- Include "green drinks" made from dark green leafy vegetables in your diet.
- Avoid alcohol, caffeine, animal fats, butter, dairy products, fried foods, foods that contain additives, all hardened fats, junk foods or fast foods, red meats, poultry (except organically raised and skinless), refined and processed foods, salt, shellfish, and sugar.
- Fast for three days each month before the anticipated beginning of the menstrual period. Use steam-distilled water and fresh live juices. (See PREMENSTRUAL SYNDROME in Part Two and FASTING in Part Three.)
- Use a heating pad, hot water bottle, or a hot bath to help relieve pain. The warmth relaxes the muscles that cramp and cause pain.
- If you are taking medication for endometriosis, report any new or worsened symptoms to your doctor immediately, especially problems such as difficulty breathing or chest or leg pain. These symptoms may indicate the presence of a blood clot. Frequent checkups are needed to monitor possible side effects such as thinning of the bones. Be aware, however, that it is normal for endometriosis symptoms to worsen temporarily when a woman begins taking medicine.

## An Alternative Theory and Treatment for Endometriosis

David Redwine, M.D., of St. Charles Medical Center in Bend, Oregon, has developed an alternative theory of the origin of endometriosis. Dr. Redwine disagrees with those obstetrician/gynecologists who accept reflux menstruation as the cause of endometriosis. Instead, he proposes that endometriosis is actually a type of birth defect. During fetal development, cells that are destined to become part of the female reproductive organs differentiate and migrate toward the appropriate locations. But, if the mechanisms that control this process do not function properly, some endometrial cells may be “left behind” in places they do not belong, where they become embedded and grow.

Initially, these bits of misplaced tissue are colorless, but over time the tissue begins to change into the lesions known as endometriosis, probably at least in part in response to stimulation from sex hormones. The lesions begin to change color and gradually become darker until they appear as the classic dark-colored implants found primarily in women in their thirties. Before they reach that stage, however, they may appear white, yellow, red, or brown, and many colors in between. Thus, according to Dr. Redwine, endometrial growths only *appear* to spread progressively throughout the pelvis—that is, they are there all the time, even before birth, but they are not usually recognized for what they are until they take on a sufficiently dark color, a process that occurs over time.

Based on his understanding of the disease, Dr. Redwine developed a treatment for endometriosis in which the implants are physically removed through surgery. Using a laparoscope, the surgeon examines the entire pelvic cavity and the entire peritoneal surface at very close range to identify any possible endometrial lesions. Then, all suspected endometrial growths are removed. Each lesion

is biopsied, and a tissue sample is analyzed in a laboratory to determine whether or not it is endometrial in origin. With this identification method, Dr. Redwine says that he has been able to demonstrate that lesions other than the black “powder-burn” lesions normally considered characteristic of the condition have been endometrial in origin.

Many women who undergo surgery for endometriosis often are diagnosed with recurrences. This would seem to support the idea that this is a progressive disease that tends to come back despite treatment. However, Dr. Redwine maintains that the reason so many women have recurring problems with endometriosis is that only a portion of their endometrial implants are removed in surgery. Most surgeons remove only the “typical” black powder-burn lesions and chocolate cysts. Dr. Redwine estimates that a surgeon who excises only the black lesions may leave from 50 to 60 percent of the actual disease behind. He has found that only 40 percent of his patients have the typical lesions, while 60 percent have the multicolored, “atypical” type. He believes that endometriosis is indeed curable, so long as all the lesions—both typical and atypical, and not only within the pelvic cavity, but on the peritoneum as well—are removed. His follow-up studies indicate that after surgery, approximately 75 percent of his patients experience complete relief of symptoms, and approximately 20 percent experience an improvement in symptoms so that what was disabling pain becomes only minimal pain.

Only about 5 percent report no relief. Several other gynecological surgeons in the United States now use Dr. Redwine’s treatment.

The following table outlines some of the key differences between Dr. Redwine’s theory and conventional medical theory.

### Endometriosis Theories Contrasted

Conventional Theory	Dr. Redwine’s Theory
Caused by retrograde menstruation.	Caused by a defect in embryonic cell differentiation.
A progressive disease primarily of women over thirty.	A static disease affecting women of all ages.
Associated with menstruation.	Independent of menstruation.
Causes infertility.	May be associated with infertility, but is not the actual cause of it.
Lesions bleed monthly.	Lesions do not bleed.
Most lesions are black.	Lesions may be clear, white, pink, red, brown, black, or multicolored. Most are not black.
Peritoneal implants are not considered endometrial in origin.	Peritoneal implants have been proved to be to be endometrial in origin.
Recurrence following removal of lesions is common.	Recurrence following removal of lesions is rare if both typical and atypical lesions are removed.
Hysterectomy is recommended for severe cases. Surgery provides undependable levels of relief.	Surgical removal of all typical and atypical lesions is the treatment of choice for this disorder, and can provide complete relief in up to 75 percent of cases.

Further information on Dr. Redwine and his approach to endometriosis treatment can be obtained by contacting the Endometriosis Treatment Program ([www.endometriosis-treatment.org](http://www.endometriosis-treatment.org)).

## Considerations

- Daily moderate exercise such as walking or stretching is beneficial.
- If you suspect you may have endometriosis, you should see a gynecologist promptly so that the condition can be controlled at the earliest possible stage of development.
- Medical treatment recommended for endometriosis depends on how far the condition has progressed. Doctors may prescribe a drug called danazol (Danocrine), which stops the normal hormonal cycles, in an attempt to control the blood flow and pain, and in hopes of keeping the abnormal tissue from spreading and inducing the growths to heal and shrink. Some doctors prescribe oral contraceptives (birth control pills) for essentially the same reason. Danazol has been shown to improve symptoms in up to 90 percent of women who take it and to reduce the size and number of implants. Weight gain and a deepened voice are possible side effects, but are usually reversible when the medication is stopped. However, symptoms may also reappear after medication is stopped.
- The synthetic versions of a reproductive hormone, gonadotropin-releasing hormone (GnRH), such as leuprolide (Lupron), nafarelin (Synarel), and goserelin (Zoladex), can be used. Taken for six months, these drugs may help to lessen the symptoms of endometriosis for a year or more. They work by stopping the production of estrogen. The side effects of GnRH are the same as the effects of menopause.
- If endometriosis is severe and disabling, or if drug therapy fails and you do not wish to have any children at that point, hysterectomy may be recommended. However, hysterectomy does not always relieve all the symptoms, especially if there are implants of endometrial tissue throughout the pelvic region.
- An excision option less traumatic than hysterectomy that is used to treat milder cases is laparoscopy with laser surgery to identify and vaporize adhesions, cysts, and endometrial implants. The procedure has yet to be perfected; repeated laparoscopy may be necessary. Advances in this technique are being made at a rapid rate, however, and the need for repeat procedures may soon be a thing of the past.
- In one study, women who had surgery experienced less pain postoperatively, and improved quality of life with a vitamin and supplement mixture (multivitamin/mineral, probiotic, and fish oil) compared to a placebo group. These results were comparable to women who received hormonal suppression therapy. The patients were classified as stage III-IV, the most advanced stages.
- According to a report in the *Journal of the American Medical Association*, strenuous exercise lowers the level of estrogen in the body, and this may help suppress the symptoms of endometriosis. The more aerobic exercise a woman engages in and the earlier she starts, the lower her risk of

developing the disease in the first place, according to a study of endometriosis led by Daniel W. Cramer of Brigham and Women's Hospital and Harvard Medical School. This study found that women who exercised more than seven hours a week had one-fifth the average risk of developing endometriosis. Unfortunately, this beneficial effect was limited to those who began exercising before the age of twenty-six.

- Because endometriosis depends on hormonal cycles, and pregnancy temporarily interrupts those cycles, many women find that their symptoms improve during pregnancy. In some cases, the improvement may be permanent, presumably because the break from cycles of growth, bleeding, and scarring finally allows the implants to heal and be shed. In other cases, however, the relief is only temporary, and once the hormonal cycles return to normal, the symptoms of endometriosis recur.
- Some nutrition researchers have theorized that endometriosis is related to an inability to absorb calcium properly. Another theory cites food allergies as part of the cause of endometriosis, and recommends removing all allergenic foods from the diet plus administering treatment for candida, using nystatin.
- Dioxins may be linked to endometriosis. Dioxins are chlorinated hydrocarbons and can be found in feminine hygiene products as a by-product of the bleaching process. Dioxin can be absorbed into the body, where it collects in fatty tissue. Pesticides are another source of dioxins, as is the effluent from some types of waste incinerators.
- Endometriosis is a benign (noncancerous) condition, but research shows that women who have endometriosis are at greater risk of developing breast cancer, melanoma, lymphoma, and ovarian cancer than women who do not.
- Adenomyosis is a condition similar to endometriosis in some respects, but it is confined to the uterus. This condition is common in women who have had several children. The uterine wall does not contract as it should, and blood flow continues after menstruation. Endometrial ablation is a thirty-minute outpatient treatment for adenomyosis. In this procedure, a balloon is inserted into the uterus and filled with water. The water is heated, causing the blood vessels to seal, thus stopping the bleeding.
- For more information about endometriosis, you can contact the Endometriosis Association. (See Health and Medical Organizations in the Appendix.)

See PROSTATITIS/ENLARGED PROSTATE.

## ENURESIS

See BED-WETTING.

## ENVIRONMENTAL TOXICITY

Environmental issues such as global warming, ozone layer depletion, and the overuse of pesticides and other chemicals are cause for concern—particularly as they affect the quality of our water and food supply and our level of exposure to radiation and toxic metals. The body's immune system can be the last line of defense against these environmental assaults. It is a complex network that protects us from infectious agents (viruses, bacteria, and other microorganisms), allergens (substances that induce allergic reactions), and other pathogens (substances that cause disease). When something foreign threatens the body, the body responds by forming antibodies and producing increased numbers of white blood cells to combat the intruder. The kidneys and liver work to rid the body of toxins. Thus, a properly functioning immune system is vital for good health, and proper nutrition is becoming increasingly important to help the body detoxify itself.

Certain minerals, such as calcium and zinc, are necessary to sustain life. Other minerals, like copper, are essential in small amounts but are toxic in greater amounts. Some minerals not only have no nutritional value but also are toxic in almost any amount. These toxic metals—lead, aluminum, cadmium, and mercury—pervade our environment and threaten our health, impairing the function of our organs.

Pesticides, herbicides, insecticides, fungicides, fumigants, and fertilizers containing these metals and other toxic substances seep into our soil and food. Food additives, preservatives, and artificial coloring pervade the products in our supermarkets. Fruits and vegetables are sprayed, treated with ripening agents, and waxed to make them appear more appetizing. Toxic chemicals and hazardous waste have contaminated our air and water.

Indoor pollution is an especially serious issue. Studies conducted by the U.S. Environmental Protection Agency (EPA) have shown that indoor air pollution levels—in homes, schools, and workplaces—are often two to five times greater than outdoor levels, and sometimes as much as a hundred times greater. People spend up to 90 percent of their time indoors, which increases their exposure to toxic elements.

Such exposure is believed to have increased in recent years due to the construction of tightly closed, energy-efficient buildings and an increase in the use of synthetic building materials and chemical products. Indoor pollutants are as varied as the health problems they can cause. These substances include animal hair, asbestos, bedding, carbon monoxide, disinfectants, dust, electromagnetic fields, formaldehyde, hair sprays, household cleaning products, lead, low-level radiation from television screens and computer monitors, mold, paint, pesticides, pollen, radon, solvents, and tobacco smoke. Some products used in the home emit volatile components into the air, among them certain plastics (which emit styrene), solvents (benzene), carpets (4-phenylcyclohexene [4-PC]), and manufactured wood products such as pressed-wood furniture and

kitchen cabinets (formaldehyde). Permanent-press clothes and plastics emit traces of toxic vapors. Smoke from cigarettes, cigars, or pipes raises the level of toxic substances not only in the smoker, but also in those exposed to second-hand smoke. Exposure to any such substances can aggravate allergies and compromise the immune system, paving the way for the development of serious illness.

