress, and learn stress-management techniques. (See STRESS in Part Two.)

### Considerations

The so-called bad cholesterol, LDL, is commonly measured and is considered a key predictor of cardiovascular risk. A component in cholesterol called apolipoprotein B (aop B) may be more closely linked to heart disease risk factors, and measuring aop B rather than LDL levels eliminates errors that can be caused by the size of the LDL particles. Small, dense LDL particles are more harmful than larger ones; thus, it would be nice to know how many small particles there are in the mix. But current tests do not differentiate for particle size or number. Testing for aop B gives the actual number of LDL particles, and the number of small particles can then be calculated. Canada has instituted testing for aop B and is currently updating the guidelines for lipids and diabetes to include an aop B test.

Both homocysteine and C-reactive protein are new markers of inflammation and are directly related to heart disease risk. Learn what your number is for each and get yearly testing. The numbers should be very low except for when inflammatory processes are occurring. Because the tests are new, your doctor might not routinely order them and insurance may not pay for them. Moreover, there is disagreement in the medical literature as to what added value they provide (especially for C-reactive protein) beyond the usual blood cholesterol tests.

Eating a high choline and betaine diet seems to lower homocysteine levels and potentially reduces your risk of heart disease. Choline-rich foods include red meat, poultry, milk, eggs, fish, and potatoes. Betaine-rich foods are spinach, pasta, white breads, cold cereals, beets, and red meat. The effect of betaine is also immediate. In one study, within two hours, a single dose of betaine significantly lowered plasma homocysteine levels.

❑ Foods containing certain plant extracts that have been shown to reduce cholesterol levels now may be labeled as such. The FDA has given food manufacturers the go-ahead to put labels on foods containing plant sterol esters and plant stanol esters to indicate that they may reduce the risk of coronary artery disease. These work by blocking the absorption of cholesterol from the diet, and have been known for some time to reduce the blood cholesterol levels that are responsible for most heart attacks. Plant sterol esters can be found in soybean oil as well as in many fruits, vegetables, nuts, cereals, and other plants. Plant stanols occur naturally in smaller quantities in some of the same sources. In one study, people with heart disease who ate a diet rich in olive oil lowered their risk for further worsening of the disease. In another study, those who took a fish oil-plant sterol mixture lowered their bad cholesterol and triglycerides. Patients took about 5 grams of omega-3 fats and 3 to 4 grams of sterols a day.

❑ The best fiber appears to come from wheat bran, which was even better than whole-wheat products. In one study, including a lot of wheat bran in the diet (7 grams per day) reduced the risk of heart disease by 30 percent. Those who consumed about 3 servings of whole-grain foods per day had a reduced risk of heart disease of 18 percent. Wheat germ was not associated with a reduced risk of heart disease in this study, but because it is rich in a variety of micronutrients it may be beneficial to add it to your diet.

❑ An eight-year study that followed nearly 50,000 women who ate a very low-fat diet with only 20 percent of the calories from fat and about 5 servings of fruits and vegetables a day did not result in significant reductions in heart disease risk. It seems that these dietary adjustments were not enough and that added emphasis should be placed on lifestyle modifications such as incorporating more exercise and obtaining more fiber. Fiber can easily be added to your diet by upping your fruit and vegetable intake as well as consuming whole-grain foods. More recently, the Dietary Approaches to Stop Hypertension (DASH) diet study (funded by NIH), which included 36,000 women who followed a fiber-rich diet from fruits and vegetables and whole grains and made lifestyle changes such as increasing exercise, showed a 37 percent lower rate of heart failure.

❑ Erythromycin, an antibiotic that has been marketed for over fifty years, has been implicated in cardiac deaths. The problem appears to be interaction with some newer drugs that tend to increase its concentration in the blood. Although it has long been known that erythromycin could present problems when used intravenously, nobody suspected a problem with the pill form. Newer calcium channel blockers and perhaps other medications can slow the breakdown of erythromycin. The result is trapping of salt inside resting heart muscle cells, prolonging the time until the next heartbeat starts and sometimes triggering an abnormal, fatal rhythm.

❑ The Japanese traditional remedy natto, which comes from the popular food made from fermented soybeans, may be very helpful in both preventing and treating cardiovascular disease. It fights the buildup of fibrin (a protein that reduces circulation), breaks up clots, and restores blood circulation to diseased vessels. Studies have indicated that natto may be an effective replacement for warfarin (Coumadin). A side benefit was an approximate 10 percent lowering of both diastolic and systolic blood pressure. More research is taking place to develop physicians' guidelines for the use of this natural medication.

❑ A Taiwanese study reported in the *Archives of Internal Medicine* indicated that habitual tea drinkers may have a significantly reduced risk of hypertension as compared with non-tea-drinkers. Although the tea-drinking group was generally found to be more obese, consume more alcohol, exercise less, and smoke more than the non-tea-drinking group in the study, those habitual tea drinkers who consumed between 120 and 599 milliliters (about 4 to 19 fluid ounces) of tea daily exhibited a 46 percent reduction in hypertension compared with the other group. Those who ingested in excess of 600 milliliters of tea in a given day had a remarkable 65 percent reduction in hypertension. No mechanism has been proposed to explain these results; however, discussions regarding the effects of caffeine, the neurotransmitter theanine, and the antioxidant effects of tea polyphenols (all compounds found in tea) have been advanced. These may act to relax and dilate blood vessels.

❑ Defibrillators are devices used to restore a normal rhythm to the heart during a heart attack. Portable defibrillators are available, and are commonly used in aircraft and police cars during emergencies. The Philips HeartStart home defibrillator is available for use in the home. It costs approximately \$1,200. Training on the proper use of defibrillators is conducted by both the American Red Cross and the American Heart Association.

❑ The use of a test called cardiokymography (CKG) together with electrocardiograms (ECGs) may help to detect "silent" heart disease. A comparison study revealed that electrocardiograms alone missed 39 percent of heart disease cases. When CKG was used along with ECGs, only 8 percent of cases were undetected.

❑ Nitroglycerin, which is sold in sublingual tablet, patch, and lingual spray forms, is commonly prescribed to relieve chest pain and to improve the oxygen supply to the heart. This drug is taken at the first sign of chest pain. If dry mouth prevents sublingual nitroglycerin tablets from dissolving, the spray form may be a better choice. Nitroglycerin has some side effects, including headache, weakness, and dizziness. These usually disappear with continued use.

❑ Some studies suggest that the hormone dehydroepiandrosterone (DHEA) may help to prevent cardiovascular disease in some people. One study showed that men with high DHEA levels were less likely to die of heart disease,

but women with high DHEA levels were at greater risk of dying from heart disease. Another study found little relationship between DHEA levels in the blood and heart disease risk in either gender. (See DHEA THERAPY in Part Three.)

❑ When vitamin C was obtained from citrus bioflavonoids coupled with tocotrienols, people with high cholesterol levels saw significant improvements. These people experienced reductions in the bad cholesterol and triglycerides, and the good cholesterol level increased after twelve weeks.

❑ In two large-scale studies (1,400 women and 1,200 men), no effect was seen for vitamin C and E on reducing heart-related events in healthy individuals.

❑ Low levels of vitamin D have been associated with heart disease. Those with blood vitamin D levels below 15 nanograms/mL had a 60 percent greater chance of developing heart disease. Low vitamin D levels also are associated with high blood pressure, diabetes, obesity, and high triglyceride levels. Each of these is a risk factor for developing heart disease. The best blood levels of vitamin D in this study were equal to or greater than 37 nanograms/mL and the worst were less than 21 nanograms/mL.

❑ Selenium supplements help reduce heart disease risk. A meta-analysis of twenty-five studies on selenium supplementation compared persons with the lowest blood level of selenium to persons with the highest and found that persons with the highest levels of selenium in their blood had 15 to 57 percent less risk of heart disease. Make sure that you don't exceed 400 micrograms from all sources (diet and other supplements).

❑ In one study, after thirty days of taking coenzyme Q<sub>10</sub>, patients with heart disease who had leg pain related to statin use experienced a 40 percent reduction in pain and reported being able to move more easily. It is thought that Coenzyme Q<sub>10</sub> decreases with statin use, thereby impairing muscle energy metabolism.

❑ Policosanol, a product made from sugar cane wax, was thought to lower the bad cholesterol and raise the good cholesterol; however, several recent studies have not supported these beneficial findings.

❑ We cannot recommend that people take up drinking to prevent heart disease, but research has shown that having a small amount of beer, wine, or liquor occasionally may make it more likely that you will avoid heart disease.

❑ Current research indicates that soy isoflavones may enhance coronary blood flow and prevent blocked arteries.

❑ According to some studies, magnesium supplementation can correct some types of irregular heartbeat, and could save the lives of many people with heart trouble.

❑ The mechanisms responsible for omega-3 essential fatty acids' reduction of cardiovascular disease risk are still being studied. However, it appears that benefits include decreases in triglyceride levels and blood clots, lower risk of

sudden death, improved arterial health, and lower blood pressure. In one study, when omega-3s were taken with statin medications, there was a decrease in triglycerides and an increase in the good cholesterol (HDL). Patients in this study took 4 grams of a concentrated fish oil (about 80 percent omega-3s). This is good news for patients who need statins to control their cholesterol, as they may be able to use less of the drugs if they also take fish oil. Certain patients with implantable defibrillators may do worse in terms of cardiac function with fish oil. It may induce arrhythmias, so it is always important to speak with a health care professional before using fish oil. Flaxseed did not seem to have the same benefits to the heart as fish oil even though it has omega-3s.

❑ Studies indicate that depression plays an important role in the occurrence of heart disease in patients who already have it and those who are at risk. People who took about 400 milligrams a day of omega-3s (about one 1-gram fish oil capsule) had the lowest level of depression.

❑ The largest women's health study ever done, the Women's Health Initiative, had 162,000 participants. Some findings taken from the study that were recently presented at an American Society for Reproductive Medicine conference indicated that taking birth control pills during reproductive years was *not* as harmful as was at one time thought. In fact, the study indicated a lower risk for heart attack, stroke, high blood pressure, and other related cardiovascular disease (CVD) problems. The overall risk reduction for CVD was 8 percent, and a bonus was a risk reduction of 7 percent regarding any type of cancer. Researchers believe the type of hormones, and when they are taken in life, seems to be what makes them helpful at one point and harmful at another.

❑ People who have had ischemic strokes and had a clot somewhere in the brain where it was impractical to remove had only one treatment possibility in the past, the clot-dissolving medication TPA. Use of TPA is a long shot by any definition, and not too many stroke patients ever receive it. A tiny experimental corkscrew-like device is now being tested that allows a surgeon to thread the device through a blood vessel in the leg to the clot in the brain, where it is used like a corkscrew to physically extract the clot. This is just like pulling the cork out of a wine bottle, according to Dr. Sidney Starkman at UCLA Stroke Center. Blood starts flowing again to the brain, and that, in the final analysis, is what it's all about.

❑ Catheters are also used to carry specialized tools and medicines to the heart, using the femoral artery. After removing the catheter, a titanium staple is often used to stop the bleeding by closing the hold in the artery.

❑ *Arnica montana*, *Arsenicum album*, *Magnesia phosphorica*, and *Spongia tosta* are homeopathic remedies often recommended for angina. They should be used only under the direction of a qualified homeopathic physician.

❑ Correcting potassium deficiencies before surgery can lessen the risks of coronary bypass surgery.

❑ Studies have shown a connection between heart disease and infection with *Chlamydia pneumoniae*, *Helicobacter pylori*, herpesviruses, and, possibly (but not conclusively) bacteria in dental plaque. The inflammatory response, which is associated with the body's defense mechanisms triggered by infection, may affect the arteries and ultimately lead to the deposition of plaque there. More alarming, researchers have found that some adenoviruses, which cause respiratory infections, may cause left ventricular dysfunction that can lead to sudden death. Because of the connection between infection and heart disease, research is being conducted on the use of antibiotics and prevention of heart attacks. Data published in the *Journal of the American Medical Association* indicates that people who had taken either tetracycline or quinolones in the three years preceding this research proved to be at a lower risk for heart attacks.

❑ Research is being conducted into the role of nitric oxide (NO) in the cardiovascular system. NO keeps the surface of blood vessels smooth so that platelets cannot bind together to form potentially dangerous clots. Researchers are aware that too much NO is toxic to the body, and studies are being conducted into controlling NO levels. Research has shown that by removing oxidants from the blood, vitamins C and E stabilize the NO and allow it to rise to higher levels. Additionally, L-arginine acts to increase the NO level, as does moderate exercise.

❑ Testosterone deficiency is a factor in causing heart disease, depression, and a host of aging-related ailments in men. This is a relatively new opinion, but it is supported by fact. Many people are leery of testosterone because of media hype concerning sports-related usage. But there is more than one type of testosterone, and one is beneficial. First of all, it is true that all the anabolic steroids are bad if taken over the long term. Their molecules resemble those of natural testosterone but are chemically different and do not react the same way in the body. The notorious methyltestosterone may be the worst of these steroids. In the body, natural testosterone is either bound (attached to a protein known as sex hormone binding globulin [SHBG]) or free. While the total amount in the body might be the same as a man ages, more and more of it is bound rather than free. A test might show no difference in overall testosterone levels, but the bound testosterone can no longer interact with testosterone receptors and therefore is in effect biologically inert. So the free testosterone available shrinks as men age. As it turns out, this free testosterone is important to cardiovascular health in many ways. Men with low free testosterone levels are more prone to high blood sugar, high blood cholesterol and triglycerides, high blood pressure, obesity in general and abdominal obesity in particular, high levels of clotting factors, and low levels of clotting inhibitors. There is data that suggests osteoporosis, which affects millions of men, and depression also are linked to low testos-

terone levels. Aside from testosterone therapy under a physician's care, an herbal product that can help the body produce testosterone naturally is the bioflavonoid chrysin (5,7-dihydroxyflavone), which is found in the passion-flower plant (*Passiflora coerulea*). Another useful herbal is an extract made from nettle root (*Urtica dioica*). The latter binds to SHBG better than testosterone, which helps increase the body's level of "free" testosterone. Make sure you use a product made from the root, not the stems and leaves.

*Caution:* Men with prostate cancer or possible prostate cancer should not take any herbal product that increases the supply of free testosterone because it can promote the growth of the cancer.

❑ Transmyocardial laser revascularization is a method of treating refractory angina. In this technique, a laser is used to create holes in the heart in order to increase the flow of blood to deprived areas of the heart.

❑ Substances known as thrombolytic agents, including streptokinase (Streptase) and alteplase (Activase, also known as tissue plasminogen activator [TPA]) have the ability to break up clots. When injected intravenously, they circulate through the arteries, locating and disintegrating blood clots. Studies have shown that thrombolytic therapy within the first six hours of the onset of a heart attack increases the chances of survival. However, this treatment probably should not be used by people who have peptic ulcers, extremely high blood pressure, a history of stroke, or recent head injury or abdominal surgery.

❑ It is important for women over the age of fifty-five, and women of any age who have gone through menopause, to consider heart disease as a possible cause of chest pain or discomfort. The chest pain may even be mild and less prominent than upper abdominal pain, shortness of breath, or nausea. Studies have shown that women are not as likely as men to receive drugs protecting them against heart disease; that they are less likely to undergo bypass surgery or angioplasty if they have cardiovascular disease; and that, when symptoms of heart trouble occur, they do not go to the hospital for treatment as quickly as men do. Because of these factors, women with cardiovascular disease are more likely to die from it than are men in comparable health.

❑ Research has shown that women with hypothyroidism (underactive thyroid) have a sharply increased risk of developing blockages in the aorta.

❑ The FDA asserts that taking one baby aspirin a day can reduce the risk of heart attack and/or stroke without side effects. You should consult with your physician first.

*Caution:* If you do use aspirin, keep in mind that it can cause internal bleeding and stomach ulceration.

❑ Allergies may be linked to some heart attacks. When a reaction in the walls of the arteries triggers a spasm in the coronary arteries, a heart attack may result. Allergies can also cause a temporarily rapid pulse. Your pulse rate may

increase after you eat certain foods or when you come into contact with particular allergens. Allergy testing is recommended to determine whether you react to certain foods or other allergens. (See ALLERGIES in Part Two.)

□ Being exposed to excessive noise for more than thirty minutes can increase blood pressure considerably.

□ People who have had a heart attack that resulted in damage to the left ventricle have been shown to have a longer life expectancy if given the angiotensin-converting enzyme (ACE) inhibitor trandolapril (Mavik) for at least two years. ACE inhibitors are a type of drug most often used to treat high blood pressure. Other ACE inhibitors include enalapril (Vasotec) and ramipril (Altace). These drugs stop the formation of a natural chemical, angiotensin II, that narrows the blood vessels. (Angiotensin II inhibitors block the action, rather than the formation, of the same chemical.) Possible side effects are constipation, dry mouth, decreased sexual desire or erectile dysfunction, and a decrease in mental function.

□ Other drugs often prescribed for people with high blood pressure include beta-blockers, calcium channel blockers, central-acting agents, and diuretics. Beta-blockers allow the heart to beat more slowly and with less force. Side effects can include a decrease in left ventricular function, a decrease in sexual desire in women, and erectile dysfunction in men. Calcium channel blockers, also known as calcium antagonists, relax the blood vessel muscle. Possible side effects are sexual dysfunction, dryness of the mouth, muscle pain, and heart arrhythmia. Central-acting agents (central adrenergic inhibitors) act on the brain, preventing the nervous system from increasing the heart rate and narrowing the blood vessels. Diuretics, also known as water pills, help the kidneys get rid of sodium and water, thus reducing the volume of blood coursing around the body. Possible side effects of diuretics include dehydration, diabetes, fainting spells, and possible heart and kidney malfunctions. Anticoagulant (blood-thinning) drugs, such as warfarin (Coumadin), are often prescribed for those in particular danger of developing blood clots, such as people who are bedridden, cancer patients (the formation of blood clots containing cancer cells that may colonize other parts of the body is a concern), and people with certain types of cardiac arrhythmias. Studies show that for those in peril of recurring clots, blood-thinning drugs should be taken for at least two years.

□ A study reported in *The New England Journal of Medicine* indicated that for most people, aspirin works as well as warfarin in helping to prevent recurrent strokes. Although not found in this study, the author believes that baby aspirin should work as well as regular aspirin and pose less of a risk of internal bleeding. Vitamin E (200 IU a day) along with aspirin also makes an effective blood-thinning combination. However, you should never take warfarin and vitamin E at the same time (do not mix them), as this might cause severe bleeding.

□ Men who take medication for hypertension can suffer from erectile dysfunction (ED) as a side effect. The anti-erectile-dysfunction drug sildenafil (Viagra), once thought to be dangerous for such individuals, may in fact be a viable option for those with high blood pressure, researchers say. It is advisable to consult your physician to determine if your medication for high blood pressure has lowered your blood pressure too much, and if any of your medications contain nitrates. The combination of nitrates and sildenafil can cause dangerously low blood pressure. Your doctor may also suggest a stress test before he or she makes a decision about prescribing sildenafil.

□ For further information on cardiovascular disease, you can consult the American Heart Association or the National Heart, Lung, and Blood Institute. (See Health and Medical Organizations in the Appendix.)

□ See also ARTERIOSCLEROSIS; CIRCULATORY PROBLEMS; HEART ATTACK; and HIGH BLOOD PRESSURE, all in Part Two, and CHELATION THERAPY in Part Three.

## CARPAL TUNNEL SYNDROME

Almost unheard-of only a generation ago, carpal tunnel syndrome (CTS) has rapidly become a curse of modern existence. It is one of many injuries called repetitive strain injuries (RSIs), which include trigger finger, nerve spasms, and carpal tunnel syndrome. CTS is the term used to describe a set of symptoms that occur when the median nerve in the wrist is compressed or damaged. The median nerve controls the thumb muscles, and is also responsible for sensation felt in the thumb, the palm, and the first three fingers of the hand. The carpal (from the Greek word *karpos*, meaning "wrist") tunnel is a very small opening about one-quarter inch below the surface of the wrist through which the median nerve passes. The median nerve is vulnerable to compression or injury from a number of sources—swelling due to pregnancy or water retention, pressure from bone spurs, diabetes, bone dislocation or fracture, inflammatory arthritis, or even tendinitis.

CTS has been associated with repetitive wrist motion injury, which is linked to continuous rapid use of the fingers. Once considered an occupational hazard affecting only supermarket checkout clerks and bookkeepers, CTS did not become widely known until the 1980s, when personal computers came to dominate the workplace. Today, CTS is commonplace among people who use computers extensively. However, it must be noted that repetitive motion by itself has never conclusively been linked to increased pressure on the median nerve. Typing with the hand in an overextended, or "hyperflexed," position because the keyboard is too high or too low can cause an increase in symptoms that lead to CTS. In other words, the task itself doesn't cause the problem, but the position of the hands during the task does.

Carpal tunnel syndrome has also been linked to strong,

steady vibrations that shake the wrist for long periods (such as using a jackhammer or chain saw). Other people whose occupations have been associated with CTS include assembly line workers, athletes, drivers, hairstylists, musicians, restaurant servers, and writers. Although CTS affects both sexes, women between the ages of twenty-nine and sixty-two seem to be affected more than any other segment of the population. People with square wrists (wrists that are roughly as deep as they are wide) are said to be more disposed to getting CTS. Whatever the cause, an estimated 4 to 10 million Americans have CTS, according to the American College of Rheumatology. Factors that increase the risk of CTS include menopause, obesity, Raynaud's disease, pregnancy, hypothyroidism, and diabetes mellitus.

Symptoms of CTS can range from mild numbness and faint tingling to excruciating pain accompanied by a crippling atrophy of the muscles in the thumb. Most commonly, it is experienced as burning, tingling, or numbness in the thumb and the first three fingers. (The little finger is spared because it receives its nerve impulses from outside the carpal tunnel.) The tingling is often referred to as feeling similar to the "pins and needles" associated with a limb "falling asleep," and it also involves a gradual weakening of the thumb. In the beginning, symptoms are often intermittent, but they become persistent as the condition worsens.

CTS can affect one or both hands. Symptoms are often worse at night or in the morning, when circulation slows down. Pain may spread to the forearm and, in severe cases, to the shoulder. Carpal tunnel syndrome may have its genesis in either the neck, upper back, and/or shoulders. A visit to a chiropractor or osteopath may help in determining whether this is the case.

Not all nerve entrapment problems are in the carpal tunnel area. Though far less common, entrapment of the ulnar nerve, located in the elbow, produces symptoms almost identical to those of CTS. This condition can be very painful and disabling. It can also be misdiagnosed as myofascial dysfunction. Myofascial dysfunction stems from the overuse or misuse of muscles. It is not connected with nerve damage.

### CTS Self-Test

A quick way to diagnose carpal tunnel syndrome is to perform a simple hand-flexing test called Phalen's maneuver. Place the backs of your hands together with the wrists bent at a 75-degree angle. If you experience tingling and numbness in your fingers after a few minutes, it may be CTS. If your job or hobby causes you to develop a burning sensation, numbness, or clumsiness affecting the first three fingers of one or both hands, chances are that CTS is the culprit.

This self-test is not foolproof, however. The only truly conclusive test for CTS is electromyography (EMG), which involves transmitting electrical impulses through the arm. The nerve impulses that direct motion are nothing more than a very low voltage current. Normal nerve impulse

transmission occurs at a speed of approximately 136 meters per second, which is fast enough to appear instantaneous to us. If nerves are damaged or entrapped by swollen tissue, however, they cannot transmit electrical neural impulses at the normal rate of speed. If you are found to have a neurotransmission speed of only 90 to 95 meters per second, nerve damage or compression is strongly suggested. A recent study suggests that sonography may be just as accurate as the preceding test to determine whether or not you have the prerequisites for CTS. Ultrasound images can show swelling within the carpal tunnel and how much space is available there for the nerve.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	30–90 mg daily.	Improves tissue oxygenation.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Supplies choline and inositol for nerve function. A fat emulsifier.
Vitamin B complex  plus extra vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>6</sub> (pyridoxine)	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily for 12 weeks.  100 mg twice daily for 12 weeks. Do not exceed this amount, or nerve damage may result.	B vitamins are essential in nerve function.  Increases the uptake of vitamin B <sub>6</sub> and improves tissue oxygenation. A potent diuretic.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Enhances healing. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Helpful</i>		
Grape seed extract	As directed on label.	A powerful antioxidant and anti- inflammatory.
Kelp	As directed on label.	Beneficial to nerves.
Manganese	As directed on label. Take separately from calcium.	Helpful for nerve problems.
Multivitamin and mineral complex	As directed on label.	For general nutritional supplementation. Use a formula without iron.
Primrose oil or Kyolic-EPA from Wakunaga	As directed on label.  As directed on label.	Contain essential fatty acids necessary for nerve function.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Important antioxidants.
Vitamin C with bioflavonoids	1,000 mg 4 times daily.	Important in healing. A potent antioxidant. Aids in reducing swelling.
Vitamin E	200 IU daily.	An important antioxidant. Use d-alpha-tocopherol form.

## Herbs

- Aloe vera, devil's claw, yarrow, and yucca are helpful for restoring flexibility and reducing inflammation.
- Bromelain and boswellia both reduce inflammation and swelling.
- Butcher's broom helps to relieve inflammation.
- Capsicum relieves pain and is a catalyst for other herbs.
- Corn silk and parsley are natural diuretics that help keep swelling down.
- Ginkgo biloba, taken in either tea or capsule form, is beneficial for improving circulation and also aids nerve function.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Gravel root tightens and soothes tissues and acts as an antiseptic.
- Marshmallow root soothes and softens tissues and promotes healing.
- Rhus toxicodendron*, a homeopathic remedy, helps in any conditions where stiffness exists in a joint when it is first used. This substance is also helpful in soothing restlessness at night and in injuries caused by overuse of the joints.
- St. John's wort stimulates circulation and helps to restore local nerve impulse transmission.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

- Skullcap relieves muscle spasms and pain.
- Venaforce from Bioforce, which contains a standardized extract of horse chestnut, helps improve circulation.
- Wintergreen oil aids in pain relief and circulation to the muscles.
- Zhen Gu Shi, a potent Chinese liniment for inflamed joints, is good for easing CTS symptoms. It is also sold in many Asian markets.

## Recommendations

- Consume foods that contain or lead to the production of oxalic acid in moderation only. These include asparagus, beets, beet greens, eggs, fish, parsley, rhubarb, sorrel, spinach, Swiss chard, and vegetables of the cabbage family. Large amounts of oxalic acid can promote joint problems.
- Eat half of a fresh pineapple daily for one to three weeks, until relief is achieved. Pineapple contains bromelain, which reduces pain and swelling. Only fresh pineapple is effective. Bromelain is also available in supplement form.

- Eat foods high in vitamin B<sub>6</sub>, such as bananas, avocados, potatoes, nuts, bluefin tuna, Atlantic salmon, chicken, whole grains, and sweet potatoes.

- Avoid salt and all foods containing sodium. They promote water retention and may aggravate carpal tunnel syndrome. They also counteract the effects of any diuretics that your physician may prescribe.

- If you engage in repetitive mechanical tasks, try to reduce the impact on your wrists and hands. See MINIMIZING THE RISK OF CARPAL TUNNEL SYNDROME, below.

- If possible, stop all repetitive finger movements for several days and see if any improvement occurs. If it does, try to rearrange your schedule so that you spend less time in CTS-stimulating activities. If possible, alternate tasks rather than performing a single task for long periods. Fortunately, employers have become more mindful of the possibility of repetitive motion injuries and are often more understanding than they might have been only a few years ago. Many now try to have their employees rotate the tasks they perform so that the risk of injury is reduced.

- Maintain ideal weight, and lose weight if necessary. Excess weight results in extra pressure on the carpal tunnel. Losing weight has brought relief to many people with CTS.

- Try using *Rhus toxicodendron*, a homeopathic remedy that helps in any conditions in which there is stiffness in a joint when it is first used. This substance is also helpful in soothing restlessness at night and in injuries caused by overuse of the joints.

- Use a splint to help prevent flare-ups. Splints are cloth-covered metal or plastic braces that attach to the forearm with an elastic bandage (an Ace bandage or the equivalent) or hook-and-loop fasteners (Velcro). These devices are available at medical supply houses and many pharmacies. If you cannot find one that fits properly, have one custom-made. Be sure to apply and wear the splint properly; if you don't, its effectiveness may be reduced or it may even aggravate the problem. Cock your wrist back slightly so that your thumb is parallel to your forearm. Your hand should be in approximately the same position as if it were holding a pen. This position keeps the carpal tunnel as open as possible. Wear the splint as much as possible for several days to see if your symptoms are reduced. Splinting is often very helpful for those who have suffered a repetitive motion injury that results in CTS.

- Keep your workplace warm and dry. Cool and/or damp conditions tend to aggravate CTS.

- Avoid taking supplements that contain iron. They are suspected of aggravating pain and swelling in joints.

## Considerations

- If CTS develops as a result of the edema of pregnancy, it usually clears up of its own accord once the baby arrives and the excess fluid of pregnancy disappears.

## Minimizing the Risk of Carpal Tunnel Syndrome

Carpal tunnel syndrome is an occupational hazard for anyone whose job involves making repetitive movements with the hands and/or fingers. In this age of computers, that means virtually anyone who works in an office, as well as assembly line workers, bookkeepers, cashiers, jackhammer operators, musicians, and many others. Spending a great deal of time engaging in a hobby such as knitting and needlework can also cause problems. No matter what your occupation, the following measures are recommended to help you reduce the risk of developing this painful and disabling condition:

- Use your whole hand and all of your fingers when you grip an object.
- Whenever possible, use a tool instead of flexing your wrists forcibly.
- Make sure your posture is correct. For keyboard tasks, sit straight in your chair with your body tilted slightly back. Raise or lower your chair so that your knees are bent at a right angle and your feet are flat on the floor. Your wrists and hands should be straight and your forearms parallel to the floor. Keep your wrists and hands consistently in a straight line.
- Keep your elbows bent. This lessens the load close to your body and reduces the amount of force required to do your job. Give yourself elbow room to allow you to use as much of your arm as you can while keeping your wrist straight. Use your whole arm while performing tasks in order to minimize the stress on your elbow.
- Adjust your computer screen so that it is about two feet away from you and just below your line of sight.
- Use armrests that attach to the chair to keep your wrists from flexing too much.
- If the relative positions of your desk, chair, and keyboard do not allow you to keep your wrists straight while keyboarding, the use of a “wrist rest” pad in front of the keyboard is highly recommended to alleviate pressure on the carpal tunnel.
- Slow your rhythm while varying wrist and hand movements.
- Take a break from handwork for a few minutes every hour.
- Shake out your hands periodically throughout the day.
- Resting one forearm on a table, grasp the fingertips of that hand and pull back gently. Hold this position for five seconds, then repeat the exercise with the other hand.
- Press the palms flat on a table, as if doing a push-up. Lean forward to stretch the forearm muscles and the wrists.
- Another recommended gentle exercise is done by rotating the wrist. Move your hands around in a circle for about two minutes, thoroughly stretching the muscles of the hand. This helps to restore circulation and improve the posture of the wrist.
- Do strengthening exercises. Place a rubber band around the fingers to provide resistance, and then open and close the fingers. Three times a day, do a set of ten repetitions with each hand.

☐ Physicians treat CTS in a variety of ways, most often with a combination of anti-inflammatory medications, splints, and the recommendation that you avoid any aggravating activity. Sometimes corticosteroid injections in the wrist are used. This treatment is controversial, however, and should not be used unless the pain from CTS is debilitating, since the injections themselves may produce discomfort.

☐ If weakness develops in the thumb, it is an indication that the median nerve has sustained some amount of damage, and surgical treatment may be recommended. This surgery involves cutting the transverse carpal ligament, a thick, fibrous band that covers part of the carpal tunnel. The surgeon can make either a small incision or a relatively large one. A small incision causes minimal scarring, but it affords the surgeon a very limited area view, which increases the risk of damage to other important structures in the wrist. A larger incision reduces the risk of peripheral damage, but a more prominent scar is usually the result,

and the scarring itself may cause some pain and disability. A splint or cast must be worn for two to four weeks following surgery. A less invasive type of surgery, called the endoscopic technique, has become popular. This procedure takes only ten minutes and the incision, made in the palm, is tiny. Most people return to work within a few days.

☐ Many doctors maintain that surgery for CTS is too often performed unnecessarily. A second opinion should always be obtained before surgery is agreed to. However, if the second doctor’s opinion confirms that surgery is unavoidable, it is best not to put the operation off for too long, as delay may result in permanent nerve damage.

☐ The numbness, tingling, and pain of CTS usually subside within a few days after surgery, but some people find that it takes as much as two years for the symptoms to resolve. When this happens, it is often because the median nerve has sustained some damage and a long time is needed for any nerve regeneration to occur. If surgery is

necessary and is put off for too long, the thumb may be left permanently weakened and the mobility of the affected hand may be diminished.

❑ A new treatment for CTS involves the use of a low-energy ("cold") laser to penetrate tissues, stimulate nerves, and increase microcirculation in the affected area.

❑ Additional information about repetitive strain injuries is available from the National Institute for Occupational Safety and Health. (See Health and Medical Organizations in the Appendix.)

❑ See also PAIN CONTROL in Part Three.

## CATARACTS

See under EYE PROBLEMS.

## CAVITIES

See TOOTH DECAY.

## CELIAC DISEASE

Celiac disease (also called celiac sprue) is a chronic digestive disorder that is caused by a hereditary intolerance to gluten. Gluten is a protein component of wheat (including durum, semolina, and spelt), rye, oats, barley, and related grain hybrids such as triticale and kamut. The cause of celiac disease is unknown, although it is known to affect mostly Caucasians of European descent.

When a person with celiac disease consumes gluten, damage to the small intestine results. It is believed that the body responds to gluten as if it was an antigen, and launches an immune system attack when it is absorbed by the intestine. This, in turn, causes the lining of the small intestine to swell. As a result, tiny hairlike projections called villi suffer damage and destruction, which impairs the body's ability to absorb vital nutrients. Malabsorption becomes a serious problem, and the loss of vitamins, minerals, and calories results in malnutrition despite an adequate diet. Diarrhea compounds the problem. Because celiac disease impairs digestion, food allergies may also appear.

Celiac disease affects both adults and children, and it can appear at any age. It often appears when a child is first introduced to cereal foods, at around three or four months of age. In others, the disease can be triggered by emotional stress or physical trauma, such as a surgery or pregnancy.

The first signs are usually bloating, chronic diarrhea, pain, weight loss, and nutritional deficiencies. Other symptoms can include nausea; abdominal swelling; large, pale, light-yellow-colored stools that float; depression; fatigue; irritability; muscle cramps; wasting; and joint and/or bone pain. Infants and children may exhibit stunted growth, vomiting, an intense burning sensation in the skin, and a red, itchy skin rash called *dermatitis herpetiformis*. A baby

with celiac disease may gain weight more slowly than normal or may lose weight. The infant may have a poor appetite, gas, and offensive-smelling bowel movements. The child is likely to have an anemic, undernourished appearance. Ulcers may develop in the mouth.

If left untreated, celiac disease can be quite serious, even life-threatening. Bone disease, such as osteoporosis, central and peripheral nervous system impairment, seizures caused by inadequate absorption of folic acid, internal hemorrhaging, pancreatic disease, infertility, miscarriages and birth defects, and gynecological disorders are just some of the long-term maladies that can affect those with celiac disease. There is also a risk of developing intestinal lymphoma and other intestinal malignancies. Certain autoimmune disorders also can be associated with celiac disease, including kidney disease (nephrosis), sarcoidosis (the formation of lesions in the lungs, bones, skin, and other places), insulin-dependent diabetes mellitus, systemic lupus erythematosus, thyroid disease, and, rarely, chronic active hepatitis, scleroderma, myasthenia gravis, Addison's disease, rheumatoid arthritis, and Sjögren's syndrome.

Celiac disease is often difficult to diagnose because the symptoms are similar to those of other diseases, such as irritable bowel syndrome, gastric ulcers, and anemia. The average time it takes for a person to be diagnosed is eleven years. Advances in blood testing have made it easier to detect celiac disease. A diagnosis based on a blood test can be followed up with a biopsy of intestinal tissue, which is usually an outpatient procedure. However, due to the fact that symptoms are so diverse, and that some people with celiac disease do not show obvious symptoms, many people go a long time before being diagnosed correctly. Because celiac disease is hereditary, if one family member is diagnosed with it, other family members should also be tested.

Celiac disease is much more prevalent in the population than was once believed, affecting at least 3 million Americans. Studies by the University of Chicago Celiac Disease Program indicate that as many as 1 in 133 apparently healthy people is affected. For those with related symptoms, the incidence may be as high as 1 in 56. (The incidence may be even higher in many areas of Europe.) Celiac disease affects 1 percent of the population worldwide. About 4 percent of patients diagnosed with inflammatory bowel disease have celiac disease. It is estimated that 97 percent of people living with the disease have not been diagnosed.

There is no known cure for celiac disease, but it can be controlled by lifelong adherence to a gluten-free diet.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Essential fatty acids (Kyolic-EPA from Wakunaga, flaxseed oil, or primrose oil)	As directed on label.	Needed for the villi in the intestines.
Free form amino acid	As directed on label.	To supply protein in a form readily available for use by the body.
Glutathione	500 mg 3 times daily.	An amino acid needed for repair of the intestinal tract.
Kyo-Dophilus from Wakunaga	As directed on label.	A dairy- and yeast-free probiotic formula to replace the friendly bacteria.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Dramatically increases levels of vitamins B <sub>1</sub> and B <sub>12</sub> for immune enhancement.
Multivitamin and mineral complex with vitamin A and mixed carotenoids and vitamin E	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 10,000 IU daily. 200 IU daily.	All nutrients are necessary in balance. Use a wheat- and yeast-free product only.
Vitamin B complex injections plus extra vitamin B <sub>6</sub> (pyridoxine) or vitamin B complex	2 cc weekly, or as prescribed by physician. 1/2 cc weekly, or as prescribed by physician. As directed on label.	Necessary for proper digestion. Injections (under a doctor's supervision) are best because they bypass the digestive system. If injections are not available, a sublingual form is recommended. Use a wheat- and yeast-free product.
Vitamin B <sub>12</sub> and folic acid	1,000–2,000 mcg daily. 400–800 mcg daily.	Malabsorption of vitamin B <sub>12</sub> results from celiac disease. Injections may be necessary. If injections are not available, use a lozenge or sublingual form.
<b>Important</b>		
L-carnitine	2 grams a day.	Shown to increase energy levels because it is involved with muscle energy production.
N-acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Forms the basis of complex molecular structures of the mucous membranes of the intestinal lining.
Vitamin K or alfalfa	As directed on label.	Fat-soluble vitamins are not absorbed well in this disorder. See under Herbs, below.
Zinc lozenges plus copper	1 15-mg lozenge 5 times daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Needed for immunity and healing. Needed to balance with zinc.
<b>Helpful</b>		
Magnesium plus calcium	750 mg daily. 1,500 mg daily.	Helps maintain the body's normal pH balance. Deficiency is common in people with celiac disease. Works with magnesium.

Proteolytic enzymes	As directed on label, 3 times daily. Take between meals, on an empty stomach.	Additional digestive enzymes may be needed to aid in breakdown and absorption of foods.
Psyllium seed or flaxseeds or ABC Aerobic Bulk Cleanse from Aerobic Life Industries	As directed on label. Take separately from other supplements and medications.	Fiber products not absorbed by the intestines. Drink large amounts of water because the fiber expands to several times its dry volume.
Vitamin C plus bioflavonoids	2,000–5,000 mg daily, in divided doses.	Boosts immune function.
Vitamin D <sub>3</sub>	As directed on label.	Stimulates absorption of calcium. People with celiac disease frequently have calcium deficiencies.

## Herbs

- Alfalfa supplies vitamin K, which is often deficient in those with celiac disease. Take 2,000 to 3,000 milligrams of alfalfa in tablet form daily.
- Olive leaf extract and/or goldenseal is helpful for keeping infection down.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

Avoid any and all foods that contain gluten. Do not eat any products that contain barley, oats, rye, or wheat. Rice and corn can be eaten. Substitute rice, potato, cornmeal, and soy flour for wheat flour. Read all labels carefully. Watch for "hidden" sources of gluten, such as hydrolyzed vegetable protein, textured vegetable protein, hydrolyzed plant protein, and all derivatives of wheat, rye, oats, and barley, including malt, modified food starch, some soy sauces, grain vinegars, binders, fillers, inert substances, and "natural flavorings." Do not consume hot dogs, gravies, luncheon meat, beer, mustard, catsup, nondairy creamer, white vinegar, curry powder, or seasonings. Gluten-free products are available at health food stores. Natural foods stores such as Whole Foods Market have a wide selection of gluten-free foods.

Eat fresh vegetables, legumes (such as lentils, beans, and peas), rice bran, nuts, sunflower seeds, raisins, figs, and "seedy" fruits, such as strawberries, raspberries, and blackberries.

Include in the diet blackstrap molasses, which is high in iron and the B vitamins. People with celiac disease need fiber and foods rich in iron and the B vitamins.

- Be sure to chew your foods thoroughly before swallowing. This improves the intake of nutrients.
- Do not eat sugary products, processed foods, dairy products, bouillon cubes, chocolate, and bottled salad dressings.
- Celiac disease causes malabsorption of the B vitamins and the fat-soluble vitamins (vitamins A, D, E, and K), so take these nutrients. Note that gluten is found in many nutritional supplements. Read labels carefully, and use supplements that are hypoallergenic, wheat-free, and yeast-free.
- If a child develops any of the symptoms of celiac disease, omit all gluten-containing foods from the child's diet and see if the problem clears up. Also eliminate milk, as lactose intolerance can occur with celiac disease. If you do this, be sure to offer another source of calcium, vitamin D, and magnesium. The disease can begin in the first few months of life, depending on the child's diet.

### Considerations

- Any child who is not thriving could have celiac disease. The disease manifests itself differently with each person. Symptoms can include irritability, fatigue, and/or behavior changes; they do not always involve obvious digestive problems.
- A child who gets blisters and sores all over his or her body should be checked for celiac disease.
- If celiac disease is suspected, a blood test and then an intestinal biopsy should be performed to make a definitive diagnosis. Make a list of symptoms and foods that set off these symptoms for your child's health care provider. Growing children need a wide range of nutrients to grow and for their brains to develop. Don't restrict a child's diet before seeking medical help.
- Starting a gluten-free diet is challenging because gluten is present in so many foods, including most grains, pasta, cereals, and processed foods. However, people with celiac disease can still eat a varied, well-balanced diet that includes breads and pastas made from potato, rice, soy, or bean flour. Gluten-free products are available from many health food stores and specialty food companies. There are also many cookbooks available for those on a gluten-free diet. Grainaissance is an industry leader in providing wheat-, gluten-, and dairy-free products. Mochi bake-and-serve rice squares are wheat-, gluten-, and dairy-free, as are Amazake Rice Shakes. Enjoy Life Foods sells a number of foods that are ideal for a gluten-free diet, including breakfast cereals. Mrs. Leepers carries a line of organic rice pastas and corn pastas that are gluten-, wheat-, and casein-free. Rizopia rice pasta is gluten-free. Nature's Path carries a number of gluten-free products. U.S. Mills offers wheat- and gluten-free cereals under the Erewhon and New Morning brands.
- Several studies suggest that people with celiac disease can safely eat oats. However, since oats are frequently pro-

cessed with other grains, it is difficult to determine whether oats are completely gluten-free. Follow your physician's or dietician's advice about including oats in a gluten-free diet. A clinical study in Finland showed that patients with celiac disease were able to tolerate both highly processed oats and those left in a more natural state, indicating that oats may be part of a gluten-free diet.