When pollutants in our environment invade our bodies, they can cause such reactions as watery eyes, diarrhea, nausea, upset stomach, and ringing in the ears. The symptoms of environmental toxicity are so varied that they also include asthma, bronchitis, stuffy nose, arthritis, fatigue, headache, eczema, and depression. If you suffer from chronic flulike symptoms, the culprit may not be a virus. You may be reacting to some material or item in your home or workplace. Exposure to environmental toxins has been linked to immune deficiency and cancer. In children, poor academic performance, and some behavioral, emotional, and learning disabilities have also been linked to indoor environmental pollution.

The symptoms of environmental toxicity and environmental allergies can be very similar, but the mechanisms that cause them are different. Allergies result from an over-reaction by the immune system to some substance encountered in the environment. Environmental toxicity, on the other hand, is not a result of an immune system reaction, but a direct poisoning of tissues or cells, so that they can no longer function as they should. Allergic reactions usually begin to subside when contact with the offending allergen ceases, whereas toxicity-based problems can persist long afterward, depending on the type and extent of the damage the toxins have caused.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Help the immune system detoxify many dangerous substances.
S-Adenosylmethionine (SAME)	As directed on label.	Has antioxidant effects that can improve the health of the liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin C with bioflavonoids and quercetin	3,000–10,000 mg daily, in divided doses.	Aids in removing toxins and heavy metals from the body.

**Very Important**

Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A potent immunostimulant.
L-cysteine and L-methionine plus L-carnitine and L-glutathione	500 mg each 3 times daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To protect the lungs, heart, and liver by destroying free radicals and harmful substances.
Proteolytic enzymes plus pancreatic enzymes	As directed on label. Take between meals. As directed on label. Take with meals.	Important for proper digestion and detoxification.
Superoxide dismutase (SOD) (Cell Guard from Biotec Foods)	As directed on label.	A powerful antioxidant that protects against free radical formation and radiation.
Taurine Plus from American Biologics	As directed on label.	An important antioxidant and immune regulator, necessary for white blood cell activation and neurological function. Use the sublingual form.

**Important**

Apple pectin	As directed on label.	Binds with toxins and heavy metals to remove them from the body.
Grape seed extract	As directed on label.	A powerful antioxidant.
Vitamin A plus carotenoid complex with beta-carotene plus vitamin E	25,000 IU daily for 1 month, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label. 200 IU daily.	Vitamins A and E both act as powerful antioxidants and detoxifiers. Use emulsion forms for easier assimilation and greater safety at high doses. Antioxidants and precursors of vitamin A. Use d-alpha-tocopherol form.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) and niacinamide	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily. 50 mg 3 times daily. Up to 500 mg daily.	All B vitamins are vital for cellular function and repair; needed for proper digestion and to protect the lining of the digestive tract. Use a high-stress formula. Sublingual forms are recommended for best absorption.

**Helpful**

Calcium plus copper and zinc	50 mg daily. 3 mg daily. 80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Minerals that aid the immune system. Use calcium pantothenate form. Use zinc gluconate lozenges or OptiZinc for best absorption.
Manganese	50 mg daily. Take separately from calcium.	Works with other trace minerals to aid the immune system. Use a chelate form.
Raw thymus glandular	500 mg daily.	Improves T cell production. (See GLANDULAR THERAPY in Part Three for its benefits.)

**Herbs**

- Burdock root and red clover assist in cleansing the bloodstream and lymphatic system.
- Milk thistle helps to protect the cells of the liver and also promotes the regeneration of damaged liver cells.
- Turmeric contains curcumin, which inhibits tumor growth and boosts the liver's ability to eliminate environmental toxins from the body.

**Recommendations**

- Include in your diet good sources of fiber, such as ABC Aerobic Bulk Cleanse from Aerobic Life Industries, oat bran, and wheat bran. Apple pectin also can be beneficial.

*Note:* Always take supplemental fiber separately from other supplements and medications.

- Drink only steam-distilled water.
- Try using an air cleaner or ionizer for symptomatic relief. These devices remove animal odors, bacteria, dust, pollen, smog, and smoke from the air.
- Use nontoxic cleaning products whenever possible; these are available at Whole Foods Market and other stores. Many disinfectants, drain cleaners, and other household chemicals have toxic properties. Fortunately, there are environmentally friendly alternatives. For example, an effective, nontoxic disinfectant can be made at home by mixing ½ cup borax with 1 gallon hot water. Try clearing your drains by pouring ¼ cup baking soda down your drain and follow it with ½ cup vinegar. Close the drain until the fizzling stops and then flush with hot water.
- To reduce your exposure to natural gas, pesticides, radon, smoke, and other chemicals in the household, ventilate your home well. Replace particleboard subflooring with exterior-grade plywood that does not contain formaldehyde. The wood should then be sealed with a nontoxic sealant.
- Have your home and workplace tested for radon. Radon is a radioactive gas that occurs naturally and seeps from the ground. It is believed to be the second leading cause of lung cancer. Simple test kits are available at most hardware stores. If radon is found, measures such as sealing cracks and increasing ventilation in basement areas can often correct the problem.
- If you have any fuel-burning appliances, such as furnaces, hot water heaters, kerosene heaters, or gas space heaters, be on the alert for carbon monoxide exposure. Be sure that all appliances are properly vented and that your house is well ventilated. Never run your car engine in the garage. Carbon monoxide is a colorless, odorless gas. When inhaled in sufficient quantities, it enters the bloodstream and combines with the hemoglobin in red blood cells, crowding out needed oxygen. Early symptoms of carbon monoxide poisoning include headaches, dizziness, nausea, vomiting, fatigue, and confusion. Continued exposure can

lead to coma and, ultimately, death. About five hundred Americans die each year from carbon monoxide poisoning, many due to motor vehicle exhaust. Portable carbon monoxide detectors can be purchased at hardware stores. Most building codes require the installation of carbon monoxide detectors in new homes, and if you are selling a home, even an older home, most states require that the home be equipped with a carbon monoxide detector before it can be sold.

❑ Scrape any peeling paint inside and outside your home, using appropriate protective gear. Older paints can contain toxic lead residue. Any paint from before 1978 (when lead-based paint was banned) is probably lead-based. (See LEAD POISONING in Part Two.)

*Caution:* Some states require that this job be done by certified companies that have the proper protective gear, the ability to protect the environment from the paint scrapings, and the means to properly dispose of the hazardous waste when they are done.

❑ Change vacuum cleaner bags frequently. Most vacuum cleaner bags do a poor job of filtering out dust, pollen, dust mites, and other potentially harmful particles. When shopping for a new vacuum, look for models that encase the bag in a hard, impermeable shell or that have a HEPA filter.

❑ Do not smoke, and do not let anyone else smoke in your home or car.

❑ Do not use insect sprays or bug bombs. If you need the services of an exterminator, make sure that anyone you hire is licensed and can offer nontoxic insect repellents (such as diatomaceous earth).

### Considerations

❑ Most metal pots and pans used for cooking leave residues of metal in your food. Some of these metals—like the iron from cast-iron skillets—actually can be beneficial. But other metals can be harmful. Some aluminum and coated cookware can leach off small amounts of metals that can be harmful over time.

❑ It is advisable to see an allergy specialist to have a radioallergosorbent test (RAST) if you experience any of the symptoms described above to rule out allergies as a cause of the problem. You may also want to have a hair analysis to determine the level of toxic substances in your system.

❑ Liver extract injections have produced good results for some people.

❑ Asbestos, once widely used in a variety of products and building materials, may still be present in buildings and homes that were built or renovated between 1900 and 1970. Asbestos is not dangerous if it is still intact and in solid form. It becomes dangerous when it breaks down and fibers are released into the air. The asbestos fibers—which are so small that they can pass through vacuum cleaner bags—can enter the lungs and get lodged in the delicate

lung tissue. Asbestos exposure can cause a variety of illnesses, including lung cancer, asbestosis, and mesothelioma, a type of tumor. Cancers of the larynx, oral cavity, kidney, and colon are sometimes attributed to asbestos as well. Only qualified contractors should do asbestos removal.

❑ One household item that can cause a lot of problems is carpeting. Some of the chemicals commonly used in carpeting have been shown to have an adverse effect on health. One suspect chemical is 4-phenylcyclohexene (4-PC), a by-product of the production of styrene-butadiene. This substance is used for the backing of many carpets. Breakdown products from styrene-butadiene are also potentially toxic. Shampooing carpeting can be particularly bad for your health. When you shampoo a carpet, the bottom stays damp well after the surface you walk on is dry. This dampness becomes a breeding ground for thousands of microorganisms that can wreak havoc on your system. The moisture can also seep into the floor beneath, which in many buildings consists of particleboard made from formaldehyde-based glue and processed wood. When the particleboard gets wet, the formaldehyde can be released into the air in the home.

❑ See also ALUMINUM TOXICITY; ARSENIC POISONING; CADMIUM TOXICITY; CHEMICAL POISONING; COPPER TOXICITY; FOODBORNE/WATERBORNE DISEASE; LEAD POISONING; MERCURY TOXICITY; and NICKEL TOXICITY, all in Part Two.

### EPILEPSY

An estimated 3 million people in America have epilepsy, a disorder characterized by recurring seizures. Seizures are a symptom of epilepsy, but not all people who have seizures have epilepsy. Even those who do may also have seizures that are not epileptic in nature. An epileptic seizure is a temporary malfunction of the brain caused by uncontrolled electrical activity from the nerve cells in the cerebral cortex. The seizures rarely damage the brain, but they can make life difficult. Seventy percent of people with epilepsy can be expected to enter remission, defined as five or more years seizure free on medication.

The underlying cause or causes of epilepsy is unknown. It is not caused by, nor is it related to, mental illness, developmental delays, or mental health issues. In fact, many famous people have or have had epilepsy and have contributed much to our society. Seizures may occur for no apparent reason or may be triggered by a wide range of things, including exposure to an allergen; drug or alcohol withdrawal; fever; flashing lights; hunger; hypoglycemia; infection; lack of sleep; metabolic or nutritional imbalances; or trauma, especially head injury. Some people have abnormally low levels of inhibitory neurotransmitters, brain chemicals that decrease neuronal activity in the brain, while others have abnormally high levels of excitatory neurotransmitters, the exact opposite situation. There is evidence for a genetic or hereditary link as well. Unfortunately, research into the genetic component is in its infancy. There are more than five

hundred genes that could play roles in epilepsy, and identifying which one does what is the trick.