- It may be necessary to remove milk and milk products from the diet because of a secondary lactase deficiency. (*See LACTOSE INTOLERANCE in Part Two.*) Many lactose-free dairy substitute products are available (milk, ice cream, cheese), so if you enjoy dairy, there are ample healthy options.
- Vitamin K deficiency caused by celiac disease may lead to hypoprothrombinemia (a lack of clotting factors in the blood). "Friendly" bacteria in the intestines manufacture one form of vitamin K; another is present in certain foods, especially leafy greens, alfalfa, tomatoes, strawberries, whole grains, and yogurt. Bacteria such as those found in yogurt and acidophilus can also help to restore the intestinal flora necessary for vitamin K production.
- Martin F. Kagnoff, M.D., of the University of California-San Diego says that heredity is a vital factor in the development of this disease. He also says that celiac disease often develops in childhood but may trail off in adolescence; in some cases, reappearing in adults in their thirties and forties. Factors that may trigger the onset of celiac disease are emotional stress, physical trauma, a viral infection, pregnancy, or surgery.
- A report published in the British medical journal the *Lancet* pointed to a possible connection between celiac disease and epilepsy. Theories as to how the two might be linked include the possibility that endorphin-like substances may be created from wheat gluten and may affect brain metabolism; another possibility is that celiac disease increases intestinal permeability, which in turn allows the absorption of substances that may affect brain chemistry.
- Schizophrenia has been observed to occur more often in those with celiac disease. (*See SCHIZOPHRENIA in Part Two.*)
- For more information about celiac disease, you can contact the Celiac Disease Foundation. (*See Health and Medical Organizations in the Appendix.*) There are also good books available on this subject.
- See also* ALLERGIES and MALABSORPTION SYNDROME in Part Two.

### CHEMICAL ALLERGIES

When the body is exposed to certain foreign chemicals, it may respond by producing antibodies to defend itself against the foreign invaders. Virtually any substance can provoke a reaction in some individuals. Some of the environmental contaminants that frequently cause problems include air pollution; gas, oil, or coal fumes; formaldehyde; chlorine; phenol; carbolic acid; insecticides; disinfectants;

paint strippers; paint; hair sprays; household cleaning products; and metals such as nickel, mercury, chrome, and beryllium.

Chemical allergies often manifest themselves as skin reactions. Other possible allergic responses to foreign chemicals include watery eyes, ringing in the ears, stuffy nose, diarrhea, nausea, upset stomach, asthma, bronchitis, arthritis, fatigue, eczema, intestinal disorders, depression, and headache. Some people may have a reaction immediately after encountering a chemical allergen; others may not react for up to twenty-four hours. Seek medical help if the reaction is severe.

The following supplement program is designed to protect you from, and help you cope with, the effects of chemical allergies. Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Vitamin A plus carotenoid complex	50,000 IU daily for 10 days, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Powerful free radical scavengers and immune enhancers. Use emulsion forms for easier assimilation.
with beta-carotene plus vitamin E	5,000–10,000 IU daily. 200 IU daily.	A powerful antioxidant. Use d-alpha-tocopherol form.
Vitamin B complex  plus extra vitamin B <sub>6</sub> (pyridoxine)  plus niacinamide	100–200 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily. 500 mg 3 times daily.	Allergies hinder absorption of B vitamins. Consider injections (under a doctor's supervision). A natural antihistamine. Also aids in detoxifying foreign substances and eliminating them through the kidneys. Aids circulation. <i>Caution:</i> Do not substitute niacin for niacinamide, or toxicity may result.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Protects the body from allergens and moderates the inflammatory response.
<b>Important</b>		
Coenzyme Q <sub>10</sub>  plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	Helps to counter histamine, a body chemical involved in allergic reactions. Supports the immune system's detoxification of many dangerous substances. Removes toxins from the body.

Pycnogenol or grape seed extract	As directed on label. As directed on label.	Serves as a free radical scavenger and aids in protecting bodily cells from damage.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Essential in immune function and protection of cells.
Superoxide dismutase (SOD) or Cell Guard from Biotech Foods	As directed on label. As directed on label.	A potent free radical scavenger. An antioxidant complex that contains SOD.
Zinc  plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Important in proper immune function. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc. Copper is lost when high doses of vitamin C are taken.

### Helpful

Aller Bee-Gone from CC Pollen	As directed on label.	A combination of herbs, enzymes, and nutrients that fight allergic outbreaks.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A powerful immunostimulant.
L-cysteine and L-methionine plus L-glutamic acid	500 mg each daily. Take on an empty stomach with juice or water. Do not take with milk. Take with 50 mg vitamin C for better absorption.	Excellent detoxifiers, especially of the liver. (See AMINO ACIDS in Part One.)
Manganese	As directed on label. Take separately from calcium.	Interacts with zinc and copper. Use manganese chelate form.
Pancreatic enzymes and proteolytic enzymes	As directed on label 3 times daily, with meals. As directed on label 3 times daily, between meals.	Both pancreatic and proteolytic enzymes are needed for proper digestion and assimilation of necessary nutrients. Proteolytic enzymes also control inflammation.
Raw thymus glandular	As directed on label.	Important for immune function.
Taurine Plus from American Biologics	500 mg daily.	The most important antioxidant and immune regulator, necessary for white blood cell activation and neurological function. Use the sublingual form.

### Herbs

If you develop a skin rash from exposure to metal in watchbands, earrings, snaps, or other items that come in contact with the skin, try using Calendula Cream from NatureWorks. Calendula, chamomile, elder flower, and tea tree oil also can be used as a soothing wash on rashes.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

**Recommendations**

The first step in managing chemical allergies is to determine which chemicals are provoking the allergic reaction, then to avoid coming in contact with them. If the source of the problem is not obvious, see an allergy specialist.

Avoid foods that have been sprayed or that contain artificial colorings (found in some apples and oranges), ripening agents, or protective waxes (found on some apples, cucumbers, and other items). Avoid things containing FD&C Yellow No. 5 dye. Read all food product labels carefully.

Supplement your diet with plenty of fiber. Oat bran is a good source of fiber. Apple pectin also can be a useful addition to your diet. It removes unwanted metals that may trigger allergic reactions.

*Note:* Always take supplemental fiber separately from other supplements and medications.

**Considerations**

Mercury and silver in old dental fillings can cause allergic reactions as well as heavy metal poisoning. (See MERCURY TOXICITY in Part Two.)

See also CHEMICAL POISONING below.

**CHEMICAL POISONING**

Like toxic metals, poisonous chemicals such as chlorine, disinfectants, heavy metals, herbicides, insecticides, petroleum products, and solvents can enter the body and decrease the functional capacity of its organs. This is chemical poisoning. Some chemicals are absorbed through the skin; others may be inhaled or ingested. The body's immune system is threatened by these chemicals and tries to cleanse the body of the poisons. Damage to internal organs, especially the liver, may occur.

Chronic chemical poisoning occurs most often in people who use or who are exposed to chemicals in their work environments, or who use excessive amounts of chemical sprays. People who live near landfills or certain industrial installations also may be chronically exposed to toxic chemicals.

Acute chemical poisoning can result from accidental ingestion of household chemicals (particularly by children) or taking improper or excessive medications.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Free form amino acid	As directed on label twice daily, on an empty stomach.	Helps liver function. Use a sublingual form.
Garlic (Kyolic from Wakunaga)	As directed on label.	Helps to detoxify and cleanse the bloodstream; chelates heavy metals.
Raw liver extract	As directed on label or as prescribed by physician.	Supplies needed B vitamins and iron, and detoxifies chemicals. For severe chemical poisoning, injections (under a doctor's supervision) are best.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label.	A powerful free radical destroyer.
Vitamin B complex injections	As prescribed by physician.	Protects the liver and bodily functions. Injections (under a doctor's supervision) are best. If injections are not available, use a sublingual form.
plus choline and inositol	50 mg 3 times daily, with meals. 50 mg 3 times daily, with meals.	
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Protects the body from pollutants and aids in the elimination of toxic substances.
<i>Important</i>		
Grape seed extract	As directed on label.	A powerful antioxidant.
L-cysteine and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To remove toxins and rebuild the body. (See AMINO ACIDS in Part One.)
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Works with vitamins C and E to detoxify the body.
Vitamin E	200 IU daily.	A powerful antioxidant. Use d-alpha-tocopherol form.
<i>Helpful</i>		
Coenzyme Q <sub>10</sub>	30–60 mg daily.	Aids in rebuilding the immune system and providing oxygen to the tissues.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed to aid in strengthening the immune system and lessening toxicity.

**Recommendations**

To aid recovery, eat a well-balanced diet that is high in fiber. Fiber helps to cleanse the system. Recommended foods include almonds, apricots, bananas, barley, beans, beets, Brazil nuts, brown rice, carrots, dates, fish, garlic,

grapes, hazelnuts, lemons, lentils, oatmeal, onions, spinach, and yogurt.

- If at all possible, eat only organically grown foods.
- Always wear protective clothing and rubber or latex gloves when handling chemicals, even commonly available products such as solvents, paint strippers, and paint thinners (most of which contain methylene chloride, xylene, acetone, toluene, benzene, and other extremely hazardous chemicals). One of the worst is the cleaning solvent used to prepare plastic pipe for the application of glue. It contains methylethylketone (MEK), a great solvent but a known carcinogen. Carefully follow the directions on the label of any product that contains chemicals. Avoid breathing the fumes, especially in a confined area.
- Avoid being outside during any aerial application of insecticides or pesticides.
- Drink steam-distilled water only. (See WATER in Part One.)
- Perform a cleansing fast for three days each month to help the body get rid of toxins. (See FASTING in Part Three.)
- Avoid chemicals whenever possible. Even getting gasoline on your hands while fueling the car or lawn mower is not a good idea.

### Considerations

- See also CHEMICAL ALLERGIES and POISONING in Part Two.

### CHICKENPOX

Chickenpox was once a very common and highly contagious disease. Most children now get a chickenpox vaccine, which can prevent chickenpox. About eight or nine out of ten people who get chickenpox vaccine will not get chickenpox. But if someone who has been vaccinated does get chickenpox, it is usually very mild. They will have fewer blisters, are less likely to have a fever, and will recover faster. Children who have never had chickenpox should get two doses of chickenpox vaccine at twelve to fifteen months and at four to six years of age. Anyone who is not fully vaccinated, and never had chickenpox, should receive one or two doses of chickenpox vaccine. The timing of these doses depends on the person's age. Ask your health care provider.

A vaccine, like any medicine, is capable of causing problems, such as severe allergic reactions. However, the risk of chickenpox vaccine causing serious harm, or death, is extremely small. Getting chickenpox vaccine is much safer than getting chickenpox disease. Most people who get chickenpox vaccine do not have any problems with it. But if they do, reactions are usually more likely after the first dose than after the second.

Before a vaccine was available approximately 4 million people contracted chickenpox, approximately 11,000 people were hospitalized, and approximately 100 died as a re-

sult of chickenpox in the United States every year. Once the vaccine was introduced, there was a 75 percent decrease in chickenpox in children aged one to four. Deaths from chickenpox went down 66 percent overall. These data are very compelling.

The same virus that causes chickenpox—*Varicella zoster*—can lie dormant for years, then resurface as shingles in adulthood. In 2006, the FDA approved a vaccine for shingles. The FDA advises that everyone over sixty years of age get vaccinated. (See SHINGLES in Part Two.)

The chickenpox virus is transmitted by direct contact with an infected person or through the air when an infected person coughs or sneezes. A person can also contract chickenpox (but not shingles) from direct contact with a person with the shingles rash. Outbreaks are common within families and in schools and day care facilities. Symptoms do not appear until after a person reaches the infectious stage, so it is difficult to isolate those who are contagious. Repeated exposures to the virus during the incubation period can result in worse symptoms. One bout with chickenpox generally affords lifetime immunity against the illness. Second attacks are possible but rare.

Most children contract chickenpox before the age of ten. It first manifests itself as a fever and headache, usually starting between seven and twenty-one days after exposure to the virus. Twenty-four to thirty-six hours later, small round "pimples" appear on the face and body. They are filled with fluid and look like water blisters. The fluid leaks from the swollen areas of the skin, forming a crust. These eruptions continue in cycles, lasting from three days to one week. The blisters and crusts are infectious and itchy, and scratching them can lead to bacterial infection and scarring. Once the scabs are gone, the individual is no longer infectious. Adults who contract the infection tend to have more severe cases than do children.

Chickenpox usually runs its course in two weeks or less for otherwise healthy children. Potentially serious complications can arise for some people, especially for newborns, adults, and those with weakened immune systems. Anyone with an impaired immune system, such as a person whose immune system is suppressed by drugs or who has a disorder such as AIDS, can develop pneumonia or encephalitis, an infection of the brain. A newborn baby also can develop complications from chickenpox, especially if infected prenatally or soon after birth.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Carotenoid complex with beta-carotene	15,000 IU daily.	Heals tissues and stimulates the immune system.
Vitamin A capsules or emulsion	20,000 IU daily for 1 month, then 15,000 IU daily for 1 week. 100,000 IU daily for 1 week, then 75,000 IU daily for 1 week. If you are pregnant, do not exceed 10,000 IU daily.	An immunostimulant that aids healing of tissues. Emulsion form is recommended for easier assimilation and greater safety at higher doses.
Vitamin C with bioflavonoids	1,000 mg 4 times daily.	Powerful immune stimulant that aids in keeping down fever.
<i>Very Important</i>		
Potassium and zinc	99 mg daily. 80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Helps reduce fever and speed healing. Enhances immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
Vitamin E	200 IU daily.	A powerful free radical scavenger that increases oxygenation and promotes healing. Use d-alpha-tocopherol form.
<i>Helpful</i>		
Maitake extract or shiitake extract or reishi extract	As directed on label. As directed on label. As directed on label.	Mushroom extracts with immune-stimulating and antiviral properties.
Multivitamin and mineral complex	As directed on label.	All nutrients help to speed the healing process.
Raw thymus glandular	As directed on label.	Stimulates the production of T lymphocytes by the thymus gland. Needed for immune function. (See GLANDULAR THERAPY in Part Three.)

## Herbs

Catnip tea sweetened with molasses is good for fever and can be given to infants and children as well as to adults. For a child over age two, catnip tea enemas can reduce fever.

Other recommended herbs include burdock root, echinacea, ginger, goldenseal, pau d'arco, and St. John's wort.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxi-

ety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

## Recommendations

Drink freshly made juices with protein powder and brewer's yeast added. Also drink pure vegetable broth.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

When the fever drops and the appetite returns, use a "starter diet" consisting of only mashed bananas, avocados, fresh raw applesauce, and/or yogurt. Do not use cooked or processed foods.

Infants under one year of age need breast milk or infant formula, even when they have a fever. Give an older child lots of water or an electrolyte replacer such as Pedialyte to prevent dehydration.

Consult a doctor immediately if symptoms include dizziness, a fever higher than 103°F, rapid heartbeat, shortness of breath, loss of muscle coordination, tremors, vomiting, and/or a stiff neck.

Take warm baths with uncooked oatmeal or cornstarch added to the water to help relieve some of the itching caused by chickenpox.

Stay out of bright sunlight and keep interior areas dimly lit. Do not expose the patient to bright lights until he or she is completely healed.

Take care not to scratch the pocks. Keep a child's nails short and clean, and bathe the child often. Put mittens on a young child's hands if necessary. Use warm baths made with tea prepared with the recommended herbs, or ginger baths using cool water. Sponge the affected area with the tea. Wet compresses help to control the itching; use these often.

Family members who have not had chickenpox should have limited contact with other family members who are known to be infected. Repeated exposure to the virus can worsen the effects. Keep an infected child away from elderly people, newborn babies, and pregnant women who have not had chickenpox.

Never give aspirin to a child who has a fever. Studies have shown an increased risk of Reye's syndrome, a rare and potentially fatal disorder, in children given aspirin for fever. This is also true for those who have received a vaccination (Varivax; see under Considerations, below). (See REYE'S SYNDROME in Part Two.)

If you are unlucky enough to contract chickenpox in adulthood, contact your health care provider. Use a fasting program to help speed healing. (See FASTING in Part Three.)

## Considerations

- Fetal exposure to chickenpox has been associated with an increased risk of birth defects.
- If the sores become infected, an antibiotic ointment is usually prescribed.
- Acyclovir (Zovirax) is an antiviral medication that lessens the severity of symptoms and shortens the duration of rash formation. It is most often recommended for those at risk for severe chickenpox: premature babies, adolescents, and adults.
- A chickenpox vaccine called Varivax was approved by the FDA in 1995. This is an attenuated live-virus vaccine. No aspirin or other similar medication should be taken for at least six months after the vaccine is administered. (See REYE'S SYNDROME in Part Two)
- See also SHINGLES in Part Two.

## CHLAMYDIA

According to the U.S. Centers for Disease Control and Prevention (CDC), sexually transmitted chlamydia infection accounts for the bulk of the sexually transmitted disease (STD) epidemic in the United States. *Chlamydia trachomatis* is believed to be twice as common as gonorrhea. This infection can be transmitted or contracted during anal, oral, or vaginal sex with an infected partner. In 2007, 1,108,374 cases of chlamydia were reported, a big jump from 1997 when only 537,904 cases were reported. It is estimated that the true number is 2.8 million cases, more than half of which are undiagnosed. About 4 percent of eighteen- to twenty-six-year-olds who were sexually active had chlamydia.

Symptoms of chlamydia include genital inflammation, vaginal or urethral discharge, difficulty in urinating and a burning sensation during urination, painful intercourse, and itching around the inflamed area. The symptoms appear within one to three weeks of contact with an infected partner. These symptoms can appear in both men and women. However, as many as 50 percent of the men and 75 percent of the women who have chlamydia experience no symptoms at all, or symptoms so mild that they do not seek treatment. This is unfortunate, as untreated chlamydia infection in women leads to sterility in an estimated 30 percent of cases. Pelvic inflammatory disease and irreparable damage to the reproductive system can occur, and a hysterectomy may be required. Also, women who have been infected with chlamydia may have three to five times the risk of becoming infected with HIV if they are exposed to it. Babies born to mothers with chlamydia may suffer from pneumonia or conjunctivitis (an eye infection). Both of those ailments require treatment with antibiotics.

In males, prostatitis and inflammation of the seminal vesicles may be caused by chlamydia. Symptoms of prostatitis include pain when urinating and a watery mucous discharge from the penis. Men may also notice pain and

swelling in the testicles. Diagnosis of chlamydia infection is made on the basis of bacteriologic examination of urine or vaginal or urethral discharge. There are also a number of tests available today that can supplement or even replace the traditional culture.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Acts as a natural antibiotic and aids in healing.
Vitamin B complex	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Needed for proper functioning of the liver and gastrointestinal tract.
Vitamin C	1,500 mg 4 times daily.	Immunostimulant that aids healing. Use a buffered form.
Vitamin E	200 IU daily. Can also be used directly on the inflamed site; cut open a capsule and apply.	Needed to protect red blood cells. Immune enhancer. Use d-alpha-tocopherol form.
<i>Helpful</i>		
Acidophilus	As directed on label. Take on an empty stomach.	Replenishes “friendly” bacteria destroyed by antibiotics. Use a nondairy formula.
Bio-Bifidus from American Biologics	Use as a vaginal douche as directed on label.	Replaces normal vaginal and bowel flora.
Coenzyme Q <sub>10</sub>	60 mg daily.	Aids in healing and is a powerful antioxidant and immune stimulant.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works with coenzyme Q <sub>10</sub> and aids in the detoxification of many dangerous substances.
Kelp	2,000–3,000 mg daily.	A rich source of minerals.
Multivitamin complex with mixed carotenoids	As directed on label.	Necessary for healing of all bodily tissues. Use a high-potency formula.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important for immune function and healing. Use zinc gluconate lozenges or OptiZinc for best absorption.
plus copper	3 mg daily.	Needed to balance with zinc.

## Herbs

- Astragalus, echinacea, goldenseal, pau d’arco, and red clover aid in healing.

**Cautions:** Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor’s supervision.

**Recommendations**

- Eat a diet consisting mainly of fresh vegetables and fruits, plus brown rice, raw seeds and nuts, well-cooked poultry, white fish, and whole grains.
- Avoid highly processed, fried, and junk foods.
- Drink only steam-distilled water, sugar-free juices, and herbal teas.
- Take acidophilus to replenish the “friendly” bacteria destroyed by antibiotics.
- If you have symptoms of chlamydia infection, do not delay seeking treatment. The danger of complications increases as time passes.

**Considerations**

- If you are under thirty-five and have had more than one sexual partner, you should be tested for infection yearly.
- All partners must be treated for this disorder so that the disease is not transmitted back and forth. (Both sexes have similar discharges, and it is through this discharge that the disease is transmitted during sexual contact.) Antibiotics such as tetracycline and doxycycline (Doryx, Vibramycin, and others) kill chlamydia. Alternatively, a single 1-gram oral dose of azithromycin (Zithromax) may be used. This is relatively expensive (a single dose costs as much as a one-week regimen of doxycycline), but the convenience of single-dose treatment may be worth it.
- Chlamydia has been linked to a form of arthritis in young women. In one study, the microorganism was found in the joints of nearly half those with unexplained arthritis.
- There are currently three FDA-approved methods of testing for chlamydia:

1. *Nucleic acid amplification test (NAAT)*. This method is based on amplification of the DNA that is present in *chlamydia trachomatis*. This is the best test and is widely used.
2. *Direct fluorescent antibody stain test (DFA)*. In this method, a scientific technique called staining makes chlamydia antigens easier to detect under the microscope. A culture can be taken from the eye, cervix, or penis.
3. *DNA probe*. Looks for chlamydia DNA but is less sensitive than NAAT.

See also SEXUALLY TRANSMITTED DISEASE (STD) in Part Two.

**CHOLESTEROL PROBLEMS**

See HIGH CHOLESTEROL.

**CHRONIC FATIGUE SYNDROME**

Chronic fatigue syndrome (CFS) is not a disease as such, but a characteristic and complex array of symptoms that

may mimic other illnesses. The symptoms of this syndrome resemble those of flu and other viral infections, so it is often mistaken for other disorders. In fact, it is often misdiagnosed as hypochondria, psychosomatic illness, or depression because routine medical tests do not detect any problems. The symptoms of CFS may include aching muscles and joints, anxiety, depression, difficulty concentrating, poor memory, fever, headaches, low blood pressure, intestinal problems and pain, irritability, environmental sensitivities, jaundice, loss of appetite, mood swings, muscle spasms, recurrent upper respiratory tract infections, nasal congestion, candidiasis, sensitivity to light and heat, sleep disturbances, night sweats, sore throat, swollen glands (lymph nodes)—and most of all, extreme and often disabling mental and physical fatigue. Immunologic abnormalities that show up on various diagnostic tests are common as well.

The syndrome is three times more prevalent in women than in men, and primarily affects young adults between the ages of twenty and fifty. In all, there are about 500,000 cases of people in the United States who have a CFS-like condition.

The cause or causes of chronic fatigue syndrome are not well understood, but it may be related to defects in immune function, psychological problems, or neurological problems. Some experts believe it is linked to infection with the Epstein-Barr virus (EBV) and/or cytomegalovirus (CMV), members of the herpesvirus family that also cause mononucleosis and retinal and gastrointestinal infections. This belief is based in large part on the fact that many people with chronic fatigue syndrome have been found to have high levels of EBV antibodies in their blood, and that many people date the onset of symptoms to a prolonged bout with a viral infection. However, no connection between EBV and chronic fatigue syndrome has ever been proven conclusively. Moreover, it is now known that many people have high EBV antibody levels without any apparent ill effects on their health. Many cases of chronic fatigue syndrome occur without any known preceding infection. This has led researchers to look for other possible causes. Some suspect an immune system problem or a defect in the mechanisms that regulate blood pressure.

Other proposed causes of chronic fatigue syndrome include anemia, arthritis, chronic mercury poisoning from amalgam dental fillings, hypoglycemia, hypothyroidism, infection with the fungus *Candida albicans*, and sleep problems.

Fibromyalgia, a muscle disorder that causes muscle weakness and fatigue, has been found in many people with chronic fatigue syndrome. Intestinal parasites are also comparatively common in people with this condition. It is likely that poor diet, nutritional deficiencies, allergies, thyroid dysfunction, candida, anemia, and stress all compromise the immune system, and can contribute to CFS.

Even though chronic fatigue syndrome is not life-threatening, it cannot be cured, and it can result in serious damage to the immune system. Some people appear to re-

cover spontaneously, but once you have had this condition, it can recur at any time, usually following a bout with another illness or during times of stress.

The major criterion used to distinguish chronic fatigue syndrome is:

- Persistent fatigue that does not resolve with bed rest and that is severe enough to reduce average daily activity by at least 50 percent for at least six months.

The presence of other chronic clinical conditions, including psychiatric disorders, should also be ruled out.

Chronic fatigue syndrome should not be confused with the results of overwork and stress. With CFS, a normal, active level of life is impossible to maintain and the symptoms exceed, by far, the normal lethargy or tiredness associated with a stressful and hardworking lifestyle. Medical treatments for CFS are numerous but have mixed outcomes because there are no standardized tests. Some people with CFS find lifestyle changes such as adopting a regular exercise routine can help. Certain over-the-counter medicines such as ibuprofen or antihistamines or prescribed medications such as antidepressants may also help to relieve some of the symptoms.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Chromium polynicotinate	200–300 mg daily.	Aids in controlling hypoglycemia.
Coenzyme Q <sub>10</sub>	75 mg daily.	Enhances the effectiveness of the immune system and protects the heart.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works with coenzyme Q <sub>10</sub> and aids in the removal of toxic substances from the body.
Kyolic-EPA from Wakunaga	As directed on label.	Supplies essential fatty acids.
L-carnitine	1,000 mg daily, on an empty stomach. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Transports fatty acids into the mitochondria, where it is used to make ATP, thus increasing energy levels.
Lecithin granules or capsules	1 tsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Promotes energy and enhances immunity.
Malic acid	As directed on label.	Involved in energy production in many cells of the body, including muscle cells. Needed for sugar metabolism. Deficiency has been linked to CFS.
and magnesium	500–1,000 mg daily.	Often deficient in people with CFS, magnesium is needed for ATP synthesis.
Manganese	5 mg daily.	Influences the metabolic rate by its involvement in endocrine function.

Nicotinamide adenine dinucleotide (NADH)	10–20 mg with water first thing in the morning, on an empty stomach.	Studies have shown that it increases energy levels and aids in preventing depression. May take 2–3 weeks to work.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label, 6 times daily, on an empty stomach. Take with meals, between meals, and at bedtime.	Reduces inflammation and improves absorption of nutrients, especially protein, which is needed for tissue repair.
Vitamin A with mixed carotenoids	25,000 IU daily for 1 month, then slowly reduce to 10,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Powerful free radical scavengers that protect the cells and enhance immune function to fight viruses. Use emulsion forms for easier assimilation and greater safety at high doses. Use d-alpha-tocopherol form of vitamin E.
and vitamin E	200 IU daily for 1 month, then slowly reduce to 100 IU daily.	
Vitamin C with bioflavonoids	5,000–10,000 mg daily.	Has a powerful antiviral effect and increases the energy level. Use a buffered form.

*Very Important*

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	50 mg 3 times daily.	Enhances oxygen utilization and destroys free radicals.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	For tissue and organ repair. Use a formula containing all the essential amino acids.
Kyo-Green from Wakunaga	As directed on label.	To improve digestion and cleanse the bloodstream.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Provides energy and builds red blood cells.
Vitamin B complex injections	2 cc twice weekly or as prescribed by physician.	B vitamins are essential for increased energy levels and normal brain function. Injections (under a doctor's supervision) are best. All injectables can be combined in a single syringe.
plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	½ cc twice weekly or as prescribed by physician.	Aids in absorption of vitamin B <sub>12</sub> .
plus liver extract injections or vitamin B complex	1 cc twice weekly or as prescribed by physician. 2 cc twice weekly or as prescribed by physician.	A natural energy booster needed to prevent anemia. A good source of B vitamins plus other valuable nutrients.
plus pantothenic acid	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily.	If injections are not available, a sublingual form is recommended for best results. Needed for proper adrenal function.

*Important*

D-ribose	5 grams, 3 times daily.	Ribose is a sugar needed by the mitochondria to produce energy for the cells. In one study, 66% of patients found that they had more energy.
----------	-------------------------	--

Gamma-amino-butyric acid (GABA)	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To maintain proper control of brain activity and to control anxiety. (See AMINO ACIDS in Part One.)
Multivitamin and mineral complex with calcium and potassium and selenium and zinc	1,500 mg daily. 99 mg daily. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily. 50 mg daily.	All nutrients are necessary in balance. Use a high-potency, hypoallergenic product.
Raw thymus glandular and spleen glandular plus raw glandular complex	As directed on label. As directed on label. As directed on label.	To boost the immune system. (See GLANDULAR THERAPY in Part Three.)
Shiitake extract or reishi extract or maitake extract	As directed on label. As directed on label. As directed on label.	Help to combat fatigue, boost immunity, and fight viral infection.
<b>Helpful</b>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	To replace necessary "friendly" bacteria. Also fights candida infection. Chronic fatigue and candidiasis often occur together. Use a nondairy formula.
Melatonin	As directed on label, taken 2 hours or less before bedtime.	A natural sleep-regulating hormone that is helpful for promoting sound, restful sleep.

**Herbs**

Astragalus and echinacea enhance immune function and are good for cold and flu symptoms.

*Caution:* Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Fresh black walnut hulls, garlic, gentian root, fresh ginger root, neem leaves, quassia bark, and fresh wormwood all help to rid the body of parasites, a common problem for people with CFS.

*Caution:* Do not use wormwood in high doses or for extended periods because it contains the chemical compound thujone that can be poisonous. Do not use wormwood if you suffer from any type of seizure disorder or are pregnant.

Teas brewed from burdock root, dandelion, and red clover promote healing by cleansing the blood and lymphatic system, as well as enhancing immune function.

Combine or alternate these herbal teas, and drink 4 to 6 cups daily.

China Gold from Aerobic Life Industries is an herbal formula containing thirty-six different herbal extracts, including ten varieties of ginseng. It helps to enhance adrenal function and overcome fatigue.

Use goldenseal to control infection. At the first signs of a sore throat, take a few drops of alcohol-free goldenseal extract, hold it in your mouth for a moment, then swallow.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Ginkgo biloba improves circulation and brain function.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Kava kava, skullcap, and valerian root all improve sleep.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

Licorice root supports the endocrine system and increases cortisol levels by blocking the action of an enzyme that breaks it down. Adrenal exhaustion leads to low production of cortisol, and licorice may prove to be beneficial for CFS sufferers.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Milk thistle protects the liver.

Olive leaf extract has antibiotic and antiviral properties, and helps fight infections.

Pau d'arco, taken in capsule or tea form, is good for treating candida infection.

St. John's wort has antiviral properties and is a good antidepressant.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

**Recommendations**

Eat a well-balanced diet of 50 percent raw foods and fresh "live" juices. The diet should consist mostly of fruits, vegetables, and whole grains, plus raw nuts, seeds, skin-

less turkey, and some deepwater fish. These quality foods supply nutrients that renew energy and build immunity.

Add some form of acidophilus to your diet, and regularly consume soured products such as yogurt and kefir. Many people with chronic fatigue syndrome also are infected with candida. Acidophilus helps to keep candida under control.

Consume plenty of water—at least ten 8-ounce glasses a day—plus juices, preferably freshly made vegetable juices. Drink a full glass of water at least every two waking hours. Water flushes out toxins and aids in reducing muscle pain.

Do not eat shellfish, fried foods, junk foods, processed foods; stimulants such as coffee, tea, and soft drinks; sugar; and products containing yeasts and/or white flour, such as bread and pasta. You may find this difficult—people with CFS generally have cravings for sugar and carbohydrate products, and could also develop a craving for alcohol—but it is important.

Make sure that the bowels move daily, and add fiber to the diet. Give yourself occasional cleansing enemas. (See ENEMAS in Part Three.)

Take chlorophyll in tablet form or obtain it from the liquid of vegetables, such as a “green drink” from leafy vegetables, wheatgrass, or Kyo-Green from Wakunaga.

Take a protein supplement from a vegetable source—Spiru-tein from Nature’s Plus is a good protein drink to take between meals.

Get plenty of rest, and make sure that you do not overexert yourself. Moderate exercise may be helpful, however. Deep breathing exercises in particular are recommended. People with CFS tend to take shallow breaths, which can cause sleeping problems. (See BREATHING EXERCISES under PAIN CONTROL in Part Three.)

Avoid chocolate, soft drinks, caffeine, and highly processed foods. These foods deplete the body of magnesium, which leads to fatigue. Magnesium is important for people with CFS.

Do not smoke, and avoid secondhand smoke. This can make symptoms worse.

Do not take aspirin. If a viral infection is present, Reye’s syndrome may result.

Get some exercise, but be careful not to overdo the duration of the activity or the intensity. Doing too much can lead to short-term pain and further fatigue.

In one study, the use of Bo’s abdominal acupuncture daily for two weeks improved general symptoms, especially on lassitude, anorexia, insomnia, amnesia, and general pain.

### Considerations

There are other health problems that can cause symptoms of chronic fatigue, including anemia, cardiovascular

disease (especially in women), depression, fibromyalgia, hepatitis, and Lyme disease, among others. Anyone who experiences extreme fatigue that persists for longer than a week or two should consult a health care provider.

In one study, adolescents with chronic fatigue benefited from cognitive behavioral therapy for as long as two years after treatment had finished. Children had increased physical functioning, better school attendance by 10 percent, and were less fatigued.

In one study, adults around age forty to fifty years had less fatigue from a combination of behavioral therapy with or without the drug mirtazapine (15 milligrams).

In one study, patients with chronic fatigue who followed a low-yeast, low-sugar (anti-candida) diet did not experience increased energy.

In 2009, researchers at the Whittemore Peterson Institute in Nevada found that people with CFS were more likely to have the retrovirus XMRV in their blood; 67 percent of patients had the virus compared to only 4 percent in a healthy population. Researchers caution that this is an association, but does not prove that the virus causes chronic fatigue. However, this data is compelling enough to warrant further investigation.

Some researchers believe that CFS may be hormone-related. Pregnenolone is a steroidal hormone that the body can metabolize into a variety of other vital hormones. It is a precursor hormone to DHEA and most of the other steroid hormones, such as progesterone, testosterone, the estrogens, and cortisol. The body naturally produces about 14 milligrams a day, but as we age this production drops. It has been found to be a hundred times more effective for memory enhancement than other steroids or precursors, and has been reported to reduce stress-induced fatigue. While it appears to be safe if the dosage is kept between 10 and 100 mg a day, it is recommended that any therapy involving its use be done under medical supervision with the appropriate pretherapy tests being given to ensure safety.

If you are diagnosed as having chronic fatigue syndrome, it is wise to seek out a health care provider who has specific experience in the management and treatment of this complex condition.

Taking regular cold showers may produce an improvement in CFS symptoms. Many also find improvement with taking hot baths or showers. However, people with heart or circulatory disorders or other serious health problems should not attempt cold or hot water treatment without first consulting their health care providers.

Amino acids may be beneficial. These include tyrosine, leucine, isoleucine, and valine, as well as lysine and taurine. (See AMINO ACIDS in Part One.)

A study at Johns Hopkins University Hospital in Baltimore identified a link between chronic fatigue and a problem in the body’s mechanisms for regulating blood pressure.

In this study, twenty-two out of twenty-three subjects with chronic fatigue were found to have a syndrome in which the body responds inappropriately to periods of prolonged standing—the heart rate slows and blood pressure drops, resulting in light-headedness, followed by a feeling of weakness and exhaustion that can persist for days afterward. A significant percentage of those in the study experienced an improvement when they were treated for this blood pressure problem.

❑ Some research points to chemical and/or food sensitivities and hypoglycemia as possible contributors to chronic fatigue. People living in the past fifty years have been exposed to more different chemicals than all of the rest of humankind combined. (See CHEMICAL ALLERGIES in Part Two.)

❑ Evidence is pointing to exhausted adrenal glands and a disturbance in the hypothalamic-pituitary-adrenal axis (HPA axis, a complex of biochemical controls that coordinate certain basic metabolic activities) as a possible cause of this disorder.

❑ Parasites are common in people with chronic fatigue. Parasitin from Växa International is a supplement designed to rid the body of parasites.

❑ Family members, friends, and coworkers must understand the nature of the disorder and realize that the person suffering from it is not exaggerating or faking symptoms.

❑ Depression can be a major feature of this illness. To combat it, your physician may prescribe an antidepressant. Antidepressants commonly recommended for people with CFS include the following:

- Doxepin (Sinequan) is a tricyclic antidepressant that may relieve symptoms of general fatigue, nasal congestion, gastritis, muscle tension and tightness, and insomnia. Other tricyclic antidepressants such as amitriptyline (Elavil) may also be prescribed for people with CFS.
- Fluoxetine (Prozac) increases the amount of serotonin in the brain. Serotonin is a neurotransmitter, a natural chemical that transmits messages from one part of the brain to another. Prozac may help to give people more energy but will not help with sleeplessness.

❑ Gamma-globulin treatment uses a transfusion of a blood product to provide protective antibodies that may be absent in the person suffering from CFS. Some consider this treatment ineffective and in rare instances it may even produce adverse side effects such as anaphylactic shock.

❑ People with CFS often suffer from disturbing side effects from prescription drugs. If this is the case, S-adenosylmethionine (SAME) and 5-hydroxy L-tryptophan (5-HTP) both work well as antidepressants, help to relax muscle tension, and prevent insomnia.

❑ The National Institute of Allergy and Infectious Diseases (NIAID), a part of the National Institutes of Health, provides current information on chronic fatigue syndrome (See Health and Medical Organizations in the Appendix.)

❑ A large review on CFS published in the *Journal of the American Medical Association (JAMA)* reported that people have found varying degrees of benefit from magnesium supplements, liver extracts, homeopathy, massage therapy, and having a buddy/mentor.

❑ See also CANDIDIASIS; FIBROMYALGIA; HYPOTHYROIDISM; and MONONUCLEOSIS, all in Part Two.

## CIRCULATORY PROBLEMS

There are many disorders associated with circulatory problems, which exist when oxygenated blood cannot make the complete circuit of the body without restriction. There are many reasons why blood flow around the body may be inhibited.

Clots may form in the larger veins in the leg or pelvic area, travel to the lung, and become trapped in a pulmonary artery. This results in diminished blood flow and less oxygen getting pumped to the rest of the body. Pulmonary embolism, as this condition is called, is difficult to detect, but is usually accompanied by a sudden shortness of breath and can be life-threatening.

When plaque or fatty deposits form along the walls of the arteries, it causes them to harden and constrict. Hypertension, or high blood pressure, results because the blood exerts greater force against the walls of the narrowed and/or more rigid blood vessels. Hypertension can lead to stroke, angina pectoris (chest pain), kidney damage, and heart attack.

A circulatory disease that is brought on by chronic inflammation of the blood vessels in the extremities is thromboangiitis obliterans (Buerger's disease). This disease is most prevalent among people who smoke. It usually affects the foot or lower leg, but it can occur in the hand, arm, or thigh as well. Early signs of Buerger's disease are a tingling sensation (commonly referred to as "pins and needles") and a burning sensation in the fingers and toes. It can lead to ulceration and gangrene; in severe cases, amputation may be required.

Another serious circulatory condition is Raynaud's disease, which is characterized by constriction and spasm of the blood vessels in the extremities, such as in the fingers, toes, and tip of the nose. Cold, stress, smoking, and other factors may cause fingers and toes to become numb; extremities may appear colorless or bluish due to lack of circulation and arterial spasm. This disorder most commonly affects women between fifteen and fifty, and, although rare, it can lead to dry gangrene if tissue dies because of a lack of oxygen. In most cases, the cause of Raynaud's disease is not known. Raynaud's phenomenon, or secondary Raynaud's, is a condition with the same symptoms as Raynaud's disease, but it is brought on by another condition, such as surgery, injury, or frostbite. Raynaud's phenomenon may be provoked or aggravated by some heart medications and drugs taken for migraine, lupus, and rheumatoid arthritis. Primary Raynaud's is more common and tends to

be less severe than secondary Raynaud's. (See RAYNAUD'S PHENOMENON in Part Two.)

Marfan's syndrome, a very rare condition, can also lead to serious circulatory problems. This syndrome is characterized by defects of the connective tissue in areas such as the skeletal system, eyes, and blood vessels, as well as such anatomical anomalies as unusually long toes and/or fingers, a high palate, an enlarged aorta, and/or taller than average height. This condition is hereditary.

Poor circulation can also result from varicose veins, which develop because of a loss of elasticity in the walls of the veins.

Impeded blood flow, from whatever cause, leads to ischemia, or oxygen deprivation and deficiency in the tissues. This, at the local level, results in tissue atrophy. Just fifteen seconds of ischemia turns off the mitochondria in the cells (the cellular energy-producing structures) and begins their programmed death spiral. In order to fight this, the blood must be kept from getting too viscous or sluggish, and to prevent platelets from clumping too rapidly. The various micronutrients in the table that follows—such as vitamins B<sub>6</sub> and B<sub>12</sub> and folic acid—are not only good antioxidants but also are good anticoagulants. The nutrient dosages below are assumed to be for adults.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
L-carnitine	500 mg twice daily.	Helps to strengthen the heart muscle and to promote circulation by transporting long fatty acid chains.
<i>Very Important</i>		
Chlorophyll (Kyo-Green from Wakunaga and wheatgrass)	As directed on label.	Enhances circulation and helps build healthy cells. Use a liquid or tablet form. Also prepare fresh "green drinks" from green leafy vegetables.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Improves tissue oxygenation. Removes toxic substances from the body.
Lecithin granules or capsules	1 tsp 3 times daily, before meals. 2,400 mg 3 times daily, before meals.	Emulsifies (breaks up) fats.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Helps to build red blood cells and lower blood pressure.
Multienzyme complex	As directed on label. Take with meals.	To aid digestion and circulation and enhance oxygen use in all body tissues.
Vitamin B complex	50–100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Needed for metabolism of fat and cholesterol. Consider injections (under a doctor's supervision). If injections are not available, use a sublingual form.
plus extra vitamin B <sub>1</sub> (thiamine)	50 mg daily.	Enhances circulation and brain function.

and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> and folic acid and para-aminobenzoic acid (PABA)	50 mg daily. 1,000–2,000 mcg daily. 300 mcg daily. 25 mg daily.	A natural diuretic that protects the heart. Prevents anemia and acts as a natural energy booster. Needed for the formation of oxygen-carrying red blood cells. Assists in the formation of red blood cells.
Vitamin C with bioflavonoids	5,000–10,000 mg daily, in divided doses.	Helps prevent blood clotting.
<i>Important</i>		
Calcium and magnesium and vitamin D	1,500–2,000 mg daily, in divided doses, after meals and at bedtime. 750–1,000 mg daily, in divided doses, after meals and at bedtime. 400 IU daily.	Essential in normal blood viscosity. Strengthens the heartbeat. Calcium and magnesium work together. Important for utilization of calcium.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	50 mg twice daily.	Enhances tissue oxygenation.
Multivitamin and mineral complex	As directed on label.	To provide a balance of nutrients basic to good circulatory function.
Vinpocetine	As directed on label.	A derivative of vincamine (an extract of periwinkle) that helps with cerebral circulatory disorders.
Vitamin A with mixed carotenoids and vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily.	Aids in storage of fat and acts as an antioxidant. Use emulsion form for easier assimilation and greater safety at high doses. Inhibits the formation of free radicals. Use d-alpha-tocopherol form; use emulsion form for best absorption.
<i>Helpful</i>		
Choline and inositol plus vitamin B <sub>3</sub> (niacin)	100 mg each 3 times daily, with meals. 50 mg 3 times daily. Do not exceed a total of 300 mg daily from all supplements.	Helps to remove fat deposits and improve circulation. Helps to lower cholesterol. Helps to lower cholesterol. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
L-cysteine and L-methionine	500 mg each daily, on an empty stomach. Take with juice or water. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Protects and preserves cells by detoxifying harmful toxins. Prevents accumulation of fat both in the liver and in the arteries, where it may obstruct blood flow. (See AMINO ACIDS in Part One.)
Proteolytic enzymes	As directed on label. Take between meals.	To combat leaky gut syndrome.
Pycnogenol or grape seed extract	As directed on label.	Neutralize free radicals, enhance the action of vitamin C, and strengthen connective tissue, including that of the cardiovascular system.

Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Deficiency has been linked to heart disorders.
Shiitake extract or reishi extract or maitake extract	As directed on label.	Helps to prevent high blood pressure and heart disease; lowers cholesterol levels.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Needed for immune function. Use zinc chelate form. Needed to balance with zinc.