There are more than thirty different kinds of seizures, divided into two basic groups: focal seizures and generalized seizures:

1. *Partial seizures.* These may be classified as either simple or complex. Focal seizures occur in just one part of the brain and affect about 60 percent of the people who have epilepsy. Because they have a focus, an area of the brain they are associated with, they are usually categorized by the area of the brain where they originate. In a simple focal seizure, the person remains conscious, but experiences odd sensations or feelings such as sudden anger, joy, nausea, or sadness, and may even experience strange sounds, smells, or tastes or see and feel things that are not real to the rest of us. In a complex focal seizure, the person usually has a loss of consciousness, or at least a change in the conscious state. This may resemble a dreamlike experience. Repetitive behaviors, such as twitching, mouth movements (chewing), blinking, walking in a circle, and other automatic movements may occur. A person may experience a distinctive warning sign called an *aura* before this type of seizure. The aura is itself a form of seizure, but one the person remembers. The aura may be experienced as a peculiar odor, butterflies in the stomach, or a distorted sound. One man with epilepsy, an ardent racetrack gambler, said he always heard the roar of a crowd, followed by the name of a favorite racehorse, just before he lost consciousness. Temporal lobe epilepsy (TLE) is the most common epilepsy syndrome with focal features. It is often associated with an aura, and has been implicated in brain damage (to the hippocampus, which shrinks over time).
2. *Generalized seizures.* These include absence seizures, atonic seizures, tonic seizures, clonic seizures, and tonic-clonic seizures. Generalized seizures are the result of abnormal neuronal activity on both sides of the brain. With this type of seizure, loss of consciousness, falling down, and/or muscle spasms are common. There are numerous kinds of generalized seizure. Absence seizures (previously known as petit mal) are most common in children and teenagers. They are characterized by a blank stare lasting about half a minute. The person appears to be daydreaming. During this type of seizure, the individual is unaware of his or her surroundings. Staring or daydreaming children do not all have epilepsy, though. A daydreaming child can be aroused by a simple touch or someone talking. A child having an absence seizure cannot be aroused. Atonic seizure (drop attack) is a childhood seizure in which the child loses consciousness for about ten seconds and usually falls to the ground because of a complete loss of muscle tone. Tonic seizures cause stiffening of the body muscles, usually those in the back, arms, and legs. Clonic seizures cause repeated jerking movements of the muscles in both

sides of the body. Tonic-clonic seizures (previously known as grand mal) are characterized by sudden cries, a fall, and rigidity and jerking of the muscles, shallow breathing, and bluish skin. Loss of bladder control is possible. The seizure usually lasts two to five minutes, and is followed by confusion, fatigue, and/or memory loss. It can be frightening to witness, especially for the first-time observer. In myoclonic seizures, brief, massive muscle jerks occur, usually in the upper body, arms, or legs.

Another epilepsy syndrome, neocortical epilepsy, can be either focal or generalized in nature. Symptoms include strange sensations, hallucinations, emotional changes, muscle spasms, and convulsions, all of which can vary depending on the location, or focus, of the seizure.

Seizures in children can be particularly disturbing. They are the most common neurological problem affecting children—indeed, one-third of people with seizure disorders are children. Idiopathic epilepsy (seizures of unknown cause) or febrile seizures (nonepileptic seizures induced by fever) affect about 3 percent of children. Angelman syndrome (a rare congenital disorder seen in children) is associated with seizures or tremors. Lennox-Gastaut syndrome is a severe seizure disorder that usually develops in children between the ages of one and eight. The old-fashioned treatment was to start a course of anticonvulsant drugs after any seizure, including febrile seizure. The hope was that this would prevent epilepsy from developing in the future. However, long-term use of such drugs in children has proven to be harmful, and certainly febrile seizures generally require a less drastic therapy.

Seizures in very young children often stem from brain injury before birth, damage to the central nervous system, or metabolic inconsistencies. In older children, epilepsy is more likely to result from genetic factors, infections of the central nervous system, or head injury.

Nutritional supplementation is important for people with epilepsy. Pregnant women with epilepsy should take prenatal vitamins and get plenty of sleep to avoid seizures. They also should take vitamin K after thirty-four weeks of pregnancy to reduce the risk of the blood-clotting disorder called *neonatal coagulopathy*, which can result from the fetal exposure to epilepsy medication.

Unless otherwise specified, the dosages recommended here are for adults. For a child between twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Dimethylglycine (DMG)	As directed on label.	A powerful antioxidant. Increases oxygenation of tissues.

L-carnitine	As directed on label.	An amino acid required to make protein and deliver essential fatty acids to the cells. Carnitine is depleted by anticonvulsant drugs.
L-tyrosine	500 mg each 3 times daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Important for proper brain function. <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug.
Magnesium	700 mg daily, in divided doses. Take between meals, on an empty stomach, with apple cider vinegar or betaine HCl.	Needed to calm the nervous system and muscle spasms. Use magnesium chloride form.
Omega-3s (fish oil)	1,000 mg daily.	Reduces risk of sudden death from heart problems.
Selenium	As directed on label. If you are pregnant, do not exceed 40 mcg daily.	Low selenium levels result in a deficiency of glutathione peroxidase, an enzyme that detoxifies peroxides in the cells.
Taurine Plus from American Biologics	10–20 drops daily, in divided doses.	Taurine is an important antioxidant and immune regulator, necessary for white blood cell activation and neurological function. Use the sublingual form.
or taurine	As directed on label.	Levels of taurine are often low in people with seizure disorders. Taurine is an essential building block of all other amino acids.
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin)	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg daily.	Extremely important in the functioning of the central nervous system. Injections (under a doctor's supervision) may be necessary. Improves circulation and is helpful for many brain-related disorders.
and vitamin B <sub>6</sub> (pyridoxine)	100–600 mg 3 times daily, under the supervision of a health care professional.	Needed for normal brain function.
and vitamin B <sub>12</sub>	1,000–2,000 mcg daily, on an empty stomach.	Involved in maintenance of the myelin sheaths that cover and protect nerve endings.
and folic acid	400 mcg daily. If you are taking anticonvulsants, do not exceed 400 mg daily from all sources.	A brain food vital for the health of the nervous system.
and vitamin B <sub>5</sub> (pantothenic acid)	500 mg daily.	The anti-stress vitamin.

**Very Important**

Calcium	1,500 mg daily.	Important in normal nerve impulse transmission.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Increases energy and acts as an antioxidant.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Protects the brain cells. Use zinc gluconate lozenges or OptiZinc for best absorption.

**Important**

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	30 mg daily.	Improves brain oxygenation.
Oxy-5000 Forte from American Biologics	As directed on label.	A potent nutritional antioxidant for health and stress. Destroys free radicals.
Quercetin	As directed on label.	A flavonoid with anti-inflammatory and antioxidant properties. More powerful than vitamin C.

**Helpful**

Chromium picolinate	200 mcg daily.	Important in maintaining stable cerebral glucose metabolism.
Kelp or alfalfa	1,000–1,500 mg daily.	For necessary mineral balance. <i>See under Herbs, below.</i>
Melatonin	Start with 2–3 mg daily, taken 2 hours or less before bedtime. If necessary, gradually increase the dosage until an effective level is reached.	Helpful if symptoms include insomnia.
Proteolytic enzymes plus multienzyme complex	As directed on label. Take between meals. As directed on label. Take with meals.	Aids in healing if inflammation is the cause of seizures. Aids digestion, helping to make needed nutrients available.
Raw thymus glandular and thyroid glandular	As directed on label.	Both the thymus and thyroid are important in proper brain function. ( <i>See GLANDULAR THERAPY in Part Three.</i> )
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	An important antioxidant that aids in protecting brain function.
Vitamin C with bioflavonoids	2,000–7,000 mg daily, in divided doses.	Vital to functioning of the adrenal glands, which are the anti-stress glands. A potent antioxidant.
Vitamin E	200 IU daily.	Aids circulation. Compensates for anticonvulsant-induced vitamin depletion. An emulsion form is recommended for easier assimilation and greater safety at high doses. Use d-alpha-tocopherol form.

**Herbs**

- Alfalfa is a good source of needed minerals. Take 2,000 milligrams daily in capsule or extract form.
- Black cohosh, hyssop, and lobelia are beneficial for people with epilepsy because they aid in controlling the central nervous system and have a calming effect. For best results, they should be used on an alternating basis.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Avoid the herb sage. It contains the chemical compound thujone, which can be poisonous. Do not use sage if you suffer from any type of seizure disorder.

### Recommendations

- Eat cultured milk products like yogurt and kefir.
- Include beet greens, chard, eggs, green leafy vegetables, raw cheese, raw milk, raw nuts, seeds, and soybeans in the diet.
- Eat fish regularly (at least twice a week) and take a fish oil supplement. Patients with refractory seizures from epilepsy taking 9,600 milligrams of fish oil per day (2,880 milligrams omega-3s) had less severe seizures and better blood lipids, indicating lower heart attack risk. Some patients with epilepsy had heart rates that were variable, and the fish oil lowered their risk of sudden death.
- Drink fresh "live" juices made from beets, carrots, green beans, green leafy vegetables, peas, red grapes, and seaweed for concentrated nutrients. (See JUICING in Part Three.)
- Eat small meals, do not drink large quantities of liquids at once, and take 2 tablespoons of olive oil daily.
- Avoid alcoholic beverages, animal protein, fried foods, artificial sweeteners such as aspartame (found in Equal, NutraSweet, and other products), caffeine, and nicotine. Avoid refined foods and sugar.
- If the bowels do not move each day, before going to bed, take a lemon enema using the juice of two lemons and 2 quarts of water. (See ENEMAS in Part Three.)
- Take an Epsom salts bath twice a week.
- Work toward self-care. Keep drug dosages as low as possible, and work toward becoming as free from drugs and seizures as possible. The correct diet and nutritional supplements are very important in the control of epilepsy.
- Get regular moderate exercise to improve circulation to the brain.
- As much as possible, avoid stress and tension. Learn stress management techniques. (See STRESS in Part Two.)

### Considerations

- Most people who have epilepsy are aware of their condition and take medication to control the seizures. Possible side effects of antiseizure medications include blood disorders, fatigue, liver problems, and mental fatigue and/or foginess.
- Other types of drugs can interact with antiseizure medications, lessening or intensifying the effects of one drug or the other. Alcohol, birth control pills, the antibiotic erythromycin, and some types of asthma, ulcer, and heart medicines are known to interact with certain epilepsy drugs.

## What to Do When Someone Is Having a Seizure

Seeing someone having a seizure can be disturbing and frightening, and many if not most people do not know exactly what to do. Complicating that are the many myths that surround seizure treatment. If you witness someone having a seizure, do the following:

- *Do not* restrain the person.
- *Do not* try to put anything in the person's mouth. A person having a seizure may bite his or her tongue, but this is not life-threatening.
- Try to restrain a fall so that the person does not hit something as he or she collapses. Often, the person knows he or she is about to have a seizure, and you can ask him or her to sit on the floor, or help him or her to sit down, before a fall.
- Leave the person lying flat on a safe surface. Do not put anything under the person's head. If possible, turn the person onto his or her side, propping him or her in that position with cushions at the back during the seizure. This way, any saliva or blood from a bitten tongue will be able to flow freely out of the mouth.
- In case of loss of bladder or bowel control, if possible, loosely cover the person with a blanket to protect his or her privacy.
- *Do not panic.* Loosen any tight clothing to make the person more comfortable. Stay with the person until the seizure has stopped. He or she may be confused and tired immediately after the seizure.
- If the person has repeated seizures, one after the other, seek medical assistance. With a baby or young child, medical help should be sought immediately.

*Caution:* Anyone who takes medication for epilepsy should always check with his or her doctor or pharmacist before taking other drugs, whether prescription or over-the-counter.

- Epilepsy is not the only cause of seizures. They can also be brought on by other factors, including alkalosis; excessive consumption of alcohol; arteriosclerosis; brain disorders such as a brain tumor, encephalitis, meningitis, or stroke; high fever (especially in children); the use of drugs; the formation of scar tissue as a result of an eye injury or a stroke; a lack of oxygen; and spasms of the blood vessels.
- High levels of aluminum have been found in the brains of some people with epilepsy. Studies in animals have shown that trace amounts of aluminum in the brain may initiate the type of disordered electrical activity that causes seizures. (See ALUMINUM TOXICITY in Part Two.)
- According to research done by Arizona State University's Biochemical Department, the artificial sweetener aspartame has been associated (rarely) with seizures in some

people. But other toxic agents such as aluminum and lead may contribute to the problem. According to the Epilepsy Foundation of America, aspartame is safe for use by people with epilepsy.

❑ Doses of folic acid in excess of 400 micrograms (mcg) per day may increase seizure activity in people with epilepsy, especially if they are taking the commonly prescribed anticonvulsant phenytoin (Dilantin).

❑ At least 90 percent of women who take epilepsy drugs during pregnancy give birth to normal, healthy infants. Because a seizure during pregnancy carries its own risks, most doctors advise pregnant women with epilepsy to continue taking their medication unless it is likely they will be seizure-free without it.

❑ Some good results have been reported using hyperbaric (high-pressure) oxygen therapy in treating people with epilepsy. (See HYPERBARIC OXYGEN THERAPY in Part Three.)

❑ If epilepsy is due to tiny tumors in the brain, a type of surgery known as lesionectomy may be recommended. Using a computer, a surgeon can view and vaporize the tiny tumors that cause some cases of epilepsy. This procedure can be performed with minimal damage to healthy tissue in the brain.

❑ Diastat, a gel form of diazepam (better known as Valium) designed for rectal administration, may be prescribed for people who suffer from multiple seizures on a regular basis. The gel takes only minutes to work and should be administered two to three minutes into a seizure.

❑ A specialized dietary program called the ketogenic diet has been used with considerable success to control seizures in children. This is a rigidly controlled diet that is high in fats and extremely low in carbohydrates and proteins, which forces the body to use fats rather than the usual carbohydrates to generate cellular energy. When fats are burned, by-products called ketones are formed. Normally, ketosis—the presence of high levels of ketones in the body—occurs only in cases of starvation or uncontrolled diabetes mellitus. Eating a diet containing virtually no carbohydrates, however, can produce essentially the same effect, and also causes biochemical changes that enable the body's tissues to burn these ketones for needed energy. It is very much like the Atkins diet, which also produces ketones. Although it is not known exactly how, this process appears to control seizure activity. The mechanism may be a ketosis by-product with a tongue-twisting name, beta-hydroxybutyrate (BHB), but no human studies have yet confirmed this link. You should discuss this in detail with a physician before attempting it, and some drug therapy still may be required. The majority of children who have been put on this diet benefit from it, and many have been able to stop taking, or reduce their dosage of, antiseizure medication. Using this dietary program can be challenging for

parents because the child's foods, liquids, medications, and even personal hygiene products such as toothpaste must be strictly controlled, and the program must be followed to the letter (even slight deviations can negate its effects). It should be undertaken only under the direct supervision of a physician who is experienced in its use. Information about the ketogenic diet is available from the Johns Hopkins Epilepsy Center. (See Health and Medical Organizations in the Appendix.) The diet has been in use since the 1920s. In a recent study, seventy-three children were assigned to a ketogenic diet and seventy-two ate a regular diet. After three months, those on the ketogenic diet had fewer seizures and some were even seizure-free. Side effects of the ketogenic diet were constipation, vomiting, lack of energy, and hunger. This is a new, important study that shows the merits of a ketogenic diet.

❑ In a survey of doctors and nurses, 58 percent believed that there was a relationship between consumption of specific foods and the occurrence of seizures. Foods that were most likely to trigger a seizure as witnessed by the group were dairy products, sour foods, food additives, meat and fish, and fruits and vegetables.

❑ Pseudoseizures, also known as psychogenic or nonepileptic attack disorder, are nonepileptic seizures and may be a symptom of a number of different psychological factors.

❑ Huntington's disease (HD), also sometimes called Huntington's chorea, is a disorder that can cause tremors, jerking movements that may resemble myoclonic seizures. This is, however, not a seizure disorder. Huntington's disease is a result of a genetically transmitted chromosome irregularity that usually manifests itself during the third decade of life. There is no known cure for Huntington's disease, but following the diet designed for epilepsy may help slow the progression and ease symptoms of the condition.

## EPSTEIN-BARR VIRUS

See under CHRONIC FATIGUE SYNDROME; FIBROMYALGIA SYNDROME; MONONUCLEOSIS.

## ERECTILE DYSFUNCTION

Erectile dysfunction (ED), or chronic erectile dysfunction, is no longer a taboo subject. It is estimated that 30 million American men suffer from ED. For a great majority of them, the problem is solvable. A man is considered to have erectile dysfunction if he does not have the ability to achieve or maintain an erection adequate for normal sexual intercourse. Erections result from a complex combination of brain stimuli, blood vessel and nerve function, and hormonal actions. Anything that interferes with any of these factors can lead to erectile dysfunction, and that can include arteriosclerosis, metabolic syndrome, and peripheral vascular disease; the use of certain medications listed later in this section; alcohol, or cigarettes; a history of sexually

transmitted disease; and chronic illness such as diabetes and high blood pressure.

Erectile dysfunction is extremely common in men who have diabetes. Men who have diabetes are two to three times more likely to have erectile dysfunction than men who do not have diabetes. Hormonal imbalances such as low levels of thyroid hormone may also contribute to the problem. Low levels of the hormone testosterone are rarely the cause of ED. Lack of desire may be the problem. If desire is not there in the first place, it is difficult to either get or maintain an erection. Loss of libido (sexual desire) may be caused by depression, illness, or medications, and a waning attraction to one's partner.

ED may be chronic or recurring, or it may occur as a single isolated incident. One or two occurrences, however, are rarely thought of as erectile dysfunction, although they may be upsetting at the time. Most of the men who have this problem are age forty or over (one in three men over sixty is affected), but those under forty may also have the problem.

In the past, it was assumed that erectile dysfunction was primarily a psychological problem, but many therapists and physicians today believe that as many as 85 percent of all cases of ED have some physical basis. There are many drugs that may cause erectile dysfunction as a side effect. Some of the most common are alcohol, antidepressants, antihistamines, antihypertensives, blood pressure medication, cancer chemotherapy, diuretics, narcotics, nicotine, sedatives, steroids (if abused), stomach acid inhibitors, and ulcer medications. Atherosclerosis, or hardening of the arteries (one type of arteriosclerosis), poses a risk to the condition of both the heart and the penis (erectile dysfunction can, in fact, be a symptom of this disorder). Most people today know smoking and eating fatty foods lead to the production of plaques that clog arteries and block the flow of blood to the heart. These plaques also can block the arteries leading to the genitals, interfering with the ability to attain an erection.

The following nutrient dosages are for adult males.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Essential fatty acid complex	As directed on label.	Aids in the formation of sperm and seminal fluid in the prostate gland.
Iodine	As directed on label (usually 150 mg daily).	Iodine is a component of the thyroid hormones and necessary for development of the reproductive organs. Toxicity results if it is taken in large quantities.
or kelp	2,000–3,000 mg daily.	A natural source of iodine.
Selenium	As directed on label.	Found in high concentration in the testicles. Caution: Do not take this supplement if you have heart, liver, or kidney disease.

Vitamin C with bioflavonoids	500 mg 3 times daily.	Helps boost testosterone levels.
Vitamin E	200 IU daily or 400 IU every other day.	Increases circulation. Use d-alpha-tocopherol form. Caution: Vitamin E is a blood-thinning agent. Do not use if you take prescription blood-thinners.
Zinc	80 mg daily. Do not exceed this amount.	Important in prostate gland function and reproductive organ growth. Also helps boost testosterone levels. Use zinc gluconate lozenges or OptiZinc for best absorption.

*Important*

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Increases oxygen supply in the blood to all tissues. Blood vessels must be dilated for an erection to occur. Use a sublingual form.
GH3 from Gero Vita	As directed on label.	Stimulates the activity of sex hormones. Caution: Do not use GH3 if you are allergic to sulfites.
Multi-Glandular from American Biologics	As directed on label.	A supplement for the endocrine, hormonal, and enzyme systems.
Octacosanol	1,000–2,000 mcg 3 times weekly.	Natural source of vitamin E. Good for hormone production.

*Helpful*

L-tyrosine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B6 and 100 mg vitamin C for better absorption.	Helps stabilize moods and alleviate stress. (See AMINO ACIDS in Part One.) Caution: Do not take tyrosine if you are taking an MAO inhibitor drug.
Raw orchid glandular	As directed on label.	Glandular extracts from the male reproductive organs that promote their function. (See GLANDULAR THERAPY in Part Three.)
Vitamin A plus mixed carotenoids or carotenoid complex (Betatene)	15,000 IU daily. 15,000 IU daily. As directed on label.	Antioxidants that enhance immunity. Antioxidants and vitamin A precursors.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	Needed for a healthy nervous system. B vitamins are important in all cell activities. Required for the synthesis of RNA and DNA, which govern cellular reproduction.

**Herbs**

- Ashwagandha and schizandra, both Ayurvedic herbs, are said to ensure potency and increase fertility.
- Damiana is good for improving blood flow to the genital area and increasing desire.

Sarsaparilla contains a testosterone-like substance for men.

Wild yam contains natural steroids that rejuvenate and give vigor to lovemaking. This hormone is found in the human body as dehydroepiandrosterone (DHEA). Take twice the amount recommended on the label for two weeks, then stop for two weeks. Continue this on-and-off cycle, taking the recommended amount.

Yohimbe bark, which comes from west Africa, is said to expand the blood vessels in the penis and increase blood flow. It also claims to increase nitrous oxide (NO), which is important for producing an erection.

*Caution:* Yohimbe should not be used by women who are pregnant or nursing. Do not use yohimbe if you have high blood pressure, heart disease, stomach ulcers, depression, or other psychiatric conditions. There have been cases of people dying from taking too much yohimbe.

Other herbs that may be beneficial include dong quai, gotu kola, hydrangea root, pygeum, saw palmetto, and/or Siberian ginseng.

*Caution:* Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

There are herbal products on the market that claim to help sexual potency; they include:

- Prostate from Gero Vita International normalizes prostate function, increasing libido and erectile ability.
- Saw Palmetto Supercritical Extract from Gaia Herbs is an herbal tincture that helps to normalize prostate function.

### Recommendations

Eat a healthy, well-balanced diet. Include in the diet pumpkin seeds, bee pollen, or royal jelly.

*Caution:* Bee pollen may cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if a rash, wheezing, discomfort, or other symptom occurs.

- Avoid alcohol, particularly before sexual encounters.
- Some men have found benefit from pomegranate juice, according to the International Index of Erectile Function (IIEF).
- In one study, men with erectile dysfunction and low levels of the hormone dehydroepiandrosterone (DHEA) derived benefit from taking supplemental doses of the hormone. Long-term studies are not available, however.
- Do not consume animal fats, sugar, or fried or junk foods.
- Do not smoke. Avoid being around cigarette smoke.
- Avoid stress.
- Consult a urologist for testing to determine whether ED is caused by an underlying illness that requires treatment.

Consider possible psychological factors that may be contributing to ED, especially repressed anger or a fear of intimacy. Exploring psychological issues with a qualified therapist can help.

If you suspect ED may be related to a drug you are taking, discuss this with your physician. There may be satisfactory alternatives that will not cause this problem. Certain blood pressure medications and tranquilizers often cause erectile difficulties. The drugs cimetidine (Tagamet) and ranitidine (Zantac), which are used to treat ulcers and heartburn, also have significant side effects in some men.

*Caution:* Do not stop taking a prescription drug or change the dosage without consulting your physician.

Investigate the possibility of heavy metal intoxication. A hair analysis can reveal possible heavy metal poisoning. (See HAIR ANALYSIS in Part Three.)