## Herbs

The following herbs support the heart and circulatory system: black cohosh, butcher's broom, cayenne (capsicum), chickweed, gentian root, ginkgo biloba, goldenseal, hawthorn berries, horseradish, hyssop, licorice root, pleurisy root, rose hips, and wormwood. Cayenne increases the pulse rate, while black cohosh slows it. Ginkgo is being used for circulatory disorders in many clinics.

*Cautions:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use wormwood in high doses or for extended periods because it contains the chemical compound thujone that can be poisonous. Do not use wormwood if you suffer from any type of seizure disorder or are pregnant.

## Recommendations

- Make sure that your diet is high in fiber. Oat bran can help lower cholesterol levels.
- Include the following in your diet: bananas, brown rice, endive, garlic, lima beans, onions, pears, peas, and spinach.
- Drink steam-distilled water only.
- Eliminate animal protein and fatty foods (such as red meat), sugar, and white flour from your diet. Do not use stimulants such as coffee, colas, or tobacco, or eat foods with a lot of spices.
- Get regular exercise to help blood flow and to keep the arteries soft and unclogged.

*Caution:* If you are over thirty-five and/or have been sedentary for some time, consult your health care provider before beginning any type of exercise program.

Keep your weight down.

To boost circulation, give yourself a dry massage over your entire body using a loofah sponge or natural bath brush. Always massage toward the heart, even when massaging your legs. Also dip a towel in cold water and rub it briskly over parts of the body.

If you have circulatory problems, do not take any preparations containing shark cartilage unless specifically directed to do so by your physician. Shark cartilage inhibits the formation of new blood vessels, the mechanism by which the body can increase circulatory capacity.

## Considerations

Blood-thinning drugs, such as warfarin (Coumadin), may be prescribed for people deemed to be in particular danger of developing blood clots, such as people who are bedridden or cancer patients. Studies show that, for those in danger of recurring clots, blood-thinning drugs should be taken for a while.

Chelation therapy is helpful for improving circulation. (See CHELATION THERAPY in Part Three.)

The simple fact of being pregnant places great strain on the circulatory system. Blood volume increases by up to 50 percent by the time a woman is nine months pregnant, and although most women with heart disease can safely have children, any such pregnancy should be closely monitored by both a cardiologist and an obstetrician.

See also ARTERIOSCLEROSIS/ATHEROSCLEROSIS; CARDIOVASCULAR DISEASE; HIGH BLOOD PRESSURE; HIGH CHOLESTEROL; HYPOTHYROIDISM; RAYNAUD'S PHENOMENON; and VARICOSE VEINS, all in Part Two.

## CIRRHOSIS OF THE LIVER

Cirrhosis of the liver is a degenerative inflammatory disease that results in hardening and scarring of liver cells. The liver becomes unable to function properly due to the scarred tissue, which prevents the normal passage of blood through the liver.

The most common cause of cirrhosis of the liver is excessive alcohol consumption. Liver disease resulting from alcohol intake is the fourth leading cause of death among people aged twenty-five to sixty-four in urban areas of the United States. A less frequent cause of cirrhosis is the hepatitis C virus (HCV). It is estimated that 3.2 million people in the United States have hepatitis C, and about 75 to 85 percent of those will go on to develop chronic liver disease, including cirrhosis. Blood transfusions given before routine testing for HCV are presumed to be the main cause of the rising number of people diagnosed as infected with HCV. Malnutrition and chronic inflammation can also lead to liver malfunction.

In the early stages, symptoms of cirrhosis of the liver may include constipation or diarrhea, fever, upset stom-

ach, fatigue, weakness, poor appetite, generalized itching, weight loss, enlarged liver, vomiting, red palms, and swelling of the abdomen and legs. Those in the later stages of the disease may develop anemia, bruising due to bleeding under the skin, jaundice, and edema. People with alcoholic cirrhosis may experience no symptoms, or they may develop very slowly. Approximately 8,000 to 10,000 people die every year from hepatitis C–related liver disease.

Complications of cirrhosis are commonplace, and as the disease develops, the liver starts losing its ability to function. This can lead to:

- High blood pressure in the veins that connect the digestive system with the liver. This is called *portal hypertension*. It can cause thinning of the walls of the vessels, with possible rupture in the areas of the esophagus and stomach.
- Fluid buildup in the abdomen (called *ascites*), or in the legs or feet (called *edema*). Severe ascites can make breathing difficult by pressing on the diaphragm, and can lead to blood poisoning.
- Kidney failure, which often follows or is a result of liver disease.
- Encephalopathy, diseases of the brain, may develop because toxins that the liver usually removes are not removed. The toxins can then be carried to the brain to cause anything from anxiousness and drowsiness to disorientation and coma.

Cirrhosis is usually permanent once you have developed it, but its progress can be slowed by completely abstaining from alcohol, changing your diet to include fresh fruits and vegetables along with whole grains, and carefully checking to make sure any drugs you are taking are not toxic to the liver. Some drugs are more dangerous in combination with each other than individually for people with cirrhosis. Also, many supplements and herbals can have an effect on the liver and they also need to be considered in the mix. Check with your doctor or pharmacist regarding effects and possible harmful interactions. The liver is the clearinghouse for all of the substances listed below. Although each has been shown to be of benefit, don't take too many different supplements at once. Start with a good multivitamin/mineral mix. Add one or two supplements at a time and see if you notice a positive change. If not, try something else. Of course, if you have any adverse reactions, stop taking them immediately. For people with this disease, protecting the health of the liver is the primary goal. These are adult recommendations only.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	An excellent liver detoxifier.

Phosphatidyl choline plus choline and inositol	As directed on label.  As directed on label.	For fatty liver.
Primrose oil or Total EFA from Health From The Sun	500 mg twice daily, with meals. As directed on label.	To prevent an imbalance of fatty acids, found in cirrhosis of the liver.
Vitamin B complex plus extra vitamin B <sub>12</sub> and folic acid	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).  1,000–2,000 mcg daily.  200 mcg daily.	The B vitamins are necessary for proper digestion, absorption of nutrients, and formation of red blood cells. Use a high-potency formula. Injections (under a doctor's supervision) may be necessary. To prevent anemia and protect against nerve damage. Use a lozenge or sublingual form. To correct deficiencies.
<i>Very Important</i>		
Bifido Factor from Natren or Kyo-Dophilus from Wakunaga	As directed on label. Take on an empty stomach.  2 to 3 capsules 3 times daily.	Repairs liver cells and aids in healing.  Human-cultured flora from the small intestine, primarily to improve assimilation of nutrients. Detoxifies ammonia.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Detoxifies the liver and bloodstream.
Inf-zyme Forte from American Biologics	As directed on label.	Balanced potent enzymes that act to inhibit inflammation.
L-arginine plus L-cysteine and L-methionine plus L-carnitine plus glutathione	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.  500 mg daily, on an empty stomach. 500 mg daily, on an empty stomach.	Helps to detoxify ammonia, a by-product of protein digestion that can accumulate when the liver isn't functioning properly.  Helps detoxify harmful toxins.  Helps prevent accumulation of fat in the liver. A powerful antioxidant that protects against liver cancer.
Lecithin granules or capsules	1 tsp 3 times daily, with meals. 2,400 mg 3 times daily, with meals.	A powerful fat emulsifier.
Multienzyme complex with betaine and hydrochloric acid (HCl) plus ox bile extract	As directed on label. Take with each meal.  As directed on label.	Needed for digestion to lessen the strain on the liver.  Replaces the digestive enzymes normally produced by the gallbladder.
Colostrum Plus from Symbiotics	As directed on label.	Improves immune function and protects the liver.
Raw liver extract	As directed on label.	Prevents anemia and aids in building the liver. (See GLANDULAR THERAPY in Part Three.)

S-Adenosylmethionine (SAME)	As directed on label.	Provides antioxidant effects that improve the health of the liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription anti-depressants.
-----------------------------	-----------------------	---

Taurine Plus from American Biologics	20 drops 3 times daily.	The most important antioxidant for health and stress from free radical damage. Use the sublingual form.
--------------------------------------	-------------------------	---

### Important

Alfalfa		See under Herbs, below.
---------	--	-------------------------

Calcium and magnesium	1,500 mg daily, in divided doses, after meals and at bedtime. 750 mg daily.	To promote healing of tissue.  Beneficial for the nervous system. Use chelate forms.
-----------------------	---	--

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Supplies oxygen for healing.
--	-----------------------	------------------------------

Vitamin C with bioflavonoids	3,000–8,000 mg daily, in divided doses.	An important antioxidant. Use a buffered form.
------------------------------	---	--

### Helpful

Alpha-lipoic acid	400 mg daily	Acts as a powerful antioxidant and balances blood sugar levels.
-------------------	--------------	---

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Promotes tissue oxygenation. Works with coenzyme Q <sub>10</sub> and removes toxic substances from the body.
---	--	---

Free form amino acid	As directed on label.	A good source of protein that is easy on the liver.
----------------------	-----------------------	---

Grape seed extract or Pycnogenol	As directed on label.	Powerful antioxidant. Aids the liver in removing toxic substances from the body.
----------------------------------	-----------------------	--

Inositol hexaphosphate (IP <sub>6</sub> ) (Cell Forté with IP-6 and Inositol from Enzymatic Therapy)	As directed on label.	Aids in reducing the buildup of fats in the liver.
--	-----------------------	--

Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A good detoxifier.
----------	---	--------------------

Vitamin A (Micellized Vitamin A from American Biologics)	As directed on label. Do not exceed 10,000 IU daily.	Needed for healing. Use emulsion form for easier assimilation and greater safety at higher doses. <i>Caution:</i> Do not substitute pill forms of vitamin A for emulsion forms. Pills put extra stress on liver.
--	--	---

plus vitamin D and vitamin E	As directed on label. 200 IU daily. Do not exceed this amount.	To correct deficiencies.  A potent antioxidant that aids circulation. Use d-alpha-tocopherol form.
------------------------------	---	--

Zinc	50 mg daily. Do not exceed a total of 100 mg daily from supplements.	Needed for the immune system and the healing process. Use zinc gluconate lozenges or OptiZinc for best absorption.
------	--	--

## Herbs

Alfalfa helps to build a healthy digestive tract and is a good source of vitamin K. It helps to prevent bleeding as a result of vitamin K deficiency, which is common with cirrhosis. It can be taken in tablet or liquid form.

Aloe vera helps to cleanse and heal the digestive tract. Drink ¼ cup of aloe vera juice every morning and evening. George's Aloe Vera Juice from Warren Laboratories is a good product. It can be taken in a cup of herbal tea if you wish.

Burdock root, dandelion, and red clover aid in liver repair by cleansing the bloodstream.

Silymarin (milk thistle extract) has been shown in scientific studies to repair and rejuvenate the liver. Take 200 milligrams of silymarin three times daily. Liv-R-Actin from Nature's Plus is also a good source of milk thistle.

Other herbs that can be beneficial for people with cirrhosis include barberry, black radish, celandine, echinacea, fennel, fringe tree, goldenseal, hops, Irish moss, rose hips, suma, thyme, and wild Oregon grape.

*Cautions:* Do not use barberry, celandine, goldenseal, or wild Oregon grape during pregnancy. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

A diet that is rich in carbohydrates is preferred for those with cirrhosis or for those at risk for it. Saturated fat from sources such as meat and dairy products has been shown to cause significant adverse effects when alcohol is consumed at the same time. Total fat intake should be around 60 to 80 grams per day, of which only one-third should be from saturated fats.

Obtain protein from vegetable sources; do not eat foods containing animal protein.

Eat a diet consisting of 75 percent raw foods. If cirrhosis is severe, consume only fresh vegetables and fruits and their juices for two weeks.

Include the following in your diet: almonds, brewer's yeast, grains and seeds, raw goat's milk, and products derived from goat's milk. Nuts must be raw and from tightly sealed packages.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Increase your consumption of foods high in potassium, such as bananas, blackstrap molasses, brewer's yeast, dulse, kelp, prunes, raisins, and rice and wheat bran.

## The Liver

Weighing about four pounds, the liver is the largest gland of the body and the only internal organ that will regenerate itself if part of it is damaged. Up to 75 percent of the liver can be removed in patients without any underlying liver disease—in those with liver disease 60 percent can be removed. It takes four to six weeks for the liver to grow back to its original size. If cared for properly, it will function more than adequately for decades. Alcohol is one of the toxins that the liver doesn't handle as well as others. The liver cannot regenerate after being severely damaged by alcohol.

The liver has many functions, perhaps the most important of which is the secretion of bile. This fluid is stored in the gallbladder and released as needed for digestion. Bile is necessary for the digestion of fats; it breaks fat down into small globules. Bile also assists in the absorption of the fat-soluble vitamins (A, D, E, and K) and helps to assimilate calcium. In addition, bile converts beta-carotene into vitamin A. It promotes intestinal peristalsis as well, which helps prevent constipation.

After nutrients have been absorbed into the bloodstream through the intestinal wall, they are transported by way of the hepatic portal system to the liver. In the liver, nutrients such as iron and vitamins A, B<sub>12</sub>, and D are extracted from the bloodstream and stored for future use. These stored substances are utilized for everyday activities and in times of physical stress. The liver plays an important role in fat metabolism; in the synthesis of fatty acids from amino acids and sugars; in the production of lipoproteins, cholesterol, and phospholipids; and in the oxidation of fat to produce

energy. The liver creates a substance called glucose tolerance factor (GTF) from chromium and glutathione. GTF acts with insulin to regulate blood sugar levels. Sugars not required for immediate energy production are converted into glycogen in the liver; the glycogen is stored in the liver and the muscles, and is converted back into sugar when needed for energy. Excess food is converted to fat in the liver, and the fat is then transported to the fatty tissues of the body for storage.

In addition to its important functions in digestion and energy production, the liver acts as a detoxifier. Protein digestion and bacterial fermentation of food in the intestines produce ammonia as a by-product; this ammonia is detoxified by the liver. The liver combines toxic substances (including metabolic waste products, insecticide residues, drugs, alcohol, and other harmful chemicals) with substances that are less toxic. These substances are then excreted via the kidneys and bowels. Thus, in order for the liver to function properly, you must also have proper kidney and bowel function.

Finally, the liver is responsible for regulating thyroid function by converting thyroxine (T<sub>4</sub>), a thyroid hormone, into its more active form, triiodothyronine (T<sub>3</sub>). Inadequate conversion of T<sub>4</sub> into T<sub>3</sub> by the liver may lead to hypothyroidism.

The liver also breaks down hormones like adrenaline, aldosterone, estrogen, and insulin after they have performed their needed functions.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Eat plenty of foods high in vitamin K. Persons with cirrhosis of the liver are often deficient in vitamin K. Good sources of vitamin K include alfalfa sprouts and green leafy vegetables.

Include legumes (kidney beans, peas, and soybeans) and seeds in your diet. These foods contain the amino acid arginine, which helps to detoxify ammonia, a by-product of protein digestion.

Drink fresh vegetable juices, such as beet, carrot, dandelion extract, and "green drinks."

Drink steam-distilled water or sip barley water throughout the day. (See THERAPEUTIC LIQUIDS in Part Three.) When taking supplements, always take them with a full glass of water.

Use only cold-pressed vegetable oils as sources of dietary fats. Consume oils in uncooked form only, such as in salad dressings.

Limit your intake of fish to two servings a week, and do not eat raw or undercooked seafood. A damaged liver cannot handle the amount of vitamin A contained in these foods. Avoid cod liver oil.

Keep the colon clean. Toxins accumulate in the liver and must be excreted via the colon and kidneys. (See COLON CLEANSING in Part Three.)

Avoid constipating foods. The liver has to work twice as hard if you are constipated. Be sure your diet contains sufficient amounts of choline, inositol, and lecithin, as well as bulk and fiber.

Do not use harsh laxatives to cleanse the system. Lemon enemas are preferred; take these twice weekly. You can also alternate wheatgrass enemas with coffee enemas for two weeks. Both of these detoxify the system. (See ENEMAS in Part Three.)

Do not take any drugs (over-the-counter or prescription) except those prescribed by your doctor. Some over-the-counter products, including some medicines for children, contain alcohol in the form of propylene glycol.

This product may cause liver problems and a mild form of drunkenness.

Consume no alcohol in any form. Also eliminate the following from your diet: animal products, candies, milk, pastries, pepper, salt, spices, stimulants of any kind (including caffeine and colas), white rice, products containing sugar and/or white flour, and spicy or fried foods. Virtually all commercially prepared foods contain some of the above.

Read all food labels carefully, and avoid most fats. Do not eat any of the following: butter, margarine, vegetable shortening, and any other hardened fats; fried or fatty foods; melted or hard cheeses; nuts or oils that have been subjected to heat (either in processing or in cooking); potato chips; and all refined and processed foods. These overwork and damage the liver.

Do not smoke, and avoid secondhand smoke.

### Considerations

If alcoholic cirrhosis is detected in the early stages and the individual stops consuming alcohol, it may be possible to halt the damage to the liver.

In one study, people with cirrhosis of the liver were found to have an imbalance of essential fatty acids, which are needed for cell protection. After taking 10 capsules of primrose oil daily for three weeks, these individuals showed a marked improvement in the balance of their fatty acids.

Animal studies indicate that the typical American diet is damaging to the liver. Improper diet results in allergies, digestive disorders, a low energy level, and an inability to detoxify harmful substances.

The four basic reasons for poor liver function are:

1. *The presence of cumulative poisons.* Insecticides, preservatives, and other toxins can build up in and impair the liver. Even though a particular toxin may not accumulate in the liver, liver function may suffer if the toxin adversely affects the functioning of other organs, especially the pancreas and/or kidneys.
2. *An improper diet.* A diet that is low in protein and high in carbohydrates and fats, especially saturated fats, fried foods, and hydrogenated fats, is hard on the liver and may not provide sufficient protein building blocks necessary for repair. Poor food choices include processed foods, junk foods, refined white flour products, white sugar products, and imitation foods that are designed to appear and taste like an original product but that have been robbed of natural vitamins, minerals, and enzymes.
3. *Overeating.* Overeating is probably the most common cause of liver malfunction. Overeating creates excess work for the liver, resulting in liver fatigue. In addition,

the liver must detoxify all of the various chemicals present in our food supply today. When the liver is overworked, it may not detoxify harmful substances properly. New studies show that the liver actually becomes fatty from overeating, just as it does from overdrinking. The syndrome is called non-alcoholic fatty liver disease.

4. *Drugs.* Drugs put a great strain on the liver. Drugs are substances that are foreign and unnatural to the body. These foreign substances cause the liver to work overtime in excreting these toxins. The liver neutralizes the effects of drugs on the body. Alcohol is particularly toxic to the liver. When excessive amounts of alcohol enter the liver, the liver begins to lose its functioning capacity. Other substances that can contribute to liver malfunction include oral contraceptives and caffeine.

See also ALCOHOLISM and HEPATITIS, both in Part Two.

### COLD

See COMMON COLD.

### COLD SORES (FEVER BLISTERS)

Cold sores, or fever blisters, are caused by herpes simplex virus 1 (HSV-1), which is related to, but different from, the virus that causes genital herpes. Cold sores first appear three to ten days after exposure to the virus and may last up to three weeks. The virus then remains permanently in the body, and moves into the nervous system close to the lips.

It will lie dormant there until triggered by fever, a cold or other viral infection, exposure to sun and wind, stress, menstruation, high levels of the amino acid arginine, or depression of the immune system. These sores are very contagious and very common. By adulthood, 30 to 90 percent of people carry the virus.

There are said to be six stages of the development of the average cold sore. First comes stage one. In this first stage, no sore is visible but there is a feeling of prickling or itchiness around the affected area. In stage two, swelling may start and the area may be slightly red. Stage three brings with it the first signs of a blister or blisters. Stage four is the most painful, and generally comes on the fourth day. A soft crust or ulcer forms, and from this the cold sore moves into stage five, when a hard crust forms on the ulcer. This stage usually lasts for four days. The sixth and last stage, coming on or around the tenth day, leaves the sore red and slightly swollen, but without the hard scab.

An outbreak of cold sores may last more or less than ten days, depending on its severity.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve,

use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Proven effective in treating and stopping the outbreak of herpes. It contains many of the nutrients listed in this table.
L-lysine	500 mg twice daily.	Fights the virus that causes cold sores. <i>Caution:</i> Do not take lysine for longer than 6 months at a time. Do not take lysine pills if you are pregnant or nursing.
L-lysine cream	Apply topically as directed on label.	This amino acid fights herpesviruses. (See AMINO ACIDS in Part One.)
Vitamin B complex	100–150 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Important for healing and immune function. Use a high-stress formula.
Zinc lozenges	1 15-mg lozenge every 3 waking hours for 2 days, then 2 lozenges daily until healed. Do not exceed a total of 100 mg daily from all supplements.	Stimulates immune function to fight the virus. Zinc is absorbed quickly in lozenge form.
<b>Very Important</b>		
Acidophilus or Kyo-Dophilus from Wakunaga	As directed on label. Take on an empty stomach.	Inhibits pathogenic organisms.
Colloidal silver	Apply topically as directed on label.	An antiseptic and antibiotic that destroys bacteria, viruses, and fungi, and promotes healing.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Acts as a natural antibiotic and immunity enhancer.
Vitamin C	3,000–6,000 mg daily, in divided doses.	Fights the virus and boosts immune function. Use a buffered form.
<b>Important</b>		
Calcium and magnesium	1,500 mg daily. 750–1,000 mg daily.	To help relieve stress.
Essential fatty acids	As directed on label.	Aids skin in healing.
<b>Helpful</b>		
Herp-Eeze from Olympian Labs	As directed on label.	Contains lignans, nordihydro-gualaretic acid (NDGA), and other phytonutrients. Has antioxidant, anti-inflammatory, antiviral, and antimicrobial properties.
Maitake extract or shiitake extract or reishi extract	As directed on label. As directed on label. As directed on label.	To fight viruses and build resistance to disease.

Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.
Vitamin A plus carotenoid complex and vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily.	Needed for healing of tissue in mouth and lip area. Use emulsion forms for easier assimilation and greater safety at higher doses. Use d-alpha-tocopherol form.

### Herbs

For cold sores, use echinacea, goldenseal, pau d'arco, and red clover. Echinacea stimulates the immune system and may also aid in preventing an outbreak.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Lemon balm contains a high concentration of polyphenols and appears to minimize herpes outbreaks. It can be applied topically in cream form. Or brew lemon balm tea and apply it directly to the sore. Taken internally, lemon balm tea has antiviral qualities.

Olive leaf extract is good as a natural antibiotic for viral infections.

### Recommendations

Eat plenty of raw vegetables, as well as yogurt and other soured products.

If cold sore outbreaks occur often, check for low thyroid function. (See HYPOTHYROIDISM in Part Two.)

### Considerations

The drug acyclovir (Zovirax), in capsule, liquid, or ointment form, is sometimes prescribed for cold sores.

In studies, penciclovir (Denavir) cream has been shown to reduce the duration of the infection by one day, on average.

An over-the-counter drug called docosanol (Abreva) has been approved by the FDA to reduce healing time and duration of symptoms of cold sores. The medication contains 10 percent docosanol, an antiviral agent. This is a topical medication that is rubbed into the sore five times a day for adults and children over age twelve. Children younger than twelve should use this medication under a doctor's supervision.

Relaxation and visualization techniques (imagining the virus being destroyed by healing white blood cells, for

example) may reduce the seriousness of cold sore outbreaks.

If you are prone to allergies, you most likely have a malfunctioning immune system and may be susceptible to cold sores. (See ALLERGIES in Part Two.)

Avoid touching others with the affected area until the sore is completely healed; the virus can be transmitted to others quite easily.

See also HERPES INFECTION in Part Two.

## COLITIS

See ULCERATIVE COLITIS.

## COLORBLINDNESS

See under EYE PROBLEMS.

## COMMON COLD

The common cold is an infection of the upper respiratory tract caused by a virus. Cold weather does not cause colds, although most colds are caught in the fall and winter. This is because most cold viruses thrive better in colder temperatures, when there is less humidity in the atmosphere.

There are more than two hundred viruses that can cause the common cold, but the most common ones are rhinoviruses. The well-known symptoms include head congestion, nasal congestion, sore throat, coughing, headache, sneezing, and watery eyes. Children may develop a low-grade fever, but this is rare in adults.

Colds usually strike eighteen to twenty-four hours after the virus enters the body. Most colds clear up on their own in a week to ten days, but occasionally a cold can lead to a more serious illness, such as bronchitis, a middle ear infection, or sinus infection. There is often confusion between the symptoms of the common cold, influenza, and allergies. Influenza, also a viral respiratory infection but caused by different types of virus, is by far the most serious complaint of the three and can lead to life-threatening complications, particularly in older or frail people. (See INFLUENZA in Part Two.) For an outline of the symptoms of colds as opposed to those of influenza and allergies, see COLD, FLU OR ALLERGY? on page 343.

It is estimated that healthy adults get an average of two colds per year. Children generally get many more because their immune systems are immature, and they have not yet developed immunity to many of the viruses that cause colds.

Unless otherwise stated, the dosages here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
ACES + Zn from Carlson Labs	As directed on label.	Contains vitamins A, C, and E, plus the minerals selenium and zinc.
Vitamin A plus carotenoid complex (Betatene)	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Helps heal inflamed mucous membranes and strengthens the immune system. Antioxidants and precursors of vitamin A.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Fights cold viruses. For children, use buffered vitamin C or calcium ascorbate.
Zinc lozenges	For adults and children, 1 15-mg lozenge every 3 waking hours for 3 days, then 1 lozenge every 4 hours for 1 week. Do not exceed a total of 100 mg daily from all supplements.	Boosts the immune system. Keep these on hand and use them at the first sign of a cold. Note: Avoid lozenges containing citric acid, sorbitol, or mannitol. These ingredients inhibit absorption.
<i>Important</i>		
Free form amino acid plus N-acetylcysteine	As directed on label. As directed on label.	To supply needed protein for healing. A powerful antioxidant.
Garlic (Kyoic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic and immune system enhancer.
L-lysine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aids in destroying viruses and preventing cold sores in and around the mouth. (See AMINO ACIDS in Part One.) Caution: Do not take lysine for longer than six months at a time.
<i>Helpful</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach. As directed on label.	To replace "friendly" bacteria. For adults.
Cold-X10 from Olympian Labs	As directed on label.	A combination of nutrients, herbal extracts, and enzymes that boost the immune system and fight viral and bacterial infection.
Maitake extract or shiitake extract or reishi extract	As directed on label. As directed on label. As directed on label.	Mushrooms with immune-boosting and antiviral properties.
Multimineral complex or kelp	As directed on label. 1,800–3,600 mg daily.	Minerals are needed for healing and for immune response. A rich source of necessary minerals.
Multivitamin complex with vitamin B complex	50–100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	For healing and to reduce stress.
Olive leaf extract	As directed on label.	Supplements with antibiotic and antiviral properties.

## Cold, Flu, or Allergy?

Since the common cold, influenza, and seasonal allergies all cause upper respiratory tract symptoms, it can sometimes be difficult to distinguish among them. There are certain

notable differences, however. The following is a summary of the characteristic signs and symptoms of each.

Characteristic	Cold	Influenza	Seasonal Allergies
Chest infection or cough	Common. Mild to moderate.	Common. Can become severe. Pneumonia is a common complication.	Rare.
Fever	Rare (except in young children).	Usually high (102°–104°F). May last for 3–4 days.	Not present.
General aches and pains	Mild.	Usual. Can be severe.	Rare.
Headache	Rare.	Common.	Rare.
Sneezing/red, watery, itchy eyes	Usual, but more prevalent in allergies.	Rare.	Usual, especially sneezing. These symptoms come on quickly, without the warning signs of a cold, and can last longer.
Sore throat	Usual.	Occasional.	Occasional.
Stuffy nose	Usual.	Occasional.	Occasional.
Tiredness	Mild.	Severe.	Rare.
Primary season	Late August–April.	Winter.	March–September.
Duration	7–10 days.	Up to a month.	As long as the allergen is present.

### Herbs

Astragalus, native to Mongolia and China, helps promote the multiplication of the white blood cells that are vital for fighting infection.

*Caution:* Do not use astragalus in the presence of a fever.

Wild pansy (*Viola tricolor*) grows wild in Europe, North Africa, the Near East, and parts of North America. When prepared as a tea or cough syrup, it is a good remedy for the common cold accompanied by fever, and for upper respiratory tract congestion. This is especially true if you have a dry cough along with the congestion. It has a high concentration of rutin, which strengthens capillary walls, and may have some beneficial effect in reducing arteriosclerosis. To make tea, pour 2 cups of hot water over 2 teaspoons of wild pansy, steep for ten minutes, and strain. Drink a cup of the tea two or three times a day after meals for a period of eight weeks. As a cough syrup, make an infusion by adding 1½ tablespoons of tea to ¾ cup of water and 1½ tablespoons of syrup. Take 1 tablespoon of this mixture three times daily.

Boneset, a Native American herb, may be used to treat a fever.

*Caution:* Do not use boneset on a daily basis for more than one week, as long-term use can lead to toxicity.

For fever, take catnip tea enemas and ¼ to ½ teaspoon of lobelia tincture every three to four hours until the fever drops. This dosage can be used for children also.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Cat's claw is useful for easing the symptoms of a cold.

*Caution:* Do not use cat's claw during pregnancy.

Chuan xin lian, a Chinese herbal remedy also known as Andrographis Anti-Inflammatory Tablets, clears the mucus from the respiratory tract.

At the first sign of a cold, use an alcohol-free echinacea and goldenseal combination extract to boost your immune system and keep the virus from multiplying. For adults, place one dropperful in the mouth, hold it for five minutes, then swallow. Do this every three hours for three days. For

## Common Cold Remedies

Americans spend billions of dollars every year on nonprescription treatments for coughs and colds. At best, these products can offer only temporary relief. The following is a list of some of the most common types of cold remedies, and what they can and cannot do:

- Analgesics, such as acetaminophen, aspirin, and ibuprofen, help to relieve aches and pains and reduce fever. By themselves, colds do not usually cause significant fever. Allowing a low-grade fever to run its course may actually be beneficial; an elevated temperature is one of the body's ways of fighting infection. If you have a fever that reaches 102°F or higher, chances are something other than the cold is causing it. It may be a sign of a developing bacterial infection somewhere in the body that requires treatment. By reducing fever, analgesics may mask this sign.
- Antihistamines decrease nasal secretions by blocking the action of histamine, a body chemical that causes swelling of small blood vessels, which results in sneezing and runny nose. These products may make you drowsy. In addition, it is better to allow the secretions that contain the virus to flow out of the body rather than trying to block them.
- Cough medicines come in two basic types: expectorants and antitussives. Expectorants make coughs more productive by increasing the amount of phlegm and de-

creasing its thickness. This helps remove irritants from respiratory airways. Guaifenesin, an expectorant found in many popular over-the-counter cough medicines, can be effective. The effectiveness of other over-the-counter expectorants is questionable. Antitussives reduce the frequency of coughing. An antitussive called dextromethorphan is generally considered reasonably safe and effective. It is often denoted by the initials "DM" on product labels. However, because coughing is the body's mechanism for clearing secretions from the lungs, it is probably best not to suppress it unless coughing is unusually severe or persistent, or it is interfering with sleep.

- Decongestants shrink nasal blood vessels to relieve swelling and congestion. These medications can cause side effects including jitteriness, insomnia, and fatigue.

Most over-the-counter cold remedies contain some combination of acetaminophen and various decongestants, antihistamines, and cough suppressants. Some experts believe that these ingredients may work against one another. For example, acetaminophen may increase nasal congestion, while the decongestant decreases it. If a cold is making you extremely uncomfortable and you feel you must take something for it, it is better to take a single-ingredient product appropriate for the particular symptom you are treating. Most are not tested in children so check with your pediatrician before using any over-the-counter cold remedy.

children, place 8 to 10 drops in the mouth; hold it for a few minutes (or as long as the child can manage), and then swallow. Do this every two hours for three days. Then take 8 to 10 drops of the liquid daily until symptoms are gone. Besides beating colds, flu, bronchitis, and other upper respiratory tract infections, echinacea is good for clearing up strep throat.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Elderberry is recommended for upper respiratory tract infections and headaches associated with colds. It promotes sweating and can help to break a fever. Research has found that elderberry is effective against colds because it contains antioxidant flavonoids that protect cell walls against foreign substances.

Eucalyptus oil is helpful for relieving congestion. Put 5 drops in a hot bath, or put 6 drops in 2 cups of boiling

water and inhale the steam. It is best to remove the boiling water from the stove, then place a towel over your head and inhale deeply through your nose for three to five minutes (be careful not to get too close to the source of the hot steam—it can cause burns). Rosemary and sage oils can be added to the eucalyptus oil to aid in breaking up congestion.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Ginger, pau d'arco, slippery elm, and yarrow tea can help the common cold.

Hyssop, an evergreen that can be taken as a tea, acts as an expectorant and has antiviral properties.

Mullein is useful for coughs and congestion.

Red clover helps clear accumulated toxins in the lymphatic system that may cause congestion and inflammation.

For a sore throat, add 3 to 6 drops of pure tea tree oil to warm water and gargle. Repeat this up to three times daily. Take up to 2 tea tree oil lozenges and allow them to dissolve slowly in your mouth. Repeat this treatment as often as required, alternating it with goldenseal extract. These products can be found in most health food stores.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Wild cherry bark soothes a cough.

### Recommendations

- Take vitamin C and zinc lozenges at the first sign of a sore throat or stuffiness in the head or nose. This can shorten the duration of a cold, and may even stop it altogether. Take the lozenges every three hours for the first day of cold symptoms.
- Sip hot liquids such as turkey or chicken broth. Drink Potato Peeling Broth twice a day—make it fresh daily. You can add a carrot, a stalk of celery, garlic, and/or onions to your drink. Chicken soup is very effective in relieving the worst of the symptoms and in shortening the duration of a cold. (See THERAPEUTIC LIQUIDS in Part Three for both recipes.)
- Remain as active as possible. Not only is staying in bed for ordinary sniffles unnecessary, but it will probably make you feel worse. Moving around helps to loosen built-up mucus and fluids. Unless you have a fever, a brisk walk or any other type of moderate exercise should make you feel better.
- A study done between 1999 and 2000 in Florida has shown that taking antioxidants such as vitamins C and E, beta-carotene, selenium, zinc, fructooligosaccharides, and protein can significantly reduce the chance of getting an upper respiratory tract infection. This is particularly important for older adults due to the reduced efficiency of their immune systems. It has also proven to be useful in increasing the effectiveness of flu vaccines. This was originally published in the *Journal of the American Geriatrics Society*.
- Consider using homeopathic remedies for cold symptoms. *Calcarea carbonica* is excellent for sore throats, colds, or bronchitis. *Anas barbariae* (also available as *Oscillococtinum* from Boiron) and *Ferrum phosphoricum* (if there is a fever) are also good for treating the common cold.
- Flush facial tissues after they have been used. Because they harbor the virus, tissues can pass on the virus or cause you to reinfect yourself.
- Wash your hands often. Cold viruses can survive for several hours on hands, tissues, or hard surfaces. A healthy person can contract the virus by touching a contaminated surface, then touching his or her own mouth or nose. Using an antibiotic soap may prevent you from reinfecting yourself, but these soaps can also contribute to the development of antibiotic-resistant bacteria, so it is best to use them only when necessary.
- Try not to spread the cold to your family or colleagues. Refrain from close contact with loved ones. Even shaking hands is out; hand contact can spread the virus.

- Do not give aspirin, or any product containing aspirin, to a child with symptoms of any viral infection, including a cold. (See REYE'S SYNDROME in Part Two.) Taking large doses of aspirin also depletes the body of vitamin C.

### Considerations

- Since there is no cure for the common cold, the best approach is prevention. Once a cold has a firm grip on you, it is hard to stop it.
- Bovine colostrum, taken in the cold and flu season, may help to ward off infection.
- There are many over-the-counter cold medications available. None of them can actually cure a cold, although they can be helpful for alleviating symptoms.
- It is unlikely that a vaccine will ever be developed to prevent the common cold because the viruses responsible have the ability to change in size and shape, and have hundreds of different forms. However, research being conducted in Britain may provide hope for cold sufferers. An experimental drug, tremacamra, appears to block cold viruses from finding a docking site in the nasal passages. So far, the drug's success rate has been impressive, cutting the risk of infection by 34 percent and symptoms by 45 percent. There have been no new developments with this drug since 1999 when the study was published.
- The possibility for real cold relief may lie in substances such as interferons, natural proteins that the body produces in response to viral infection. Interferons seem to improve the respiratory tract's ability to ward off viruses. Vitamin C promotes interferon production.
- Antibiotics are ineffective against viral infections, but many people still ask their doctors to prescribe them. It is important to understand that penicillin and most other antibiotics work only against bacterial infections—such as strep throat—not viral infections. Viruses and bacteria may produce similar symptoms, but they are very different kinds of microbes and do not respond to the same treatment. In fact, because antibiotics kill off “good” bacteria together with the bad, antibiotics actually inhibit the body's efforts to defend itself against viral invasion.
- You can, in a sense, catch a cold from yourself. When your immune system weakens from factors such as stress and/or a poor diet, viruses can take hold. These viruses are opportunistic and lie dormant in the body, taking hold when the immune system is at its weakest. Stress is often a factor.
- One study of young adults deliberately infected with a cold virus revealed that those given the drug naproxen or ibuprofen, which are commonly prescribed for arthritis, suffered fewer cold symptoms, such as sneezing, than those given a placebo. Coughing was not affected.
- Medical researchers at Dartmouth College gave a group of thirty-five cold sufferers zinc lozenges, and told

these individuals to take a lozenge as often as every two hours. Another thirty-five cold sufferers were given placebo. The zinc takers' colds subsided in an average of four days, while the control group struggled with their colds for another nine days.

Under experimental conditions, polysaccharides found in the herb echinacea have been shown to enhance the immune response.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Allergies can cause symptoms that mimic those of colds and flu. Allergy testing is recommended. (See ALLERGIES in Part Two.)

Anyone who has frequent colds or bouts with the flu should be checked for thyroid malfunction. When you are well, perform the thyroid function self-test. (See under HYPOTHYROIDISM in Part Two.) If your temperature is low, consult your health care provider.

Congestion, cough, and/or sore throat are signs of a cold, but if these symptoms occur together with fever or fatigue, you may have the flu. (See INFLUENZA in Part Two.) If congestion develops in the chest, it is best to consult a physician, as chest (lung) infections can be serious. Also contact your health care provider if your fever goes above 102°F for more than three days, if yellow or white spots appear in the throat, if the lymph nodes under the jaw and in the neck become enlarged, and/or if chills and shortness of breath occur.

## COMPLEXION PROBLEMS

See ACNE; DRY SKIN; OILY SKIN; PSORIASIS; ROSACEA; and WRINKLES.

## CONJUNCTIVITIS

See under EYE PROBLEMS.

## CONSTIPATION

Constipation is difficulty in passing stools or the infrequent passage of hard, dry stools as a result of food moving slowly through the large intestine. Most people experience constipation from time to time, but usually lifestyle changes and better eating habits help relieve the symptoms and prevent recurrences.

In most cases, constipation arises from insufficient amounts of fiber and fluids in the diet. Fiber is found in plant foods, such as whole grains, fruits, and vegetables. Fiber that is soluble in water takes on a soft texture and helps soften the stools. Insoluble fiber passes through the intestine largely unchanged and adds bulk to stools, which in turn helps to stimulate bowel contractions. Other factors

that can cause constipation include inadequate exercise, advanced age, muscle disorders, structural abnormalities, bowel diseases, neurogenic disorders, and a poor diet, especially heavy consumption of junk food. Constipation may be a side effect of iron supplements and some drugs, such as painkillers and antidepressants. It is also common during pregnancy. High levels of calcium and low levels of thyroid hormone are two metabolic disturbances that can lead to constipation.

People with kidney failure or diabetes also tend to have problems with constipation. In older individuals, constipation is often caused by dehydration; in people of any age, depression can be a factor. Some medications can cause constipation, including cough syrups, pain medications that contain codeine, some antidepressants, iron supplements, blood pressure and heart medicines, calcium supplements, and some antihistamines.

A small percentage of people, such as persons with spinal injuries, have problems with constipation because the nerves that usually regulate bowel movement have been damaged or destroyed. In a condition called Hirschsprung's disease, normal excretion of feces is impossible because the nerves inside the bowel are missing. The nerve cells in the wall of the colon can also be damaged by long-term, habitual use of laxatives. When this happens, constipation is inevitable. A thrombosed hemorrhoid, an anal fissure, or a pocket of infection at the anus can create a spasm of pain strong enough to contract the muscles and hinder the evacuation of stools.

Constipation can give rise to many different ailments, including appendicitis, bad breath, body odor, coated tongue, depression, diverticulitis, fatigue, gas, headaches, hemorrhoids (piles), hernia, indigestion, insomnia, malabsorption syndrome, obesity, and varicose veins. It may even be involved in the development of serious diseases such as bowel cancer.

Regular bowel movements are an important mechanism for removing toxins from the body. The colon serves as a holding tank for waste matter. Antigens and toxins from bowel bacteria and undigested food particles may play a role in the development of diabetes mellitus, meningitis, myasthenia gravis, thyroid disease, candidiasis, chronic gas and bloating, migraines, fatigue, and ulcerative colitis. People can have bowel movements as infrequently as three times a week and still not be constipated, although there are some health practitioners who maintain that it is important to have a bowel movement every day.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, it is suggested that one-quarter the recommended amount be used.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Garlic (Kyolic from Wakunaga)	2 capsules twice daily, with meals. (See ASCORBIC ACID FLUSH in Part Three.)	Destroys harmful bacteria in the colon.
Vitamin C with bioflavonoids	5,000–20,000 mg daily.	Has a cleansing and healing effect. Use a buffered form.
<i>Helpful</i>		
Apple pectin	500 mg daily. Take separately from other supplements and medications.	For fast results, use it in an enema. A source of fiber that aids in correcting constipation.
Bio-Bifidus from American Biologics	As directed on label.	For bowel flora replacement to improve assimilation of nutrients from foods.
Chlorophyll liquid or alfalfa	1 tbsp daily, before meals.	Eliminates toxins and bad breath. See under Herbs, below.
Essential fatty acids (Kyolic-EPA from Wakunaga, flaxseed oil, and primrose oil)	As directed on label.	Restores proper fatty acid balance to aid in proper bowel movements.
Kyo-Dophilus from Wakunaga	As directed on label.	Aids in normal bowel function. Allows survival and rapid passage of “friendly” bacteria through the stomach into the small intestine.
Multienzyme complex	As directed on label. Take after meals.	To aid digestion.
Multivitamin and mineral complex with vitamin A and mixed carotenoids	As directed on label. If you are pregnant, do not exceed 10,000 IU daily.	Constipation blocks proper absorption of nutrients, resulting in vitamin and mineral deficiencies. Use a formula <i>without</i> iron.
Oxy-Cleanse from Earth’s Bounty	As directed on label.	Removes harmful anaerobic pathogens from digestive tract.
Vitamin B complex plus extra vitamin B <sub>12</sub> and folic acid	50 mg of each major B vitamin 3 times daily, before meals (amounts of individual vitamins in a complex will vary). 1,000–2,000 mcg daily. 200 mcg daily.	Aids in proper digestion of fats, carbohydrates, and protein. Use a high-potency formula. A sublingual form is best.  To aid in digestion and prevent anemia. Deficiency may result in constipation.
Vitamin D plus calcium	400 mg daily. 1,500 mg daily.	Aids in preventing colon cancer.  Needed for proper muscular contraction. May also help prevent colon cancer.
and magnesium	750 mg daily.	Works with calcium to regulate muscle tone.
Vitamin E	200 IU daily. Take before meals.	Aids in healing of the colon. Use d-alpha-tocopherol form.

## Herbs

- Alfalfa extract contains chlorophyll, which aids in detoxifying the body and cleansing the breath. Fennel seed tea also is good for freshening the breath.
- Aloe vera has a healing and cleansing effect on the digestive tract and aids in forming soft stools. Drink ½ cup of aloe vera juice in the morning and at night. It can be mixed with a cup of herbal tea if you wish. Warren Laboratories has a product called George’s Aloe Vera Juice that is good.
- Ginger stimulates the digestive system and eases passage of food through the intestines. Try Ginger Dry Extract and Ginger Soft Extract from Sabinsa Corporation.
- Use milk thistle to aid liver function and to enhance bile output to soften stools.
- Naturalax 2 from Nature’s Way is an herbal formula that is good for constipation.
- Triphala from Planetary Formulas is an herbal product that aids in the formation of odor-free, firm, and healthy stools.
- Other herbs that are helpful for constipation include cascara sagrada, goldenseal, rhubarb root, senna leaves, and yerba maté. If you take yerba maté, take 2 to 3 teaspoons in 16 ounces of hot water on an empty stomach.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor’s supervision.

## Recommendations

- Eat high-fiber foods such as fresh fruits, raw green leafy vegetables, whole-grain oatmeal, and brown rice daily. Also eat asparagus, beans, Brussels sprouts, cabbage, carrots, garlic, kale, okra, peas, sweet potatoes, and whole grains. Foods that contain high levels of soluble fiber are adzuki beans, barley, dried beans, oats, and some fruits, especially apples, apricots, bananas, blackberries, blueberries, cranberries, figs, grapes, peaches, and prunes. Foods high in insoluble fiber are cereals, seeds, wheat bran, whole grains, and the skins of many fruits and vegetables. Eating in this way is a good idea for adults and children.
- Drink more water. This is important when adding fiber to the diet. Drink at least ten 8-ounce glasses of water every day, whether you are thirsty or not. As you age, you become less able to detect true thirst.
- Consume plenty of foods that are high in pectin, such as apples, carrots, beets, bananas, cabbage, citrus fruits, dried peas, and okra. Pectin is also available in supplement form.
- Follow a low-fat diet. Eat no fried foods.
- Avoid foods that stimulate secretions by the mucous membranes, such as dairy products, fats, and spicy foods.

## Types of Laxatives

Laxatives are substances that are used to promote bowel movement. There are four basic types of laxatives: bulk-forming agents, stool softeners, osmotic agents, and stimulants. The following are basic descriptions of the way the different laxatives work to achieve their effects:

- Bulk-forming agents increase the bulk and water content of the stools. They are the only type of laxatives that can be safe to take on a daily basis. Examples include bran (both in foods and in supplement form), psyllium, and methylcellulose.
- Stool softeners, such as mineral oil and docusate sodium, soften fecal matter so that it passes through the intestines more easily. They should not be used on a regular basis because they can have other effects on the body. Mineral oil can damage the lungs if inhaled, and it reduces the absorption of fat-soluble vitamins. Docusate sodium (found in Colace and Dialose) may increase the toxicity of other drugs taken at the same time, and may cause liver damage to occur.
- Osmotic agents contain salts or carbohydrates that promote secretion of water into the colon, initiating bowel movement. They are among the safest laxatives for occasional use, but if they are used more than occasionally, dependency can result. Examples include lactulose (a prescription medication sold under the brand names Cephulac and Chronulac), sorbitol (which is cheaper than lactulose but just as effective), milk of magnesia, citrate of magnesia, and Epsom salts.
- Stimulant laxatives irritate the intestinal wall, stimulating peristalsis. They can damage the bowels with habitual use, and can lead to dependency. Examples include bisacodyl (found in Dulcolax), casanthranol (Peri-Colace), cascara sagrada, castor oil, and senna (Perdiem, Senokot).

Do not consume dairy products, soft drinks, meat, white flour, highly processed foods, salt, coffee, alcohol, or sugar. These foods are difficult to digest and have little or no fiber. For children, try a milk substitute such as soymilk.

For quick relief of constipation, drink a large glass of quality water every ten minutes for half an hour. This can work wonders to flush out toxins and relieve constipation.

Eat prunes or figs. These are the best natural laxatives.

Eat smaller portions—no large, heavy meals or high-fat foods.

Consume barley juice, Green Magma from Green Foods Corporation, Kyo-Green from Wakunaga, or wheatgrass for chlorophyll.

Get some exercise. Physical activity speeds the movement of waste through the intestines. A twenty-minute walk can often relieve constipation. Regular exercise is also important for preventing constipation in the first place.

Go to the toilet at the same time each day, even if the urge does not exist, and relax. Stress tightens the muscles and can cause constipation. Many people find reading helpful as a way to relax. Never repress the urge to defecate.

Keep the bowel clean. (See COLON CLEANSING in Part Three.)

If constipation is persistent, take cleansing enemas. (See ENEMAS in Part Three.)

Do not consume products containing mineral oil, which can interfere with the absorption of fat-soluble vitamins. Also avoid taking Epsom salts, milk of magnesia, and citrate of magnesia, which draw volumes of fluid into the intestines and wash out minerals from the body.

If you use laxatives, take acidophilus to replace the “friendly” bacteria. The continued use of laxatives cleans out the intestinal bacteria and leads to chronic constipation.

### Considerations

Psyllium seed is helpful for constipation. If you take psyllium seed, be sure to take it with a full glass of water.

Some yogurts contain active cultures that help with constipation. Activia has bifidobacteria and fiber (fructooligosaccharide). In one study, women who consumed the yogurt twice a day experienced significant improvement.

Flaxseed oil or freshly ground flaxseeds help to soften stools. Freshly ground flaxseeds have a pleasant, nutty taste and can be sprinkled over cereals, salads, and other foods.

Fast periodically (adults only). (See FASTING in Part Three.)

Laxatives can be used occasionally to relieve constipation, but if used regularly they can cause serious problems, including diarrhea, abdominal cramping, bloating, dehydration, and, ultimately, damage to the colon. Using laxatives too often also promotes dependence. Lifestyle changes, including getting regular exercise and eating a high-fiber diet, are better ways to avoid constipation.

If added natural fiber and herbal laxatives do not improve constipation, you may have a problem with muscle coordination. Normally, the upper muscles in the bowel contract as the lower ones relax. Problems occur if the lower muscle tightens and goes into a spasm instead of relaxing.

If constipation is more than an occasional problem, the possibility of a cancer or another obstruction in the lower bowel should not be dismissed unless a proctoscopic examination or a barium enema has shown that there is no blockage. Other symptoms of colon cancer include the presence of blood in the feces; severe cramping; a tender, distended abdomen; and markedly narrowed stools. However, cancer may be present even without these symptoms.

Foul-smelling stools and a burning feeling in the anus may be signs of acidosis. (See ACIDOSIS under ACID/ALKALI IMBALANCE in Part Two.) Also, you could be malabsorbing fat and you may need medical attention to sort these issues out.

Alternating constipation and diarrhea may be a sign of irritable bowel syndrome. While this disorder is chronic and unpleasant, it is not dangerous. Other common symptoms are cramps, gassiness, and variation in the consistency of the stool. The cause of irritable bowel syndrome is not known, but many experts believe it is stress related. (See IRRITABLE BOWEL SYNDROME in Part Two.)

See DIVERTICULITIS and ULCERATIVE COLITIS, both in Part Two.

See also under PREGNANCY-RELATED PROBLEMS in Part Two.

## CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD)

See ASTHMA; BRONCHITIS; and EMPHYSEMA.

## COPPER DEFICIENCY

Copper is an essential trace mineral. Even a mild copper deficiency impairs the ability of white blood cells to fight infection. Copper is necessary for proper absorption of iron in the body, and it is found primarily in foods containing iron. If the body does not get a sufficient amount of copper, hemoglobin production decreases and copper-deficiency anemia can result.

Various enzyme reactions require copper as well. Copper is needed as a cross-linking agent for elastin and collagen, as a catalyst for protein reactions, and for oxygen transport. It is also used for the metabolism of essential fatty acids. Copper deficiency can produce various symptoms, including diarrhea, inefficient utilization of iron and protein, and stunted growth. In babies, the development of nerve, bone, and lung tissue can be impaired, and the structure of these body parts may be altered.

Since the body does not manufacture copper, it must be taken in through the diet. Too much copper produces a condition called copper toxicity or copper overload. (See COPPER TOXICITY in Part Two.) For the body to work properly, it must have a proper balance of copper and zinc; an imbalance can lead to thyroid problems. In addition, low (or high) copper levels may contribute to mental and emotional problems. Copper deficiency may be a factor in anorexia nervosa, for example.

The DRI for copper is 900 micrograms per day for adults nineteen to seventy years of age. For children, the DRI ranges from 200 micrograms for infants under six months to 890 for children fourteen to eighteen years of age. The DRI represents the recommended dietary allowance for copper. A normal healthy diet will provide the correct amount of copper for most people.

Copper deficiency is most likely to occur in babies who are fed only cow's milk (infant formulas are supplemented), persons suffering from sprue (a malabsorption syndrome) or kidney disease, and those who chronically take megadoses of zinc. Long-term use of oral contraceptives can upset the balance of copper in the body, causing either excessively high or excessively low copper levels. Copper levels can be determined through a blood test, urine samples, and hair analysis. Determining mineral levels and ratios is the basis for a nutritional program to balance body chemistry.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Copper	5 mg daily for 1 month, then reduce to 3 mg daily.	To restore copper in the body. Use copper amino acid chelate.
Zinc	30 mg daily. Do not exceed this amount.	Needed to balance with copper. Use zinc chelate form.
<i>Helpful</i>		
Iron	As directed by physician. Take with 100 mg vitamin C for better absorption.	Copper deficiency may cause anemia. Use a chelate form. <i>Caution:</i> Do not take iron unless anemia is diagnosed.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.

### Recommendations

If you suspect that you may have a copper deficiency, increase your intake of foods rich in copper, such as legumes (especially soybeans), nuts, cocoa, black pepper, seafood, egg yolks, raisins, molasses, avocados, whole grains, oats, and cauliflower. Pregnant women in particular should be sure to eat a well-balanced diet that includes these foods.

Copper deficiency can be confirmed through hair analysis. (See HAIR ANALYSIS in Part Three.) If deficiency is confirmed, follow the supplementation plan above to restore proper mineral balance.

**Considerations**

❑ Copper deficiencies that have health consequences are thought to be linked to living in, and eating foods grown in, areas where the soil has been depleted of this mineral. However, deficiency is very rare in the United States.

❑ Patent ductus arteriosus is a congenital defect in which the ductus arteriosus, or fetal blood vessel, fails to close properly shortly after birth. It results in blood flow between the pulmonary artery, which goes to the lungs, and the aorta, which brings oxygenated blood to the rest of the heart. In a laboratory experiment reported in *Developmental Pharmacology and Therapy* the ductus arteriosus remained open in 100 percent of offspring of a copper-deficient group of rats, but in only 20 percent of the offspring of a control group not suffering from copper deficiency. This study underscores the importance of taking a multivitamin when you are pregnant.

**COPPER TOXICITY**

Trace amounts of copper are essential for the human body. Since copper is not manufactured by the body, it must be taken in through the diet. A number of biochemical processes depend on copper to function normally, plus copper is involved in the function of the nervous system. (See COPPER DEFICIENCY above.) However, as with all trace minerals, excess amounts of copper in the body can be toxic.

Too much copper in the system can cause a variety of ailments, including diarrhea, eczema, hemolytic anemia, high blood pressure, kidney disease, nausea, premenstrual syndrome, sickle cell anemia, stomach pain, and severe damage to the central nervous system. As with mercury and lead, high levels of copper are also associated with mental and emotional disorders, including autism, behavioral problems, childhood hyperactivity, clinical depression, anxiety, postpartum psychological problems, hallucinatory and paranoid schizophrenia, insomnia, mood swings, stuttering, and senile dementia (senility).

Sources of copper include beer, copper cookware, copper plumbing, industrial wastes, insecticides, pasteurized milk, tap water, and various foods, as well as swimming pool chemicals and permanent-wave solutions.

The DRI for copper is 900 micrograms per day for adults nineteen to seventy years of age. For children, the DRI ranges from 200 micrograms for infants under six months to 890 for children fourteen to eighteen years of age. The DRI represents the recommended dietary allowance for copper.

Copper levels can be determined through blood tests, urine samples, and hair analysis. Normal urine samples collected over a twenty-four-hour period contain 15 to 40 micrograms of copper. In people with diseases such as arthritis, heart disease, hypertension, schizophrenia, or cancer, serum copper levels tend to be high. During illness, copper is released from the tissues into the blood to promote tissue repair. High serum copper readings during illness should not be taken to mean that the copper is a cause

of the illness; rather, it is an indication that the body's natural repair processes have been activated.

The use of oral contraceptives and/or tobacco can cause a rise in the amount of copper in the body. Excess serum copper is also characteristic of anemia, cirrhosis of the liver, leukemia, hypoproteinemia, and vitamin B<sub>3</sub> (niacin) deficiency.

Serum copper levels also tend to be higher than normal during pregnancy. Wilson's disease is a rare hereditary disorder in which the body is unable to properly metabolize copper, and the metal accumulates in the body. Treatment for Wilson's disease is high doses of zinc throughout childhood. Patients can grow and develop normally with this treatment. People with diminished adrenal gland function or abnormally slow metabolism can develop high copper levels. Zinc, another mineral, plays an important role in how much copper is stored in the tissues. A deficiency of zinc, especially when combined with a high copper intake, can cause too much copper to build up in the tissues. In addition, stress can cause a decrease in the amount of zinc available to the body, which can lead to copper overload.

With knowledge of how minerals interact in the body, it is possible to lower the amount of copper in the body and maintain a proper mineral balance. Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Vitamin C with bioflavonoids plus extra rutin	1,000 mg 4 times daily.  60 mg daily.	Copper chelators. Use ascorbic acid form.  A bioflavonoid that is a by-product of buckwheat and lowers serum copper.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Zinc deficiency predisposes one to excessive copper levels. Use zinc chelate form.
<i>Helpful</i>		
Calcium chelate or calcium disodium edetate plus magnesium	1,500 mg daily.  As prescribed by physician.  750 mg daily, at bedtime.	Binds with metallic ions in the body. Used by doctors to treat heavy metal poisoning. Available by prescription only. Works with calcium.
L-cysteine and L-cystine and L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aids in elimination of copper from the body and protects the liver. (See AMINO ACIDS in Part One.)

Manganese	2–4 mg daily. Take separately from calcium.	Aids in excretion of excess copper.
Molybdenum	30 mcg daily.	Prevents accumulation of excess copper in the body.

## Herbs

- Grape seed extract serves as a free radical scavenger and aids in protecting cells from damage.

## Recommendations

- Have your drinking water tested. Drinking water can be a source of copper. The level of copper and other minerals in household drinking water can be tested by special labs. If there is more than 1 part per million of copper in your drinking water, an alternate source of water, such as bottled steam-distilled water, is advisable. If this is not feasible, always run the water for at least two minutes before using it to clear out some of the impurities.
- Increase your intake of sulfur, found in such foods as eggs, onions, and garlic. These help to rid the body of copper. In addition, supplement your diet with pectin, which can be found in apples.
- Do not take a multivitamin and/or mineral supplement that contains copper.
- Do not use copper pots or other cooking utensils.

## Considerations

- Hair analysis has been shown to be a reliable test of the copper level in body tissues. (See HAIR ANALYSIS in Part Three.)
- If you have an extremely high level of copper, you may require medical treatment with chelation to remove the excess copper. Chelation therapy removes toxic metals from the body. (See CHELATION THERAPY in Part Three.) If the copper levels are higher than normal, but not extreme, this can often be managed with supplements.
- The trace minerals manganese, molybdenum, and zinc can prevent excess copper from accumulating in the body.
- Many people with schizophrenia have been found to have high levels of copper and iron, combined with deficiencies of zinc and manganese, probably as a result of lower than normal excretion of copper. Increasing the intake of zinc and manganese, whether through the diet or supplementation, increases elimination of copper and helps to return copper levels to normal.
- See also ENVIRONMENTAL TOXICITY and WILSON'S DISEASE, both in Part Two.

## CORNEAL ULCER

See under EYE PROBLEMS.

## CORNS AND CALLUSES

Corns and calluses are areas of hyperkeratosis, or overgrowth of skin tissue. The skin thickens and hardens. Calluses most commonly form on the soles of the feet and sometimes on the hands or knees. Corns are small cone-shaped areas of skin overgrowth that most often form on or between the toes. They can be either soft or hard. If they form between the toes, the moisture of the area keeps them soft; corns that form on top of the toes are typically hard.

Having a hammertoe or mallet toe may lead to a more severe form of callus called intractable plantar keratosis (IPK). This callus forms as a result of a serious imbalance in weight-bearing, with considerably more pressure being placed on one area of the foot than on others.

These growths can cause inflammation and pain. Corns especially may ache and be tender to the touch. Both corns and calluses usually form in response to repeated friction or pressure, such as from wearing ill-fitting shoes or performing certain tasks repeatedly. Other factors that may be involved include staphylococcus- or streptococcus-type infection, and an acid/alkaline imbalance in the body.

## Herbs

- Use alternate applications of alcohol-free goldenseal extract and tea tree oil to keep down infection and speed healing.

## Recommendations

- Consume raw vegetables and juices for three days to aid in balancing the acidity/alkalinity of your system. Um-eboshi (Japanese salt plum) can quickly balance the body's pH. These are available in health food stores and Asian markets. Take one every three hours for two days.
- Avoid fried foods, meats, caffeine, sugar, and highly processed foods.
- To treat corns and calluses, soften the thickened skin by adding 2 tablespoons of Dr. Bronner's liquid soap (available in health food stores) or a mild dish soap to ½ gallon of warm water. Soak your feet in this mixture for fifteen minutes. Afterward, dry your feet with a soft towel and rub a couple of drops of vitamin E oil into the affected area. Then, using a pumice stone or a special callus file, gently file down the top layer of the corn or callus. Clean the area with mild soap and water, using a gauze pad or cotton ball, and apply a moisturizer to the area. Do this twice a day. Wear clean white cotton socks after treatment. This is effective only if the callus is not too thick.
- Apply a nonmedicated corn pad (a small round or oval-shaped foam pad with a hole in the center) around a corn to help to relieve the pressure. Stretch the pad so that it clears the corn by at least one-eighth inch on all sides. Then apply vitamin E oil to the corn, cover with a gauze

square, and wrap the toe with adhesive tape. Alternate between using vitamin E oil and tea tree oil.

- For corns between the toes, dab on vitamin E oil and place a clean piece of cotton or a cotton ball over it. Make sure to use 100 percent cotton, not synthetic cosmetic puffs. Put on clean white cotton socks and leave them on overnight after treatment. Vitamin E oil mixed with a crushed garlic clove is good for softening corns and calluses.
- Never use a knife or any sharp instrument to cut the hardened area away, as infection can result.
- Always wear properly fitting shoes.

### Considerations

- Compresses made from hot Epsom salts or Foottherapy solution from Queen Helene/Hain Celestial Group are good.
- Medicated pads are available that are supposed to treat corns and calluses. Most of these products are fairly aggressive, however, and may attack good tissue as well, provoking an allergic reaction.
- If you suffer from diabetes, you may need to consult a doctor or podiatrist. In people with diabetes, poor circulation can lead to problems with the feet. You should also consult a professional if the area becomes infected.
- If the problem is persistent, a physician may suggest an X-ray to rule out an underlying bone spur.
- See also ACID/ALKALI IMBALANCE in Part Two.

### CRAMPS

See MUSCLE CRAMPS; PREMENSTRUAL SYNDROME.

### CROHN'S DISEASE

Crohn's disease is an inflammatory bowel disorder of unknown origin. Also called *ileitis* or *enteritis*, it usually affects the lowest portion of the small intestine, but it can occur in other parts of the digestive tract, from the mouth to the anus. Crohn's disease causes inflammation that extends deep into the lining of the intestinal wall, frequently causing crampy abdominal pain, diarrhea, rectal bleeding, loss of appetite, and weight loss.

A common complication of the disease is blockage of the intestine caused by scar tissue that narrows the passageway. The disease may also cause sores, or ulcers, that break through to the surrounding tissues. These tunnels are called *fistulas*, and while they can be treated using medication, surgery is sometimes required. People with Crohn's disease also suffer from nutritional deficiencies.

Crohn's disease affects men and women equally and tends to run in families. According to the Crohn's and Colitis Foundation of America (CCFA), people who have a relative with the disease have at least ten times the risk of

developing Crohn's disease compared with the general population. This disorder affects people in all age groups, but the onset usually occurs either between ages fifteen and thirty or between ages sixty and eighty. Children with Crohn's disease may suffer delayed development and stunted growth due to nutritional deficiencies.

Crohn's disease can be difficult to diagnose because its symptoms are similar to those of other intestinal disorders, particularly ulcerative colitis—another inflammatory bowel disease which affects only the colon. Crohn's symptoms can also appear intermittently, occurring every few months to every few years for some people. In rare cases, the symptoms may appear once or twice and not return. If the disease continues for many years, bowel function gradually deteriorates. Left untreated, it can become extremely serious, even life-threatening, and it may increase the risk of cancer by as much as twenty times.

Doctors believe that Crohn's disease has a genetic basis, but that it does not appear until triggered by the presence of bacteria or virus that provokes an abnormal activation of the immune system. The onset of Crohn's disease can be dramatic, with alarming symptoms such as sudden high fever, sudden weight loss of more than five pounds in a few days, significant rectal bleeding, severe abdominal pain that persists for more than an hour at a time, and persistent vomiting accompanied by a cessation of bowel movements.

A series of tests may be required to confirm Crohn's disease. Blood tests may be done to check for anemia and/or a high white blood cell count. A doctor may do an upper gastrointestinal X-ray series to look at the small intestine, or a colonoscopy, in which the doctor inspects the interior of the large intestine using a long, flexible lighted tube linked to a computer and monitor. If the tests show the presence of Crohn's disease, the doctor may do more X-rays of both the upper and lower digestive tract to find out how much is affected by the disease.

Since there is no cure for Crohn's disease, the goals of treatment are to control inflammation, relieve symptoms, and correct nutritional deficiencies—all of which can help keep Crohn's disease in remission. Two-thirds to three-quarters of patients with Crohn's disease will require surgery at some point in their lives. Surgery becomes necessary when medications can no longer control symptoms. Surgery is used either to relieve symptoms that do not respond to medical therapy or to correct complications such as blockage, perforation, abscess, or bleeding in the intestine. Surgery to remove part of the intestine can help people with Crohn's disease, but it is not a cure. It is not uncommon for people with Crohn's disease to have more than one operation, as inflammation tends to return to the area next to where the diseased intestine was removed.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve,

use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Duodenal glandular	As directed on label.	Aids in healing gastrointestinal ulcers.
L-glutamine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A major metabolic fuel for the intestinal cells; maintains the villi, the absorption surfaces of the gut. (See AMINO ACIDS in Part One.)
Liver extract injections plus vitamin B complex and vitamin B <sub>12</sub> and folic acid	2 cc once weekly or as prescribed by physician.	Needed for proper digestion.
vitamin B complex and vitamin B <sub>12</sub> and folic acid	1 cc once weekly or as prescribed by physician. 1 cc twice weekly or as prescribed by physician.	Helps to prevent anemia. Important for proper digestion and to prevent anemia. Deficiency aggravates malabsorption.
or folic acid	1/4 cc twice weekly or as prescribed by physician.	Needed for constant supply of new cells. Injections (under a doctor's supervision) are best. If injections are not available, use a lozenge or sublingual form.
plus extra vitamin B <sub>12</sub> and folic acid	100 mg 3 times daily. 1,000–2,000 mcg daily. 200 mcg daily.	
N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	A major constituent of the barrier layer that protects the intestinal lining from digestive enzymes and other potentially damaging intestinal contents.
Omega-3 essential fatty acids (Kyolic-EPA from Wakunaga, flaxseed oil, primrose oil, and salmon oil)	As directed on label.	Needed for repair of the digestive tract; reduces inflammatory processes. Studies show essential fatty acids may reduce Crohn's symptoms and aid in maintaining remission.
Pancreatin plus bromelain	As directed on label. Take with meals. As directed on label.	To break down protein and assist digestion.
Taurine Plus from American Biologics	500 mg daily, on an empty stomach. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	An important antioxidant and immune regulator. Use the sublingual form.
Vitamin C with bioflavonoids	1,000 mg 3 times daily	Prevents inflammation and improves immunity. Use a buffered type.
Vitamin D	800 IU.	68 percent of people with Crohn's disease have a vitamin D deficiency. Have your blood levels measured to see if this dose is right for you and correct it if not.

Vitamin K	As directed on label.	Vital to colon health. Deficiency is common in people with this disorder due to malabsorption and diarrhea.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for the immune system and for healing. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Important</i>		
Free form amino acid (Amino Balance from Anabol Naturals)	1/4 tsp twice daily.	Protein is essential in the healing of the intestine. Use a sublingual form.
Garlic (Kyolic)	2 capsules 3 times daily, with meals.	Combats free radicals in Crohn's disease. Aids healing.
Lactobacilli (Kyo-Dophilus from Wakunaga) or Capricin from Probiologic	As directed on label.	Aids in digestion. Use a nondairy formula. A product containing both <i>L. acidophilus</i> and <i>L. bifidus</i> is best. Works in conjunction with butyric acid to reduce inflammation and seepage of undigested food particles.
Spiru-tein from Nature's Plus	2 capsules 3 times daily, between meals.	Supplies necessary protein. Helps stabilize blood sugar.
<i>Helpful</i>		
Calcium and magnesium	2,000 mg daily. 1,500 mg daily.	Aids in preventing colon cancer.
Floradix Iron + Herbs from Salus Haus	2 tsp daily.	To prevent anemia, if your physician agrees. Floradix is a readily absorbable form of iron that is nontoxic and derived from food sources.
Gastro-Calm from Olympian Labs	As directed on label.	A combination of herbs and digestive enzymes to help relieve indigestion and reduce gastrointestinal inflammation.
Multivitamin and mineral complex with copper and manganese and selenium plus extra potassium	As directed on label. 99 mg daily.	Malabsorption is often a result of this disorder. Copper, selenium, and manganese are important for treating this disorder and are often deficient because of absorption problems. Use a liquid, powder, or capsule formula. May reduce surgical complications and also the need for surgery.
Oxy-Caps from Earth's Bounty	As directed on label.	An oxygen supplement to counter nutritional deficiencies caused by Crohn's disease.
Quercetin plus bromelain or Activated Quercetin from Source Naturals	500 mg twice daily, before meals. 100 mg twice daily, before meals. As directed on label.	Slows histamine release; helps control food allergies. Needed for a variety of enzyme functions. Improves absorption of quercetin. Contains quercetin plus bromelain and vitamin C.

Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Antioxidants that aid in controlling infection and in repair of the intestinal tract. Use emulsion forms for easier assimilation.
and		
vitamin E	Up to 200 IU daily.	Use d-alpha-tocopherol form of vitamin E.

## Herbs

Aloe vera is beneficial for Crohn's disease because it softens stools and has a healing effect on the digestive tract. Drink ½ cup of aloe vera juice three times daily.

There are many combination herbal products designed to offer gastrointestinal relief. Enzymatic Therapy, Olympian Labs, and Solaray are recommended sources.

Other herbs that are good for this disorder include burdock root, echinacea, fenugreek, goldenseal, licorice, marshmallow root, pau d'arco, enteric-coated peppermint (do not use any other form), red clover, rose hips, silymarin (milk thistle extract), and yerba maté. These herbs support digestion, cleanse the bloodstream, and reduce inflammation and infection. For best results, use them on an alternating basis.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

## Recommendations

Eat a diet consisting mainly of nonacidic fresh or cooked vegetables such as broccoli, Brussels sprouts, cabbage, carrots, celery, garlic, kale, spinach, and turnips. Steam, broil, boil, or bake your food.

Drink plenty of liquids, such as steam-distilled water, herbal teas, and fresh juices. Fresh cabbage juice is very beneficial.

Add papaya to your diet. Chew a couple of the seeds to aid digestion.

During an acute attack, eat organic baby foods, steamed vegetables, and well-cooked brown rice, millet, and oatmeal.

Try eliminating all dairy foods (including cheese), fish, hard sausage, pickled cabbage, and yeast products from your diet, and see if symptoms improve. These foods are high in histamine. Many people with Crohn's disease are histamine-intolerant. Milk and other dairy products also

contain carrageenan, a compound extracted from red seaweed. Carrageenan, which is widely used in the food industry for its ability to stabilize milk proteins, has been shown to induce ulcerative colitis in laboratory animals.

Avoid alcohol, caffeine, carbonated beverages, chocolate, corn, nuts, popcorn, eggs, foods with artificial additives or preservatives, fried and greasy foods, margarine, meat, dairy products such as milk and cheese, pepper, spicy foods, tobacco, white flour, and all animal products, with the exception of white fish from clear waters. These foods are irritating to the digestive tract. Mucus-forming foods such as processed, refined foods and dairy products should also be avoided. Limit your intake of barley, rye, and wheat.

Avoid refined carbohydrates. Do not consume such foods as boxed dry cereals or anything containing any form of sugar. Diets high in refined carbohydrates have been associated with Crohn's disease. These foods must be eliminated from the diet.

Check stools daily for bleeding.

As much as possible, avoid stress. Our thoughts, nervous systems, and bodily functions are deeply interconnected. Our thoughts and moods affect our bodies. During an attack, rest is important.

Make sure the bowels move daily, but do not use harsh laxatives. (See CONSTIPATION and/or DIARRHEA in Part Two.) Gentle enemas made by adding a dropperful of alcohol-free herbal extract and 1 teaspoon of nondairy acidophilus powder to 2 quarts of lukewarm water are good. Accumulations of toxic body wastes often become breeding grounds for parasitic infestation. Toxins can also be absorbed into the bloodstream through the colon wall. Psyllium husks should be used daily to add fiber to the diet; this aids in removing toxins before they are absorbed.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Do not use rectal suppositories that contain hydrogenated chemically prepared fats.

If you are constipated, use a cleansing enema. (See ENEMAS in Part Three.)

Use a heating pad to reduce abdominal pain.

## Considerations

There are no consistent dietary rules that apply to everyone, but people with Crohn's disease are generally encouraged to eat a healthy diet to help the body replace lost nutrients. Moreover, some nutrients, such as essential fatty acids and the amino acid glutamine, have been shown to help maintain a state of remission. However, one study using 4 grams of fish oil (up to 80 percent omega-3s) per day had no effect over one year's time on whether people who

were in remission from Crohn's disease relapsed. It is possible that the dose was not large enough to see an effect, but the study was well done and included nearly 400 patients from around the world.

❑ It is important that nutritional deficiencies be corrected for healing. Persons with inflammatory bowel disorders require as much as 30 percent more protein than normal. If chronic diarrhea is present, electrolyte and trace mineral deficiencies should be considered. Chronic steatorrhea (fatty stools resulting from improper digestion of fats) may result in deficiencies of calcium and magnesium.

❑ Drugs such as corticosteroids and sulfasalazine (Azulfidine), which are prescribed for inflammatory bowel diseases, and cholestyramine (Questran), which is prescribed to bind bile in the gastrointestinal tract to prevent its reabsorption in people who had part of their intestine removed, increase the need for nutritional supplements. Corticosteroids depress protein synthesis and inhibit normal calcium absorption by increasing excretion of vitamin C in the urine. Deficiencies of other nutrients, such as zinc, potassium, vitamin B<sub>6</sub> (pyridoxine), folic acid, and vitamin D, decrease bone formation and slow healing. Sulfasalazine inhibits the transport of folic acid and iron, causing anemia.

❑ Antioxidants decrease a person's risk of developing Crohn's disease. The intestinal walls normally contain small amounts of the antioxidant enzymes superoxide dismutase (SOD), catalase, and glutathione peroxidase, but their ability to fight free radicals may be overwhelmed during periods of active inflammation that results in tissue damage.

❑ To reestablish a proper healing environment, it is necessary to maintain a generally alkaline (greater than 7.0) bodily pH.

❑ Adhering to an allergen-free diet, replacing lost nutrients, and using selected herbs can speed healing and may prevent future disturbances. Studies have proven that when a person who has achieved remission goes back to his or her former diet, Crohn's disease returns. Other things that have been implicated in this disorder include prolonged stress, trauma, and psychosomatic and vascular factors.

❑ Nutritional deficiencies resulting from malabsorption may weaken the immune system, in turn prolonging the time required for the inflammation and ulcers to heal.

❑ Many microorganisms have been considered as possible causes of Crohn's disease, including fungi, bacteria, viruses, mycobacteria, pseudomonas-like organisms, and chlamydia. However, the cause of Crohn's disease has not yet been established. It is likely that multiple factors are involved.

❑ Antigenic reactions may result from "leaky gut syndrome," in which minute particles of undigested or partially digested food pass through the swollen and inflamed

mucosal wall into the bloodstream, where they cause reactions. The mucosal wall must be repaired to avoid this. Avoiding foods that cause a reaction is important. (See ALLERGIES in Part Two.) Treatment with butyric acid, a mono-unsaturated fatty acid, reduces inflammatory conditions, reduces seepage of undigested food particles, and aids in repair of the mucosal wall. N-acetylglucosamine (NAG) prevents leaky gut syndrome.

❑ Some foods—such as fruits and vegetables—are protective against getting Crohn's disease and some—such as fatty foods—increase the risk. Children are especially vulnerable to the effects of certain foods. In one study, four food patterns were identified and each had a different impact on the risk for Crohn's disease. Foods that seemed to prevent it were vegetables, fruits, olive oil, fish, grains, and nuts. Foods that were thought to cause it—only in girls—were meats, desserts, and fatty foods in general.

❑ If Crohn's disease continues for many years, bowel function gradually deteriorates. Surgery may be required to remove the diseased portion of the intestine. While this surgery doesn't cure the disease, it can relieve symptoms, and five years later at least 50 percent of people who undergo it are in good health, can work full-time, and enjoy life without being restricted by diarrhea or pain.

❑ People with Crohn's disease have a significantly higher than normal risk of developing colon cancer. If you have this disorder, you should undergo a colonoscopy at least once every two years, starting eight to ten years after diagnosis.

❑ Most people with Crohn's disease are initially treated with drugs, particularly corticosteroids, such as Budesonide, to help control inflammation. This newer drug has fewer side effects than the older corticosteroids. Drugs that suppress the immune system are also used, but they can increase susceptibility to infection. Currently, the drugs methotrexate (Trexall, Rheumatrex) and cyclosporine (Neoral, Sandimmune, SangCya) are being tried along with the traditional immunosuppressive drugs. Some of these drugs may be enhanced with 3 grams of fish oil containing 400 milligrams of EPA and 200 milligrams of DHA.

❑ The Food and Drug Administration (FDA) approved under an accelerated program a genetically engineered product called infliximab (Remicade). Remicade is an intravenously administered drug for people with moderate-to-severe Crohn's disease who have not responded to traditional treatments. Remicade works specifically against a protein that promotes inflammation, and it has been shown to reduce intestinal inflammation. In drug trials, one dose relieved many of the symptoms for two to four weeks, after which the benefits waned. Because the long-term toxic effects of the drug are unknown, scientists are still trying to better define risks and benefits. A new study showed that infliximab helped to improve symptoms over a five-year period and changed disease outcome by decreasing the rate of

hospital admissions and surgery. A second drug, adalimumab (Humira), was also approved.

Natalizumab (Tysabri) is another drug, approved in 2008, that appears to reduce symptoms and improve quality of life. This drug decreases inflammation by binding to immune cells and preventing them from getting to the intestines to cause inflammation. Antibiotics are used to treat the bacterial infections that often accompany Crohn's disease.

Interleukin-10 is a cytokine that suppresses inflammation. It has shown some promise in treating Crohn's disease.

Growth hormone seems to help adult patients with Crohn's disease to increase their activity levels. This must be done under a doctor's supervision. In one study, side effects were headaches and swelling (edema), but these resolved within the first month of treatment.

## CROUP

Croup, or laryngotracheobronchitis, is a viral infection that causes the larynx or trachea (the upper part of the windpipe, near the vocal cords) to narrow due to swelling. The larynx goes into spasms, and the sufferer experiences difficulty breathing; a harsh, barking cough; hoarseness; tightness in the lungs; and feelings of suffocation. Mucus production may also increase, further clogging the airway.

At the beginning, croup has all the hallmarks of the common cold. It starts off with congestion, a runny nose, and a cough that develops into the distinctive barking cough associated with croup. Another trademark of croup is a harsh, wheezing noise that is made when air is breathed in through the constricted windpipe and over the inflamed vocal cords.

Croup accounts for approximately 15 percent of clinic and emergency room visits for pediatric respiratory infections. In North America, incidence peaks in the second year of life at 5 to 6 cases per 100 children. Approximately 5 percent of children experience more than one episode. Croup is most common in late fall and early winter but may be seen at any time of year. Attacks frequently occur at night. In the past, this illness was often caused by the measles virus, but now that children are immunized against measles, croup has become much less common than it once was. The virus usually runs its course in five to six days.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Vitamin C with bioflavonoids	Children 6–12 months old: 60 mg 4 times daily. Children 1–4 years old: 100 mg 4 times daily. Children over 4 years: 500 mg 4 times daily.	Helps control infection and fever by boosting the immune system.

Zinc	Children 6–12 months old: 5 mg once daily for 3 days. Children 1–3 years old: 5 mg twice daily for 3 days. Children over 3 years: 5 mg 3 times daily.	Promotes immune function and is necessary in healing. Use lozenges for faster absorption.
------	---	---

### Very Important

Vitamin A with mixed carotenoids	2,000 IU daily.	Needed for healing of the mucous membranes. Use an emulsion form.
Vitamin E	Children 4–8 years old: 50 IU daily. Children 9–13 years old: 100 IU daily.	Destroys free radicals and carries oxygen to all cells. Use an emulsion form for best absorption. Use d-alpha-tocopherol form.

## Herbs

The following herbs are recommended for croup: echinacea, fenugreek, goldenseal, and thyme. Echinacea tincture should be taken if a fever is present. Take 15 drops in liquid every three to four hours.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Put a few drops of eucalyptus oil in a vaporizer and inhale the steam. It makes it easier for a child to breathe if the air is kept humidified.

Give a child with croup very warm ginger herb baths; then immediately wrap the child in a heavy towel or blanket, and put him or her to bed to perspire. This helps loosen mucus and rid the body of toxins. You can also let your child stay in a steam-filled bathroom for ten or fifteen minutes. The moisture makes it easier to breathe.

## Recommendations

Give a child with croup plenty of fluids to help to thin mucus. Steam-distilled water, herbal teas, and homemade soups are good choices.

Apply hot onion packs over the chest and back three times a day. Slice onions and place them between cloths, and then apply the pack and cover it with a heating pad. Onion packs open the pores and relieve congestion.

If a child with croup is having difficulty breathing, take him or her to the emergency room of the nearest hospital for treatment and for X-rays of the larynx. Oxygen may be needed. Milder cases of croup can be treated at home, but parents should be alert for signs of increasing breathing difficulty.

## Considerations

- ❑ Croup is a viral infection, so antibiotics will not help. In most cases, self-care measures at home—such as breathing moist air and drinking fluids—can speed your child’s recovery. More aggressive treatment is rarely needed.
- ❑ If your child’s symptoms persist or worsen, his or her doctor may prescribe corticosteroids, epinephrine, or another medication to open the airways. For severe croup, your child may need to spend time in a hospital receiving humidified oxygen. Rarely, a temporary breathing tube may need to be placed in a child’s windpipe.
- ❑ Fresh cold air may also help a child with croup to breathe by reducing the swelling of the trachea and larynx.

## CUSHING’S SYNDROME

See under ADRENAL DISORDERS.

## CYSTIC FIBROSIS

Cystic fibrosis (CF) is the most common inherited illness among Americans of northern and western European ancestry. It occurs in people of all ethnic backgrounds and is most common in Caucasians. It occurs with approximately equal frequency in men and women. About 30,000 people in the United States (70,000 worldwide) have been diagnosed with CF and 1,000 new cases are diagnosed each year.

It is estimated that about 12 million Americans—adults and children—are silent carriers of the defective gene that leads to this disease. Many of them don’t know that they are CF carriers. The gene responsible for CF was identified in 1989 on human chromosome 7, and it encodes instructions for a protein that regulates the passage of salt in and out of the cells of the body’s exocrine glands. This defective gene transforms the protein called the cystic fibrosis transmembrane conductance regulator (CFTR) and causes it to produce a mucus too thick and too abundant for the body to excrete.

In most people with CF, the genetic instructions omit just one of the protein’s 1,480 constituent amino acids—a tiny glitch, but a devastating one that affects many different glands in the body, including the pancreas, sweat glands, and glands of the digestive and respiratory systems.

All human cells (except red blood cells, eggs, and sperm) contain two copies of this gene, one inherited from each parent. CF results when both copies of the “CF gene” are abnormal. If one copy is abnormal and the other is normal, an individual is said to be a carrier. He or she will show no signs of CF, but can pass on a defective gene to offspring. Statistically, a child of two carrier parents has a 1-in-4 chance of inheriting CF; a 1-in-4 chance of being completely free of the mutant gene; and a 1-in-2 chance of being a carrier, like the parents.

The airway, gastrointestinal tract, bile ducts of the liver, ducts of the pancreas, and the male genitourinary tract all

produce mucus. Cystic fibrosis alters this normally protective mucus and transforms it into a thick, abnormal excretion that obstructs airways and damages tissue. Symptoms of CF begin early in life. Glands in the lungs and bronchial tubes secrete large quantities of thick, sticky mucus that blocks lung passages and provides the perfect place for harmful bacteria to thrive. *Pseudomonas aeruginosa* (also seen in cancer and burn patients) is the bacteria that most commonly colonizes the lungs, resulting in chronic coughing and wheezing, difficulty breathing, and recurrent lung infections. Once established, the bacteria remain in the lungs and are responsible for repeated outbreaks of infection.

The bacteria form their own dense structure, called a biofilm, and are immune to most current treatments. They also produce toxic proteins that can cause tissue damage and weaken the immune system. The lungs of many children with CF are inhabited or colonized by the *Pseudomonas aeruginosa* bacteria before they are ten years of age.

Thick secretions also often obstruct the release of pancreatic enzymes, resulting in digestive difficulties and malabsorption problems, particularly problems with the metabolism of fats. Malnutrition may result because a lack of necessary digestive enzymes means that nutrients from foods are not properly absorbed. This in turn can cause pain after eating and, especially in young children, a failure to gain weight normally. Pancreatic enzymes need to be replaced to counter this.

Persons with this disease also lose excessive amounts of salt through their sweat glands. Sweating may be profuse, and the sweat itself contains abnormally high concentrations of sodium, potassium, and chloride salts. Other signs suggestive of CF include clubbing of the fingers and toes (a result of poor oxygenation due to weak lung function); greasy, bulky, foul-smelling stools; and salty-tasting skin. The reproductive organs may be affected, causing infertility in almost all men and some women.

The identification of the CF gene has enabled researchers to begin developing new approaches to diagnosis and treatment of the disease. A test is now available in which cells are swabbed from the inside of the cheek and then examined for the presence of defective genes. The presence of both normal and mutant CF genes indicates that the individual is a carrier. If only mutant genes are there, CF is indicated.

The most widely used test for CF is the electrolyte sweat test. Developed over forty years ago, the sweat test detects the excessive amounts of electrolytes (charged mineral salts) found on the skin of many people with CF. A physician would likely recommend that a sweat test be performed on a child who failed to gain weight despite adequate feeding, or who suffered from very frequent respiratory infections. CF testing is currently recommended only for those individuals with symptoms highly suggestive of the disease, or with a family history of the disorder. However, if there is doubt about the diagnosis, the sweat test can be confirmed by performing a genetic test.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Complete Enzyme Blend	As directed on label, on an empty stomach. Take between meals.	Aids in controlling infection, helps digestion, and thins the mucous secretions of the lungs. Contact your physician to find a high-quality enzyme blend. Some of the food-based enzymes do not have the same potency as non-food-based enzymes.
Vitamin A plus carotenoid complex with beta-carotene	As directed on label.	Aids in the maintenance and repair of epithelial tissue, which makes up the mucous membranes. Use emulsion form for better absorption and greater safety at higher doses.
Vitamin B complex plus extra	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Aids in digestion, healing, and tissue repair.
vitamin B <sub>2</sub> (riboflavin)	50 mg 3 times daily.	
Vitamin B <sub>12</sub>	1,000–2,000 mcg daily, on an empty stomach.	Needed for proper digestion and assimilation of nutrients, including iron. Use a lozenge, sublingual, or spray form.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	For tissue repair and immune function.
Vitamin E	As directed on label. Do not to exceed 200 IU daily from all supplements.	Repairs tissue and prevents cell damage. Also helps in the utilization of vitamin A. Use d-alpha-tocopherol form.
Vitamin K or alfalfa	100 mcg twice daily.	Deficiency is common in those with this disorder. Needed for proper digestion. See under Herbs, below.
<b>Important</b>		
Essential fatty acids (fish oil, primrose oil)	As directed on label.	Relieves inflammation. <i>Caution:</i> DHA omega-3 oil had no effect on breathing in children with Delta 508 homozygous cystic fibrosis. So don't use DHA alone; use a blend of DHA and EPA.
Protein supplement or free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	Needed for healing. Use protein from a vegetable source or a free form amino acid. Speak to your doctor before using a protein supplement.

Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in immune function and healing of tissue. Use zinc gluconate lozenges or OptiZinc for best absorption. Taking 30 mg a day may allow children to take less antibiotics to treat upper respiratory infections.
------	--	--

### Helpful

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily.	Acts as an immunostimulant.
Copper and selenium	3 mg daily. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Low levels of copper and selenium have been linked to cystic fibrosis.
Kyo-Green from Wakunaga or chlorophyll	As directed on label. As directed on label.	To supply minerals and chlorophyll needed to control infection.
L-cysteine and L-methionine	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed for repair of lung tissue and to protect the liver. (See AMINO ACIDS in Part One.)
Lipoic acid	As directed on label.	Helps the pancreas to function properly and controls the metabolism of sugar.
Methylsulfonylmethane (MSM)	As directed on label.	Clinical tests have proven that this supplement combats lung damage.
Pycnogenol	As directed on label.	A powerful antioxidant that also protects the lungs.
Raw pancreas glandular and raw spleen glandular and raw thymus glandular	As directed on label. As directed on label. As directed on label.	To relieve inflammation. (See GLANDULAR THERAPY in Part Three.)
Vitamin D	400 IU daily.	Aids in protecting the lungs.

### Herbs

- Alfalfa extract supplies vitamin K and necessary minerals, which are often deficient in those with cystic fibrosis due to absorption problems. It is also a good source of chlorophyll.
- Boswellia, bromelain, cayenne, ginger, and peppermint can aid in reducing inflammation.
- Expectorant herbs such as cayenne, elecampane, garlic, horehound, hyssop, and mullein may be effective in helping to clear some of the congestion.
- ClearLungs from RidgeCrest Herbals is a Chinese herbal formula that is highly recommended for this condition.

Eucalyptus, garlic, onion, tea tree oil, and thyme have natural antiseptic properties and fight infection.

Echinacea, licorice, and Siberian ginseng are good for building up the immune system.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

Lung Tonic from Herbs, Etc., is a combination of many organic herbs designed to support the lungs.

Other herbs beneficial for cystic fibrosis include ginger, goldenseal, and yarrow tea.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

Eat a diet consisting of 75 percent raw fruits and vegetables, and raw nuts and seeds.

Make sure your intake of calories, protein, and other nutrients is adequate. People with CF require as much as 50 percent more of many nutrients than normal. Take supplements to provide required enzymes, vitamins, and minerals. Antioxidant supplements (vitamins A, E, and Coenzyme Q<sub>10</sub>) have been shown to increase blood levels of these nutrients and reduce airway inflammation. The supplements were given in a novel micellar formulation to allow for better absorption.

Include in the diet foods that are high in germanium, such as garlic, shiitake mushrooms, and onions. Germanium helps to improve tissue oxygenation at the cellular level.

During hot weather, drink plenty of fluids and increase your salt intake.

Do not eat foods that stimulate secretions by the mucous membranes. Cooked and processed foods cause excess mucus buildup and drain the body of energy. These foods are harder to digest. Do not eat animal products, dairy products, processed foods, sugar, or white flour products.

When you must take antibiotics, take acidophilus to replace "friendly" bacteria.

## Considerations

Recent media reports on the beneficial effects of the spice turmeric (actually, its pigment, curcumin) in treating CF should not be taken to indicate that this is a cure. It is true that in animal tests conducted by Yale University, curcumin achieved beneficial results. Curcumin is a weak calcium-pump inhibitor and this enhances the energy transport mechanism of the cell, which appears to be defective in patients with CF. At this point, researchers caution that taking curcumin pills as a supplement, along with the existing CF drug therapies, has not been tested and could pose hazards. A phase I safety trial is being conducted. Research is still in the preliminary stages.

The symptoms of cystic fibrosis are normally controlled with a number of different drugs. Antibiotics are used to combat the infections to which people with CF are prone, especially infection with *Pseudomonas aeruginosa*, a type of microbe that is attracted to the sticky mucus in the lungs.

Pancrelipase (also sold under a variety of brand names, including Viokase) is a prescription product containing a combination of digestive enzymes that is often prescribed for people with CF and other pancreatic insufficiencies.

Many people also take anti-inflammatory drugs such as ibuprofen (Advil, Nuprin, and others), naproxen (Naprosyn, Aleve), or prednisone (Deltasone and others).

A small handheld device called the Flutter helps people with CF to dislodge mucus from the airways. It can replace conventional physiotherapy.

The future of CF treatment may lie in gene therapy. In the laboratory, normal CF genes have been successfully introduced into cells from people with CF. Experiments in rats have indicated that replacing the defective CF genes with normal ones in just 10 percent of the lung-lining cells improves lung function. However, because the genes in the cells of the reproductive system are unaffected by this procedure, the defect can still be passed on to offspring. As part of this gene therapy, work is proceeding with vector aerosols. A vector is like a shuttle that can deliver a good copy of the defective gene to the appropriate place in the body.

Dornase (Pulmozyme) is a naturally occurring enzyme that breaks down DNA molecules. Part of the reason the mucus that clogs the airways of people with CF is so thick and sticky is that it contains large molecules of DNA released by white blood cells as they die fighting chronic bacterial infection. This makes the mucus even denser and more difficult to expel. Breaking down the DNA molecules helps to thin the mucus. Other drugs that are used to increase sputum volume and decrease its thickness include N-acetylcysteine (Mucomyst) and guaifenesin (Humibid LA, Entex). Still others such as albuterol (Ventolin) and theophylline (Theo-Dur) open airways.

Levels of two fatty acids—arachidonic acid (AA) and docosahexaenoic acid (DHA)—have been found to be out

of balance in people with CF. This lipid imbalance is most noticeable in the lungs, pancreas, and intestine—all of the areas most affected by cystic fibrosis. Research in this area seems promising.

When the antibiotic tobramycin (Nebcin) is administered by aerosol spray, it has proved to be more effective in reaching infected lung tissue than when administered through the traditional intravenous route.

Low levels of selenium and vitamin E have been linked to cystic fibrosis and cancer.

Further information about cystic fibrosis is available from the Cystic Fibrosis Foundation. (See Health and Medical Organizations in the Appendix.)

**CYSTITIS**

See BLADDER INFECTION.

**DANDRUFF**

Dandruff is a common scalp condition that occurs when dead skin is shed, producing irritating white flakes. It is usually a condition of oily, rather than dry, skin, and occurs as skin cells renew themselves and the old cells are shed.

Some people tend to generate and discard skin cells at a faster rate than others. Recent research shows that severe cases of flaking scalp, usually associated with seborrhea (a type of dermatitis), may be caused by an overgrowth of the yeast *Pityrosporum ovale*, which lives naturally on the skin.

Dandruff can be triggered by trauma, illness, hormonal imbalances, improper carbohydrate consumption, and the consumption of sugar. Deficiencies of nutrients such as the B-complex vitamins, essential fatty acids, and selenium have been linked to dandruff as well. Dandruff is normally worse in the winter months.

Dandruff is an annoying and embarrassing problem, but is rarely serious. There is no cure for dandruff, but the condition can be minimized.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Essential fatty acids (flaxseed oil, primrose oil, or salmon oil)	As directed on label.	Helps to relieve itching and inflammation; essential for healthy skin and scalp.
Kelp	1,000–1,500 mg daily.	Supplies needed minerals, especially iodine, for better hair growth and healing of the scalp.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	An important antioxidant to aid in controlling dry scalp.
Vitamin B complex plus extra	100 mg of each major B vitamin twice daily, with meals (amounts of individual vitamins in a complex will vary).	B vitamins are needed for healthy skin and hair. Use a high-stress formula. Sublingual forms are best for absorption.

vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50 mg twice daily.	
Vitamin E	200 IU daily.	For improved circulation. Use d-alpha-tocopherol form.
Zinc lozenges	One 15-mg lozenge 5 times daily for 1 week. Do not exceed a total of 100 mg daily from all supplements.	Protein metabolism depends on zinc. The skin is composed primarily of protein.

*Important*

Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	Needed for repair of all tissues and for proper hair growth. Use a formula containing both essential and nonessential amino acids.
L-cystine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed for flexibility of the skin and for hair texture. (See AMINO ACIDS in Part One.)

Vitamin A plus mixed carotenoids	Up to 20,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily.	Helps prevent dry skin. Aids in healing of tissue. Antioxidants and precursors of vitamin A.
----------------------------------	---	--

Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	An important antioxidant to prevent tissue damage to the scalp and to aid in healing.
------------------------------	---	---

*Helpful*

Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Protects the scalp and strengthens cell membranes of the scalp and hair.
-------------------------------	---	--

**Herbs**

- An infusion of thyme may be used as a hair rinse.
- Aloe vera cream or gel is a powerful antiseptic and anti-inflammatory. Twice a day applications of the pure gel, or a shampoo containing aloe vera, should be beneficial.
- Those with dandruff can benefit from taking dandelion, goldenseal, and red clover.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

**Recommendations**

- Eat a diet consisting of 50 to 75 percent raw foods. Eat soured products such as yogurt.
- Avoid fried foods, dairy products, sugar, flour, chocolate, nuts, and seafood.

- See FASTING in Part Three and follow the program once a month.
- Before washing your hair, add about 8 tablespoons of pure organic peanut oil to the juice of half a lemon and rub the mixture into your scalp. Leave it on for five to ten minutes, then shampoo.
- Try rinsing your hair with vinegar and water instead of plain water after shampooing. Use ¼ cup vinegar to 1 quart of water.
- If antibiotics are prescribed, take extra B-complex vitamins. Also take an acidophilus supplement to replace the “friendly” bacteria that are destroyed by antibiotics.
- Do not pick or scratch the scalp. Make sure to wash your hair frequently, and use a non-oily shampoo. Use natural hair products that do not contain chemicals. Avoid using irritating soaps and greasy ointments and creams. Massage your scalp first before washing your hair.
- Do not use a shampoo containing selenium on a daily basis, even if it aids in controlling dandruff.
- If dandruff is persistent or symptoms seem to be getting worse, or if it appears in areas other than the scalp, consult your health care provider.

### Considerations

- Some people have found that sun exposure helps clear up dandruff, but others find that it seems to make the problem worse.
- It is best not to use over-the-counter ointments for dandruff. They can often do more harm than good.
- Nizoral A-D is an antifungal dandruff shampoo.
- See also SEBORRHEA in Part Two.

### DEAFNESS

See HEARING LOSS.

### DEPRESSION

Depression—including anxiety—affects one in five Americans aged eighteen and older every year, making it one of the most common medical problems in the United States. It affects young and old, and is twice as common in women as in men.

Depression is a whole-body illness, one that affects the body, nervous system, moods, thoughts, and behavior. It affects the way you eat and sleep, the way you feel about yourself, and the way you react to and think about the people and things around you. Symptoms can last for weeks, months, or years. There are many types of depression, with variations in the number of symptoms, their severity, and persistence.

People with depression typically withdraw and hide from society. They lose interest in things around them and become incapable of experiencing pleasure. Symptoms of depression include chronic fatigue, sleep disturbances (either insomnia or excessive sleeping), changes in appetite, headaches, backaches, digestive disorders, restlessness, irritability, quickness to anger, loss of interest or pleasure in hobbies, and feelings of worthlessness and inadequacy.

Many think of death and consider suicide. Things appear bleak and time seems to pass slowly. A person with depression may be chronically angry and irritable, sad and despairing, or display little or no emotion at all. Some try to “sleep off” depression, or do nothing but sit or lie around.

Older adults with hardening of the arteries (atherosclerosis) are more likely to have depression than older adults without the coronary disorder, according to a study by Dutch researchers. This study, reported in the journal *Archives of General Psychiatry*, suggested a relationship between vascular factors, such as hardening of the arteries or calcium deposits in the blood vessels, and late-life depression. A theory has been put forward that atherosclerosis may have an effect on the brain that leads to depression. Depression is *not* a normal part of growing older, but rather a treatable condition that affects more than 5 million Americans over the age of sixty-five, according to the American Association for Geriatric Psychiatry.

There are three main types of clinical depression: major depressive disorder, dysthymic disorder, and bipolar depression (the depressed phase of bipolar disorder). Within these types are variations in the number of associated mental symptoms, their severity, and their persistence. Unlike major depressive disorder, dysthymic disorder—a chronic but less severe type of depression—does not strike in discrete episodes, but is instead characterized by milder, persistent symptoms that may last for years. Although it usually doesn’t interfere with everyday tasks, people with this milder form of depression rarely feel like they are functioning at their full capacities. Bipolar disorders usually begin as depression, but as they progress, they involve alternating episodes of depression and mania, which is characterized by abnormally and persistently elevated mood, energy, restlessness, or irritability. As a result, bipolar depression is commonly known as manic depression. Other symptoms of mania include overly inflated self-esteem, a decreased need for sleep, and increased talkativeness, racing thoughts, distractibility, physical agitation, and excessive risk-taking. Because bipolar disorder requires different treatment than major depression or dysthymia, obtaining an accurate diagnosis is extremely important. (See BIPOLAR MOOD DISORDER in Part Two.)

This section focuses primarily on various types of unipolar depression.

The causes of depression are not fully understood, but they are probably many and varied. Depression may be triggered by tension, stress, a traumatic life event, a hyperstimulated immune system, chemical imbalances in the

brain, thyroid disorders, nutritional deficiencies, poor diet, the consumption of sugar, mononucleosis, lack of exercise, endometriosis, any serious physical disorder, or even allergies. One of the most common causes of depression is food allergies. Hypoglycemia (low blood sugar) is another common cause of depression. Heredity is a significant factor in this disorder. In up to 50 percent of people suffering from recurrent episodes of depression, one or both of the parents also experienced depression. Death rates can be higher for depressed people, too. A recent study based on the Women's Health Initiative, the largest study of U.S. women's health ever undertaken, shows that depressed women had a 50 percent greater chance of dying of heart attack, and 30 percent higher chance of dying from other causes, than nondepressed women. This was in spite of the fact that the depression was only mild or moderate, and was under treatment. Why this should be is still unknown.

Whatever the factors that trigger it, depression begins with a disturbance in the part of the brain that governs moods. Most people can handle everyday stresses; their bodies readjust to these pressures. When stress is too great for a person and his or her adjustment mechanism is unresponsive, depression may be triggered.

Perhaps the most common type of depression is a chronic low-grade depression called *dysthymia*. This condition involves long-term and/or recurring depressive symptoms that are not necessarily disabling but keep a person from functioning normally and interfere with social interactions and enjoyment of life. Research has found that this type of depression often results from (unconscious) negative thinking habits. Double depression is a variation of dysthymia in which a person with chronic, low-grade depression periodically experiences major depressive episodes, then returns to his or her "normal," mildly depressed state.

Some people become more depressed in the winter months, when the days are shorter and darker. This type of disorder is known as seasonal affective disorder (SAD). Women are more likely to suffer from SAD than are men. People who suffer this type of depression in the winter months lose their energy, suffer anxiety attacks, gain weight as a result of craving the wrong foods, sleep too much, and have a reduced sex drive. Many people get depressed around the December holidays. While most of them probably just have the "holiday blues," some of them may be suffering from SAD. Suicides also seem to be highest during this time of year.

Foods greatly influence the brain's behavior. A poor diet, especially one with a lot of junk foods, is a common cause of depression. The levels of brain chemicals called neurotransmitters, which regulate our behavior, are controlled by what we eat, and neurotransmitters are closely linked to mood. The neurotransmitters most commonly associated with mood are dopamine, serotonin, and norepinephrine. When the brain produces serotonin, tension is eased. When it produces dopamine or norepinephrine, we tend to think and act more quickly and are generally more alert.

At the neurochemical and physiological levels, neurotransmitters are extremely important. These substances carry impulses between nerve cells. Serotonin, for example, plays a role in mood, sleep, and appetite. Low levels of serotonin can lead to depression, anxiety, and sleep disorders.

The substance that processes serotonin is the amino acid tryptophan. The consumption of tryptophan increases the amount of serotonin made by the brain. Thus, eating complex carbohydrates (not simple carbohydrates such as fructose, sucrose, and lactose), which raise the level of tryptophan in the brain (thereby increasing serotonin production), has a calming effect. High-protein foods, on the other hand, promote the production of dopamine and norepinephrine, which promote alertness.

The American Psychiatric Society estimates that most cases of depression can be treated effectively, but that 80 percent of people who suffer from depression do not get the help they need. Many people do not seek treatment because they are ashamed, or they feel lethargic and despondent. In many cases, people with major depression only seek help when they are at the point of breakdown, or when they are hospitalized following a suicide attempt (an estimated 15 percent of chronic depression cases result in suicide). A good support system from friends and family members is often crucial in getting a depressed person to seek help for his or her illness.

According to the National Institute of Mental Health (NIMH), most people with a depressive illness do not get the help they need, although the great majority—even those whose depression is severe—can be helped. Without treatment (nutrition is very important), the symptoms of depression can last for weeks, months, or even years. With treatment, many people can find relief from their symptoms and lead a normal, healthy life.

The following nutrients are helpful for those suffering from depression. Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Essential fatty acids (Kyolic-EPA from Wakunaga, salmon oil, flaxseed oil, or primrose oil)	As directed on label. Take with meals.	Aid in the transmission of nerve impulses; needed for normal brain function.
5 Hydroxytryptophan (5-HTP)	As directed on label.	Increases the body's production of serotonin. It should not be used with other antidepressants.

L-tyrosine	Up to 50 mg per pound of body weight daily. Take on an empty stomach with 50 mg vitamin B <sub>6</sub> and 100–500 mg vitamin C for better absorption. Best taken at bedtime.	Alleviates stress by boosting production of adrenaline. It also raises dopamine levels, which influence moods. ( <i>See</i> AMINO ACIDS in Part One.) <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug.
S-adenosylmethionine (SAME) (SAME Rx-Mood from Nature's Plus)	As directed on label.	Works as an antidepressant. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Sub-Adrene from American Biologics	As directed on label.	A dietary supplement for adrenal support.
Taurine Plus from American Biologics	As directed on label.	An important antioxidant and immune regulator, necessary for white blood cell activation and neurological function. Use the sublingual form.
Vitamin B complex injections	2 cc once weekly or as prescribed by physician.	B vitamins are necessary for the normal functioning of the brain and nervous system. If depression is severe, injections (under a doctor's supervision) are recommended. All injectables can be combined in a single shot. Needed for normal brain function. May help lift depression.
plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> or vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) plus vitamin B <sub>3</sub> (niacin)	1/2 cc once weekly or as prescribed by physician. 1 cc once weekly or as prescribed by physician. As directed on label. 500 mg daily. 50 mg 3 times daily.	Linked to the production of the neurotransmitter acetylcholine. If injections are not available, a sublingual form of B complex is recommended. The most potent anti-stress vitamin.
plus vitamin B <sub>12</sub> and folic acid	50 mg 3 times daily. Do not exceed this amount. 1,000–2,000 mcg daily. 400 mcg daily.	Improves cerebral circulation. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure. Found to be deficient in people with depression.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Found to be deficient in people with depression. Use zinc gluconate lozenges or OptiZinc for best absorption.

**Important**

Choline and inositol or lecithin	100 mg each twice daily. As directed on label.	Important in brain function and neurotransmission. <i>Caution:</i> Do not take these supplements if you suffer from bipolar mood disorder.
----------------------------------	---	--

**Helpful**

Calcium and magnesium	1,500–2,000 mg daily. 1,000 mg daily.	Has a calming effect. Needed for the nervous system. Works with calcium. Use magnesium aspartate or magnesium chelate form.
Chromium	300 mcg daily.	Aids in mobilizing fats for energy.

Gamma-amino-butyric acid (GABA)	750 mg daily. Take with 200 mg niacinamide for best results.	Has a tranquilizing effect, much as diazepam (Valium) and other tranquilizers do. ( <i>See</i> AMINO ACIDS in Part One.)
Lithium	As prescribed by physician.	A trace mineral used to treat bipolar mood disorder. Available by prescription only.
Multivitamin and mineral complex	As directed on label.	To correct vitamin and mineral deficiencies, often associated with depression.
Nicotinamide adenine dinucleotide (NADH)	5–15 mg daily.	Enhances production of dopamine, serotonin, and noradrenaline, which are key neurotransmitters.
Vitamin C with bioflavonoids plus extra rutin	2,000–5,000 mg daily, in divided doses. 200–300 mg daily.	Needed for immune function. Aids in preventing depression. Buckwheat-derived bioflavonoid. Enhances vitamin C absorption.

**Herbs**

- Balm, also known as lemon balm, is good for the stomach and digestive organs during stressful situations.
- Ginger, ginkgo biloba, licorice root, oat straw, peppermint, and Siberian ginseng may be helpful.

*Cautions:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

- Kava kava helps to induce calm and relieve depression.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

- St. John's wort acts in the same way as monoamine oxidase (MAO) inhibitors do, but less harshly.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

**Recommendations**

- Eat a diet that includes plenty of raw fruits and vegetables, with soybeans and soy products, whole grains, seeds, nuts, brown rice, millet, and legumes. A diet too low in complex carbohydrates can cause serotonin depletion and depression.
- If you are nervous and wish to become more relaxed, consume more complex carbohydrates. For increased alert-

## Can Depression Be Caused by Testosterone Deficiency?

Testosterone deficiency is a factor in causing depression and a host of age-related ailments in men such as erectile dysfunction. Many people are leery of testosterone because of media hype concerning sports-related usage. But there is more than one type of testosterone, and one is beneficial. First of all, it is true that all the anabolic steroids are “bad” over the long term. Their molecules resemble those of natural testosterone but are chemically different and do not react the same way in the body. The notorious methyltestosterone may be the worst of these steroids.

In the body, natural testosterone is either free (unattached to anything else) or bound to a molecule known as sex hormone binding globulin (SHBG). While the total amount of testosterone in the body, as measured by a blood test, might be the same as a man ages, more and more of the testosterone is bound to SHBG. Bound testosterone cannot interact with testosterone receptors and thus is, in effect, biologically inert. The amount of free, or active, testosterone available declines as men age. As it turns out, this free testosterone is important to health in many ways. Men with low free testosterone levels are more prone to

high blood sugar, high blood cholesterol and triglycerides, high blood pressure, obesity in general and abdominal obesity in particular, high levels of clotting factors, and low levels of clotting inhibitors. There is data suggesting that osteoporosis, which affects millions of men, and depression also are linked to low testosterone levels. Aside from testosterone therapy under a physician's care, there is an herbal product, the bioflavonoid chrysin, extracted from the plant *Passiflora coerulea* (a type of passionflower), which can help the body produce testosterone naturally. Another useful herbal is an extract made from nettle root (*Urtica dioica*). This binds to SHBG better than testosterone does, thus helping to increase the body's level of free testosterone. If you choose to try this remedy, make sure you use a product made from the root, not the stems and leaves.

A word of caution here: Men with prostate cancer, or possible prostate cancer, should not take any herbal that increases the supply of free testosterone because it may enhance the cancer.

ness, eat protein meals containing essential fatty acids. The omega-3 fatty acids in particular are very necessary for healthy bodies and minds, and studies have shown that a deficiency can lead to mood disorders. Salmon and whitefish are good choices. In a study published in the *American Journal of Clinical Nutrition*, those who ate fish of any type had fewer depressive symptoms than those who didn't eat fish. Of the two major omega-3 fatty acids obtained from fish, EPA and DHA, only EPA seems to be protective against depression. Fish usually have a 50:50 mixture of the two fatty acids, which is a good ratio. If you are using dietary supplements, make sure they have the same ratio, or slightly more EPA than DHA.

If you need your spirits lifted, you will benefit from eating foods like turkey and salmon, which are high in tryptophan and protein.

The omega-3 fat DHA, docosahexaenoic acid, which is found in many cold-water fish such as salmon, tuna, and mackerel, is known to have cardioprotective effects. Researchers at the University of California—Los Angeles School of Medicine found that genetically engineered mice fed a diet rich in DHA also were found to have less brain cell damage than those fed a diet that substituted safflower oil, which is low in omega-3 fatty acids. We recommend at least two meals a week of fish (not fried) rich in omega-3 fatty acids. While this is for good cardiovascular health, it is possible that this diet can also favorably affect people with Alzheimer's disease or depression. Low levels of DHA have also been associated with postpartum depression. However, newer data from Holland showed that

DHA when combined with another fatty acid did not prevent depressive symptoms associated with childbirth.

Omit wheat products from the diet. Wheat gluten has been linked to depressive disorders in those who do not tolerate gluten protein.

Avoid diet sodas and other products containing the artificial sweetener aspartame (in NutraSweet, Equal, and other products). This additive can possibly block the formation of serotonin and cause headaches, insomnia, and depression in individuals who are already serotonin-deprived.

Limit your intake of supplements that contain the amino acid phenylalanine. It contains the chemical phenol, which is highly allergenic. Most depressed people are allergic to certain substances. If you take a combination free form amino acid supplement, look for a product that does not contain phenylalanine. Phenylalanine is one of the major components of aspartame.

Avoid foods high in saturated fats; the consumption of meat or fried foods, such as hamburgers and French fries, leads to sluggishness, slow thinking, and fatigue. They interfere with blood flow by causing the arteries and small blood vessels to become blocked and the blood cells to become sticky and tend to clump together, resulting in poor circulation, especially to the brain.

Avoid all forms of sugar, including normally “good” sweeteners such as honey, molasses, and fruit juice. The body reacts more quickly to the presence of sugar than it does to the presence of complex carbohydrates. The in-

crease in energy supplied by the simple carbohydrates (sugars) is quickly followed by fatigue and depression. Stevia, a concentrated natural sweetener derived from a South American shrub, does not have the same effect on the body as sugar, and does not have the side effects of artificial sugar substitutes.

- Avoid alcohol, caffeine, and processed foods.
- Investigate the possibility that food allergies are causing or contributing to depression. (See ALLERGIES in Part Two.)
- Have a hair analysis to rule out heavy metal intoxication as the cause of depression. (See HAIR ANALYSIS in Part Three.)
- Keep your mind active, and get plenty of rest and regular exercise. Studies have shown that exercise—walking, swimming, or any activity that you enjoy—is most important for all types of depression. Avoid stressful situations.
- Learn to recognize, and then to “reroute,” negative thinking patterns. Working with a qualified professional to change ingrained habits can be rewarding (cognitive behavioral therapists specialize in this type of work). Keeping a daily log also can help you to recognize distorted thoughts and develop a more positive way of thinking.
- If you are suffering from situational depression—depression that occurs in response to an event such as in the death of a loved one or the breakup of a relationship—try using *Ignatia amara*. This is a homeopathic remedy derived from a plant, the Saint Ignatius bean, that helps control emotions during periods of extreme grief and hysteria.
- If depression is seasonal (SAD), light therapy may help. For information about devices for this type of light treatment, contact either The SunBox Company or Apollo Health. (See Manufacturer and Distributor Information in the Appendix.)
- See HYPOTHYROIDISM in Part Two and take the underarm test to detect an underactive thyroid. If your temperature is low, consult your physician. Thyroid dysfunction is behind many depressive disorders.
- Try using color to alleviate depression. (See COLOR THERAPY in Part Three.)

### Considerations

Finding the right treatment for depression can be as difficult as convincing someone that he or she needs help. Even so, according to the National Institute of Mental Health, clinical depression is one of the most treatable of all medical illnesses. Today, most people with depression can be treated with antidepressant medications, “talk” therapy (psychotherapy), or a combination of the two. Experts agree that successful treatment also hinges on early intervention. Early treatment increases the likelihood of preventing serious recurrences. Medications, such as the selective serotonin reuptake inhibitors, or SSRIs, are help-

ful. (See CATEGORIES OF ANTIDEPRESSANT DRUGS on page 366.) SSRIs generally produce fewer side effects than the older drugs (tricyclics), making it easier for people, including older adults, to adhere to treatment. Both generations of medication are effective in relieving depression, although any given individual may respond to one type of drug and not another. It is difficult to predict which people will respond to which drug, or who will experience what side effects.

Despite the relative safety and popularity of SSRIs and other antidepressants, some studies have suggested that they may have unintended effects on some people, especially adolescents and young adults. In 2004, the Food and Drug Administration (FDA) conducted a thorough review of published and unpublished controlled clinical trials of antidepressants that involved nearly 4,400 children and adolescents. The review revealed that 4 percent of those taking antidepressants thought about or attempted suicide (although no suicides occurred), compared to 2 percent of those receiving placebos. This information prompted the FDA, in 2005, to adopt a “black box” warning label on all antidepressant medications to alert the public about the potential increased risk of suicidal thinking or attempts in children and adolescents taking antidepressants. In 2007, the FDA proposed that makers of all antidepressant medications extend the warning to include young adults up through age twenty-four. A “black box” warning is the most serious type of warning on prescription drug labeling. Results of a comprehensive review of pediatric trials conducted between 1988 and 2006 suggested that the benefits of antidepressant medications likely outweigh their risks to children and adolescents with major depression and anxiety disorders. The study was funded in part by the National Institute of Mental Health.

The FDA issued a warning that combining an SSRI or SNRI antidepressant with one of the commonly used triptan medications for migraine headache could cause a life-threatening serotonin syndrome, marked by agitation, hallucinations, elevated body temperature, and rapid changes in blood pressure. Although most dramatic in the case of the MAOIs, newer antidepressants may also be associated with potentially dangerous interactions with other medications.

Seasonal affective disorder can be treated using light therapy, which involves exposing yourself to light of a certain frequency from a special light box for fifteen minutes to two hours per day. The reason this therapy works is that more melatonin, a hormone produced by the pineal gland in the brain, is produced in the dark, or on dark days, than in the light or on longer, brighter summer days. At certain levels, melatonin appears to trigger the onset of depression in some people. Most insurance companies now honor claims for these special light boxes.

Atypical depression is a common but often undiagnosed disorder. Nearly fifty years ago, two English psy-

chiatrists first described atypical depression as a type of depression that seemed to differ from classic forms of depression in both its symptoms and treatment. Experts in the field of psychiatric research continue to debate the finer points of this diagnosis. However, atypical depression is usually characterized by onset of symptoms at an early age, overeating, oversleeping, and mood reactivity. Mood reactivity refers to the observation that although people with atypical depression experience pervasive sadness, mood may improve or worsen in direct response to specific events. This is different from classically depressed individuals who experience persistent sadness. In addition, some research suggests that an older class of drugs, monoamine oxidase inhibitors (MAOIs), may be more effective in treating atypical depression than are newer drugs, including tricyclic antidepressants and selective serotonin reuptake inhibitors (SSRIs). However, research continues to try to define this more clearly. Atypical depression is more common in women than in men. Its exact cause isn't clear, but genetics and environmental factors play roles. If you're concerned that you or someone you know has atypical depression, seek help from a mental health professional.

Pregnenolone is a naturally occurring hormone that may improve brain function, enhancing mood, memory, and thinking ability. (See under NATURAL FOOD SUPPLEMENTS in Part One.)

Depression is not a natural part of aging, but it is frequently linked to age-related nutritional problems, such as B-vitamin deficiencies and poor eating habits. Older people who suffer from depression are as likely to benefit from treatment as a person in any other age bracket.

Tyrosine is needed for brain function. This amino acid is directly involved in the production of norepinephrine and dopamine, two vital neurotransmitters that are synthesized in the brain and the adrenal medulla. A lack of tyrosine can result in a deficiency of norepinephrine in certain sites in the brain, resulting in mood disorders such as depression. The effects of stress may be prevented or reversed if this essential amino acid is obtained in the diet or by means of supplements. Mustard greens, beans, and spinach are good sources of tyrosine.

*Caution:* If you are taking an MAO inhibitor drug for depression, do not take tyrosine supplements, and avoid foods containing tyrosine, as drug and dietary interactions can cause a sudden, dangerous rise in blood pressure. Discuss food and medicine limitations thoroughly with your health care provider or a qualified dietitian.

Some preliminary studies show promise in using dehydroepiandrosterone (DHEA)—a hormone naturally produced by the body—in the treatment of depression. In one study, nearly all patients taking DHEA for six weeks significantly improved, and about half of those were no longer considered clinically depressed.

## Categories of Antidepressant Drugs

Following is a quick reference guide to the major categories of antidepressant medications currently in use, according to their mode of action and including both generic and brand names.

CATEGORY OF ANTIDEPRESSANT	GENERIC NAME	BRAND NAME(S)
Serotonin transport blocker (selective serotonin reuptake inhibitor or SSRI)	citalopram	Celexa
	escitalopram	Lexapro
	fluoxetine	Prozac
	paroxetine	Paxil
	sertraline	Zoloft
Tricyclic	amitriptyline	Elavil
	amoxapine	Asendin
	clomipramine	Anafranil
	desipramine	Norpramin
	doxepin	Sinequan
	imipramine	Tofranil
	nortriptyline	Aventyl
trimipramine		Pamelor
		Surmontil
Serotonin and norepinephrine reuptake inhibitor (SNRI)	venlafaxine	Effexor
	duloxetine	Cymbalta
Monoamine oxidase inhibitor (MAOI)	isocarboxazid	Marplan
	phenelzine	Nardil
	tranylcypromine	Parnate
Tetracyclic	mirtazapine	Remeron
	maprotiline	Ludiomil
Aminoketone	bupropion	Wellbutrin
Other	trazodone	Desyrel

Selenium has been shown to elevate mood and decrease anxiety. These effects were more noticeable in people who had lower levels of selenium in their diets to begin with.

Vigorous exercise can be an effective antidote to bouts of depression. During exercise, the brain produces pain-killing chemicals called endorphins and enkephalins. Certain endorphins and other brain chemicals released in response to exercise also produce a natural "high." Most of those who exercise regularly say that they feel really good afterward. This may explain why exercise is the best way to get rid of depression.

Music can have powerful effects on mood and may be useful in alleviating depression. (See MUSIC AND SOUND THERAPY in Part Three.)

In one study, people suffering from depression were found to have lower than normal levels of folic acid in their blood than nondepressed individuals. Other studies have

shown that zinc levels tend to be significantly lower than normal when people suffer from depression.

❑ It may be possible to diagnose depression by using a computerized tomography (CAT) scan to measure a person's adrenal glands. Researchers at Duke University found that people suffering from clinical depression have larger adrenal glands than non-depressed people.

❑ A variety of different drugs are commonly prescribed to treat depression (see chart above). Antidepressant drugs fight depression by changing the balance of neurotransmitters in the body. These medications include the following:

- *Selective serotonin reuptake inhibitors (SSRIs)*. A popular class of drugs known as “second-generation” antidepressants that have become available in recent years. These new drugs have not been shown to be more effective than the others, but they tend to have fewer serious side effects. They include fluoxetine (Prozac), paroxetine (Paxil), and sertraline (Zoloft), which specifically block the uptake of the neurotransmitter serotonin.
- *Tricyclics*. These drugs work by inhibiting the uptake of the neurotransmitters serotonin, norepinephrine, and dopamine, making more of the mood-enhancing chemical messengers available to nerve cells. Examples include amitriptyline (Elavil), desipramine (Norpramin), imipramine (Tofranil), amoxapine (Asendin), and nortriptyline (Aventyl, Pamelor). Possible side effects include blurred vision, constipation, dry mouth, irregular heartbeat, urine retention, and orthostatic hypotension, a severe drop in blood pressure upon sitting up or standing, which can lead to dizziness, falls, and fractures.
- *Serotonin and norepinephrine reuptake inhibitors (SNRIs)*. These drugs increase the levels of both serotonin and norepinephrine by inhibiting their reabsorption (reuptake) into cells in the brain. Although the precise mechanism of action isn't clear, it's thought that these higher levels enhance neurotransmission—the sending of nerve impulses—and so improve and elevate mood. Medications in this group of antidepressants are sometimes called dual reuptake inhibitors. Examples include venlafaxine (Effexor) and duloxetine (Cymbalta).
- *Monoamine oxidase (MAO) inhibitors*. These drugs increase the amounts of mood-enhancing neurotransmitters in the brain by blocking the action of the enzyme monoamine oxidase, which normally breaks them down. Examples of MAO inhibitors include isocarboxazid (Marplan), phenelzine (Nardil), and tranylcypromine (Parnate). Possible side effects include agitation, elevated blood pressure, overstimulation, and changes in heart rate and rhythm. MAO inhibitors also have a high potential for dangerous interactions with other substances, including drugs and foods. Persons taking these drugs must adhere strictly to a diet that includes no foods containing the amino acid tyrosine. Refer to

the detailed insert given out with the drug for details of the possible interactions. Over-the-counter cold and allergy remedies must also be avoided.

- *Tetracyclics*. These drugs have an action similar to that of the tricyclics, but have a slightly different chemical structure and appear to cause fewer side effects. Maprotiline (Ludomil) and mirtazapine (Remeron) are in this category.
- Another drug, bupropion (Wellbutrin), is believed to act by inhibiting the uptake of dopamine but not serotonin or norepinephrine.

❑ Paxil (paroxetine) has been approved by the FDA for treatment of generalized anxiety disorders (GAD). The drug is already approved for treating social anxiety disorder, depression, panic disorder, and obsessive-compulsive disorder. GAD affects about 6.8 million adult Americans, and about twice as many women as men, according to the National Institute of Mental Health. People with GAD experience exaggerated, worrisome thoughts and tension about routine life events, lasting a minimum of six months. GAD is often accompanied by physical symptoms such as fatigue, trembling, muscle tension, headache, and nausea. The effectiveness of Paxil in long-term treatment of GAD (greater than eight weeks) was not evaluated, nor was Paxil studied in children and adolescents with GAD.

*Caution:* Paxil should not be used in children and adolescents for the treatment of major depressive disorder. Antidepressants in adults and children should be used with caution. Never discontinue use of antidepressants without first consulting a physician.

❑ Steroid drugs and oral contraceptives may cause serotonin levels in the brain to drop.

❑ Prozac and other “selective serotonin reuptake inhibitors” work to increase the activity of serotonin, while 5-hydroxy L-tryptophan (5-HTP) works to boost the body's production of serotonin.

❑ A study published in the *British Medical Journal* indicates that extracts of St. John's wort may be as effective as prescription antidepressants for mild and moderate depression. St. John's wort is the most-prescribed antidepressant in Germany, but is treated as a dietary supplement in the United States (it is not approved as a safe and effective drug by the FDA). Many studies are under way to determine the effectiveness and safety of long-term use of St. John's wort. Research published recently in the *British Medical Journal* indicates that, in a German study where St. John's wort was matched against Paxil, the supplement proved to be just as effective and subjects had fewer side effects.

In some patients with HIV, using St. John's wort and SSRIs may not be a good idea. It is expected that St. John's wort may significantly decrease blood concentrations of all of the currently marketed HIV protease inhibitors (PIs) and possibly other drugs (to varying degrees) that are similarly

metabolized, including the nonnucleoside reverse transcriptase inhibitors (NNRTIs).

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

❑ People who smoke are more likely than nonsmokers to be depressed. Smokers and nonsmokers alike may benefit from Zyban (a sustained-release preparation of bupropion, also sold as Wellbutrin SR), an antidepressant also approved to help people quit smoking. Bupropion elevates levels of dopamine and norepinephrine, substances that are also elevated by nicotine in tobacco products. It allows patients to obtain the same feeling while weaning themselves off nicotine.

❑ Allergies, hypoglycemia, hypothyroidism, and/or malabsorption problems can cause or contribute to depression. In people with these conditions, vitamin B<sub>12</sub> and folic acid are blocked from entering the system, which can lead to depression.

❑ Individuals with depression are more likely than other people to have various disturbances in calcium metabolism.

❑ There is no doubt that attitude affects health. Study after study has shown that optimistic people are not only happier but also healthier. They suffer less illness, recover better from illness and surgery, and have stronger immune defenses.

❑ Many groups and organizations offer more information on depression. (See Health and Medical Organizations in the Appendix.)

## DERMATITIS

Dermatitis is a general term for any type of inflammation of the skin. Types of dermatitis include atopic dermatitis, nummular dermatitis, seborrheic dermatitis, irritant contact dermatitis, and allergic contact dermatitis. The distinction between the use of dermatitis and eczema to describe skin disorders can be confusing. Often, the terms are used interchangeably, although many people use the term eczema to refer specifically to atopic dermatitis. The inflammation of the skin that accompanies dermatitis (or eczema) produces scaling, flaking, thickening, weeping, crusting, color changes, and, often, itching.

Several underlying problems can lead to eczema. Hypochlorhydria (low levels of hydrochloric acid in the stomach) has been cited, as has a condition known as "leaky gut syndrome," in which the intestines become porous and allow tiny particles of undigested food to enter the bloodstream, provoking allergic reactions. Candidiasis (an overgrowth of yeast in the system), food allergies, and a genetically based weakness in the enzyme delta-6-desaturase (which converts essential fatty acids into anti-inflammatory prostaglandins) are other possible causes of this condition.

Many cases of dermatitis are simply the result of allergies. This type of condition is called allergic contact dermatitis. Skin inflammation may be linked to contact with perfumes, cosmetics, rubber, medicated creams and ointments, latex, plants such as poison ivy, and/or metals or metal alloys such as gold, silver, and nickel found in jewelry or zippers. Some people with dermatitis are sensitive to sunlight. Whatever the irritant, if the skin remains in constant contact with it, the dermatitis is likely to spread and become more severe. Stress, especially chronic tension, can cause or exacerbate dermatitis.

Atopic dermatitis (AD; also known as atopic eczema or, in children, infantile eczema) is a condition known to affect allergy-prone individuals. It typically appears on the face, in the bends of the elbows, and behind the knees, and is very itchy. In children, it usually appears in the first year of life, and almost always in the first five years. Over half of the infants who have this condition get better by the age of eighteen months. Triggers vary from person to person, but tend to include cold or hot weather, a dry atmosphere, and exposure to allergens, stress, and infections such as colds. If other family members have histories of hay fever, asthma, or atopic dermatitis, it is more likely that a child will be diagnosed with AD. Women who take probiotics during pregnancy have had some success at reducing AD in their infants.

Nummular ("coin-shaped") dermatitis is a chronic condition in which round, scaling lesions appear on the limbs. It may be caused by an allergy to nickel and is often associated with dry skin. Dermatitis herpetiformis is a very itchy type of dermatitis associated with intestinal and immune disorders. This form of dermatitis may be triggered by the consumption of dairy products and/or gluten. Seborrhea is a form of dermatitis that most commonly affects the scalp and/or face.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Betaine HCl	As directed on label.	A form of hydrochloric acid. People with dermatitis often have low levels of hydrochloric acid. <i>Caution:</i> Do not take this supplement if you suffer from stomach acidity.
OptiMSM	As directed on label.	A patented form of methylsulfonylmethane. Reduces inflammation and contains a natural analgesic.

Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin)	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily. Do not exceed this amount.	Needed for healthy skin and proper circulation. Aids in reproduction of all cells. Use a high-stress, yeast-free formula. A sublingual form is recommended. Important for proper circulation and healthy skin. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure. Deficiency has been linked to skin disorders.
and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50 mg 3 times daily. 1,000–2,000 mcg daily.	Aids in cell formation and cellular longevity. Use a lozenge or sublingual form. Deficiency has been linked to dermatitis.
and biotin	300 mg daily.	

**Important**

Essential fatty acids (black currant seed oil, flaxseed oil, primrose oil, or salmon oil)	As directed on label.	Promotes lubrication of the skin.
Kelp	1,000 mg daily or as directed on label.	Contains iodine and other minerals needed for healing of tissues.
Vitamin C with bioflavonoids	As directed on label.	Inhibits inflammation and stabilizes cell membranes.
Vitamin E	200 IU daily.	Relieves itching and dryness. Use d-alpha-tocopherol form.
Zinc	100 mg daily. Do not exceed this amount.	Aids healing and enhances immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.