Keep in mind that sexual function changes with age. As you age, you may require more stimulation and a longer period of time to achieve an erection.

### Considerations

A study done at the Boston University School of Medicine linked overall health to erectile dysfunction. Researchers studied the medical histories of 1,300 men aged forty to seventy years. They found some ED in a total of 52 percent of those under study. Men who were being treated for heart disease, high blood pressure, or diabetes were one and a half to four times more likely than the overall group to be completely impotent later in life. The situation was even worse for men with heart disease or hypertension who also smoked.

Men with metabolic syndrome (a combination of medical disorders such as high blood pressure and high cholesterol, sugar, and insulin levels that increase the risk of cardiovascular disease and diabetes) who followed a Mediterranean diet were able to regain their erectile function. In this study, the men followed the diet—which included more fruits, vegetables, nuts, whole grains, and olive oil—for two years and were compared to a group who ate their regular diet. Nearly half the men in the Mediterranean diet group improved their symptoms, while only 6 percent did in the regular diet group.

In one study published in the *Journal of the American Medical Association (JAMA)*, losing 10 percent of body weight coupled with an exercise program seemed to be enough to get rid of ED in 31 percent of men compared to a group who did not change their diet or who did not exercise.

Alcohol intake decreases the body's ability to produce testosterone. Research at Chicago Medical School revealed that drinking alcohol may cause the hormonal equivalent of menopause in men. Alcohol not only affects sexual function, but also helps set the stage for a heart attack and other dangerous conditions.

□ Arteriosclerosis, which restricts blood supply to the penis and to the nerves that govern sexual arousal, may result in a “failure to perform.” If ED is related to clogged blood vessels, a diet low in fats can actually help reverse the problem. (See ARTERIOSCLEROSIS/ATHEROSCLEROSIS; CARDIOVASCULAR DISEASE; and/or CIRCULATORY PROBLEMS in Part Two.)

□ A study done at Boston University showed that men who smoked one pack of cigarettes a day for five years were 15 percent more likely to develop clogging in the arteries that serve the penis, a situation that can cause ED. In addition, heavy smoking decreases sexual capability by damaging the tiny blood vessels in the penis. The use of marijuana and cocaine can also result in ED.

□ Duplex ultrasonography, a noninvasive method of measuring penile blood flow, is a reliable method of determining whether arterial occlusion plays a role in ED. If your doctor believes atherosclerosis to be the underlying problem, he or she may advise vascular surgery to improve blood flow to the penis.

□ Urologists differ in the types of treatment they recommend for ED, but many opt first for nonsurgical treatment. Sildenafil (Viagra) is probably the best-known drug for dealing with ED. It is not, however, a drug that will make you feel like having sex, but rather a drug that will help you to have an erection. In other words, if desire is not there, it will not help. Partners of men who take Viagra may have difficulty adjusting to the higher level of potency shown by their partners, so taking an enhancement drug such as sildenafil should always be discussed with your partner.

*Caution:* Sildenafil may not be suitable for men with certain cardiovascular or blood disorders, or for men with advanced kidney or liver disease. There are some concerns about sildenafil and high blood pressure.

□ Tadalafil (Cialis) is another oral medication that relaxes muscles in the penis and increases blood flow, and it has been shown to stay in the body longer. However, like sildenafil, serious side effects can occur, and tadalafil should only be taken under the direction of a physician.

□ Apomorphine (Uprima) is a newer prescription drug for ED that works through the brain to produce erections—unlike sildenafil, which works by increasing blood flow to the penis.

*Caution:* This drug can cause unpleasant side effects, most notably nausea, vomiting, dizziness, or sweating.

□ Injections of the drugs papaverine (Pavabid) and phenolamine (Regitine) or prostaglandin E1 (PGE1) into the base of the penis before intercourse have proven effective in producing “satisfactory erection” in men with ED. The drug alprostadil also is available in an injection kit (Caverject). These drugs work by relaxing smooth muscle, which causes the blood vessels in the penis to dilate, promoting an erection that can last an hour or more. Possible side ef-

fects include priapism (prolonged, painful erections). Also, although the injections are done with a tiny needle, and are supposed to be painless when done properly (proper technique is crucial), this prospect is unappealing to many men. A less invasive technique involves instilling alprostadil into the urethra with a suppository applied with a tiny plunger.

□ If ED is linked to high levels of the hormone prolactin, bromocriptine (Parlodel) may be prescribed to correct the problem.

□ A number of vacuum devices are used to promote erection. With these devices, a cylinder is placed over the penis and a hand pump is used to create a vacuum in the cylinder. This in turn causes blood to flow into the penis, creating an erection. The user then puts a constriction band around the base of the penis, causing the erection to last up to thirty minutes.

□ Some men turn to inflatable penile implants to mechanically create erections. Penile implants are surgically installed devices that are made of silicone or polyurethane. One type is made of two semirigid but bendable rods; another type consists of a pump, a fluid-filled reservoir, and two cylinders into which the fluid is pumped to create an erection. With the development of more effective agents, implants are now considered to be a last resort, to be tried only when all other methods have failed.

□ Premature ejaculation (PE) is considered sexual dysfunction. It is not the same thing as ED, but it too can diminish the quality of one’s sex life. Premature ejaculation—reaching orgasm too quickly to satisfy one’s partner—is thought to be a learned trait, acquired through the habit of masturbation and immediate gratification, that can be unlearned through counseling. However, if PE begins suddenly, when there was no history of it before, it is probably due to problems with the arteries and veins that run to the penis. Venous leaks may be one of these problems because the extra blood that should be going to the penis and making it erect is draining away, so it is difficult to maintain a good erection for any length of time. This problem is common with older men.

□ Peyronie’s disease results in a twisting of the penis when it is erect. This is due to plaque or scars blocking the tunica albuginea, a membrane containing the corpora cavernosa, the two long, thin chambers in the penis that fill with blood and create the erection. This prevents the penis from retaining its overall elasticity. When erect, the penis may look deformed and contorted.

□ See also HYPERTHYROIDISM and HYPOTHYROIDISM in Part Two.

## EYE PROBLEMS

Two of the most complex organs of the body, the eyes provide us with instantaneous visual feedback of the world

around us. We have all experienced eye trouble at one time or another—eyes that are tired, bloodshot, dry, irritated, itchy, sensitive to light, or watery, to name just a few. While some eye disorders—nearsightedness or cataracts, for example—are localized problems, eye disturbances can be a symptom of disease elsewhere in the body. Watery eyes, for example, can be a symptom of the common cold; protruding or bulging eyes and reading difficulties may indicate a thyroid problem; dark circles under the eyes and eyes that are red, swollen, and/or watery may indicate allergies; yellowing of the eyes from jaundice can be a sign of hepatitis, gallbladder disease, or gallstone blockage; droopy eyes are often an early sign of myasthenia gravis, a disorder in which the eye muscles weaken. A drastic difference in the sizes of the pupils can indicate a tumor somewhere in the body, whereas high blood pressure and diabetes may manifest themselves in periodic blurring of vision.

The eyeball is a sphere about an inch in diameter that is covered by a tough outer layer called the sclera, the “white of the eye.” Underneath the sclera is the middle layer of the eye, the choroid, which contains the blood vessels that serve the eye. The front of the eye is covered by a transparent membrane called the cornea. Behind the cornea is a fluid-filled chamber called the anterior chamber; behind that—in the center of the sclera, on the front of the eyeball—is the highly pigmented iris, and in the center of the iris is the pupil. Behind the iris is the transparent lens. Inside, at the back of the eye, is the retina, a delicate light-sensitive membrane that is connected to the brain by the optic nerve.

The eye also contains two important fluids. The ciliary body, whose muscles are responsible for focusing the lens of the eye, also produces a waterlike substance called the aqueous humor, which fills the space between the cornea and the lens. The aqueous humor contains all of the constituents of blood except for red blood cells. The other fluid is the vitreous humor, a jellylike substance that fills the back of the eyeball, the space between the lens and the retina.

On the outside of the eyeball are six muscles that move the eyes. Under the upper eyelids are the lacrimal glands, which secrete tears. At the inner corners of the eyelids are the tear ducts, small openings through which the tears drain into the nose and the back of the throat. At the edges of the eyelids, where the eyelashes are, are glands that produce oils, sweat, and other secretions.

What we think of as the simple act of seeing is actually a complex, multistep process that goes on continuously and at breathtaking speed. Light enters the eye through the pupil, which changes size depending on the amount of light entering it. When there is very little light, the pupil dilates; in bright light, the pupil constricts. As light enters the eye, it is focused by the lens, which adjusts its shape by means of the action of the muscles and ligaments of the ciliary body.

The lens becomes fatter or flatter depending upon the distance to the object being focused on. The lens projects

## Maintaining Healthy Eyes

Like all other parts of the body, the eyes need to be nourished properly. In addition to making sure that the eyes are not strained by too much intense close work or inadequate light, proper eye care includes a healthy diet containing sufficient amounts of vitamins and minerals.

In order to promote good eyesight, you must make sure your diet contains the proper amounts of the B vitamins; vitamins A, C, and E; and the minerals selenium and zinc. Fresh fruits and vegetables are good sources of these vitamins and minerals; include plenty of these in your diet, especially yellow and yellow-orange foods such as carrots, yams, and cantaloupes. A well-balanced diet with plenty of fresh fruits and vegetables can help keep your eyes healthy.

When you are outdoors, exposure to sunlight can be damaging. The recommendation is that people who must deal with prolonged exposure should wear ultraviolet (UV) protective sunglasses that block both types of UV rays, UV-A and UV-B. UV-A is ultraviolet radiation with a wavelength of 320–400 nanometers. It passes right through the earth’s ozone layer. UV-B is ultraviolet radiation with a wavelength of 280–320 nanometers. The ozone layer absorbs most of this radiation, but a small amount gets through and can cause cataracts, pterygia (benign lesions that grow on either side of the cornea), and skin cancer. This especially is true for children, and their sunglasses should be as good or better than those of an adult. In other words, buy real sunglasses, not the kiddie models. Look for polycarbonate lenses, which are light, shatterproof, and optically sound.

light onto the retina, where special pigment absorbs the light and forms a corresponding image. Finally, this image is transmitted by means of the optic nerve to the brain, which interprets the image. Anything that interferes with any link in this chain of events can result in impaired vision.

Many cases of eye damage and vision loss are linked to underlying diseases of one type or another. Diabetes often leads to hemorrhages in the retina and the vitreous humor, eventually producing blindness. Early cataracts also may be related to diabetes. High blood pressure produces a gradual thickening of the blood vessels inside the eyes that can result in visual impairment and even blindness. Other factors linked to declining eyesight include too much sun exposure, poor nutrition, exposure to tobacco smoke or other pollutants, and dehydration.

One major contributor to eye trouble is poor diet, specifically the denatured, chemical- and preservative-laden foods that most Americans consume daily. A deficiency of just one vitamin can lead to various eye problems. Supplementation with the correct vitamins and minerals can help prevent or correct eye trouble. Some of these supplements also protect against the formation of free radicals, which

can damage the eyes. Specific eye problems that can be helped by supplementing the diet with vitamins and other nutrients are discussed in this section.