**Helpful**

Aller Bee-Gone from CC Pollen	As directed on label.	For allergic dermatitis. A combination of herbs, enzymes, and nutrients designed to fight allergic flare-ups.
Borage oil and flaxseed oil	As directed on label.	Contain omega-6 and omega-3 essential fatty acids.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label. As directed on label.	Removes toxins from the body, boosts the immune system, improves overall physical and mental processes.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label, on an empty stomach.	To supply protein, important for construction and repair of all tissues. Use a formula containing both essential and nonessential amino acids.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote overall skin health.
Kyo-Dophilus from Wakunaga	As directed on label.	A nondairy probiotic formula. Prevents the overgrowth of yeasts in the body.

Kyolic-EPA from Wakunaga	As directed on label.	Restores fatty acid balance. Repairs tissue and aids in healing.
Shark cartilage	1 gram per 15 lbs of body weight daily, divided into 3 doses.	Reduces inflammation in eczema.
Vitamin A emulsion or capsules plus carotenoid complex	100,000 IU daily for 1 month, then 50,000 IU daily for 2 weeks, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 5,000 IU daily. 25,000 IU daily.	Needed for smooth skin. Aids in preventing dryness. Use emulsion form for easier assimilation and greater safety at high doses. Antioxidants and precursors of vitamin A.
Vitamin D	400–1,000 IU daily.	Aids in healing of tissues.

**Herbs**

Blackthorn, blueberry leaf, hawthorn berry, and rue contain flavonoids that are excellent for reducing inflammation.

Chamomile can be taken internally or used to soothe the skin. It reduces inflammation.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Poultices combining dandelion and yellow dock root can be helpful. (See USING A POULTICE in Part Three.)

The following herbs can be used in tea or capsule form: dandelion, goldenseal, myrrh, pau d'arco, and red clover. Alternate them for best results.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

To relieve itching and promote healing, mix goldenseal root powder with vitamin E oil, then add a little honey until it is the consistency of a loose paste. Apply this mixture to the affected area.

Gotu kola contains powerful antioxidants and promotes the formation of lipids and proteins that are essential for healthy skin.

Grape seed extract contains oligomeric proanthocyanidins (OPCs), which reduce inflammation and rid the body of toxins.

Oregon grape root detoxifies the body and reduces inflammation.

Wild pansy (*Viola tricolor*) can be used externally to treat bruises and various skin ailments. It is especially good

against psoriasis and acne and can be used on eczema and cradle cap in infants.

### Recommendations

- Add brown rice and millet to your diet.
- Avoid eggs, peanuts, soy foods, wheat, and dairy products.
- Avoid sugar, strawberries, chocolate, white flour, fats, fried foods, and processed foods.
- Try a gluten-free diet for six weeks, then add gluten-containing foods back to the diet one at a time, and see if the condition changes. A gluten-free diet is often of therapeutic benefit in controlling dermatitis. (See CELIAC DISEASE in Part Two for the recommended diet.)
- Do not eat foods containing raw eggs, which contain avidin, a protein that binds to biotin and prevents it from being absorbed. Biotin is needed for skin and scalp disorders.
- Try keeping your house humidified and take fewer showers and baths. Showers and baths deplete the skin of its natural oils.
- Use a perfume-free moisturizing lotion daily.
- For dermatitis of the scalp, make a strong, concentrated tea of rosemary, comfrey, tea tree oil (add the tea tree oil after the tea is made), dried nettles, and witch hazel, and apply it to the scalp after shampooing with a fragrance-free shampoo. Leave it on the scalp for ten or fifteen minutes.
- Massage tea tree oil antiseptic cream into the skin after contact with water or irritants.
- Keep the colon clean. Use a fiber supplement such as flaxseed, psyllium husk, or ABC Aerobic Bulk Cleanse from Aerobic Life Industries daily. Use occasional cleansing enemas for removing toxins for quicker healing. (See COLON CLEANSING and/or ENEMAS in Part Three.)

*Note:* Always take supplemental fiber separately from other supplements and medications.

### Considerations

- Chemicals used in bubble bath products may cause dermatitis and may even irritate the tissues of the lower urinary tract sufficiently to cause bloody urine. This is most likely to occur if you soak in treated bathwater for too long.
- Primrose oil and vitamin B<sub>6</sub> (pyridoxine) have helped infants with dermatitis.
- Food allergies can cause dermatitis. (See ALLERGIES in Part Two.)
- See also FUNGAL INFECTION; HIVES; POISON IVY/POISON OAK/POISON SUMAC; PSORIASIS; ROSACEA; SCABIES; and/or SEBORRHEA, all in Part Two.

## DETACHED RETINA

## DIABETES

Diabetes is a disease in which the body either does not produce or cannot properly use the pancreatic hormone insulin. Insulin controls the amount of glucose (sugar) in the blood and the rate at which glucose is absorbed into the cells. The cells need glucose to produce energy. Furthermore, the brain's only food is glucose; therefore the level of glucose must be maintained at a certain minimum for the brain to function normally. After eating a meal that contains carbohydrate or protein, the blood sugar normally rises, often to between 120 and 130 milligrams per decaliter (mg/dL), but generally not above 140 mg/dL. This increase triggers a release of insulin from cells in the pancreas called beta-cells. The insulin "opens the doors" of cells throughout the body, allowing glucose to enter them. As glucose enters the cells, the blood sugar level falls back toward normal and the release of insulin tapers off until the next time protein or carbohydrates are eaten. Every day, every hour, blood sugar levels vary, even in people who do not have diabetes. If blood sugar falls too low (hypoglycemia), a person's ability to reason can become impaired. If blood sugar is too high (hyperglycemia), the person has diabetes.

In people with diabetes, glucose builds up in the bloodstream instead of being taken into and used by the cells, leading to hyperglycemia. If it is not properly controlled, diabetes can lead to heart disease, kidney disease, edema, nerve damage, and infections of the mouth, gums, lungs, skin, feet, bladder, and genital areas. Skin sores may develop and fail to heal properly.

According to figures published by the American Diabetes Association (ADA), there are 23.6 million people in the United States with diabetes. The total prevalence of diabetes increased 13.5 percent from 2005 to 2007. Twenty-four percent of diabetes is undiagnosed, down from 30 percent in 2005 and from 50 percent ten years ago. About 57 million people have impaired fasting glucose (IFG) levels or prediabetes. More people are developing diabetes or IFG because of an increase in obesity and longer life spans. This disease is the seventh leading cause of death in the United States and the primary cause of new cases of blindness in people between the ages of twenty and seventy-four. The death rate for African-Americans with diabetes is 50 percent higher than the death rate for Caucasians who have the disease. Unfortunately, two-thirds of the people diagnosed with diabetes do not associate the disease with an increased risk of cardiovascular problems, such as heart disease and stroke. To someone with diabetes, controlling blood sugar must be done in conjunction with controlling cholesterol and blood pressure.

There are two major types of diabetes: type 1 (or insulin-dependent diabetes mellitus [IDDM]) and type 2 (non-insulin-dependent diabetes mellitus [NIDDM]).

Type 1 diabetes affects 5 to 10 percent of people with diabetes and usually starts at an early age. It is an autoimmune disease in which the body's immune system attacks and destroys the insulin-producing beta-cells in the pancreas. Experts believe this may result from an immune response after a viral infection or something related to nutrition.

Type 2 diabetes, by far the most common form of diabetes, affects 90 to 95 percent of diabetes sufferers. In type 2 diabetes, the pancreas does produce insulin in small quantities, but not enough to fuel the cells. The cells may also become resistant to the effects of what little insulin there is in the bloodstream. Many people have type 2 diabetes and are completely unaware of it. This type of diabetes usually begins in later years, although, unfortunately, it is now becoming more common in young people. The first clinical study sponsored by the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) has begun in twelve medical centers around the country. The five-year study, called Treatment Options for type 2 Diabetes in Adolescents and Youth (TODAY), will compare three treatments of type 2 diabetes in children and teens to determine how well and how long each treatment approach controls blood glucose levels. The treatments will involve FDA-approved drugs and lifestyle changes. TODAY is the first clinical study aimed at showing the effects of lowering weight by cutting calories and increasing physical activity in youths with type 2 diabetes. It is now recognized that obesity and type 2 diabetes are among the most serious health challenges facing America's youth. During the last forty years, the percentage of overweight children (ages six to nineteen) in the United States has gone from 4 percent to 16 percent.

Known risk factors for type 2 diabetes include being overweight or obese; having a parent or sibling with diabetes; being Alaskan Native, American Indian, African American, Hispanic/Latino, Asian American, or Pacific Islander; having had gestational diabetes or having given birth to a baby over nine pounds; blood pressure of 140/90 mm/Hg or higher; abnormal cholesterol, including levels of HDL ("good") cholesterol less than 35 mg/dL and triglycerides of 250 mg/dL or higher; inactivity, defined as exercising fewer than three times per week; having polycystic ovary disease; having had a previous test showing impaired fasting glucose (IFG) or impaired glucose tolerance (IGT); clinical signs of insulin resistance like acanthosis nigricans (dark rash around the neck); and a history of heart disease. Epidemiological data from around the world show that the United States is not the only area that has this problem. Within the next thirty years, diabetes is projected to increase the most in the Middle East Crescent (163 percent); Sub-Saharan Africa (161 percent); Latin America, the Caribbean, and Asia (not including China and India) (148 per-

cent); India (151 percent); China (104 percent); and overall around the world (114 percent).

Gestational diabetes is a form of the condition that develops during pregnancy, affecting about 5 percent of pregnant women. Hormonal changes during pregnancy can affect the body's resistance to insulin. Although this form of diabetes usually goes away after the baby is born, a woman who has had it is more likely to develop type 2 diabetes later in life.

Pre-diabetes is a condition in which blood glucose levels are higher than normal but not high enough for a diagnosis of diabetes. This condition is sometimes called impaired fasting glucose (IFG) or impaired glucose tolerance (IGT), depending on the test used to diagnose it. The U.S. Department of Health and Human Services estimates that about one in four U.S. adults aged twenty years or older—or 57 million people—had pre-diabetes in 2007. However, many people with IFG go on to develop type 2 diabetes. According to the American Diabetes Association, people with pre-diabetes can prevent or delay the development of type 2 diabetes by up to 58 percent through changes to their lifestyle that include modest weight loss and regular exercise. The expert panel recommends that people with pre-diabetes reduce their weight by 5 to 10 percent and participate in some type of modest physical activity for thirty minutes daily. For some people with pre-diabetes, intervening early can actually return elevated blood glucose levels to the normal range.

People with diabetes are subject to episodes of both high and low blood sugar. The symptoms of hyperglycemia (too much glucose in the blood) often include fatigue, a constant need to urinate, extreme thirst, constantly feeling hungry, loss of weight, and problems with eyesight. Episodes of hypoglycemia (less than normal amounts of glucose in the blood), which strike suddenly, can be caused by a missed meal, too much exercise, or a reaction to too much insulin.

The initial signs of hypoglycemia are hunger, dizziness, sweating, confusion, palpitations, and numbness or tingling of the lips. If not treated, the individual may go on to experience double vision, trembling, and disorientation, may act strangely, and may eventually lapse into a coma.

At present there is no cure for type 1 or type 2 diabetes. However, for people with type 2 diabetes, it is possible to reduce dependence on medications and diminish the effect of the disease on the body through weight loss and exercise. The major danger with diabetes is not the disease itself, but the complications that can arise if insulin levels are not maintained at a constant level. Consistently high blood sugar levels can, over time, lead to blindness, kidney failure, heart disease, limb amputations, and nerve damage. In fact, diabetes is the leading cause of blindness in adults between the ages of twenty and seventy-four, and it accounts for 44 percent of the people who have kidney failure. Cardiovascular disease is two to four times more common among people with diabetes, and is the leading cause of

diabetes-related deaths. The risk of stroke is also two to four times higher in people with diabetes, and 73 percent have high blood pressure as well. Left untreated, diabetes can lead to diabetic ketoacidosis (DKA) or hyperosmolar syndrome. DKA occurs when the body is so low in insulin that it starts using stored fat as fuel. When this fat breaks down, substances known as ketones are produced as a by-product. In large quantities, ketones can cause the body to become excessively acidic. DKA is most often seen in people with type 1 diabetes. Symptoms include nausea, difficulty breathing, sweet breath, and confusion that can progress to coma. Hyperosmolar syndrome is a result of a combination of very high blood sugar levels (but without the presence of ketones) and dehydration. It is more common in older people with type 2 diabetes who are taking steroid medications. The condition may also be prompted by stress from a major illness. With hyperosmolar syndrome, blood sugar levels are so high that the blood thickens. Symptoms include confusion, tiredness, and coma. Hyperosmolar syndrome can sometimes be the first indication of diabetes in older adults. Both of these conditions require the immediate attention of a physician. Urinalysis can often detect unsuspected diabetes.

Monitoring blood sugar levels is a key component in treatment and management of the disease. Research has indicated that people who keep their blood sugar levels within individual target ranges set by their doctor stand a good chance of reducing the risk of associated complications. In many cases, intensive lifestyle changes in diet and exercise actually can prevent, reduce, or delay the risk of developing adult-onset diabetes.

## Diabetes Self-Tests

There are several ways to test yourself for diabetes. The tests for type 1 diabetes are also used for self-monitoring by persons diagnosed with the condition. Home testing tends to be slightly less accurate than tests done in a doctor's office.

### Type 1 Diabetes

To test for type 1 diabetes:

1. Purchase chemically treated plastic glucose testing strips at a drugstore.
2. Prick your finger and apply a drop of blood to the tip of the strip.
3. Wait one minute and compare the color on the strip to a color chart, which lists various glucose levels.

There are also electronic devices available that can analyze the test strip for you and give you a numerical readout of the glucose level. There are now more than a hundred different home-testing-type instruments available for testing blood glucose levels. Many of these devices are avail-

able free or have large rebates attached if you have a doctor's prescription. You simply prick your finger with the spring-loaded needle, apply a drop of your blood to the test strip, and place it in the machine for analysis. This test gives you an immediate blood sugar result and stores the result in memory for future reference. It is a device that all people with diabetes should own.

The following is an approximate guideline for fasting blood sugar levels for people who have not been diagnosed with diabetes. Fasting blood sugar levels should be measured from six to eight hours after eating. The measurement is milligrams of glucose per one-tenth liter (mg/dL) of blood:

- Less than 109 mg/dL: Normal
- 110–125 mg/dL: Fasting blood glucose/borderline, pre-diabetes
- 126 mg/dL and over: Diabetes

If you test at random, a number of 200 mg/dL or higher is considered diabetes when coupled with other signs of diabetes such as excessive thirst, unplanned weight loss, or fatigue. (See QUICK REFERENCE GUIDE—GOALS FOR PEOPLE WITH DIABETES, on page 375.)

There is another test that is used normally as a diabetes management tool rather than a screening test. This is the hemoglobin A1c lab test. It is based on the notion that sugar is sticky, and the longer it is around the harder it is to get off. The red blood cells in the bloodstream usually live for about three months, circulating around the body all that time. As they circulate, blood sugar sticks to them, and if it can be measured, it will tell how much sugar has been in the blood over the life of these cells, or about three months. The normal range for this test is 4 to 5.9 percent, but people can have 8 percent or above if they have poorly controlled diabetes. Those whose diabetes is under control usually have about a 7 percent or lower reading. There is a correlation between average blood sugar levels in mg/dL and A1c, as follows:

- A1c of 6: 135 mg/dL
- A1c of 7: 170 mg/dL
- A1c of 8: 205 mg/dL
- A1c of 9: 240 mg/dL
- A1c of 10: 275 mg/dL
- A1c of 11: 310 mg/dL
- A1c of 12: 345 mg/dL

### Type 2 Diabetes

Testing for type 2 diabetes should begin at age forty-five. Younger people should get tested if they are overweight or have one of these risk factors:

- Physically inactive.
- Have a parent or sibling with diabetes.
- Are African American, Alaskan Native, American Indian, Asian American, Hispanic/Latino, or Pacific Islander.
- Have blood pressure of 140/90 or above.
- Have good cholesterol that is too low (less than 35 mg/dL).
- Have a history of heart disease.

People with type 2 diabetes often cannot perceive sweet tastes. This abnormality may play an important role in how individuals with diabetes perceive the taste of their food, and also in how well they comply with the dietary aspects of treatment. Because our society as a whole is addicted to sugar, this distorted taste perception is very common among the population in general.

The following test can detect an impaired ability to taste sweets:

1. Do not consume stimulants (coffee, tea, soda) or sweets for one hour before the test.
2. Fill seven identical glasses with 8 ounces of water each and label the glasses as having no sugar, ¼ teaspoon sugar, ½ teaspoon sugar, 1 teaspoon sugar, 1½ teaspoons sugar, 2 teaspoons sugar, and 3 teaspoons sugar. Add the appropriate amount of sugar to each glass, then ask someone else to rearrange the order of the glasses and hide the labels.
3. Take a straw and sip from each glass, then write down the amount of sugar you think it contains. Between sips, rinse your mouth with pure water. Healthy people generally notice a sweet taste when a teaspoon or less of sugar is added to 8 ounces of water. By contrast, people with adult-onset diabetes usually do not notice sweetness until 1½ to 2 teaspoons of sugar have been added to the water.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Alpha-lipoic acid	As directed on label.	For treatment of peripheral nerve damage in diabetic patients. Helps control blood sugar levels.
Chromium picolinate or Diabetic Nutrition Rx from Progressive Research Labs or brewer's yeast	400–600 mcg daily. As directed on label. As directed on label.	Improves insulin's efficiency, which lowers blood sugar levels. A combination of chromium picolinate, vanadyl sulfate, and other vitamins and minerals that work synergistically to regulate blood sugar levels

with added chromium		and correct deficiencies. <i>Caution:</i> If you have diabetes, consult with your physician before taking any supplement containing chromium.
Garlic (Kyolic from Wakunaga)	As directed on label.	Decreases and stabilizes blood sugar levels. Enhances immunity and improves circulation.
L-carnitine	500 mg twice daily, on an empty stomach. Take with water. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Mobilizes fat.
plus L-glutamine plus taurine	500 mg twice daily, on an empty stomach. 500 mg twice daily, on an empty stomach.	Reduces the craving for sugars. Aids in the release of insulin.
Quercetin (Activated Quercetin from Source Naturals)	100 mg 3 times daily.	Helps protect the membranes of the lens of the eyes from accumulations of polyols as a result of high glucose levels.
Raw adrenal glandular and raw pancreas glandular and thyroid glandular	As directed on label. As directed on label. As directed on label.	Aids in rebuilding and nourishing these organs. (See GLANDULAR THERAPY in Part Three.)
Vanadium	As directed on label.	Aids insulin's ability to move glucose into the cells. Use vanadyl sulfate form.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). Do not exceed 300 mg daily from all supplements.	The B vitamins work best when taken together.
plus extra biotin and inositol	50 mg daily. 50 mg daily.	Improves the metabolism of glucose. Important for circulation and for prevention of atherosclerosis.
Vitamin B <sub>12</sub> plus folic acid	As prescribed by physician or directed on label.	Needed to prevent diabetic neuropathy. Injections (under a doctor's supervision) are best. If injections are not available, use a lozenge or sublingual form.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Deficiency has been associated with diabetes. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Very Important</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	80 mg daily. As directed on label.	Improves circulation and stabilizes blood sugar. Works well with coenzyme Q <sub>10</sub> in protecting the cells and removing toxic substances from the body.

Magnesium	750 mg daily.	Important for enzyme systems and pH balance. Protects against coronary artery spasm in arteriosclerosis. Increases energy levels. Low readings of magnesium are often found in people with diabetes, and are associated with the complications of eye disease. Those who eat a healthy diet rich in foods with magnesium such as whole grains and nuts are less likely to develop diabetes.
Manganese	5–10 mg daily. Take separately from calcium.	Needed for repair of the pancreas. Also a cofactor in key enzymes of glucose metabolism. Deficiency is common in people with diabetes.
Psyllium husks or ABC Aerobic Bulk Cleanse from Aerobic Life Industries	As directed on label. Take with a large glass of water. Take separately from other supplements and medications.	Good fiber source and fat mobilizer.
Vitamin D	400–800 IU.	Helps maintain good blood flow in patients with diabetes who live in northern climates.
<b>Important</b>		
Vitamin A with carotenoids	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	An important antioxidant needed to maintain the health of the eyes. Use emulsion form for best absorption.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Deficiency may lead to vascular problems in people with diabetes. Vitamin C may slow or prevent complications that occur in diabetes.
Vitamin E	200 IU daily.	Improves circulation and prevents complications through its antioxidant properties. Use d-alpha-tocopherol form.
<b>Helpful</b>		
Calcium	1,500 mg daily.	Important for pH balance. Always take calcium with vitamin D. The combination at levels near or slightly above the DRI has been shown to prevent diabetes. Be sure to get calcium and vitamin D from foods (dairy products are the best sources of both) and supplements.
Copper complex	As directed on label.	Aids in protein metabolism and in many enzyme systems.
Maitake extract	1–4 gm (1,000–4,000 mg) daily.	May help to normalize blood sugar levels.
Multienzyme complex plus proteolytic enzymes	As directed on label. Take with meals. As directed on label. Take between meals.	To aid digestion. Proper digestion is essential in management of diabetes.
Pantethine	As directed on label.	A form of pantothenic acid that reduces LDL cholesterol and helps prevent buildup in the arteries.

Pycnogenol	As directed on label.	Contains powerful antioxidants that also enhance the activity of vitamin C and strengthen connective tissue, including that of the cardiovascular system.
or grape seed extract	As directed on label.	

## Herbs

Beanpod tea, made up of kidney, white, navy, lima, and northern beans, detoxifies the pancreas.

Bitter melon (*Momordica charantia*), gudmar (*Gymnema sylvestre*), and gulvel (*Tinospora cordifo*) are herbal remedies used in Ayurvedic medicine to regulate blood sugar levels.

Cedar berries are excellent nourishment for the pancreas.

Dandelion root protects the liver, which converts nutrients into glucose.

*Note:* If you suffer from gallbladder problems, avoid large quantities of dandelion.

Fenugreek seeds have been shown to reduce cholesterol and blood sugar levels. They can be purchased under the brand name Sugar-Down.

Ginseng tea is believed to lower blood sugar levels.

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Huckleberry helps to promote insulin production.

Juniper berries have been found to lower blood glucose levels.

In the premier diabetes medical journal, *Diabetes Care*, a review summary of 108 individual studies was published on herbal use in diabetic patients. The best herbs to control blood sugar according to the study were *Coccinia indica* and American ginseng. Other supplements included *Gymnema sylvestre*, aloe vera, vanadium, *Momordica charantia*, and nopal.

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

Silymarin (200 mg per day) taken with a regular diabetes medication (glibenclamide) resulted in a reduction in fasting blood sugars as well as postprandial glucose levels. In addition, the patients lost weight and had improvements in the hemoglobin A1c.

Other herbs that may be beneficial for diabetes include bilberry, buchu, goldenseal, and uva ursi.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Quick Reference Guide—Goals for People with Diabetes (Using a Finger Stick Blood Sample)

When Checked	Goal for People with Diabetes
Before breakfast (fasting)	80–120 mg/dL
Before lunch, dinner, and snack	80–120 mg/dL
Two hours after meals	Less than 170 mg/dL
Anytime (A1c hemoglobin)	Less than 7 percent

### Recommendations

Opinions may differ as to the optimal ratio of dietary carbohydrates, proteins, and fats for prevention and treatment of diabetes. However, it is safe to say that carbohydrates trigger the release of insulin. As more carbohydrates are consumed, more insulin is produced. The current epidemic of obesity and diabetes in the United States indicates that we are asking our bodies to burn the wrong fuel—refined carbohydrates in this case. It has been suggested by Dr. Gerald Reaven of Stanford University School of Medicine that a diet consisting of 45 percent carbohydrates, 40 percent “good” (polyunsaturated) fats, and 15 percent protein will benefit individuals with diabetes.

In a study published in the *Journal of the American Medical Association*, those with diabetes who adopted a healthy diet that included adequate protein (about 20 to 30 percent), fats—mainly from polyunsaturated fats (about 30 percent), and carbohydrates (40 to 50 percent) from fruits and non-starchy vegetables, and ate a limited amount of whole grains, starchy vegetables, and pasta had less ill effects from the disease as evidenced by a reduction in hemoglobin A1c. Those who followed a diet rich in high-glycemic-load foods such as white and brown rice, baked potatoes, and breads did not get this benefit.

Eat a low-fat, high-fiber diet including plenty of raw fruits and vegetables as well as fresh vegetable juices. This reduces the need for insulin and also lowers the level of fats in the blood. Fiber helps to reduce blood sugar surges. For snacks, eat oat or rice bran crackers with nut butter or cheese. Legumes, root vegetables, and whole grains are also good. Remember to regulate your complex carbohydrate intake.

The types of carbohydrates consumed are at least as important as the total carbohydrate loading. High-glycemic foods such as white rice, white flour products, starchy vegetables, and many processed foods are quickly converted into blood sugar during digestion, causing insulin levels to

go up. Carbohydrates found in low-glycemic foods such as asparagus, broccoli, cabbage, green beans, and low-starch vegetables and fruits are converted into blood sugar more slowly, which only gradually raises insulin levels. Avoiding “white foods” might be best.

For those who are trying to lose weight, following a low-carbohydrate diet appears to be safe and effective in patients with type 2 diabetes. In one study, those who followed a diet that contained 20 percent of the total calories from carbohydrates lost about 16 pounds and reduced their hemoglobin A1c levels to 6.6 percent from 8.0 percent over a twenty-two-month period.

Supplement your diet with spirulina. Spirulina helps to stabilize blood sugar levels. Other foods that help normalize blood sugar include berries, brewer’s yeast, dairy products (especially cheese), egg yolks, fish, garlic, kelp, sauerkraut, soybeans, and vegetables.

*Caution:* Brewer’s yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Get your protein from vegetable sources, such as grains and legumes. Fish and low-fat dairy products are also acceptable sources of protein. Kidney function in people with type 2 diabetes seems to benefit from dietary soy protein. This protein also raises the level of “good” cholesterol.

Avoid saturated fats, trans fats, hydrogenated or partially hydrogenated oils, and simple sugars (except when necessary to balance an insulin reaction). While total fat intake doesn’t seem to change the risk of getting diabetes, the trans saturated fats and hydrogenated oils found in most fast foods can greatly increase the risk. Beneficial fats and oils include extra virgin olive oil, fish oil, almond oil and butter, avocados, nuts, and seed oils such as sesame, flax, sunflower, and pumpkin. Substituting polyunsaturated fats such as these and other vegetable oils also reduces cognitive decline in people with diabetes. Getting saturated and trans fats out of your diet is key to maintaining good

brain function. Trans fats now are out of most of the American food supply—except for at some restaurants. To reduce your saturated fat intake, read labels and limit the amount of animal fat you consume.

Eat more complex carbohydrates or reduce your insulin dosage before exercise. Exercise produces an insulinlike effect in the body. Talk to your doctor about the right approach for you.

Do not take supplements containing large amounts of para-aminobenzoic acid (PABA), and avoid salt and white flour products. Consumption of these products results in an elevation of blood sugar.

Do not take supplements containing the amino acid cysteine. It has the ability to break down the bonds of the hormone insulin and interferes with absorption of insulin by the cells.

Do not take extremely large doses of vitamins B<sub>1</sub> (thiamine) and C. Excessive amounts may inactivate insulin. These vitamins may, however, be taken in normal amounts.

*Note:* Consult the Nutrients table in this section for recommendations.

If symptoms of hyperglycemia develop, go to the emergency room of the nearest hospital. This is a potentially dangerous situation. Intravenous administration of proper fluids, electrolytes, and insulin may be required.

Avoid taking large amounts of vitamin B<sub>3</sub> (niacin). However, small amounts (50 to 100 milligrams daily), taken by mouth, may be beneficial.

Chromium deficiency may be a key player in the type 2 diabetes problem. In addition, chromium may help improve body composition—that is, the ratio of fat to muscle. Chromium is not generally available in plant foods, as plants have no requirement for it and thus do not concentrate it. Brewer's yeast, beer, whole grains, cheese, broccoli, and meat are good dietary sources, but not all are good choices for people with diabetes. Inorganic forms of chromium are poorly absorbed. Chromium picolinate is an effective organic form that is readily available as a supplement. (See the Nutrients table in this section for dosage and details.)

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

If you have a child with diabetes, be sure his or her teacher knows how to respond to the warning signs of hypoglycemia and hyperglycemia.

If symptoms of hypoglycemia develop, immediately consume fruit juice, soda pop, or anything else that contains sugar. If that fails to help within twenty minutes, repeat this regimen. If the second treatment fails, or if you cannot ingest food, seek immediate medical attention and/or administer a glucagon injection. Anyone who has insulin-dependent diabetes should always carry a glucagon kit and know how to use it.

Avoid tobacco in any form; it constricts the blood vessels and inhibits circulation. Keep your feet clean, dry, and warm, and wear only white cotton socks and well-fitting shoes. Lack of oxygen (because of poor circulation) and peripheral nerve damage (with loss of pain sensation) are major factors in the development of diabetic foot ulcers. Try to avoid injury, and take measures to improve the circulation in the feet and legs. (See CIRCULATORY PROBLEMS in Part Two.)

Exercise regularly. Women who exercised at least once a week had a reduced risk of developing type 2 diabetes.

Moderate coffee consumption (up to 4 cups a day) of either caffeinated or decaffeinated coffee reduces the risk of getting type 2 diabetes. These surprising results were obtained from over 88,000 women and published in the prestigious diabetes journal *Diabetes Care*. Coffee contains natural compounds besides caffeine that have been shown to improve glucose control in laboratory animals.

### Considerations

To compensate for the lack of insulin production, a person with type 1 diabetes must inject insulin on a daily basis. Injections are necessary because insulin cannot be absorbed from the gastrointestinal tract into the bloodstream if taken orally. Insulin pumps and pens (individual, disposable pre-filled insulin syringes in the form of a pen) are also available for the delivery of insulin. Because the management of type 1 diabetes is such a complex challenge, it is imperative that a person with this condition have a good relationship with the physician prescribing the insulin. There are many insulin formulations on the U.S. market. A table in this section shows what is available today.

Since 1982, most of the newly approved insulin preparations have been produced by inserting portions of DNA (recombinant DNA) into special lab-cultivated bacteria or yeast. This process allows the bacteria or yeast cells to produce complete human insulin. Recombinant human insulin has all but completely replaced animal-derived insulin, such as pork or beef insulin. Recently, insulin analogs have been produced that have a structure differing slightly from human insulin (usually by one or two amino acids). This changes the onset and peak of action times. Refer to the table on page 381 for information about some of the more common insulin preparations.

Strict glucose control in type 1 diabetes also reduces the risk of atherosclerosis, according to a study reported in *The New England Journal of Medicine*. Intensive glucose control was found to greatly reduce damage to the eyes, nerves, and kidneys. Researchers also concluded that the tight control benefited the heart. Strict glucose control involves at least three insulin injections per day, or the use of an insulin pump, plus frequent self-monitoring. However, some newer studies have refuted these results. Ask a trained dia-

betologist or endocrinologist what the latest thinking is on the subject.

❑ The FDA has approved pramlintide (Symlin), a new drug for people with diabetes who cannot adequately control their blood glucose levels with insulin. It is intended to be used along with insulin to help lower blood glucose levels during the three hours after meals. Pramlintide must be kept separately from insulin and never mixed, nor should the same syringe be used to administer both, to prevent alteration of the activity of the insulin.

❑ Gastroparesis, which affects up to 75 percent of people with diabetes, causes bloating, loss of appetite, vomiting, and dehydration. With this condition, the flow of food from the stomach to the intestine is blocked or slowed. Because the timing of the digestive process is disrupted, this can complicate efforts to control blood sugar levels with medication. Researchers at Johns Hopkins University School of Medicine have found that sildenafil (Viagra) could be an effective remedy for the condition. Sildenafil appears to cause muscles in the digestive tract to relax.

❑ Caiapo, an extract of white sweet potatoes that is taken as a supplement in Japan, has been studied for its efficacy and tolerability. Dr. Bernard Ludvik of the University of Vienna Medical School found that subjects with type 2 diabetes experienced improvement in both blood sugar and cholesterol levels when taking caiapo. Subjects who took a placebo experienced no significant change. The research was published in the journal *Diabetes Care*.

❑ Cinnamon, a spice third only to pepper and mustard in popularity, may be a possible and pleasant treatment for diabetes. In a small study, taking 1 or 2 teaspoonfuls a day in capsule form was shown to lower blood sugar, triglycerides, and cholesterol. Some investigators have shown that people with diabetes who took 1, 3, or 6 grams a day of cinnamon reduced serum glucose, triglycerides, and the bad cholesterol (LDL). Mostly associated with pastry products, cinnamon is also an excellent spice for teas, meats, and vegetables, as well as fruits such as apples, bananas, and peaches. The continuous ingestion of table cinnamon is, however, probably not advisable due to the potential toxic buildup of certain cinnamon compounds.

❑ Do not take too much selenium. One study showed that taking 200 micrograms a day for 7.7 years resulted in a nearly threefold increase in the risk of type 2 diabetes.

❑ Taking 600 milligrams of chromium picolinate and 2 milligrams of biotin each day helped patients with poorly controlled diabetes improve glucose management and blood lipid measurements. Larger amounts of chromium picolinate (1,000 micrograms) helped attenuate weight gain and abdominal fat accumulation, while at the same time improving blood sugar control.

❑ In the Nurses' Health Study, a study of over 80,000 women, higher zinc intake was associated with a slightly lower risk of developing type 2 diabetes. The lowest risk

was associated with taking at least 18 milligrams a day of zinc.

❑ Cut back on soft drinks that contain sugar. That is the conclusion drawn by a study that appeared in the *Journal of the American Medical Association*. Women who drank more than one sugar-sweetened soft drink a day were found to be twice as likely to develop diabetes than those who did not. Even when other factors, such as weight, diet, and lifestyle differences, were factored in, researchers still found that the soft-drink group was 1.3 times more likely to develop the disease. It was hypothesized that in addition to the extra calories, the increase in risk might be attributable to the high amount of rapidly absorbed sugars that cause a dramatic rise in glucose and insulin. Neither diet soda nor fruit juice indicated a problem in the study, but sugared fruit punch showed results similar to the sugared soda.

❑ Cut back on soft drinks that contain artificial sweeteners. In a study of over 5,000 participants, those who drank one or more diet sodas a day had a 62 percent greater chance of developing diabetes. It is possible that the artificial sweetener increases the hedonistic desire for more sweet foods, or that incorporating diet sodas into one's life is just an indication that the rest of the diet is unhealthy.

❑ Some newly diagnosed patients with diabetes benefited from a whole-system Ayurvedic protocol that included an herbal blend of neem, bitter gourd, blackberry, and Bael fruit coupled with an Ayurvedic diet and meditation. These patients experienced higher hemoglobin A1c levels, which showed better control of blood sugar levels over the six-month study.

❑ People with type 2 diabetes are less able than most people to perceive sweet tastes, and this may make it more difficult for them to lose weight. Because they do not recognize the sweet taste of substances, they often consume sugary products that they do not appreciate as sweet. If a person with type 2 diabetes attains a better understanding of food, exercises greater care in choosing foods, and reads food product labels carefully, he or she should be able to control the problem and avoid the need for treatment with drugs or insulin. Adhering to a low-glycemic-load diet may help control cravings, as it reduces hunger.

❑ A higher magnesium intake lowers the risk of getting type 2 diabetes. The journal *Diabetes Care* published a study in which overweight women who consumed large amounts of magnesium were 22 percent less likely to develop type 2 diabetes than women who consumed lower amounts. A diet rich in nuts, whole grains, and vegetables that are high in magnesium may be beneficial.

❑ Type 2 diabetes can be controlled by diet and exercise alone, but oral medications or injections of insulin can be added if regulating the diet does not work. Obesity is a major factor in type 2 diabetes, and a weight reduction program is often all that is required to control it.

## Oral Medications for Type 2 Diabetes

Type 2 diabetes may be managed with any number of different drugs. Following is a quick reference guide to the major medications currently used for this purpose, together with

how they act in the body, generic and brand names, and general comments.

Action in the Body	Generic Name	Brand Name(s)	Comments
<b>Sulfonylureas</b>			
Stimulates beta cells to release more insulin	chlorpropamide	Diabinese	Taken one or two times daily before meals. First-generation drug.
	glipizide	Glucotrol	Second-generation drug. Used in smaller doses than first-generation agents.
	glyburide	DiaBeta Micronase Glynase	Second-generation drug. Smaller doses.
	glimepiride	Amaryl	Second-generation drug. Smaller doses.
<b>Meglitinides</b>			
Stimulates the pancreas to release more insulin.	repaglinide	Prandin	Taken before each of three meals.
Works similarly to sulfonylureas.	nateglinide	Starlix	Taken before each of three meals.
<b>Biguanides</b>			
Sensitizes the body insulin already present.	metformin metformin Extended Release metformin with glyburide	Glucophage Glucophage XR Glucovance	Taken two times daily with food for best results.
<b>Thiazolidinediones (Glitazones)</b>			
Helps insulin work better in muscle and fat and lowers insulin resistance.	rosiglitazone pioglitazone	Avandia ACTOS	Taken once or twice daily with food. Very rare but serious side effects on the liver are possible.
<b>Alpha-Glucose Inhibitors</b>			
Slows or blocks breakdown of starches and sugars; action slows rise in blood sugar after eating.	acarbose miglitol	Precose Glyset	Should be taken with first bite of meals.
<b>DPP-4 Inhibitors</b>			
Increases the insulin made in the pancreas and decreases the sugar made in the liver.	sitagliptin	Januvia	Taken once daily with food.

❑ It was once thought that people with diabetes should avoid all sweetened foods. For weight control, this is still the case. However, research has shown that sugar—a simple carbohydrate—does not cause the greatest increase in blood glucose. Eating baked potatoes or some breakfast ce-

reals causes a greater rise in blood sugar. Indeed, carrots raise blood sugar more than ice cream does. However, it is important to note that the extra vitamins and fiber in carrots probably make carrots a better choice for a diabetic than ice cream. Also, the amount of carrots consumed is

usually not enough to cause concern. Carbohydrates are converted quickly into glucose in the body. It is on this principle that many high-protein, low-carbohydrate diets are based. It is essential, therefore, that people with diabetes measure their intake of both simple and complex carbohydrates—not simply those coming from sugar.

❑ Insulin inhalers are now in development. The dose is inhaled through the mouth into the lungs, and from there, the dry or dissolved insulin can easily be absorbed into the bloodstream. The benefits to this method of ingestion, as compared with injection, are obvious. The drawbacks, however, are in accurately administering the correct dose in the correct form. The inhalers deliver only up to 10 percent of the drug into the lungs, making it more expensive because more insulin is needed. The size of the drug particles is also critical—if they are too small, the drug will bind together; if too large, the insulin will not be able to reach the lungs.

❑ A continuous glucose monitoring system, the CGMS® System Gold™, is available from Medtronic, Inc. It records blood glucose levels at five-minute intervals for periods up to three days. Data can be downloaded into a computer for review by a doctor. This device should be used along with traditional finger stick tests for calibration purposes.

❑ A needle management system, called the Q-103 Needle Management System, is available to remove certain hypodermic needles from insulin syringes and to store them safely for later disposal. The device holds as many as 5,000 needles, and is produced by QCare International LLC.

❑ The FDA recently approved a wristwatch-like glucose-monitoring device for use by children and adolescents. The device, called the GlucoWatch G2 Biographer, manufactured by Cygnus, Inc., was previously approved for use by adults. Fluid is extracted through the skin as the device is worn and the glucose level is measured and displayed. Up to six painless measurements per hour for a thirteen-hour period are possible. The device must be warmed up and calibrated using a finger stick.

❑ A wound dressing, called Apligraf, is available that helps heal diabetic foot ulcers, open foot sores that can lead to amputation. It is manufactured by Organogenesis, Inc.

❑ Research indicates that supplementation with the hormone dehydroepiandrosterone in the form of 7-keto DHEA may help prevent diabetes. (See DHEA THERAPY in Part Three.)

❑ Hypothyroidism may be a leading cause of diabetes. Well-known researcher and author Stephen Langer, M.D., has noticed that neuropathies, together with other diabetic complications, disappear when thyroid hormone is administered. Many complications of diabetes and hypothyroidism are a result of clogged arteries, which prevent the blood from delivering nutrients and oxygen and carrying off waste and debris.

❑ Glycosylation—the binding of glucose and other sugars onto proteins in the blood, nerve cells, and lenses of the

eyes—may be responsible for many of the long-term effects of diabetes. Researchers at the University of Surrey's School of Biological Sciences and the Academic Unit of Diabetes and Endocrinology of London's Whittington Hospital have shown that vitamin C may inhibit this destructive process. They say that if glycosylation is part of the normal aging process, taking vitamin C supplements may slow it.

❑ Magnet therapy helps some people with diabetes in coping with foot pain associated with the disorder. (See MAGNET THERAPY under PAIN CONTROL in Part Three.)

❑ A woman with diabetes who wants to become pregnant should watch her blood sugar levels long before she plans to conceive. The fetus has the greatest chance of developing birth defects during the first five to eight weeks of pregnancy, before most women know they are pregnant. It usually takes a few months to get the blood sugar under proper control; if a woman begins to monitor her blood sugar level the day she conceives, damage may already be done by the time it is under control. Pregnant women are routinely checked during pregnancy for gestational diabetes. This disorder usually resolves after giving birth. However, many women who have gestational diabetes will develop type 2 diabetes later in life.

❑ Retinopathy (damage to the retina) from diabetes is the leading cause of blindness in the United States. The incidence of blindness from diabetic retinopathy has dropped with the use of laser surgery. However, persons with untreated diabetes are said to be twenty-five times more at risk for blindness than the general population. The Diabetes Control and Complications Trial (DCCT), a ten-year study which ended in June 1993, showed that improved blood glucose control among type 1 patients prevents or delays diabetic retinopathy. Therapy that keeps blood sugar levels as close to normal as possible reduced damage to the eyes by 76 percent. Persons with diabetes should get annual retinal examinations to check on their condition.

❑ Diabetic nephropathy (damage to the kidneys caused by diabetes) is quite common, but is becoming less so as people recognize the necessity of maintaining a stable blood sugar level. It is important to monitor kidney function periodically. Treating high blood pressure is important. Diabetic neuropathy (damage to the nerves caused by diabetes) usually affects the peripheral nerves, such as those in the feet, hands, and legs. Symptoms include numbness, tingling, and pain. Amitriptyline and desipramine, common antidepressant drugs, have proved to be successful in the treatment of this condition. They work by increasing levels of the neurochemical that carries messages between cells, thus increasing sensation. Autonomic neuropathy may lead, among other complaints, to a buildup of gastric juices in the stomach. Too much stomach acid can cause nausea and diarrhea, but the condition can be relieved by either antibiotic treatment or by eating smaller, low-fat meals. For men, neuropathy or circulatory prob-

lems can lead to erectile dysfunction (ED). Sildenafil (Viagra) and tadalafil (Cialis) may be able to alleviate this problem. Your physician will probably want to do a stress test before prescribing this drug.

❑ In one study, large amounts of niacin raised blood sugar levels in people with non-insulin-dependent diabetes by as much as 16 percent. Over time, this could cause dependence on insulin or medication. Niacin can also cause the level of uric acid in the blood to rise, indicating probable kidney dysfunction and an increased risk of gout. However, niacinamide, a form of niacin, slows down the destruction and enhances the regeneration of the insulin-producing beta cells in the pancreas, and therefore may be helpful for those with type 1 diabetes.

❑ Elevated glucose levels in the lens of the eye can result in the accumulation of substances called polyols, whose presence can ultimately cause damage to the lens. High polyol concentrations resulting from high glucose levels can persist even if glucose levels subsequently return to normal. Flavonoids, such as quercetin, help to inhibit the accumulation of polyols.

❑ Diabetes and high blood pressure often go hand in hand, and both can lead to kidney disease. In one recent study, hypertensive diabetics who took drugs called angiotensin converting enzyme (ACE) inhibitors cut their risk of developing serious kidney disease in half.

❑ Coronary artery disease is common in people with diabetes. Women with diabetes are particularly at risk. A sixteen-year study published in *Circulation: Journal of the American Heart Association* by Frank B. Hu, M.D., lead author and associate professor of nutrition and epidemiology at the Harvard School of Public Health, indicates that women with type 2 diabetes who consumed fish five or more times a week had a 64 percent reduction in coronary heart disease and a 52 percent reduction in total mortality compared with women who ate fish less than once a month. This was attributed to the higher consumption of omega-3 fatty acids associated with this diet. Concerns with environmental toxins found in fresh fish point to fish oil supplements as an acceptable substitute for the actual consumption of fish. Dr. Hu did not study supplements specifically, but did not rule out their theoretical use as substitutes. It is probable that the consumption of omega-3 fatty acids would have the same effect on men.

❑ Researchers at the University of Colorado Health Sciences Center found that smokers who have diabetes are two to three times more likely than their nonsmoking counterparts to develop kidney damage, often leading to the need for dialysis or a transplant. Smoking constricts blood vessels. In people with diabetes, this helps to push large protein molecules out of the vessels and into the kidneys. That can eventually lead to kidney failure.

❑ Rosiglitazone (Avandia) is a drug sometimes prescribed for type 2 diabetes. This drug controls blood sugar by adjusting the sensitivity of fat and muscle tissue to the insulin in the body. Rosiglitazone may cause fluid retention (a condition where the body keeps excess fluid), which may lead to or worsen congestive heart failure.

❑ People with diabetes who experience the pain associated with nerve damage (diabetic peripheral neuropathy) have a new treatment option—the first FDA-approved drug for managing the burning, tingling, and numbing sensations in the extremities that mark this condition. The drug, duloxetine (Cymbalta), was approved in September 2004 for treating the condition, the most common complication of diabetes. In clinical trials, people treated with Cymbalta reported less pain than those given a placebo. Treated with Cymbalta, 58 percent of the people reported at least a 30 percent sustained reduction in pain. Only 34 percent of the people treated with a placebo reported sustained pain reduction. Most commonly reported side effects included nausea, dry mouth, constipation, and diarrhea. In a few cases, patients experienced dizziness and hot flashes.

❑ On days having high levels of airborne particulates, such as dust and soot, people with diabetes are twice as likely to be hospitalized for cardiovascular problems. Exposure to these particles may affect heart rate and increase inflammation in the heart. This places diabetics with cardiovascular problems at a greater risk. If you have diabetes, check air quality levels and stay indoors during periods of risk.

❑ Many nutrients recommended for people with diabetes are available in combination supplements. One company that produces a line of specialty supplements for people with diabetes is Progressive Research Labs of Austin, Texas.

❑ It is vital for people who have diabetes to take care of their feet. Nerve damage can lead to lack of sensation in the feet, and once the skin is broken, sores there may not heal. Treatments for diabetic foot problems include becaplermin (Regranex), a topical gel that encourages tissue growth in the wound, and Dermagraft. Dermagraft is a skin substitute used to help wound closure associated with diabetic foot ulcers. It helps replace and rebuild damaged tissue.

❑ People with diabetes should be vigilant about blood fat and cholesterol levels. Optimum cholesterol levels are LDL (“bad cholesterol”), less than 130; HDL (“good cholesterol”), 60 or above; triglycerides, 150 or under. Your doctor may set different levels for you if you are diagnosed with diabetes.

❑ For more information on diabetes and its potential complications, contact any of the organizations listed under Health and Medical Organizations in the Appendix.

## Insulin Preparations for Type 1 Diabetes

Type 1 diabetes is managed with injections of the hormone insulin, as well as with close attention to diet and other lifestyle factors. Not all insulins are the same, however, and it may take some trial and error to find the one or ones that are

right for any given individual. The principal differences are related to the speed with which they take effect, and the period of time they remain active in the body. Following is a quick reference guide to the major types of insulin available.

Examples	Onset of Action	Peak of Action	Duration of Action
<b>Rapid-Acting Insulin</b>			
Humalog (Lispro)	15 minutes	30–90 minutes	3–5 hours
Apidra (Glulisine)	15 minutes	30–90 minutes	3–5 hours
NovoLog (Aspart)	15 minutes	30–90 minutes	3–5 hours
<b>Short-Acting Insulin (Regular)</b>			
Humulin R	30–60 minutes	2–4 hours	5–8 hours
Novolin R	30–60 minutes	2–4 hours	5–8 hours
<b>Intermediate-Acting Insulin (NPH)</b>			
Humulin N	1–3 hours	8 hours	12–16 hours
Novolin N	1–3 hours	8 hours	12–16 hours
<b>Intermediate- and Short-Acting Insulin Mixtures</b>			
Humulin 70/30	30–60 minutes	Varies	10–16 hours
Novolin 70/30	30–60 minutes	Varies	10–16 hours
Humalog Mix 75/25	10–15 minutes	Varies	10–16 hours
Humalog Mix 50/50	10–15 minutes	Varies	10–16 hours
Novolog Mix 70/30	5–15 minutes	Varies	10–16 hours
<b>Long-Acting Insulin</b>			
Ultralente	4–8 hours	10–30 hours	36 hours
Levemir (Detemir)	1 hour	None	20–26 hours
Lantus (Glargine)	1 hour	None	20–26 hours

### DIABETIC RETINOPATHY

See under EYE PROBLEMS.

### DIARRHEA

Diarrhea is characterized by frequent and loose, watery stools. Symptoms that may accompany diarrhea include vomiting, cramping, thirst, and abdominal pain. Some people run a fever as well. It is rarely a serious condition, except in young children and older adults. Diarrhea causes the loss of both fluids and electrolytes (minerals), which can lead to troublesome problems. Diarrhea can exist alone or as a symptom of other problems.

Among the many possible causes of diarrhea are incomplete digestion of food; food poisoning; food allergies; excess alcohol consumption; bacterial, viral, or other infection; and consumption of contaminated water. Caffeine, magnesium, laxatives, and sorbitol and all sugar alcohols (espe-

cially for young children) are all known to cause diarrhea in some people. The use of certain drugs, including antibiotics such as tetracycline, clindamycin (Cleocin), or ampicillin can also contribute to diarrhea. Inflammatory bowel disease, such as ulcerative colitis, diverticulitis, or Crohn's disease; pancreatic disease; and cancer may all lead to severe intestinal upsets. Emotional stress also can cause diarrhea. Acute diarrhea accompanied by fever and mucus or blood in the stool can be a sign of infection or the presence of parasites.

Unless otherwise noted, the dosages recommended here are for adults. In any case, don't take too many supplements at once until your gastrointestinal tract has become quiescent. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between the ages of six and twelve, use one-half the recommended dose, and for a child under six, use one-quarter of the recommended amount. If diarrhea is severe, seek medical attention.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
ABC Aerobic Bulk Cleanse from Aerobic Life Industries or psyllium seeds	As directed on label.  4 capsules daily, at bedtime. Take with a large glass of water.	To provide bulk that aids in forming stools.
Charcoal tablets	4 tablets every hour with water until the diarrhea subsides. Take separately from other supplements and medications.	Absorbs toxins from the colon and bloodstream and aids in firming stools. <i>Note:</i> Do not take for more than 3 days at a time.
Essential fatty acid complex	As directed on label.	Aids in forming stools.
Kelp	1,000 mg daily.	To replace minerals lost through diarrhea.
L-glutamine	As directed on label.	Helps the gut to produce healthy new cells and boosts the immune system.
Potassium	99 mg daily.	To replace potassium lost in watery stools.
<b>Important</b>		
Acidophilus (Kyo-Dophilus or Probiata from Wakunaga)	1 tsp in distilled water, twice daily, on an empty stomach.	Replaces lost "friendly" bacteria. Use a nondairy powder form.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Kills bacteria and parasites. Enhances immunity.
<b>Helpful</b>		
Calcium	1,500 mg daily.	To replace calcium depleted from the body. Also aids in forming stools.
and magnesium	1,000 mg daily.	Needed for calcium uptake. Promotes pH balance.
and vitamin D	400 IU daily.	Needed for calcium uptake.
Multienzyme complex with pancreatin	Take with meals. As directed on label.	Needed for normal digestion.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 200 mg daily for 2 weeks.	All B vitamins are necessary for digestion and absorption of nutrients. Sublingual forms are recommended for better absorption. Injections (under a doctor's supervision) may be necessary.
plus extra vitamin B <sub>1</sub> (thiamine)	50 mg daily.	
and vitamin B <sub>3</sub> (niacin)	50 mg daily.	
and folic acid	50 mg daily.	
Vitamin C with bioflavonoids	500 mg 3 times daily.	Needed for healing and immunity. Use a buffered form.
Vitamin E	200 IU daily.	Protects the cell membranes that line the colon wall. Use d-alpha-tocopherol form.

Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Aids in repair of damaged tissue of the digestive tract and enhances immune response. Use zinc gluconate lozenges or OptiZinc for best absorption.
------	--	--

## Herbs

If you suffer from occasional bouts of diarrhea, use blackberry root bark, chamomile, pau d'arco, and/or raspberry leaves. Herbs can be taken in tea form or added to applesauce, bananas, pineapple, or papaya juice.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Cayenne (capsicum) capsules, taken two to three times daily, may be beneficial.

Fenugreek, taken as a tea, lubricates the intestines and reduces fever.

Ginger tea is good for cramps and abdominal pain.

Grapefruit seed extract has antiparasitic properties.

Marshmallow root tea (also known as malva tea) helps calm the stomach and soothe intestinal problems.

Slippery elm bark, taken in tea or extract form, is soothing to the digestive tract.

Wild oregano oil contains antibacterial, antifungal, antiparasitic, and antiviral agents.

## Recommendations

Drink plenty of liquids, such as hot carob drink, "green drinks," and plenty of quality water. Do not drink very hot or cold liquids. The prolonged loss of fluids as a result of diarrhea can lead to dehydration and loss of necessary minerals, such as sodium, potassium, and magnesium. Liquid gelatin, clear broth, sodas such as ginger ale or flat cola, and weak tea with honey can be substituted for water if necessary. Carrot juice is also good, and makes the stools less watery. Do not drink apple juice, as this can make diarrhea worse. Most fruit juices are good sources of potassium, except cranberry juice. Include the potassium-rich juices, but try diluting them with half water until you can tolerate a stronger amount.

Avoid high-fiber foods, which may stress the digestive system. Instead, stick to foods that are easy to digest, such as cooked potatoes, rice, bananas, applesauce, or toast.

Drink 3 cups of rice water daily. To make rice water, boil ½ cup of brown rice in 3 cups of water for forty-five minutes. Strain out the rice and drink the water. Eat the rice as well. Rice helps to form stools and supplies needed B vitamins.

Do not consume any dairy products (except for low-fat soured products). They are highly allergenic. Moreover, di-

arrhea causes a temporary loss of the enzyme needed to digest lactose (milk sugar). Limit your intake of fats and foods containing gluten, including barley, oats, rye, and wheat. Avoid alcohol, caffeine, and spicy foods.

Let a mild case of diarrhea run its course. It is the body's way of cleaning out toxins, bacteria, and other foreign invaders. Do not take any medication to stop diarrhea for at least two days. Stick to a liquid diet for twenty-four hours to give the bowel a rest.

Consider using homeopathic remedies. *Arsenicum album* is a homeopathic remedy for burning diarrhea that is troublesome at night. *Podophyllum* can be used for watery stools. *Sulfur* is excellent for diarrhea that comes on suddenly. *Pectin* is known to counteract diarrhea.

Consult your health care provider if any of the following conditions occur: the diarrhea lasts for more than two days, there is blood in the stool, the stool looks like black tar, you have a fever above 101°F, you have severe abdominal or rectal pain or bleeding, you suffer from dehydration as evidenced by dry mouth or wrinkled skin, or urination is reduced or stops in any eight-hour period. If an infant has a dry diaper for more than four hours accompanied by a fever, it is wise to seek the advice of your physician.

### Considerations

Carob powder is high in protein and helps halt diarrhea.

When traveling abroad, do not drink the water unless you know it is safe. Avoid ice cubes, raw vegetables, dairy products, and unpeeled fruit. Use bottled water when you brush your teeth. Diarrhea is common when traveling in other countries, so it may be advisable to take certain preparations with you. Lactobacillus GG, a type of probiotic, is a natural alternative to both antibiotics or bismuth subsalicylate (Pepto-Bismol).

Chronic diarrhea in very young children is evident if the child has five or more watery stools a day. A baby with diarrhea can become dehydrated very quickly and should be evaluated by a health care provider.

If diarrhea is chronic or recurrent, an underlying problem such as a food allergy, infection, or intestinal parasites may be the cause. Allergy testing can determine whether you have any food allergies. A stool culture can be done to check for infection or the presence of parasites.

### DIVERTICULITIS

Diverticulitis is a condition in which diverticula are perforated and become infected and inflamed. Diverticula are saclike, pea- or grape-sized protrusions in the intestinal wall. They typically form if an individual suffers from frequent constipation. Eating a low-fiber diet, as is typical in

industrialized countries such as the United States, may contribute to the development of diverticulitis. Without sufficient fiber to soften and add bulk, stools are harder to pass. Greatly increased pressure is required to force small portions of hard, dry stool through the bowel. This rise in pressure can cause pouches to form at weak points in the wall of the colon. Once diverticula develop, they do not go away. The diverticula themselves cause no symptoms.

Many people have diverticulosis (the pouchlike protrusions) and never develop diverticulitis (the inflamed pouches). However, if tiny cuts in the pouches become infected or inflamed, the result can be severe, causing fever, chills, nausea, and pain. Fifty percent of people over age sixty will develop diverticulosis. Complications including bleeding occur in 10 to 25 percent of this group. As many as 3,300 people die from it each year.

Diverticulitis can be either acute or chronic. Symptoms include cramping, bloating, tenderness on the left side of the abdomen that is relieved by passing gas or a bowel movement, constipation or diarrhea, nausea, and an almost continual need to eliminate. There may be blood in the stool. Peritonitis, an inflammation of the lining of the abdominal cavity, can develop if a diverticulum ruptures and intestinal contents flow into the abdomen.

Because the walls of the large intestine often weaken as a person ages, this is a condition affecting older rather than younger people. It usually strikes people between the ages of fifty and ninety. It affects millions of Americans, but many people do not even know they have the condition because they either experience no symptoms or accept their symptoms as simple indigestion.

Exactly why is not known, but it is known that smoking and stress make symptoms worse. In fact, this is a classic example of a stress-related disorder. Poor eating habits compound the problem. A poor diet, a family history of the disease, gallbladder disease, obesity, and coronary artery disease all increase the chances of developing diverticulitis.

There are several diagnostic tests available to help diagnose diverticulitis. A barium enema is a procedure in which the colon is filled with liquid barium and X-rays are taken to reveal pouches in the colon wall, narrowing of the colon, or other abnormalities. With sigmoidoscopy, a thin, flexible lighted tube is inserted into the rectum to give the physician a closer look at the lower colon. If necessary, tissue samples can be removed for examination. To see into other parts of the colon, a colonoscopy must be performed. This is similar to a sigmoidoscopy, but allows a view of the entire colon.

Unless otherwise noted, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount. Do not take too many different supplements at once if you are in pain. Go slowly and add one at a time.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Bio-Bifidus from American Biologics and Kyo-Dophilus from Wakunaga	As directed on label.	To replace flora in the small intestine, primarily to improve assimilation.
Fiber (oat bran, psyllium, ground flaxseeds, and ABC Aerobic Bulk Cleanse from Aerobic Life Industries)	As directed on label. Take 1 hour before meals with a large glass of liquid. Take separately from other supplements and medications.	Helps prevent constipation. Prevents infection by preventing accumulation of wastes in pouches in the colon walls.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Needed for all enzyme systems in the body and for proper digestion. Use a hypoallergenic formula.
<b>Very Important</b>		
Multienzyme complex with pancreatin	As directed on label. Take with meals.	Needed to break down proteins. Use a formula high in pancreatin.
Proteolytic enzymes	As directed on label. Take between meals.	Aids in digestion and reduces inflammation of the colon.
<b>Important</b>		
Essential fatty acids (flaxseed oil, primrose oil, salmon oil, or Kyolic-EPA from Wakunaga)	As directed on label 3 times daily, before meals.	Improves lymphatic function and aids in protecting the cells lining the wall of the colon.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Aids in digestion and destroys unwanted bacteria and parasites. Use a yeast-free formula.
Kyo-Green from Wakunaga	As directed on label.	Aids in normal bowel function.
L-glutamine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A major metabolic fuel for the intestinal cells; maintains the villi, the absorption surfaces of the gut. (See AMINO ACIDS in Part One.)
Vitamin K or alfalfa	100 mcg daily.	Deficiency has been linked to intestinal disorders. See under Herbs, below.
<b>Helpful</b>		
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label, on an empty stomach, 1/2 hour before meals.	To supply protein, needed for healing and repair of tissue.
Raw thymus glandular	As directed on label.	See GLANDULAR THERAPY in Part Three for its benefits. <i>Caution:</i> Do not give this supplement to a child.

Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Protects and heals the lining of the colon.
Vitamin C with bioflavonoids	3,000–8,000 mg daily, in divided doses.	Reduces inflammation and boosts immune response. Use a buffered form.
Vitamin E	Up to 200 IU daily.	A powerful antioxidant that protects the mucous membranes. Use d-alpha-tocopherol form.

**Herbs**

- Alfalfa is a good natural source of vitamin K and valuable minerals, which are often deficient in people with intestinal disorders. It also contains chlorophyll, which aids healing. Take 2,000 milligrams daily in capsule or extract form.
- Aloe vera promotes the healing of inflamed areas. It also helps to prevent constipation. Drink ½ cup of aloe vera juice three times daily. It can be mixed with a cup of herbal tea if you wish.
- Pau d'arco has antibacterial, cleansing, and healing effects. Drink two cups of pau d'arco tea daily.
- Other herbs beneficial for diverticulitis include cayenne (capsicum), chamomile, goldenseal, papaya, red clover, slippery elm bark, and yarrow extract or tea. The fibrous inner bark of slippery elm contains large quantities of a gentle laxative that soothes the digestive tract while keeping things moving. The U.S. Food and Drug Administration has declared slippery elm to be a safe and effective digestive soother. Prepare it like oatmeal, adding hot milk or water to the powdered bark to make a cereal. Capsules also are available.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

**Recommendations**

- The key to controlling this disorder is to consume an adequate amount of fiber and lots of quality water. You need at least 30 grams of fiber each day. You may prefer to supplement your diet with a bulk product and/or a stool softener that contains methylcellulose or psyllium, since these do not promote as much gas formation in the colon as other sources of fiber, especially wheat bran. Drink at least ten 8-ounce glasses of water daily. Herbal teas, broth, and live juices can account for some of the liquid needed. Liq-

uid aids in keeping the pouchlike areas clean of toxic wastes, preventing inflammation.

Eat a low-carbohydrate diet with high levels of protein from vegetable sources and fish. Do not eat grains, seeds, or nuts, except for well-cooked brown rice. These foods are hard to digest, resulting in bloating and gas. Also eliminate dairy products, red meat, sugar products, fried foods, spices, and processed foods. Make sure to get adequate calcium and vitamin D if you are eliminating dairy.

Eat plenty of green leafy vegetables. These are good sources of vitamin K. Obtaining this vitamin through diet is especially important for people with intestinal disorders.

Eat garlic for its healing and detoxifying properties.

During an acute attack of diverticulitis, your health care provider may recommend a temporary low-fiber diet. Once the inflammation clears, you may slowly switch back to a high-fiber diet.

When an attack or pain begins, give yourself a cleansing enema using 2 quarts of lukewarm water and the juice of a fresh lemon. (See ENEMAS in Part Three.) This helps to rid the colon of undigested and entrapped foods and to relieve pain. Make sure to first get the approval of your health care professional or your child's pediatrician.

On the day of an acute attack, take 4 charcoal tablets or capsules with a large glass of water to absorb trapped gas. Charcoal tablets are available at health food stores. Always take charcoal separately from medications and other supplements, and do not take it for prolonged periods, as it absorbs beneficial nutrients as well as gas.

During severe attacks, use liquid vitamin supplements for better assimilation and put all vegetables and fruits through a blender. Eat steamed vegetables only. Baby foods are good until healing is complete. Earth's Best produces organically grown baby foods that are available in health food stores and some supermarkets. Add supplemental fiber to the baby food. As healing progresses, gradually add raw fruits and vegetables to the diet. Drink carrot juice, cabbage juice, and "green drinks." Or take chlorophyll liquid or liquid alfalfa in juice.

To relieve pain, massage the left side of the abdomen. Stand up and do stretching exercises.

Clay tablets are beneficial. Take them as directed on the product label, on an empty stomach, when you get up in the morning.

Check stools daily for blood. If the stool is black, take a portion of it to your physician for an analysis.

Try to have a bowel movement at the same time each day. Take fiber first thing in the morning, before breakfast, to help the bowels move at this time.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Do not overuse laxatives; they can irritate the colon wall.

### Considerations

Food allergies are often a cause of intestinal disorders. Allergy testing is advised. (See ALLERGIES in Part Two.)

One study of 47,000 males on high-fiber diets including hard, fibrous foods such as nuts, popcorn, and corn, did not show an increase in the risk of developing diverticulosis or diverticular complications.

If the diverticula are infected, your doctor may prescribe antibiotics. Be sure to consume plenty of soured products and some form of nondairy acidophilus if you are taking antibiotics.

Fasting is beneficial. (See FASTING in Part Three.)

See also CROHN'S DISEASE; IRRITABLE BOWEL SYNDROME; and ULCERATIVE COLITIS, all in Part Two.

### DIZZINESS

See MÉNIÈRE'S DISEASE; VERTIGO. See also under PREGNANCY-RELATED PROBLEMS.

### DOG BITE

A bite or scratch from a dog (or cat) that breaks the skin poses the danger of infection, especially if the wound is deep. Bites also carry the risk of rabies. Most household pets are immunized against rabies, but the possibility of infection still exists. Rabies is always fatal if you don't get treated, so seek medical attention immediately. It is also possible to contract a tetanus infection from an animal bite. The microbe that causes tetanus, *Clostridium tetani*, lives in the top layers of soil, and in the intestinal tracts of cows and horses. It easily infects wounds that result in reduced oxygen flow in the tissue, particularly crushing and puncture wounds.

A dog bite can be nothing more than a minor graze, or it can be so severe as to be life-threatening. Children are at most risk from dog bites, and children under five years of age are victims of the most severe attacks—many of them requiring hospitalization.

Unless otherwise stated, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between the ages of six and twelve, use one-half the recommended dose, and for a child under six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Vitamin C with bioflavonoids	4,000–10,000 mg daily for 1 week, then reduce to 3,000 mg daily.	Fights infection. Important for repair of collagen and connective tissue.
<i>Important</i>		
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label. Take between meals. As directed on label.	Act as anti-inflammatories.
<i>Helpful</i>		
Colloidal silver	As directed on label.	To reduce the danger of infection. Can be placed on a sterile bandage covering the wound.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Acts as a natural antibiotic.
L-cysteine and L-methionine	500 mg each daily for 2 weeks. Take with water or juice on an empty stomach. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Powerful detoxifying agents. (See AMINO ACIDS in Part One.)
ViraPlex from Enzymatic Therapy	As directed on label.	Aids in healing and fights infection.
Vitamin A plus mixed carotenoids plus vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily. 200 IU daily.	Powerful antioxidants that aid the immune system and assist healing of the skin. Use d-alpha-tocopherol form.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Aids in tissue oxidation and antibody production.

## Herbs

Echinacea, goldenseal, pau d'arco, and red clover, taken in tea form, are good for dog bites. Goldenseal extract can also be applied directly on the affected area. This is a natural antibiotic that helps to fight infection.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

If you are bitten by a dog, the first thing you should do is seek medical attention. Rabies treatment needs to begin at once.

If you know who the dog's owner is, inquire as to the animal's vaccination status. If the dog is unfamiliar, try to have someone confine it if possible so that its health can be checked and it can be placed under observation. But time is of the essence, so it is always better to be treated against rabies when you are not sure about the dog's vaccination status.

Teach children how to behave around animals, and teach them not to approach strange animals. Never leave a young child alone with an animal—even the family pet.

## Considerations

Your physician may prescribe an oral antibiotic to prevent infection. If so, make sure that you take acidophilus to replace the "friendly" bacteria that antibiotics destroy. Your doctor will also likely recommend that you have a tetanus booster shot if you haven't had one in six years or more.

In most states, dog bite incidents must be reported to the local health department, and the dog must then be kept under observation for any signs of rabies—viciousness, paralysis, growling, foaming at the mouth, or agitation. Rabies is an RNA-type virus that, once established in the human central nervous system, is invariably fatal. If the animal cannot be located so that rabies can be ruled out, a series of rabies injections will be necessary. The series of injections given today is no longer so painful, nor are injections given in the stomach, as in the past.

## DOWN SYNDROME

Down syndrome is a condition caused by the presence of extra genetic material in the cells of a developing embryo. The disorder—named for English physician John Langdon Down—occurs in approximately 1 in every 733 births, and usually results in mental retardation with distinctive physical abnormalities.

The incidence of Down syndrome increases with the age of the parents, especially if the mothers are thirty-four or older. The risk is also higher for children of parents who have already given birth to a Down syndrome child. Life expectancy for people with Down syndrome has increased dramatically in recent decades—from twenty-five years in 1983 to sixty years today.

Down syndrome is usually caused by a phenomenon geneticists call nondisjunction, in which an error in cell division produces three copies of a chromosome—in this case, chromosome 21—instead of the normal two. In trisomy 21, which accounts for 95 percent of Down syndrome

cases, the extra chromosome is due to an error in chromosome separation in the ovum before conception, although nondisjunction can also take place in the sperm. A small percentage of Down syndrome cases are linked to other kinds of chromosomal abnormalities, but all result in extra genetic material in some or all of the cells.

An infant born with Down syndrome typically—but not always—has characteristic physical traits such as a small head, poor muscle tone, a flat facial profile, slanted eyes, a depressed nose bridge, low-set ears, furrowed tongue, and a single deep crease across the center of the palm (known as a simian crease). People with Down syndrome are especially prone to having congenital heart disease and are more susceptible than most people to developing acute leukemia, thyroid disorders, and respiratory and digestive problems. While females with Down syndrome may menstruate and be fertile, males are almost always infertile.

Although the degree of mental retardation varies greatly among different individuals with Down syndrome, the average IQ falls within the range of 50 to 60. Generally, children with Down syndrome are able to learn everyday life skills and can be raised at home. Special education and training allow many individuals with Down syndrome to lead happy, useful, and love-filled lives. People with Down syndrome can live to middle or old age; however, as adults, they may be prone to developing Alzheimer's disease plus pneumonia and other lung diseases.

It is clear that the metabolism of people with Down syndrome differs considerably from those who have a normal complement of chromosomes. Immunological dysfunction, growth retardation, lipoprotein metabolism (cholesterol) problems, and an increased risk for Alzheimer's disease are among the issues raised by these metabolic differences.

It can be said that people with Down syndrome have a different genotype, and because of this their nutritional needs are very different from those of the general population. With proper, specialized nutrition, it is possible to improve metabolic and immune functions, as well as overall health, even though a definitive cure is probably not possible.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount. Persons with malabsorption problems should consult a health care provider before starting any nutritional program.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Aangamik DMG from FoodScience of Vermont	50 mg 4 times daily.	Promotes the utilization of oxygen.

Acetyl-L-carnitine (ALC)	100–500 mg daily.	A carnitine derivative produced naturally in the body, involved in carbohydrate and protein metabolism and the transport of fats into the mitochondria. Increases carnitine in tissues, surpassing the metabolic potency of carnitine.
Coenzyme Q <sub>10</sub>	10 mg daily.	Prevents heart damage by improving oxygenation of cells.
Essential fatty acids (Kyolic-EPA from Wakunaga, salmon oil, flaxseed oil, or primrose oil)	As directed on label. Take with meals.	Needed for proper brain and cardiovascular function.
Free form amino acid	As directed on label.	To provide needed protein and bolster the immune system.
Garlic (Kyolic from Wakunaga)	As directed on label.	Natural antibiotic that helps the body to eliminate toxins and strengthens the cardiovascular system.
Kelp	As directed on label.	To supply minerals helpful in establishing thyroid balance.
Lecithin granules or capsules	1 tsp 3 times daily. 2,400 mg 3 times daily.	Aids brain function.
Multivitamin and mineral complex with vitamin A and mixed carotenoids and selenium	As directed on label. 10,000 IU daily. 15,000 IU daily. 200 mcg daily.	All nutrients are needed for proper immune function.
Potassium	200 mg daily.	Helps transmit nerve impulses.
Taurine Plus from American Biologics	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Reduces stress and regulates nervous system.
Vitamin B complex with choline	As directed on label. 100 mg daily.	Prevents and/or treats memory loss and increases learning capacity. Also protects against cardiovascular disease.
Vitamin C with bioflavonoids	3,000 mg daily.	Enhances immune function and reduces cholesterol levels.
Vitamin E	200 IU daily.	Boosts immune system; facilitates absorption of lecithin. Use d-alpha-tocopherol form.
Zinc plus copper	50 mg daily. 2–3 mg daily.	Needed for proper brain function and a healthy immune system. Needed to balance with zinc.

### Recommendations

Be patient when feeding a child with Down syndrome, and be sure to provide a balanced diet. Include fresh and whole foods that are rich in vegetable proteins, as well as

foods that are high in magnesium, such as fresh green vegetables, figs, meat, fish and seafood, nuts and seeds, tofu, blackstrap molasses, apples, kelp, soybeans, cornmeal, rice, apricots, and brewer's yeast. Reduce consumption of foods high in gluten, such as wheat, rye, barley, and oats. Avoid refined foods, sugars, dairy products, and alcohol.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

### Considerations

- ❑ Vitamin/mineral supplements and extra nutrients can be nutritionally beneficial for people with Down syndrome. However, any kind of nutritional program should be designed with the help of a qualified physician or health care provider, who should take into account the individual makeup of any person with Down syndrome. However, in a review on the effect of vitamin supplementation on persons with Down syndrome, 337 studies showed no cognitive improvement. These authors cautioned parents about using mega-dosing vitamins for their children.
- ❑ One of the most common side effects seen in children with Down syndrome is hypothyroidism. One way to correct it in those whose zinc levels are too low is to supplement the diet with zinc. It is important to determine your child's zinc level before giving him or her zinc supplements.
- ❑ Care for the child with Down syndrome depends on the degree of mental and physical impairment. Carefully planned programs to promote development of motor and mental skills are important. Since learning potential is greatest during infancy, an early stimulation program of exercises based on the child's ability is necessary for teaching gross motor skills.
- ❑ The risk of giving birth to a child with Down syndrome increases markedly after the age of thirty-five. Amniocentesis is recommended if you become pregnant past this age. (For additional information on amniocentesis and other types of prenatal testing, *see under* PREGNANCY-RELATED PROBLEMS in Part Two.)
- ❑ Additional information on Down syndrome, parent support groups, and early intervention programs for children with Down syndrome is available from The National Down Syndrome Society. (*See* Health and Medical Organizations in the Appendix.)

### DRUG ADDICTION (SUBSTANCE ABUSE)

Addiction is said to exist when the body becomes so accustomed to the presence of a foreign substance that it can no longer function properly if the substance is withdrawn.

Not everyone who uses drugs, legal or illegal, becomes addicted to them. The three most commonly used drugs—alcohol, tobacco, and caffeine—are legal and freely available, but they do not pose an addiction problem for all those who take them. Not everyone who drinks becomes an alcoholic; some people smoke only on weekends or special occasions. Many people who drink coffee don't crave it all the time.

Much research is focusing on the question of why some people become addicted while others do not, and scientists and nutritionists are providing some answers to the complex question of chemical dependency.

The reasons for addiction, according to most research, lie in the brain. A group of chemicals called neurotransmitters carry the signals between neurons in the brain. One of these neurotransmitters, dopamine, plays a pivotal role in transmitting feelings of satisfaction, arousal, and reward, so that every time we experience these feelings, we have the desire to replicate them by doing whatever it was that caused them before. This may account for the repetition inherent in addictive behavior.

Alcohol, nicotine, marijuana, cocaine, and amphetamines are a few of the substances that increase dopamine levels in the brain, and the more they are used, the more deeply these substances are associated with pleasure and reward, and the more profound the dependency. It is also thought that people who become addicted to a substance eventually take less pleasure in things they used to enjoy.

Positron-emission tomography (PET) brain scans of addicted people have shown that their brains show less response to other pleasurable pursuits, such as listening to their favorite music, than do the brain scans of people not involved in substance abuse.

The pleasure elicited by whatever substance the individual is addicted to is so strong that it is difficult to eradicate, and even after years of abstinence, there are triggers that may cause the person to relapse. Research has shown that long-term drug abuse results in significant changes in brain function that persist long after an individual stops using drugs.

Signs of drug addiction can include a decreased desire to work and/or socialize, extreme drowsiness, inattentiveness, frequent mood swings, restlessness, personality changes, and a loss of appetite. Persons addicted to drugs may want to be alone, and lose their tempers easily. Drug withdrawal symptoms may include headache, insomnia, sensitivity to light and noise, diarrhea, hot and cold flashes, sweating, deep depression, irritability, irrational thinking, and disorientation. Not surprisingly, individuals who are addicted to drugs can end up centering their lives on avoiding the excruciating pain of withdrawal—that is, on assuring a continuing supply of the drug. This need to obtain the drug at all costs leads ultimately to a disintegration of normal life, including broken personal relationships, loss of employment, and even criminal behavior.

People who become chemically dependent do so at different rates, and research is showing that susceptibility to addiction may be, in part, hereditary. Complicating the phenomenon of addiction is the problem of drug tolerance. Researchers have found that children who were diagnosed with ADHD (attention deficit hyperactivity disorder) are more likely than their peers to report alcohol-related problems, as well as drug and tobacco addictions, later in life. This study appeared in the *Journal of Abnormal Psychology*. Youngsters with severe inattention problems were five times more likely than others to use an illegal drug other than alcohol or marijuana at an early age. This turned out to be a uniquely important variable even when the presence of oppositional defiant disorder (ODD) and conduct disorder (CD) were considered. The risk factor for inattention paralleled the importance of family history as a predictor.

With prolonged drug use, the body often ends up needing more and more of the substance to produce the desired effect and to prevent withdrawal symptoms. Some users end up increasing the dosage to the point that they die, or come close to dying, from overdose. In addition, addiction almost always has a powerful psychological as well as a physical component.

The nutrient program outlined below is designed to help those recovering from drug addiction. Unless otherwise specified, the dosages recommended here are for adults. For a child under the age of seventeen, use one-half to three-quarters of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Essential fatty acids complex	As directed on label.	Good for reversing the effects of malnourishment common in those with substance abuse problems.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Fights stress and protects the liver.
Kyolic Neuro Logic from Wakunaga	As directed on label.	Nourishes the central nervous system. Detoxifies the body. Encourages normal brain function.
Vitamin B complex injections	2 cc daily or as prescribed by physician.	Needed when under stress to rebuild the liver. Injections (under a doctor's supervision) are most effective. If injections are not available, use a sublingual form.
plus extra vitamin B <sub>12</sub> or vitamin B complex	1 cc daily or as prescribed by physician. 100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	Can give the same energy boost as a cup of coffee.
plus extra vitamin B <sub>5</sub> (pantothenic acid)	500 mg 3 times daily.	Essential for the adrenal glands and for reducing stress.

and vitamin B <sub>3</sub> (niacinamide)	500 mg 3 times daily.	Important for brain function. <i>Caution:</i> Do not substitute niacin for niacinamide. Niacin should not be taken in such high doses.
<b>Important</b>		
Calcium and magnesium	1,500 mg at bedtime. 1,000 mg at bedtime.	Nourishes the central nervous system and helps control tremors by calming the body. Use chelate forms.
Free form amino acid plus extra L-glutamine	As directed on label, on an empty stomach. 500 mg 3 times daily, on an empty stomach.	To supply needed protein in a readily assimilable form. Passes the blood-brain barrier to promote healthy mental functioning. Increases levels of gamma-aminobutyric acid (GABA), which has a calming effect.
and L-tyrosine	500 mg twice daily, on an empty stomach. Take these supplements with water or juice, not milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Tyrosine and valerian root taken every 4 hours have given good results for cocaine withdrawal. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug.
Gamma-amino-butyric acid (GABA)	As directed on label, on an empty stomach.	Acts as a relaxant and lessens cravings. (See AMINO ACIDS in Part One.)
Glutathione	As directed on label.	Aids in detoxifying drugs to reduce their harmful effects. Also reduces the desire for drugs or alcohol.
Lithium	As prescribed by physician.	A trace mineral that aids in relieving depression. Available by prescription only.
L-phenylalanine	1,500 mg daily, taken upon arising.	Necessary as a brain fuel. Use for withdrawal symptoms. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or suffer from panic attacks, diabetes, high blood pressure, or PKU.
S-Adenosylmethionine (SAME)	As directed on label.	Aids in stress relief, depression, eases pain, and produces antioxidant effects that can improve the health of the liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin C with bioflavonoids	2,000 mg every 3 hours.	Detoxifies the system and lessens the craving for drugs. Use a buffered form such as sodium ascorbate. Intravenous administration (under a doctor's supervision) may be necessary.
Zinc	As directed on label. Do not exceed a total of 100 mg daily from all supplements.	Promotes a healthy immune system and protects the liver from damage.

Helpful		
5-Hydroxytryptophan (5-HTP)	As directed on label.	Aids with both stress and withdrawal symptoms.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed in high amounts. Use a high-potency formula.

**Herbs**

Burdock root and red clover aid in cleansing toxins from the bloodstream.

Siberian ginseng helps those experiencing cocaine withdrawal.

*Caution:* Do not use this herb if you have hypoglycemia, high blood pressure, or a heart disorder.

Milk thistle helps to detoxify the liver.

Pueraria, a Chinese herb, has been used for centuries as a cure for alcoholism.

St. John's wort is a good antidepressant, and can help with withdrawal symptoms.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

Valerian root has a calming effect. Used with the amino acid tyrosine, it has been found to be helpful for those undergoing withdrawal from cocaine.

**Recommendations**

Eat a well-balanced, nutrient-dense diet that emphasizes fresh, raw foods.

Add high-protein drinks to the diet.

Avoid heavily processed foods, all forms of sugar, and junk food. These foods are a quick source of energy, but are followed by a low feeling that may increase cravings for drugs.

See FASTING in Part Three, and follow the instructions.

Consider consulting a qualified acupuncturist. Acupuncture has been known to help addicts by decreasing stress, anxiety, and the craving for drugs.

**Considerations**

There is no single treatment that will help all addicted people. Treatment needs to be tailored to fit the different needs and problems facing the individual.

To minimize withdrawal symptoms, withdrawal from any drug should be done slowly. The dosage should be decreased gradually over a period of four weeks or longer.

This task cannot be accomplished alone; most often hospitalization and/or professional help is required.

Most people are aware that a drug overdose can kill, but many do not realize that these poisons kill in other ways as well. Angina, heart attack, coronary artery spasms, and life-threatening damage to the heart muscle may occur with the use of cocaine and heroin. All drugs weaken the immune system in one way or another. Chronic marijuana use can reduce the immune response by as much as 40 percent by damaging and destroying white blood cells. Without a strong immune system, the body is vulnerable to all kinds of infectious and degenerative diseases.

Methadone may be prescribed as a substitute for illegal opiates.

Many drug users suffer from malnutrition because they eat poorly. In addition, drugs rob the body of necessary nutrients, those addicted to drugs need to take high doses of supplemental nutrients.

Research has found that children of alcoholics are more inclined than others to use drugs, including cocaine. These individuals are four hundred times more likely to use drugs than those who do not have a family history of alcohol addiction.

An individual can be addicted to substances other than illegal drugs. Many are addicted to nicotine, caffeine, colas, alcohol, sugar, and even certain foods. Although these addictions may not pose as great a health risk, withdrawal still may be painful and difficult. Those who use these substances may also be more susceptible to illness and disease because these addictive substances deplete the body of needed nutrients. (See SUBSTANCES THAT ROB THE BODY OF NUTRIENTS on page 391.)

A growing problem for substance abusers in these times, especially for those who use drugs intravenously and share needles, is the threat of AIDS (see AIDS in Part Two) and hepatitis. Unfortunately, for long-term drug users, even this is not enough to deter them from continuing the habitual use of drugs.

See also ALCOHOLISM and SMOKING DEPENDENCY in Part Two.

**DRY SKIN**

A balance of oil and moisture is crucial for healthy, attractive skin. Oil is secreted by the sebaceous glands and lubricates the surface of the skin. Moisture is the water present inside the skin cells, and comes to the cells through the bloodstream. It is the water in the skin cells that keeps them plumped-up, healthy, and youthful-looking. Oil and moisture work together; there must be enough moisture in the skin cells, but there must also be enough oil to act as a shield, preventing excessive evaporation of moisture from the skin's top layers. Ichthyosis is one of several inherited skin conditions that cause the skin to lose moisture.

## Substances That Rob the Body of Nutrients

Different substances deplete the body of different nutrients. Use the table below to determine which supplements you

may need as a result of the use of prescription or over-the-counter drugs, including alcohol and caffeine.

Substance	Depleted Nutrients
Allopurinol (Zyloprim)	Iron.
Antacids B	B-complex vitamins; calcium; phosphate; vitamins A and D.
Antibiotics, general ( <i>See also</i> isoniazid, penicillin, sulfa drugs, and trimethoprim)	B-complex vitamins; vitamin K; "friendly" bacteria
Antihistamines	Vitamin C.
Barbiturates	Vitamin C.
Beta-blockers (Corgard, Inderal, Lopressor, and others)	Choline; chromium; vitamin B <sub>5</sub> (pantothenic acid).
Caffeine	Biotin; inositol; potassium; vitamin B <sub>1</sub> (thiamine); zinc.
Carbamazepine (Atretol, Tegretol)	Dilutes blood sodium.
Chlorthiazide (Aldoclor, Diuril, and others)	Magnesium; potassium.
Cimetidine (Tagamet)	Iron.
Clonidine (Catapres, Combiapres)	B-complex vitamins; calcium.
Corticosteroids, general ( <i>See also</i> prednisone)	Calcium; potassium; vitamins A, B <sub>6</sub> , C, and D; zinc.
Digitalis preparations (Crystodigin, Digoxin, and others)	Vitamins B <sub>1</sub> (thiamine) and B <sub>6</sub> (pyridoxine); zinc.
Diuretics, general ( <i>See also</i> chlorthiazide, spironolactone, thiazide diuretics, and triamterene)	Calcium; iodine; magnesium; potassium; vitamins B <sub>2</sub> (riboflavin) and C; zinc.
Estrogen preparations	Folic acid; vitamin B <sub>6</sub> (pyridoxine).
Ethanol (alcohol) B	B-complex vitamins; magnesium; vitamins C, D, E, and K.
Fluoride	Vitamin C.
Glutethimide (Doriden)	Folic acid; vitamin B <sub>6</sub> (pyridoxine).
Guanethidine (Esimil, Ismelin)	Magnesium; potassium; vitamins B <sub>2</sub> (riboflavin) and B <sub>6</sub> (pyridoxine).
Hydralazine (Apresazide, Apresoline, and others)	Vitamin B <sub>6</sub> (pyridoxine).
Indomethacin (INH and others)	Vitamins B <sub>3</sub> (niacin) and B <sub>6</sub> (pyridoxine).
Laxatives (excluding herbs)	Potassium; vitamins A and K.
Lidocaine (Xylocaine)	Calcium; potassium.
Nitrate/nitrite coronary vasodilators	Niacin; pangamic acid; selenium; vitamins C and E.
Oral contraceptives	B-complex vitamins; vitamins C, D, and E.
Penicillin preparations	Vitamin B <sub>3</sub> (niacin); niacinamide; vitamin B <sub>6</sub> (pyridoxine).
Phenobarbital preparations	Folic acid; vitamin B <sub>6</sub> (pyridoxine); vitamin B <sub>12</sub> ; vitamins D and K.
Phenylbutazone (Cotylbutazone)	Folic acid; iodine.
Phenytoin (Dilantin)	Calcium; folic acid; vitamins B <sub>12</sub> , C, D, and K.
Prednisone (Deltasone and others)	Potassium; vitamins B <sub>6</sub> (pyridoxine) and C; zinc.
Quinidine preparations	Choline; vitamin B <sub>5</sub> (pantothenic acid); potassium; vitamin K.
Reserpine preparations	Phenylalanine; potassium; vitamins B <sub>2</sub> (riboflavin) and B <sub>6</sub> (pyridoxine).
Spironolactone (Aldactone and others)	Calcium; folic acid.
Statins	Coenzyme Q <sub>10</sub>
Sulfa drugs	Para-aminobenzoic acid (PABA); "friendly" bacteria.
Synthetic neurotransmitters	Magnesium; potassium; vitamins B <sub>2</sub> (riboflavin) and B <sub>6</sub> (pyridoxine).
Thiazide diuretics	Magnesium; potassium; vitamin B <sub>2</sub> (riboflavin); zinc.
Tobacco	Vitamins A, C, and E.
Triamterene (Dyrenium)	Calcium; folic acid.
Trimethoprim (Bactrim, Septra, and others)	Folic acid.