Unless otherwise specified, the nutrient dosages given in the tables within this section are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Desiccated liver	As directed on label.	A good source of many important vitamins and minerals. Use only liver derived from organically raised beef.
Free form amino acid plus glutathione	As directed on label.	For necessary protein. Free form amino acids are assimilated best.
or N-acetylcysteine	500 mg daily, on an empty stomach.	Powerful antioxidants that protect the lenses of the eyes.
	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	
Multivitamin and mineral complex with selenium	200 mcg daily.	All nutrients are needed in balance.
	If you are pregnant, do not exceed 40 mcg daily.	Destroys free radicals that can damage the eyes.
Ocu-Care from Nature's Plus	As directed on label.	These formulas provide many eye-strengthening nutrients, as well as protective and antioxidant substances, to support and nourish the eyes.
or OcuGuard from Twinlab	As directed on label.	
or Visual Eyes from Source Naturals	As directed on label.	
Taurine Plus from American Biologics	As directed on label.	Taurine is associated with zinc in maintaining eye function. It is present in the retina of the eye in high concentrations. Use the sublingual form.
Vitamin A emulsion	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Absolutely necessary for proper eye function. Protects the eye from free radicals. Emulsion form is recommended for easier assimilation and greater safety at higher doses.
or capsules plus carotenoid complex with lutein and zeaxanthin	15,000 IU daily.	Precursors of vitamin A.
	As directed on label.	
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual	Needed for intracellular eye metabolism.

vitamins in a complex will vary).

Vitamin C with bioflavonoids	2,000 mg 3 times daily.	An antioxidant that reduces intraocular pressure.
Vitamin E	200 IU daily.	Important in healing and immunity. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Deficiency has been linked to retinal detachment. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Herbs

- Bayberry bark, cayenne (capsicum), and red raspberry leaves, taken by mouth, are beneficial.
- Bilberry extract has been shown to improve both normal and night vision.

### Recommendations

- Include the following in your diet: broccoli, raw cabbage, carrots, cauliflower, green vegetables, squash, sunflower seeds, and watercress.
- Drink fresh carrot juice. This can help to prevent or alleviate some eye problems.
- Eliminate sugar and white flour from your diet.
- If you wear glasses, wear clear spectacles that have been treated to keep out ultraviolet rays. This will help protect against damage from ultraviolet exposure. Avoid wearing tinted eyeglasses for this purpose, especially on a regular basis; dark glasses prevent needed light from entering the eyes. The functioning of the pineal gland, which plays an important role in the regulation of metabolism, behavior, and physiological functions, is largely governed by sunlight.
- Never use hair dyes containing coal tar on the eyelashes or eyebrows; doing so can cause injury or blindness. Although coal tar dyes are legal, marketing them for the eyebrows and eyelashes is not.
- Be careful when using drugs, whether prescription or over-the-counter. Some may cause eye problems. Drugs that can cause light sensitivity, blurriness, dizziness, or damage to the optic nerve, retina, or other vital parts of the eye include:
  - Adrenocorticotrophic hormone, or ACTH (HP Acthar, Cortrosyn).
  - Anticoagulants such as heparin and warfarin (Coumadin).
  - Corticosteroids, such as hydrocortisone (Cortenema Enema, Hydrocortone, Solu-Cortef, VoSol HC), prednisolone (Blephamide, Hydextra-T.B.A.), and prednisone (Deltasone).
  - Chlorpropamide (Diabinese), which is used for non-insulin-dependent diabetes.

- Diuretics, antihistamines, and digitalis preparations.

Consult your health care provider if you develop any of the following conditions: change in pupil size; eye pain or pain on eye movement; impaired vision; intolerance to light; known exposure to gonorrhea or chlamydia; seeing floating black bits that you hadn't seen before; or swelling, tenderness, or redness around the eyes.

If you have a baby or young child who exhibits any signs of eye infection, have the child evaluated by a professional.

### Considerations

There are three types of specialists who deal with the eyes:

1. Ophthalmologists are medical doctors who are eye specialists. They diagnose and treat eye disease, perform eye surgery, give eye tests, and prescribe corrective lenses.
2. Optometrists are not medical doctors, but they are licensed by the states to give eye tests and treat nonsurgical eye problems. They can prescribe corrective lenses. In some states, they can prescribe medication.
3. Opticians fill prescriptions for glasses and contact lenses. Only twenty-two states require opticians to be licensed.

Because the light-absorbing retinal pigment is composed of vitamin A and protein, which are continually being used up as images are formed, adequate supplies of these nutrients are vital for proper eye function.

The combination of nicotine, sugar, and caffeine may temporarily affect vision.

Sea mussel is a source of protein that aids in the functioning of eye tissues and the secretion of eye fluids.

Zinc may help reduce vision loss because it is a factor in the metabolic functioning of several enzymes in the choriorretinal complex (the vascular coating of the eye). Never take more than 100 milligrams a day.

People who work at computers every day are at risk for eyestrain, headaches, blurred vision, dry or irritated eyes, sensitivity to light, double vision, and afterimages.

People who wear contact lenses need to take precautions against eye damage because of the increased risk of injury and infection associated with them.

Two studies have shown that leaving contact lenses in place for more than twenty-four consecutive hours can result in ulcerative keratitis, a condition in which the cells of the cornea are rubbed away by the contact lens, leading to infection and scarring. If not properly treated, this condition can cause blindness. Users of extended-wear lenses are ten to fifteen times more likely than other people to develop ulcerative keratitis, according to *The New England Journal of Medicine*. If ordinary daily-wear lenses are left in place overnight, the risk rises to the same level.

Abnormalities in one or more of the six muscles that move the eyes, or a lack of coordination among these muscles, can result in a cross-eyed or walleyed condition. These muscles can be exercised and relaxed to improve their function. The internal muscles likewise can be exercised to improve the focusing ability of the eyes, both near and far.

### Astigmatism

See under BLURRED VISION in this section.

### Bags Under the Eyes

Skin loses some of its elasticity with age, and muscles within the eyelids lose tone, causing what is known as bags under the eyes. In addition, fat can gather in the eyelid, and fluids can accumulate and cause swelling. Puffiness around the eyes can also be caused by allergies or excessive consumption of salt. Smoking can aggravate the problem.

### Recommendations

Avoid drinking fluids before bed.

Avoid monosodium glutamate (MSG) and limit your salt intake.

Do not smoke, and avoid secondhand smoke.

Get plenty of sleep.

Place a washcloth moistened in ice water, or a chilled gel-filled compress, over your eyes for fifteen minutes once or twice daily. You can also try using a lukewarm wet tea bag or cold cucumber slices. The cold shrinks the swollen blood vessels.

See ALLERGIES in Part Two and take the self-test to determine allergens that may be causing the problem.

### Bitot's Spots

Bitot's spots are distinct elevated white patches on the conjunctiva, the membrane that covers most of the visible part of the eye. They may signify a severe deficiency of vitamin A. Before taking large doses of vitamin A, establish that you have a deficiency. Large doses are usually given to children living in areas prone to vitamin A deficiency.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A	25,000 IU daily for two weeks, then 15,000 IU daily for 1 month, then reduce to 10,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Aids in dissolution of Bitot's spots, which may be caused by vitamin A deficiency. Use emulsion form for easier assimilation and greater safety at higher doses.
plus carotenoid complex with lutein and zeaxanthin	As directed on label.	

**Recommendations**

- Avoid eyestrain and smoke-filled rooms.

**Blepharitis**

Blepharitis is an inflammation of the outer edges of the eyelids that causes redness, itching, burning, and, often, a sensation that something is in your eye. Other possible symptoms include swelling of the eyelids, loss of eyelashes, excessive tearing, and sensitivity to light. Secretions may form crusts that "glue" the eyes together during sleep.

This condition may be caused by an infection of the eyelash follicles or glands at the outer edges of the eyelids. Eyestrain, poor hygiene, poor living and sleeping habits, poor nutrition, and systemic disease with resulting immunodepression commonly contribute to the problem. Blepharitis may also be associated with seborrhea of the face or scalp. (See SEBORRHEA in Part Two.)

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Inf-zyme Forte from American Biologics	As directed on label.	Aids in reducing inflammation.
Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Important in all eye disorders.
plus carotenoid complex with lutein and zeaxanthin	As directed on label.	Important antioxidants and precursors of vitamin A.
Vitamin C with bioflavonoids	6,000 mg daily, in divided doses.	A powerful antioxidant that protects the eyes and reduces inflammation.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for proper immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.

**Herbs**

- Warm eyebright, goldenseal, or mullein compresses are soothing and help reduce inflammation. Prepare a tea using one of these herbs, cool it to a comfortably warm temperature, and soak a clean cloth or a piece of sterile cotton in it to make the compress. Apply the compress and relax for ten to fifteen minutes. Then make a fresh compress and gently wipe the edge of the eyelid and the area around and between the eyelashes to remove any scaly matter or dandruff-like debris. Do this twice a day or as needed. Use each compress only once before laundering or discarding it.

**Recommendations**

- Eat a well-balanced diet that emphasizes fresh, raw vegetables, plus grains, legumes, and fresh fruits.

- Keep the eyelids clean, especially along the edges (see the procedure described under Herbs, above), but do not touch or rub your eyes except when necessary. Always wash your hands before touching your eyes.

- Get sufficient sleep, and avoid eyestrain. Anything that increases eye fatigue makes the discomfort worse.

**Considerations**

- See also SEBORRHEA in Part Two.

**Bloodshot Eyes**

Bloodshot eyes occur when the small blood vessels on the surface of the eye become inflamed and congested with blood, usually in response to an insufficient supply of oxygen in the cornea or tissues covering the eyes. They are usually a consequence of eyestrain, fatigue, and improper diet, especially the consumption of alcohol. But they can also indicate bodywide capillary fragility, the presence of a blood clot, or high blood pressure.

A bloodshot appearance can also result from deficiencies in vitamins B<sub>2</sub> (riboflavin) and B<sub>6</sub> (pyridoxine), and the amino acids histidine, lysine, or phenylalanine. Once the body receives the nutrients it needs, the congestion in the blood vessels should disappear.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for all eye disorders.
plus carotenoid complex with lutein and zeaxanthin	As directed on label.	
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Deficiencies have been linked to bloodshot eyes.
plus free form amino acid	As directed on label.	Use a formula containing both essential and nonessential amino acids.
Vitamin C with bioflavonoids	1,000–2,500 mg 4 times daily.	Important antioxidants and necessary free radical destroyers. Required for tissue growth and repair.

**Herbs**

- Use raspberry leaf to alleviate redness and irritation. Prepare a raspberry leaf tea, allow it to cool, and soak a clean cloth or piece of sterile cotton in the tea to make a compress. Apply the compress to the eyes with the lids closed for ten minutes or as needed.

## Blurred Vision

Vision may become blurred for any number of reasons. Refractive error (nearsightedness, farsightedness, and/or astigmatism) results in chronically blurry vision that can usually be overcome with corrective lenses. Eyestrain, fatigue, and excessive tearing can result in a temporary blurring of vision. A disturbance in the fluid balance in the body can also result in blurry vision.

A recurring tendency to periodic blurring can result from an inadequate supply of the light-sensitive pigment in the eye called rhodopsin, or visual purple, which is composed of vitamin A and protein. Any light that enters the eyes breaks down part of the visual purple, and the products of this purposeful breakdown set up nerve impulses that tell the brain what the eyes are seeing. If there is not enough pigment present, a time delay occurs between the time the eyes focus on an object and the time the brain forms an image of it. This is experienced as blurred vision.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Potassium	99 mg daily.	Needed to maintain proper fluid balance.
Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Necessary for pigment formation and proper balance of intraocular fluid.
plus carotenoid complex with lutein and zeaxanthin	As directed on label.	Needed for all eye disorders.