There are actually two types of dry skin—simple dry skin and complex dry skin. Simple dry skin results from a lack of natural oils. This condition most often affects women under the age of thirty-five. Complex dry skin lacks both oil and moisture, and is characterized by fine lines, brown spots, discolorations, enlarged pores, and sagging skin. It is usually associated with aging. The proteins that make up the skin—elastin, collagen, and keratin—may also be damaged by prolonged exposure to sunlight.

Dry skin tends to be dull-looking, even scaly and flaky, and readily develops wrinkles and fine lines. It usually feels “tight” and uncomfortable after washing unless some type of moisturizer or skin cream is applied. Chapping and cracking are signs of extremely dry, dehydrated skin.

Dry skin is most common on areas of the body that are exposed to the elements, such as the face and hands, but it also can be a whole-body problem, especially in winter. Dry skin can be caused (or aggravated) by a poor diet and by environmental factors such as exposure to sun, wind, cold, chemicals, or cosmetics, or excessive bathing with harsh soaps. Nutritional deficiencies, especially deficiencies of vitamin A and the B vitamins, can also contribute to the problem.

Fair-skinned people seem to be more likely than others to have dry skin, especially as they age. Most skin tends to become thinner and drier as people get older. If all other causes for dry skin, such as dermatitis, eczema, psoriasis, or seborrhea have been excluded, then it is most likely that the reason for dry skin lies in a combination of heredity, vitamin deficiencies, and poor nutrition. Many people have skin that is dry in some areas and oily in others. In the classic case of “combination skin,” the skin on the forehead, nose, and chin tends to be oily, while the skin on the rest of the face is dry.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount. Persons with malabsorption problems should consult a health care provider before starting any nutritional program.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Primrose oil or Kyolic-EPA from Wakunaga	Up to 500 mg daily.  As directed on label.	Contains linoleic acid, an essential fatty acid needed by the skin.
Vitamin A with mixed carotenoids  or	25,000 IU daily for 3 months, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Strengthens and protects the skin tissue.

ACES + Zn from Carlson Labs	As directed on label.	Contains antioxidants that protect the skin by neutralizing free radicals.
Vitamin B complex plus extra vitamin B <sub>12</sub>	As directed on label. 1,000–2,000 mcg daily.	Antistress and antiaging vitamins. Use a sublingual form.
<i>Important</i>		
Kelp	1,000–1,500 mg daily.	Supplies balanced minerals. Needed for good skin tone.
Vitamin E	200 IU daily.	Protects against free radicals. Used topically, it can minimize wrinkling. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Necessary for proper functioning of the oil-producing glands of the skin. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Helpful</i>		
Ageless Beauty from Biotec Foods	As directed on label.	Protects the skin from free radical damage.
Collagen cream	Apply topically as directed on label.	Good for very dry skin. A nourishing cream that can restore a healthy tone to damaged skin.
Elastin	Apply topically as directed on label.	Helps prevent and smooth wrinkles.
Glucosamine sulfate or N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label. As directed on label.	Important for healthy skin and connective tissue.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote skin health.
L-cysteine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Contains sulfur, needed for healthy skin. (See AMINO ACIDS in Part One.)
Lecithin granules or capsules	1 tsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Needed for better absorption of the essential fatty acids.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Contains a free radical scavenger that also strengthens collagen.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Encourages tissue elasticity and is a powerful antioxidant. Protects against ultraviolet-induced damage.
Superoxide dismutase (SOD)	As directed on label.	A free radical destroyer. Also good for brown age spots.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Necessary for collagen production; strengthens the capillaries that feed the skin.

## Herbs

- Used topically, aloe vera has excellent soothing, healing, and moisturizing properties. It also helps to slough off dead skin cells. Apply aloe vera gel topically on affected areas as directed on the product label.
- Calendula and comfrey have skin-softening properties. They can be used in a facial sauna or to make herbal or floral waters (see below). Comfrey also reduces redness and soothes irritated skin. Allantoin, an ingredient in many skin care products, is derived from comfrey.

*Note:* Comfrey is recommended for external use only.

- Spray an herbal or floral water mist on your skin throughout the day to replenish lost moisture. Almost all skin types, but particularly dry skin, benefit from lavender. You can purchase lavender water already made, or you can make your own by adding a few drops of essential oil to 4 ounces of distilled water, or by making an infusion of fresh lavender leaves and flowers.
- A weekly facial sauna using the herbs chamomile, lavender, and peppermint is good for dry skin. Using a glass or enameled pot, simmer a total of 2 to 4 tablespoons of dried or fresh herbs in 2 quarts of water. When the pot is steaming, place it on top of a trivet or thick potholder on a table, and sit with your face at a comfortable distance over the steam for fifteen minutes. You can use a towel to trap the steam if you wish. After fifteen minutes, splash your face with cold water and allow your skin to air-dry or pat it dry with a towel. Then either apply a good natural moisturizer or facial oil, or apply a clay mask (see under Recommendations, below). After the sauna, you can allow the herbal water to cool and save it for use as a toning lotion to be dabbed on your face with a cotton ball after cleansing.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

## Recommendations

- Eat a balanced diet that includes vegetables, fruits, grains, seeds, and nuts. Eat quality protein from vegetable sources. Increase your intake of raw foods.
- Eat foods high in sulfur, which helps to keep the skin smooth and youthful. Good sources include garlic, onions, eggs, and asparagus. Sulfur is also present in the amino acid L-cysteine, which can be purchased in pill form.
- Consume plenty of yellow and orange vegetables. These are high in beta-carotene, a precursor of vitamin A.
- Drink at least 2 quarts of quality water every day to keep the skin well hydrated.
- Avoid fried foods, animal fats, and heat-processed vegetable oils such as those sold in supermarkets. Use cold-

pressed oils only. Beware of any oils that have been subjected to heat, whether in processing or cooking. Heating oils leads to the production of free radicals, which have a destructive effect on the skin. Do take supplemental essential fatty acids (see under Nutrients, above). This may be the best supplement available for dry skin, but be patient; it may take a month or more to see results.

- Do not drink soft drinks or eat sugar, chocolate, potato chips, or other junk foods.
- Avoid alcohol and caffeine. These substances have a diuretic effect, causing the body—including the skin cells—to lose fluids and essential minerals.
- Twice weekly, use a loofah sponge and warm water for the face to boost circulation and remove dead skin cells. Avoid using the loofah around your eyes, however.
- Always moisturize your skin after cleansing, and at other times throughout the day, if necessary, to keep it from drying out. Use a liquid moisturizer or facial oil that contains nutrients and other natural ingredients. Do not use solid, waxy moisturizing creams. Vitamin A and E Wrinkle Treatment Oil and Vitamin A Retinyl Palmitate Wrinkle Treatment Gel are both good for dry age lines caused by the sun and the skin's natural aging. The Wrinkle Treatment Oil is also good for cleansing the skin. The moisturizing gel is non-oily and fast absorbing.
- Look for skin care products that contain humectants. Humectants are substances that attract water to the skin to hold in moisture. Natural humectants include vegetable glycerine, vitamin E, and panthenol, a form of pantothenic acid (vitamin B<sub>5</sub>).
- Use a humidifier (or even a pan of water placed near a radiator) to humidify your environment, especially in winter. This helps to reduce the amount of moisture lost from the skin through evaporation.
- Once a week, use a facial mask to clarify the skin and remove dull, dry surface skin cells. (This can be done immediately after the facial sauna described under Herbs in this section.) Blend together well 1 teaspoon green clay powder (available in health food stores) and 1 teaspoon raw honey. Apply the mixture to your face, avoiding the eye area. Leave it on for fifteen minutes, then rinse well with lukewarm water. While your skin is still slightly damp, apply a natural skin oil or liquid moisturizer.
- If your skin is chapped or cracked, increase your consumption of water and essential fatty acids. Keep any chapped areas well lubricated and protected from the elements.
- For cracked, dry skin on the fingers, use calendula cream or oil with comfrey, vitamin E oil, and aloe vera. Apply the mixture to hands at bedtime, then wear plastic gloves overnight. Pure vitamin E oil can be found in health food stores.
- Do not smoke, and avoid secondhand smoke. Smoking has a harmful effect on the skin for several reasons. First,

nicotine constricts the blood vessels, including the tiny capillaries that serve the skin. This deprives the skin of the oxygen and nutrients it needs for good health. Second, smoking involves the frequent repetition of certain facial postures, which eventually become etched in the skin in the form of wrinkles. The characteristic “smoker’s face” has wrinkles radiating in a circle outward from the mouth. Smoking also can make the skin dry and leathery.

❑ Do not use harsh soaps, cold cream, or cleansing creams on your skin. Cleansing creams are made from hydrogenated oils, which can cause free radical damage to the skin, resulting in dryness and wrinkles. Instead, use pure olive, avocado, or almond oil to cleanse the skin. Pat the oil on, then wash it off with warm water and a soft cloth.

❑ Do not use very hot water when bathing or showering.

❑ As much as possible, stay out of the sun. The sun is responsible for most of the damage done to the skin. It causes dryness, wrinkles, and even rashes and blisters. Always apply a good sunscreen to all exposed areas of skin if you must be in the sun.

❑ To care for combination skin, simply treat the dry areas as dry skin and the oily areas as oily skin. (See OILY SKIN in Part Two.)

### Considerations

❑ Dry skin can be a sign of an underactive thyroid. (See HYPOTHYROIDISM in Part Two.)

❑ Serious skin complications can arise for people with diabetes. (See DIABETES in Part Two.)

❑ Skin care for people of color used to be a hit-or-miss proposition. There is now more of an awareness that some of these problems are ethnic-specific. A clinic specifically to address this issue is the Multicultural Dermatology Clinic at Henry Ford Hospital in Detroit. There is also the book by Dr. Fran Cook-Bolden, director of the Ethnic Skin Specialty Group in New York—*Beautiful Skin of Color: A Comprehensive Guide to Asian, Olive and Dark Skin* (HarperCollins, 2005).

❑ Certain drugs, including diuretics, antispasmodics, and antihistamines, can contribute to dry skin.

❑ Balanced skin depends upon the production of natural moisturizing factors that help the skin attract and retain moisture. A group of acids known as alpha-hydroxy acids, applied topically, helps to stimulate production of these naturally occurring substances. Alpha-hydroxy acids also encourage the formation of new skin cells. These acids occur naturally in apples, milk, sugar cane, citrus fruits, tomatoes, grapes, and blackberries. Of the alpha-hydroxy acids, lactic acid appears to be the best for improving moisturization, while glycolic acid is more effective at sloughing off dead skin cells and promoting cell renewal.

❑ Cocoa butter is a good skin cream and is not expensive. It also helps reduce skin wrinkling. Keep it in the refrigerator after opening.

❑ A deficiency of vitamin A can result in scaly skin, particularly on the hands and feet. Cod liver oil is a good source of vitamins A and D. Although vitamin A deficiency is rare, vitamin D deficiency is much more common.

❑ GH3 cream from Gero Vita International, applied topically, is good for the prevention of wrinkles and can help with discoloration of the skin.

❑ Kinetin, a manufactured version of a plant hormone that prevents plants from withering, is proving effective in the treatment of fine facial lines.

❑ Hyper-C Serum from Jason Natural Cosmetics/Hain Celestial Group boosts collagen production and moisturizes and protects the skin.

❑ Pycnogenol Crème (or Gel) with Vitamins E, C, & A from Derma-E Skin Care is good for moisturizing, softening, and protecting the skin. Derma E also makes Vitamin E Deep Moisturizing Crème, a refreshing skin treatment, and Vitamin A with E Wrinkle Treatment for dry and aging skin.

❑ Tretinoin (Retin-A), applied topically, removes fine wrinkles and is also excellent for age spots, precancerous lesions, and sun-damaged skin. It is available by prescription only, and takes around six months to show results. Don’t use Retin-A around your mouth, eyes, or nose.

### DYSPEPSIA

See INDIGESTION.

### DYSTHYMIA

See under DEPRESSION.

### DYSTONIA

See under RARE DISORDERS.

### EAR INFECTION

It has been estimated that 90 percent of all children suffer from some type of ear infection, most often between the ages of six months and four years. External otitis, also known as swimmer’s ear, affects the outer ear. It may be preceded by an upper respiratory tract infection or an allergic reaction to some foods, most commonly dairy products.

The ear canal, extending from the eardrum to the outside, becomes inflamed and swollen. Symptoms can include slight fever, discharge from the ear, and pain, often severe and throbbing, that worsens when the earlobe is touched or pulled.

Middle ear infections (*otitis media*) are very common in infants and children. The site of this infection is behind the eardrum, where the small bones of the ear are located. Air pressure is regulated in this area by the eustachian or auditory tube, which runs from the ear to the back of the nasal

cavity. If bacteria or viruses get into this space, the area becomes inflamed and fluid starts to build up, causing the sensation of pressure. Unfortunately, in small children the eustachian tube runs almost horizontally rather than sloping downward. This allows fluids to build up and lie stagnant, giving bacteria an ideal place to grow, rather than draining out. Other symptoms include earache; sharp, dull, or throbbing pain; a feeling of fullness in the ear; and a fever as high as 103°F or higher. Children often pull at their ears in an attempt to relieve the pressure. High altitudes and cold temperatures increase discomfort and can worsen an infection.

A severe middle ear infection can cause perforation of the eardrum. If this happens, it can actually cause a sudden reduction in pain. This is because the pain of an ear infection results when pressure builds up in restricted spaces; this pressure on sensitive nerve endings causes pain. A perforated eardrum results in hearing loss and a discharge of bloody fluid from the ear.

Recurring ear infections are generally an indication that an original infection has been resistant to the prescribed treatment. In babies, earache is often associated with teething. Living in a household where someone smokes can be a contributing factor to ear problems in children.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Manganese	10 mg daily. Take separately from calcium.	Deficiency has been linked to ear disorders.
Vitamin C with bioflavonoids	3,000–7,000 mg daily, in divided doses. Children: 200 mg 4 times daily.	Boosts immunity and fights infection. Use an esterified or buffered form such as Ester-C or calcium or zinc ascorbate.
Zinc	10 mg in lozenge form 3 times daily for 5 days, then 50 mg daily in pill form. Do not exceed this amount.	Quickens immune response. Aids in reducing infection.
<b>Important</b>		
Kyolic-EPA from Wakunaga	As directed on label.	To reduce infection and inflammation.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg daily.	Essential for healing and immune function. A sublingual form is recommended. Important for immune function.

Vitamin E	200 IU daily.	Enhances immune function. Use d-alpha-tocopherol form.
-----------	---------------	--

### Herbs

Take alcohol-free echinacea extract by mouth; this will generally end an ear infection if you catch it early.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Eardrops containing garlic (*Allium sativum*), mullein (*Verbascum thapsus*), and St. John's wort are available at drug and health food stores. Check with your doctor before putting anything into your child's ear.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Olive leaf extract helps the body fight infection.

Place ½ dropperful of alcohol-free goldenseal (*Hydrastis canadensis*) extract in your mouth and swish it around for a few minutes before swallowing. Do this every three hours for three days. Alternating echinacea (*Echinacea purpurea*) with goldenseal works wonders. For an infant, put the extract in formula or expressed breast milk, or in fruit-flavored sugar-free yogurt.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Astragalus (*Astragalus membranaceus*) is an old Chinese remedy. Used as a tonic, it strengthens the body's resistance to disease.

*Caution:* Do not use astragalus in the presence of a fever.

Onion poultices are good for ear infections. (See USING A POULTICE in Part Three.)

### Recommendations

Avoid the most common allergenic foods: wheat, dairy products, corn, oranges, peanut butter, and all simple carbohydrates, including sugar, fruits, and fruit juices.

To help reduce and prevent the development of food allergies, do not repeat foods frequently. A four-day rotation diet may be beneficial. (See ALLERGIES in Part Two.) With a young child, introduce new foods one at a time and watch carefully for any reaction.

If a bottle-fed baby has an ear infection, try eliminating milk and dairy products from the child's diet for thirty

days to see if any benefits result. Try giving your baby soymilk instead of cow's milk, but do not do this without speaking to your child's pediatrician.

Take garlic enemas if toxins accumulate to dangerous levels and cause the body to react. Signs of dangerous toxin levels include fever, chills, and general aches and pains. (See ENEMAS in Part Three.) Do not do this to a child without checking with a pediatrician.

Apply hot compresses to the scalp, just behind the ear.

For ringing in the ears, mix 1 teaspoonful of salt and 1 teaspoonful of glycerine (sold in drugstores) in 1 pint of warm water. Use a nasal spray bottle to spray each nostril with the solution until it begins to drain into the back of the throat. Spray the throat with the mixture as well. Do this several times a day.

If you suffer from a chronic cough that lasts more than three weeks, see your health care provider. A chronic cough can be caused by impacted earwax that exerts pressure on a nerve in the ear canal, stimulating the coughing reflex. A physician can easily see if you have excessive earwax buildup and can remove it using careful suction or warm water with a slender blunt curette, plus a special microscope to aid in guiding the removal.

Oscopes (for examining the inside of the ear) are available for home use. Your physician can show you how to use one.

Earache Tablets from Hyland's Inc. is a homeopathic combination remedy containing *Belladonna*, *Calcarea carbonica*, *Chamomilla*, *Lycopodium*, *Pulsatilla*, and *Sulfur* that appears to work well in reducing pain and fever.

Do not blow your nose if you have an ear infection.

Keep the ear canal dry. Retained soap and water in the ear canal can be dangerous. Put cotton in the ear canal when showering or bathing. Do not go swimming until healing is complete.

Avoid unsanitary conditions. An ear infection may result from lowered resistance due to a recent illness. Non-prescription eardrops may relieve the pain. A nasal spray may help open up the eustachian tube and relieve the pressure.

If there are symptoms of dizziness, ringing in the ears, bleeding or a bloody discharge, sudden pain (or a sudden lessening of pain), and hearing loss in one or both ears, contact your health care provider immediately. These symptoms could indicate a ruptured eardrum.

### Considerations

For children younger than two years of age, doctors often prescribe antibiotics. Older children can frequently go without antibiotics, as 80 percent of earaches clear up on their own. Antibiotics have only minimal effect on reducing pain and fever. Other considerations include the cost

and the risk that overuse of antibiotics may produce bacteria that are resistant to treatment.

Use pain relievers like Tylenol to make your child comfortable. Do not give aspirin to anyone under twenty years of age, as it has been linked to Reye's syndrome, a serious illness that requires emergency treatment. Use only eardrops prescribed by your health care professional. Decongestants, antihistamines, and other over-the-counter cold remedies do not work for earaches. Antihistamines can cause sleepiness and thicken fluids, which may make your child worse.

In most cases, with proper treatment, a perforated eardrum heals naturally, with no permanent loss of hearing. An eardrum may rupture as a result of infection or due to sudden inward pressure to the ear from swimming, diving, a slap, a nearby explosion, or even a kiss over the ear. For ruptured eardrums, keep water from getting into the ear. Don't use earplugs unless your doctor says it is safe to do so.

Breast-fed babies are much less likely than bottle-fed babies to suffer from ear infections.

Ear problems are much more common in the homes of smokers.

*Branhamella catarrhalis* (B-cat), a common cause of ear infections, has developed strains that resist standard antibiotics. Fortunately, the antibiotic Augmentin (a combination of amoxicillin and clavulanate) can still destroy the B-cat bacterium.

Ear infection is not the only cause of ear pain. Rapid changes in air pressure, such as occur during air travel, often cause ear pain and can even result in damage to the eardrum. This is called aerotitis or barotitis media. If an infection is present, the effects of pressure changes are magnified.

Children who have frequent ear infections should be tested for food allergies. The role of allergies as a major cause of chronic otitis media has been firmly established. (See ALLERGIES in Part Two.)

### EATING DISORDERS

See ANOREXIA NERVOSA; APPETITE, POOR; BULIMIA; OBESITY; UNDERWEIGHT.

### ECZEMA

See DERMATITIS.

### EDEMA

Edema is the accumulation of fluid in spaces between the cells in the soft tissue of the body. Any part of the body may develop edema. The swelling can be localized in the face, arms, and neck, or may involve the legs and ankles—a condition known as dependent edema. Periorbital edema

is swelling around the eyes. Corneal stroma is edema of the cornea. Generalized edema is known as anasarca. Pre-eclampsia is a condition that occurs in approximately 5 percent of pregnant women, causing high blood pressure, fluid accumulation in the tissues, and albuminuria (protein in the urine).

The underlying causes of edema may be serious. Edema can indicate a much more profound illness, such as cirrhosis of the liver, congestive heart failure, diabetes, or vena cava syndrome (narrowing of the vein that supplies blood from the upper body to the heart). More simply, edema can occur as the result of infection or prolonged bed rest. Fluid retention can also be caused by allergies.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	Sometimes edema is caused by inadequate protein assimilation. Protein deficiency has been linked to water retention.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	50–100 mg of each major B vitamin twice daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	B vitamins work best when taken together.  Reduces water retention.
<b>Important</b>		
Alfalfa		See under Herbs, below.
Calcium and magnesium	1,500 mg daily. 1,000 mg daily.	To replace minerals lost with correction of edema.
Silica	As directed on label.	A natural diuretic.
<b>Helpful</b>		
Bromelain	As directed on label 3 times daily.	An enzyme derived from pineapples that helps digestion and allergies.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	A detoxifier.
Kelp	1,000–1,500 mg daily.	Supplies needed minerals.
Potassium	99 mg daily.	Very important if taking diuretics. Helps to keep fluids on the inside of the cells.
Pycnogenol	As directed on label.	A powerful antioxidant that also strengthens the tissues of the circulatory system.
Superoxide dismutase (SOD)	As directed on label.	Helpful in heart and liver disorders.
Taurine	As directed on label.	Aids heart function.

Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Essential for adrenal function and production of adrenal hormones, which are vital for proper fluid balance and control of edema.
Vitamin E	200 IU daily.	Aids circulation. Use d-alpha-tocopherol form.

### Herbs

- Alfalfa is a good source of important minerals. It also contains chlorophyll, a potent detoxifier. Take 2,000 to 3,000 milligrams daily, in divided doses.
- Hawthorn berries, juniper, and uva ursi are diuretics. By increasing the output of urine, they help to counteract edema.
- Horse chestnut has been shown to reduce postsurgical edema.
- Rose hips contain bioflavonoids helpful in the treatment of edema.
- Kidney Blend SP-6 from Solaray contains corn silk and other herbs that aid the body in expelling excess fluids. Take 2 capsules three times daily.
- Other herbs that can be beneficial if you are suffering from edema include butcher's broom, dandelion root, juniper berries, lobelia, marshmallow, parsley, and pau d'arco tea.

**Caution:** Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

### Recommendations

- Eat a diet that is high in fiber.
- For protein, eat eggs, broiled whitefish, and broiled skinless chicken or turkey. Consume small amounts of buttermilk, cottage cheese, kefir, and low-fat yogurt.
- Use kelp to supply needed minerals.
- Avoid alcohol, animal protein, beef, caffeine, chocolate, dairy products (except for those listed above), dried shellfish, fried foods, gravies, olives, pickles, salt, soy sauce, tobacco, white flour, and white sugar. Salt, in particular, may exacerbate fluid retention.
- If you have swelling of the legs and feet, sit with your feet up as often as you can. Wear support hose for swelling in the legs.
- Exercise daily and take hot baths or saunas twice a week.
- Avoid stress.
- See FASTING in Part Three and follow the program. Fasting flushes excess water from the tissues.

❑ If pressing with the fingers on your feet and ankles results in the formation of small “pits,” consult your physician. This can be a sign of a serious health problem.

### Considerations

- ❑ According to traditional Chinese medicine, avoiding raw foods, cold drinks, and fatty foods helps to prevent water retention.
- ❑ Food allergy testing is recommended. (See ALLERGIES in Part Two.)
- ❑ See also under PREGNANCY-RELATED PROBLEMS in Part Two.

## EMPHYSEMA

Emphysema is a degenerative lung disease that usually develops after many years of exposure to cigarette smoke or other toxins that pollute the air. It is one of a group of lung diseases referred to as chronic obstructive pulmonary disease (COPD). COPD, which also includes asthma and chronic bronchitis, can interfere with normal breathing. The predominant symptom of emphysema is shortness of breath and the feeling of not being able to get enough air during any kind of physical exertion.

In people with emphysema, damage to the alveoli (small air sacs in the lungs) causes the lungs to lose their elasticity. As a result, exhaling becomes difficult, and stale air remains trapped in the lungs, preventing the needed exchange of oxygen and carbon dioxide. A person with advanced emphysema may experience a near-constant state of breathlessness, chronic coughing and wheezing, and frequent discharge of sputum from the respiratory passages. Emphysema can also contribute to other health problems, such as lung infections and a condition called erythrocytosis, in which the blood contains abnormally high levels of red blood cells. Erythrocytosis can cause such symptoms as weakness, dizziness, fatigue, light-headedness, headache, and vision problems.

Most people who are diagnosed with emphysema are long-term smokers. Symptoms may not occur until middle age, when the individual's ability to exercise or do heavy work begins to decline, and a productive cough begins. The symptoms may be subtle at first, but worsen with time.

In rare cases, emphysema is caused by a genetic condition that leads to a deficiency of a blood protein called alpha-1-antitrypsin. The overwhelming majority of cases, however, are related to smoking. Regular smoking, whether of tobacco or marijuana, causes chronic low-level inflammation of the lungs, which increases the chance of developing this progressive disease.

In the United States, more than 12 million adults have been diagnosed with COPD. An additional 12 million likely have the disease and don't know it. COPD is the fourth leading cause of death in the United States, behind heart

ailments, cancers, and stroke. The COPD death rate for women grew much faster than the rate for men from 1980 to 2000. This increase suggests that smoking, which increased dramatically among women from about 1940 onward, is now taking its toll.

In third-world countries, poor indoor air quality appears to be a major factor in the development and progression of the disease.

Unless otherwise specified, the dosages recommended here are for adults.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Chlorophyll (Kyo-Green from Wakunaga)	As directed on label 3 times daily.	Aids in clear breathing.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	250 mg 3 times daily.	Increases endurance and provides oxygen to cells. Use a sublingual form.
Essential fatty acids (Kyolic-EPA from Wakunaga, salmon oil, flaxseed oil, or primrose oil)	As directed on label. Take with meals.	Essential for rebuilding and producing new cells.
Zinc plus copper	80 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Works as an antioxidant with specific protective effects on lung proteins. Needed to balance with zinc.
<i>Very Important</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	A powerful antioxidant; enhances oxygen in the lungs. Aids in removing toxins from the body.
Free form amino acid	As directed on label.	Important for repair of lung tissue.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	An immunity enhancer for protection against pneumonia.
L-cysteine and L-glutathione and L-methionine	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To aid in repairing damaged lung tissue and act as antioxidants protecting lung tissue. (See AMINO ACIDS in Part One.)
Lung Support Formula from Gero Vita	As directed on label.	Promotes healing and improved breathing.
Pycnogenol or grape seed extract	30 mg 3 times daily. As directed on label.	Powerful antioxidants that help protect the lungs.
Vitamin A plus carotenoid complex	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for repair of lung tissues and for the immune system. Emulsion form is recommended for easier assimilation and greater safety at higher doses. Powerful antioxidants that

		protect against excess levels of free radicals.
Vitamin C with bioflavonoids	5,000–10,000 mg daily, in divided doses.	Strengthens immune response and aids healing of inflamed tissue.
Vitamin E emulsion or capsules	200 IU daily.	An oxygen carrier and potent antioxidant. A deficiency can lead to destruction of cell membranes. Emulsion form is recommended for easier assimilation and greater safety at higher doses.
<b>Helpful</b>		
Aerobic 07 from Aerobic Life Industries	9 drops in water once daily.	Supplies oxygen and kills bacteria.
Beta-1,3-D-glucan	As directed on label.	Promotes healing and works as a highly effective free radical scavenger.
Calcium and magnesium	2,000 mg daily, at bedtime. 500–1,000 mg daily, at bedtime.	Act as a nerve tonic, protect nerve endings, and promote sound sleep. Use chelate forms.
Kelp	1,000–1,500 mg daily.	Contains minerals needed for improved breathing and healing.
Multienzyme complex with pancreatin plus proteolytic enzymes	As directed on label. Take with meals.	To keep infection in check by cleansing the lungs.
Inf-zyme Forte from American Biologics	As directed on label.	A balance of potent enzymes and cofactors that acts as a powerful inflammatory inhibitor.
Oxy-5000 Forte from American Biologics	As directed on label.	A potent nutritional antioxidant for health and stress that destroys free radicals.

## Herbs

Astragalus, a Chinese herb also known as *huang qi*, accelerates healing in the bronchial tubes and promotes better breathing.

*Caution:* Do not use astragalus in the presence of a fever.

ClearLungs from RidgeCrest Herbals is an herbal combination that helps provide relief from shortness of breath, tightness in the chest, and wheezing due to bronchial congestion.

Cordyceps may slow the progress of lung degeneration. Chinese medicine teaches that there is a synergistic connection between the kidneys and the lungs. Cordyceps reinforces this connection, opens up the bronchioles, and better oxygenates the blood to the kidneys. Cordyceps from R-Garden, Inc. ([www.rgarden.com](http://www.rgarden.com)) is a good source of this herb.

Licorice extract increases energy levels and helps to improve organ function. Use an alcohol-free extract.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Thyme is also very helpful for respiratory disorders.

Other beneficial herbs for emphysema include alfalfa, fenugreek, fresh horseradish, mullein tea, and rosemary.

## Recommendations

Avoid any and all contact with tobacco. Tobacco smoke is the single most dangerous thing anyone suffering from emphysema can encounter. If you have emphysema and smoke, you must quit. Avoid areas where people smoke. Do not allow smoking in your home, your car, or anywhere near you.

Eat a diet consisting of 50 percent raw foods. The other 50 percent should consist of soups, skinless chicken or turkey, fish, brown rice, millet, and whole-grain cereals.

Consume onions and garlic daily.

Do not eat a typical American breakfast. Instead, sip hot, clear liquids (such as herbal teas) in the morning to help clear the mucus from the airways. Drink at least eight glasses of quality water daily. Using a psyllium-based fiber product or ABC Aerobic Bulk Cleanse from Aerobic Life Industries (a colon cleanser available in health food stores and online) is helpful after consuming the liquids. Mix ABC with a glass of juice and drink it quickly. This will help rid the colon of excess mucus and reduce gas and distention.

Avoid fried and greasy foods, salt, and all foods that cause excess mucus to be formed in the gastrointestinal tract, lungs, sinuses, and nasal cavity. Foods that lead to the formation of mucus include meats, eggs, all dairy products and cheese, processed foods, junk foods, and white flour products, as well as tobacco. Read labels carefully; these are sometimes “hidden” ingredients in food products.

Avoid gas-forming foods such as legumes and cabbage. These foods cause abdominal distention that can interfere with breathing. Try using a product called Beano, available in local supermarkets, when you do eat foods that can cause gas. Place a few drops of the liquid on the first bite of food for best results.

Avoid foods that require a great deal of chewing, such as meats and nuts. Chronic lung disease can make it difficult to breathe while chewing. If necessary, vegetables can be steamed to make them easier to eat.

Get regular exercise. Daily exercise, especially walking, can be extremely beneficial for people with emphysema. It increases endurance, improves circulation, and generally leads to a reduced level of breathlessness. Start out with what you are able to do, even if it is only a minute or two of exercise every hour, then gradually increase the

amount as you are able. Any exercise program should be started at a very low intensity and be gradually increased over time. Yoga or martial arts exercise, such as tai chi, may also be helpful. Consult your health care provider before beginning any exercise program.

- Try to lose weight, especially if you have abdominal fat, which could further impair breathing.
- Humidify your home, especially if you experience a lot of congestion or have heavy discharges of sputum.
- Go on a cleansing fast periodically, using carrot, celery, spinach, kale, and all dark green fresh juices. (See FASTING in Part Three.)
- Use warm castor oil packs on the chest and back to help reduce mucus and enhance breathing. To make a castor oil pack, place a cup or so of castor oil in a pan and warm but do not boil it. Dip a piece of cheesecloth or other white cotton material into the oil until the cloth is saturated. Apply the cloth to the affected area and cover it with a piece of plastic that is larger in size than the cotton cloth, then place a warm cloth or a hot water bottle on top. Keep the pack in place for one-half to two hours, as needed.
- Rest and avoid stress. Get plenty of fresh air.
- Leave the house during major housecleaning and other major household projects, and remain away for at least two hours afterward. Housecleaning stirs up dust and mold.
- Do daily breathing exercises, which can improve lung function. A technique known as deep breathing involves inhaling through the nose while pulling the abdominal muscles inward in order to allow more air to be inhaled. Exhaling takes place steadily and slowly through the mouth while the tongue is pressed between the roof of the mouth and top of the teeth, so that slight pressure is felt through the windpipe and chest. A hissing sound is produced as the air is expelled through the lips. Exhaling should take at least twice as long as inhaling, so that all air is forced out. Do this for about ten minutes, two to three times daily. This will aid in an exchange of air in the lungs and improve breathing capacity.
- Because every extra chemical adds potential risk to the lungs, use only essential (and unscented) laundry products. Avoid perfume and anything containing fragrance. Avoid gas stoves as well; electric stoves are better for people with respiratory disorders. Choose flooring made from hardwood, ceramic tile, or stone rather than carpeting, which holds dust, mold, and many chemicals that get into the air and that can irritate the lungs. Avoid using window curtains and draperies, which also can harbor dust. Decorate with paint (new “odorless” formulas are now available) rather than wallpaper; the glues used to make the paper adhere to the wall can have volatile chemicals that may bother some people. Avoid plastic chairs, plastic dishes, and other plastic items in furnishing your home. Do not use aerosol products.

- Avoid air pollution. If your current working environment is dirty, dusty, or toxic to inhale, change jobs.
- Avoid hot, humid climates. If you must live in such a climate, continuous central air-conditioning is essential. An air-conditioned car is also essential. Do not allow anyone to smoke or wear perfume in your car.
- Avoid letting furry or feathered animals into your home or car, as their hair and dander can irritate the lungs.

### Considerations

- There is no known cure for emphysema, but the measures outlined in this section should slow the progression of the disease, ease discomfort, and make breathing a bit easier.
- Lung reduction surgery can be very effective in enhancing breathing function. This procedure involves making cuts in the damaged portions of the lungs and using a special stapling device that gives the healthy lung tissue more room to expand. In a similar procedure, surgeons section off the damaged lung tissue and buttress the folds using bovine pericardium (cow muscle) to enhance the viability of the tissue. Candidates for either type of surgery are carefully screened before being considered for treatment.
- In some cases, a lung transplant may be considered. This is a highly invasive, complex procedure that carries substantial risk. It is a viable option for only a small proportion of people with emphysema.
- Supplemental oxygen can benefit anyone with impaired lung function. Long-term oxygen therapy combats erythrocytosis and lowers the risk of heart failure.
- Older adults are at risk for magnesium deficiency, which can further compromise the ability to breathe. Taking magnesium supplements (500 to 1,000 milligrams daily) can significantly strengthen the muscles that power breathing and promote better oxygenation of the body's cells.
- The Air Supply personal air purifier from Wein Products is a miniature unit that is worn around the neck. It sets up an invisible pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants). It also eliminates vapors, smells, and harmful volatile compounds in the air.
- The University of Pennsylvania Hospital Department of Allergy reports that having an air conditioner and an electrostatic air-cleaning machine in the bedroom of persons with respiratory disease is a major factor in the health of individuals with breathing trouble.
- A routine lung function test can determine lung capacity and other characteristics that can help identify various stages of emphysema. Several kinds of test are available:
  - *Arterial blood gas (ABG)*. An ABG is a blood test that measures amounts of carbon dioxide and oxygen in the

blood. This test is used to assess more-advanced stages of emphysema.

- *Pulse oximetry.* This test measures the amount of oxygen in the blood using a special light that is clipped onto a finger or earlobe.
- *Spirometry.* In this test, you take a deep breath and blow it out as quickly as possible through a tube that is connected to a machine that records airflow and capacity.
- *X-ray.* A plain chest X-ray and computerized axial tomography (CAT) scan can help diagnose moderate to severe cases of emphysema.

☐ See also ASCORBIC ACID FLUSH in Part Three and ENVIRONMENTAL TOXICITY in Part Two.

## ENDOMETRIOSIS

Endometriosis is the abnormal growth of cells that form in the lining of the uterus. Some of these cells may, instead of being expelled from the body during the menstrual process, actually end up continuing their cycle elsewhere in the body. They then have no way of leaving the body, so the material builds up and may attach itself to other organs in the lower abdomen, such as the ovaries or bowel.

This can produce a host of different symptoms, including incapacitating pain in the uterus, lower back, and organs in the pelvic cavity prior to and during the menses; intermittent pain throughout the menstrual cycle; painful intercourse; excessive bleeding, including the passing of large clots and shreds of tissue during the menses; nausea, vomiting, and constipation during the menses; dyschezia (difficulty in passing stools due to weak pelvic muscles and anal sphincter); dysuria (pain while urinating); and, sometimes, infertility. Because menstruation is typically heavy, iron-deficiency anemia is common. Women whose cycles are shorter than twenty-seven days and/or whose periods last longer than one week are at increased risk of anemia.

Growths of endometrial tissue outside of the uterine cavity occur most often in or on the ovaries, the fallopian tubes, the urinary bladder, the bowel, the pelvic floor, and/or the peritoneum (the membrane that lines the walls of the abdominal cavity), and within the uterine musculature.

The most common site of endometriosis is believed to be the deep pelvic peritoneal cavity, or the cul-de-sac. The presence of endometrial implants outside the pelvic area is uncommon.

During the normal menstrual cycle, a continually changing hormonal environment stimulates the endometrium to grow in preparation for a possible pregnancy. This same cycle causes a follicle within one of the ovaries to ripen, and an egg is released. Fingerlike tissues on the fallopian tube grasp the egg, and the tiny, hairlike cilia inside the tube transport it toward the uterus, the lining of which is now spongy and well supplied with blood. If the egg is not

fertilized within twenty-four hours or so of being released, the uterine lining proceeds to “die,” to be sloughed off, and to pass through the vagina during the menses.

Though not inside the uterus, the abnormal implants of endometriosis also respond to the hormonal changes controlling menstruation. Like the uterine lining, these fragments build tissue each month, then break down and bleed.

Unlike blood from the uterine lining, however, blood from the implants has no way to leave the body. Instead, it must be absorbed by surrounding tissue, which is a comparatively slow process. In the meantime, the blood accumulates in body cavities. The entire sequence, from bleeding through absorption, can be painful.

As the menstrual cycle recurs month after month, the implants may get bigger. They may seed new implants and form localized scar tissue and adhesions—scar tissue that attaches to pelvic organs and binds them together. This contributes to the pain of endometriosis, and it can cause extreme pain in a subsequent pregnancy, as the uterus enlarges and the organs within the abdomen are pushed into different positions. Sometimes a collection of blood called a sac or cyst forms. Endometrial or “chocolate” cysts are common on the ovaries. These are usually found to contain moderate amounts of oxidized blood, which looks something like chocolate syrup. If a cyst ruptures, it can cause excruciating pain.

No one knows what causes endometriosis, but several theories have been proposed. The reflux menstruation theory was developed by John Sampson, M.D., in 1920. According to this theory, menstrual fluid backs up into the fallopian tubes and drops into the peritoneal cavity, where endometrial cells implant themselves and grow. While this theory offers a possible answer to the question of what causes endometriosis, it has never been proven. Another popular theory states that endometriosis is caused when endometrial cells spread to other parts of the body through blood and lymphatic channels. Still another theory postulates that endometriosis is in effect a congenital condition (see AN ALTERNATIVE THEORY AND TREATMENT FOR ENDOMETRIOSIS on page 403).

Despite disagreement over the cause, more is known today about this condition than ever before. For example, research has shown that exposure to environmental polychlorinated biphenyls (PCBs) and dioxin, two types of hazardous waste materials, can cause spontaneous endometriosis.

This may account for the rising incidence in the condition over the last few decades. Most women who suffer from endometriosis have never been pregnant, and as many as 30 to 40 percent of women who report infertility problems actually have endometriosis. According to the Endometriosis Association, women who develop this condition have a history of more vaginal yeast infections, hay fever, eczema, and food sensitivities than most women. In addition, vulnerability to endometriosis appears to run in

families. An estimated 10 percent of women of reproductive age suffer from endometriosis. Unfortunately, many women fail to seek medical help because they mistake the symptoms of this disease for normal menstrual discomfort.

Laparoscopy is the procedure most commonly used to diagnose endometriosis. This involves the insertion of a tiny lighted optical tube (a laparoscope or a smaller version, the microlaparoscope) through a small incision in the navel. The surgeon can then see inside the abdominal cavity. Laparoscopic procedures are usually done on an outpatient basis.

The nutrient program and other recommendations outlined below may help to keep endometriosis under control if it is diagnosed in the early stages.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Vitamin E	200 IU daily	Aids hormonal balance. Use d-alpha-tocopherol form.
Vitamin K or alfalfa	200 mcg daily.	Needed for normal blood clotting. See under Herbs, below.
<i>Important</i>		
Essential fatty acids (primrose oil and Kyolic-EPA from Wakunaga)	1,500 mg daily.	Provides essential fatty acids such as gamma-linolenic acid (GLA) that aid in regulating hormonal and prostaglandin balance.
Iron	As directed by physician.	Iron-deficiency anemia is common in those with this disorder. Use ferrous fumarate form.
or Floradix Iron + Herbs from Salus Haus	As directed on label.	<i>Caution:</i> Do not take iron unless anemia is diagnosed. An easily assimilated and nontoxic source of iron.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	As directed on label. 50 mg 3 times daily. 25 mg 3 times daily.	Promotes blood cell productivity and proper hormone balance. Relieves stress. Needed for proper adrenal function.
Vitamin C with bioflavonoids	2,000 mg 3 times daily.	Aids the body in removing excess fluids.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in the healing process. Use a buffered form.
<i>Helpful</i>		
Beta-1,3-D-glucan	As directed on label.	For tissue repair and immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
Calcium and magnesium	1,500 mg daily. 1,000 mg daily, at bedtime.	Stimulates the activity of macrophages, which can remove foreign cellular debris.
		To supply needed minerals. Use chelate forms.

Kelp	1,000–1,500 mg daily.	To supply needed iron and other minerals.
Multivitamin and mineral complex	As directed on label.	All nutrients are required for repair and healing.

**Herbs**

- Alfalfa is a good source of vitamin K (necessary for blood clotting and healing) and minerals, including iron. Many women with endometriosis are iron-deficient.
- Astragalus, garlic, goldenseal, myrrh gum, pau d'arco, and red clover have antibiotic and antitumor properties.

*Cautions:* Do not use astragalus in the presence of a fever. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Burdock root, dong quai, and red raspberry leaf help to balance hormones.
- Nettle is rich in iron.

**Recommendations**

- Eat a diet consisting of 50 percent raw vegetables and fruits and including soy foods. In addition, eat only whole-grain products (no refined flour products) and raw nuts and seeds. A diet rich in legumes and other fiber-rich foods is very important in managing endometriosis.