## Considerations

❑ Laser surgery is an increasingly popular method for correcting refractive errors that cause myopia (nearsightedness) and hyperopia (farsightedness). Three laser surgery procedures—photorefractive keratectomy (PRK), conductive keratoplasty, and laser in situ keratomileusis (LASIK)—may be used to correct mild to moderate nearsightedness. These are outpatient procedures with relatively short recovery times. They also have very high rates of success, but neither procedure is foolproof. Some people have improved vision as a result of the laser surgery, but still have to wear corrective lenses afterward. Others have to have follow-up surgery to improve results. In rare cases, people who have laser surgery end up with worse vision. People who tend to heal slowly or who have ongoing medical problems such as glaucoma or diabetes are not good candidates for laser surgery. The same is true of those with uncontrolled high blood pressure, autoimmune diseases, or certain eye diseases involving the cornea or retina. Pregnant women should not have refractive surgery of any kind because the refraction of the eye may change during pregnancy.

## Cataracts

A cataract is a clouding of the eye's lens that can lead to vision problems. If the lens of the eye thickens and becomes clouded or opaque, it becomes unable to focus or admit light properly. Some causes of cataracts include aging, diabetes, heavy metal poisoning, exposure to radiation, injury to the eye, and the use of certain drugs, such as steroids. High blood sugar levels are a major risk factor for developing cataracts.

The main symptom of a developing cataract is a gradual, painless loss of vision. Cataracts are the number-one cause of blindness in the world, although the vast majority of cataract conditions can be successfully treated with surgery. Occasionally, a cataract may swell and cause secondary glaucoma.

The most common form of cataract is the senile cataract, which typically affects people over sixty-five. This type of cataract is often caused by free radical damage. Exposure to ultraviolet rays and low-level radiation from X-rays leads to the formation of reactive chemical fragments in the eye's lens. The resistance of the lens begins to decline in older people. Free radicals attack the structural proteins, enzymes, and cell membranes of the lens. The free radicals in our food, water, and environment are probably a major factor in the increasing number of cataracts in our population.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Copper and manganese	3 mg daily. 10 mg daily. Take separately from calcium.	These minerals are important for proper healing and for retarding the growth of cataracts.
Glutathione	As directed on label.	An amino acid that is a potent antioxidant and aids in maintaining a healthy lens and protects against toxins. Has been shown to slow the progression of cataracts.
Grape seed extract	As directed on label.	A powerful antioxidant.
L-lysine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Important in collagen formation, which is necessary for lens repair. Also neutralizes viruses implicated in lens damage. <i>Caution:</i> Do not take lysine for longer than 6 months at a time.
Vitamin B <sub>5</sub> (pantothenic acid)	500 mg daily.	An anti-stress vitamin.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	An important free radical destroyer that works synergistically with vitamin E.
Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Vital for normal visual function.
plus carotenoid complex with lutein and zeaxanthin	As directed on label.	Precursors of vitamin A. Needed for all eye disorders.

Vitamin B complex plus extra vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>2</sub> (riboflavin)	As directed on label. 50 mg daily. 50 mg daily.	B vitamins work best when taken together. Important for intracellular eye metabolism. Deficiency has been linked to cataracts.
Vitamin C with bioflavonoids	3,000 mg 4 times daily.	A necessary free radical destroyer that also lowers intraocular pressure.
Vitamin E	200 IU daily.	An important free radical destroyer. Has been shown to arrest and reverse cataract formation in some cases. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Protects against light-induced damage. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Herbs

Bilberry extract, taken orally, supplies bioflavonoids that aid in removing toxic chemicals from the retina of the eye.

Ginkgo biloba improves microcapillary circulation.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

### Recommendations

Increase your consumption of green leafy vegetables—especially collard greens, kale, mustard greens, spinach, and turnip greens—legumes, and yellow vegetables. Also, flavonoid-rich berries—such as blueberries and blackberries—cherries, and foods rich in vitamins E and C, such as raw fruits and vegetables.

Follow a low-glycemic-load diet. It can reduce the risk of cataracts by 77 percent. Such a diet is rich in fruits and vegetables, low-fat dairy products, and proteins (meat and vegetable sources). It has smaller amounts of whole grains, refined grains, and sugars.

Avoid dairy products, saturated fats, and any fats or oils that have been subjected to heat, whether by cooking or processing. These foods promote formation of free radicals, which can damage the lens. Use cold-pressed vegetable oils only. Get calcium and vitamin D from other sources such as soy milk or supplements.

Drink quality water, preferably steam-distilled water. This is absolutely necessary in cataract prevention. Avoid fluoridated and chlorinated water. Even water from deeply driven wells may not be safe, since many aquifers (underground water sources), especially those located near or under farmland, are contaminated with toxic residue from farm runoff.

Avoid direct sunlight. Wear a wide-brimmed hat when outdoors, and protect your eyes by wearing sunglasses

(polarized) that block ultraviolet rays. Make sure the sunglasses are large enough to adequately protect your eyes.

If you have cataracts, avoid antihistamines.

### Considerations

Several studies have found that people who eat foods rich in lutein and zeaxanthin—broccoli, collard greens, kale, mustard greens, spinach, and turnip greens—are much less likely to develop age-related cataracts than those who do not include these foods in their diets. These foods also are effective in reducing risk of macular degeneration. Researchers believe lutein and zeaxanthin act as antioxidants, protecting the cells in the eyes from free radical damage.

Selected vitamins have been shown to reduce the risk of cataracts. In one study of 35,000 women who did not yet have cataracts, those who consumed a diet highest in lutein/zeaxanthin (6,700 micrograms) had an 18 percent reduced risk for cataracts; those who consumed the most vitamin E (262 milligrams) had a 14 percent reduced risk. The lutein/zeaxanthin came from fruits and vegetables and the vitamin E from supplements and diet.

Taking vitamin C supplements (400 milligrams a day) for at least a decade and eating a diet rich in antioxidants can lower the risk of cataracts, according to researchers at the Harvard Medical School.

A study published by the *Journal of Pineal Research* showed that melatonin was very effective in preventing laboratory-induced cataracts in rats. A control group of rats not given melatonin developed cataracts in 89 percent of the cases, whereas only 7 percent of the rats that had received melatonin developed cataracts. It is known that melatonin production slows with age, and most cataract cases develop in people who are sixty or older. Melatonin is known to be a powerful antioxidant, with the ability to permeate every level of the cell. Its effectiveness against cataract formation in humans needs to be further studied.

A number of heavy metals increase in concentration in the lenses of both aging people and people with cataracts. Cadmium, for instance, is found at levels two or three times higher than normal in lenses with cataracts. Concentrations of other metals, such as cobalt, nickel, iridium, and bromine, also are elevated.

An article in *Science* magazine reported that the single greatest cause of cataracts is the body's inability to cope with food sugars. Lactose (milk sugar) was the worst offender, followed by refined white sugar. Many eye specialists note that most people with cataracts eat diets that include substantial amounts of dairy products and refined white sugar. Cataracts can also develop if the diet is inadequate and prolonged stress is endured.

People who are deficient in the enzyme that converts galactose into glucose (ordinary blood sugar) develop cataracts much sooner than the rest of the population.

Smoking is a risk factor for cataracts, probably because the free radicals it generates increase the oxidant stress on the body. A study of cigarette smoking and the risk of cataracts reported in the *Journal of the American Medical Association* found a significant association between smoking and the incidence of cataracts.

The conventional treatment for cataracts is surgery. In cataract surgery, the eye's own dysfunctional lens is removed, and usually is replaced with a prosthetic intraocular lens implant made of plastic or silicone. The lens may be removed whole, or a surgical procedure called phacoemulsification (often called the "phaco" technique) may be used. In this operation, the surgeon makes one minuscule incision, inserts the tip of a vibrating instrument into the cataract, and beats it until it turns liquid. The liquid is then sucked out and a new lens is implanted. With this type of surgery, the incision is only one-tenth of an inch long, compared to conventional one-third inch or one-half inch incisions. Another method used is extracapsular surgery, in which a slightly longer incision is made on the side of the cornea. The surgeon then removes the hard center of the lens, and the remainder of the lens is removed by suction.

## Colorblindness

Colorblindness is a general term for the inability to see colors as most people see them. Specialized cells in the retina known as cones, which are vital for translating light waves into a perception of color, may be completely or partially lacking, or may not function properly, resulting in colorblindness.

There are different types and varying severities of this condition. Most colorblind people confuse certain colors (they may not be able to tell red from green, for example); in rare cases, an individual may see no color at all. Some can distinguish colors only in certain lights.

There are also certain diseases, including pernicious anemia and sickle cell disease, as well as a number of different medications, that can cause disturbances in color vision.

Because few people are tested for color vision, colorblindness is probably an underdiagnosed condition, especially among women. In most cases, colorblindness is present from birth, although the dimming of vision caused by cataracts can diminish a person's ability to distinguish colors later in life. Colorblindness is passed along through the mother and is more common in males.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A plus carotenoid complex with lutein	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	May be helpful because it is essential for proper functioning of the cones in the retina. Also improves night blindness. Use emulsion form, which is safe at higher doses than capsules.
Vitamin B <sub>12</sub>	1,000–2,000 mcg daily.	Deficiency can lead to yellow-blue colorblindness.

## Conjunctivitis (Pinkeye)

Conjunctivitis is an inflammation of the conjunctiva—the membrane that lines the eyelid and wraps around to cover most of the white of the eye. The eyes may appear swollen and bloodshot; they are often itchy and irritated. Because the infected membrane is often filled with pus, the eyelids are apt to stick together after being closed for an extended period.

Factors that can contribute to conjunctivitis include bacterial infection, virus, injury to the eye, allergies, and exposure to substances that are irritating to the eye, such as fumes, smoke, contact lens solutions, chlorine from swimming pools, chemicals, makeup, or any other foreign substance that enters the eye. Conjunctivitis is highly contagious if it is caused by a viral infection.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily for 1 month; then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Vitamin A, vitamin C, and zinc all help to promote immunity, which is especially important in common viral conjunctivitis. Use an emulsion form for easier assimilation and greater safety at high doses.
Vitamin C with bioflavonoids	2,000–6,000 mg daily, in divided doses.	Protects the eye from further inflammation. Enhances healing.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Enhances immune response. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Calendula, chamomile, fennel, and/or eyebright herbal teas can be used to make hot compresses. Eyebright can also be taken orally in capsule or tea form. It is good for any eye irritation or inflammation. The tea can also be used to rinse the eyes.

**Caution:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporin, so patients using these drugs should avoid it.

The homeopathic remedy Similasan can help with pinkeye.

Goldenseal, used as an alternative or in addition to eyebright, is very useful if conjunctivitis is caused by infection.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

### Recommendations

- Increase your consumption of green leafy vegetables—especially collard greens, kale, mustard greens, spinach, and turnip greens—legumes, and yellow vegetables. Also, flavonoid-rich berries such as blueberries and blackberries, cherries, and foods rich in vitamins E and C, such as raw fruits and vegetables.
- Apply hot compresses several times a day. Many of the microorganisms that cause conjunctivitis cannot tolerate heat. For greater benefit, use one of the herbal teas recommended above to make the compresses.
- If pain or blurred vision occurs, seek medical attention immediately. These can be signs of a more serious problem.
- If your eyelids are swollen, try peeling and grating a fresh potato, wrapping it with gauze, and placing it over your eyes. This acts as an astringent and has a healing effect.

### Considerations

- Pinkeye associated with hay fever can be treated with prescription drops containing steroids.
- A bacterial infection is typically treated with antibiotics if the eye does not improve within four days of using compresses and taking supplements.

### Corneal Ulcer

If the cornea—the membrane covering the front of the eye—is damaged, the eye becomes inflamed and vulnerable to infection that can result in ulceration. Damage may occur as a result of injury, a foreign body in the eye, or excessive or inappropriate wearing of contact lenses. The infections that can result in ulceration of the cornea may be caused by viruses, bacteria, or fungi.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for all eye disorders.
Vitamin C with bioflavonoids	6,000 mg daily, in divided doses.	A healing and antiviral substance.

### Recommendations

- If you suspect that a corneal ulcer may be developing, consult a physician immediately.

### Diabetic Retinopathy

Diabetes can cause retinopathy, a disorder in which some of the tiny capillaries that nourish the retina leak fluid or blood that can damage the rod and cone cells. New capillaries then begin to form in the injured area, and these also interfere with vision. Problems with the blood vessels can cause retinal hemorrhage (leakage from the vessels that transmit the fluids of the eye), microaneurysms (abnormally enlarged blood vessels in the eye), retinal edema (the accumulation of fluid in the eye), and, perhaps, loss of vision.

Diabetic retinopathy affects nearly every patient with type 1 or type 2 diabetes, and causes blindness among about 12,000 to 14,000 persons each year.

Unfortunately, there are few warning signs; the condition usually causes no symptoms until it is relatively advanced.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Shark cartilage	1 gm per 15 lbs of body weight daily, divided into 3 doses. If you cannot tolerate taking it orally, it can be administered rectally in a retention enema.	To prevent or possibly halt the progression of the condition by inhibiting the growth of tiny blood vessels in the eye that contribute to vision loss.
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for all eye disorders.

### Recommendations

- See DIABETES in Part Two and follow the dietary recommendations.
- If you have diabetes, make sure to have an annual eye examination to detect the onset of retinopathy. If the disorder is detected in time, laser surgery to seal leaking blood vessels can help stem vision loss.

### Considerations

- One study reported that people with insulin-dependent (type 1) diabetes who controlled their blood sugar levels tightly were able to slow the pace of retinopathy by about 60 percent.
- Researchers at the National Eye Institute induced a condition resembling diabetic retinopathy in dogs and then treated the animals with an experimental drug called sorbinil, which suppresses the action of an enzyme that converts excess sugar in the blood into an alcohol that seems to damage the retinal blood vessels. In this study, the sorbinil treatment totally blocked the progression of retinopathy.

## Dimness or Loss of Vision

Many different conditions can lead to a dimming or loss of vision. Among the most common are cataracts, glaucoma, and diabetic retinopathy. Macular degeneration and retinitis pigmentosa are less common, but do occur with some frequency. There are others as well:

- *Retinal detachment.* This causes a loss of vision often compared to having a curtain drawn across one's field of vision. Loss of vision may be preceded by a shower of "sparks" or lightning-like flashes of light, or by a dramatic increase in the number of black floaters in the field of vision. (See FLOATERS in this section.)
- *Uveitis.* This is an inflammation in the middle layer of the eye, which consists of the iris, the ciliary body, and the choroid. In many cases it is caused by an underlying systemic disease such as rheumatoid arthritis or infection. Pain and redness may be present, but often symptoms consist primarily of diminished or hazy vision. Another condition that can lead to loss of vision is blockage of a blood vessel serving the retina, usually by a blood clot. Visual loss is generally sudden if the affected blood vessel is an artery, but it may be less rapid if the blocked vessel is a vein. Usually only one eye is affected.
- *Inflammation of the optic nerve.* This inflammation is another possible cause of vision loss. Such inflammation may occur as a result of a systemic illness or infection, but in many cases the cause cannot be determined. This condition usually affects only one eye but it may affect both, causing varying degrees of vision loss over the course of a few days.
- *Toxic amblyopia.* This is a condition in which a toxic reaction damages the optic nerve, creating a small "hole" in the field of vision that enlarges over a period of time and may even lead to blindness. In most cases, both eyes are affected. This disorder is most common in people who smoke—in fact, it is sometimes referred to as tobacco amblyopia—and is seen most often in pipe smokers. It may also occur in those who consume excessive amounts of alcohol or who come into contact with lead, methanol, chloramphenicol, digitalis, ethambutol, and other chemicals.

### Recommendations

- If any of the above symptoms develop, consult a physician. For most of these conditions, prompt treatment may help to preserve sight or at least slow vision loss.
- Do not smoke, and avoid those who do. Even people who have already developed toxic amblyopia as a result of smoking can have their vision improve if they quit.

### Considerations

- The syndromes discussed here are usually painless. Physical discomfort is not a reliable indicator of visual

health. Regular ophthalmic examinations are recommended for everyone over thirty-five.

See also CATARACTS; DIABETIC RETINOPATHY; GLAUCOMA; MACULAR DEGENERATION; and RETINITIS PIGMENTOSA in this section.

## Dry Eyes

Dry eyes occur when the tear ducts do not produce enough fluid (tears) to keep the eyes moist, resulting in burning and irritation. This problem is more common in women than in men, and women's susceptibility increases after menopause.

Contact lens wearers are particularly prone to developing dry eye problems. Dry eyes generally stem from a lack of vitamin A, and are more likely to affect people over the age of sixty-five. Some drugs are known to inhibit tear production or change the composition of tears, including antihistamines, decongestants, and various drugs used to control Parkinson's disease and high blood pressure.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Primrose oil	1,000 mg 2–3 times daily.	A source of essential fatty acids.
Vitamin A ointment and/or vitamin A	As directed on label. 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Beneficial for eyes that seem dry and scratchy. Tears contain vitamin A.
plus carotenoid complex with lutein and zeaxanthin	As directed on label.	Needed for all eye disorders.

### Recommendations

- Drink at least ten glasses (80 ounces) of water every day. Steam-distilled water is best.
- See your health care provider if you have dry eyes. It may be a symptom of a more serious condition, such as rheumatoid arthritis or lupus. Also, constant irritation to the eye as a result of dryness can result in injury and damage.
- If your tear ducts are swollen, add more calcium to your diet and avoid processed foods.
- Artificial tears are safe and effective for keeping the eyes moist. Choose a product that is preservative-free, such as Cellufresh from Allergan or Tears Naturale from Alcon.
- Similasan Dry Eye Relief is a soothing homeopathic eye-drop product containing *Belladonna*, *Euphrasia*, and *Mercurius sublimatus*.
- Use a humidifier to add moisture to the dry air.
- Wear wraparound glasses on windy days.

- Avoid cigarette smoke and other types of smoke.
- Avoid products that claim they can “get the red out.” Some over-the-counter drops used to relieve red and sore eyes contain vasoconstrictors that can further dry your eyes, especially if used for an extended period of time.
- Limit your use of hair dryers. Allow your hair to dry naturally. Shield your eyes from direct heat blasts from hair dryers and other heat sources.

### Considerations

- In some cases, an ophthalmologist may perform a procedure to close the internal tear ducts, through which some tears drain from the eyes into the nose, to conserve tears and keep the eyes moist.
- Contact lenses made of a material called sulfoxide hydrogel may hold promise for people who currently cannot wear contact lenses because they are prone to dry eyes or frequent eye infections. The new material holds more water than current lens materials. It is currently being tested in clinical trials.
- Sjögren’s syndrome is a disorder that can cause dryness in the eyes.

### Eyestrain

Eyestrain causes a dull, aching sensation around and behind the eyes that can expand into a generalized headache. It may feel painful or fatiguing to focus the eyes. Eyestrain is commonly a result of overuse of the eyes for activities requiring close, precise focus, such as reading or computer work. People in certain occupations, such as jewelers, are particularly prone to eyestrain. Wearing improper lenses (whether the wrong prescription or an incorrectly made pair of glasses) can also cause eyestrain.

Acute closed-angle glaucoma can cause pain around the eyes as well, but the sensation is usually sharp and throbbing and accompanied by other symptoms. Most other eye disorders, even serious ones, cause little or no discomfort.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for all eye disorders.
Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin)	50–100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 25 mg 3 times daily.	Improves intraocular cellular metabolism. Helps to alleviate eye fatigue.

### Herbs

- Taking eyebright in capsule or tea form can be helpful. Eyebright tea can also be used to rinse the eyes.
- Goldenseal can be used as an alternative or in addition to eyebright.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor’s supervision.

### Recommendations

- Lie down, close your eyes, and place a cold compress over your eyes. Relax for ten minutes or longer, replacing the compress with a fresh one as necessary. This often helps to alleviate discomfort. You can also try using a wet tea bag or cold cucumber slices. The cold shrinks the swollen blood vessels.
- Take measures to avoid eyestrain. Try to vary your tasks so that your eyes change focusing distance every so often. When doing close work for prolonged periods, take periodic “focus breaks.” Every twenty minutes or so, look away from your work and focus your eyes on something in the distance for a minute or two.
- If you work with computers for long periods of time, take a five- or ten-minute break every hour. Focus on distant objects as often as possible. Position the computer monitor to reduce glare from all light sources. Try a glare-reduction filter that carries a seal of approval by the American Optometric Association. If possible, use an active-matrix LCD flat display, which is sharper and brighter than a typical CRT-based display.
- Get sufficient sleep. Fatigue promotes eyestrain.
- If pain is severe and comes on suddenly, and especially if vision is disturbed or the pain is accompanied by nausea and vomiting, seek professional help at once. This may be a sign of an acute glaucoma attack. (See GLAUCOMA in Part Two.)

### Floaters

Bits of cellular debris floating within the eye are commonly referred to as floaters. Because these floaters cast shadows over the retina, the individual sees small specks that move slowly before the eyes, especially in certain lights and against certain backgrounds. Older adults and nearsighted people are most likely to complain of floaters. Most floaters are considered benign, but seek medical attention anyway if you get them.

Floaters that coalesce into long, stringy strands may be caused by a disorder called fibrillar degeneration of the vit-

reous. This condition is usually caused by excessive exposure to sunlight.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Apple pectin	As directed on label.	Chelates heavy metals that can circulate through the eyes.
L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Chelates heavy metals. (See AMINO ACIDS in Part One.)
Oxy-5000 Forte from American Biologics	As directed on label.	A potent nutritional antioxidant for health and stress that destroys free radicals.
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for all eye disorders.

### Recommendations

It is normal to see a few floaters at times, but if you suddenly see a large number of them, consult an ophthalmologist. This may be a sign of developing retinal detachment. Delaying treatment can result in a detached retina requiring lengthy surgery.

### Glaucoma

Glaucoma is a serious eye disease marked by an increase in the pressure that the fluids within the eyeball exert on other parts of the eye. If this pressure is unrelieved, it may harm the retina and ultimately damage the optic nerve, resulting in vision loss, even blindness. It is most common in people over thirty-five, in nearsighted people, and in people with high blood pressure. See GLAUCOMA in Part Two for a more complete discussion of this condition.

### Hyperopia

See under BLURRED VISION in this section.

### Itchy or Tired Eyes

Itchy or tired eyes can be the result of many different factors, including allergies, eyestrain, fatigue, infection (conjunctivitis), and an inadequate supply of oxygen to the cornea and outer eye tissues.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for all eye disorders.
Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin)	50–100 mg daily. 50 mg daily.	Improves intraocular cellular metabolism. Helps improve oxygenation of eye tissues.

### Recommendations

For quick relief of occasional itchy or tired eyes, close your eyes and apply a cold compress. Leave the compress in place for ten minutes. Compresses can be used as often as necessary.

### Considerations

- If the problem is a recurrent one, allergies are a likely culprit. (See ALLERGIES in Part Two.)
- If itching and aching are accompanied by a bright pink or red color and thick secretions, you may have conjunctivitis. (See CONJUNCTIVITIS in this section.)
- If itchy and tired eyes persist over a long period of time, there may be an underlying nutritional cause. Supplement your diet with the B vitamins as described under Nutrients, above.

### Macular Degeneration

This disorder causes a progressive visual loss due to degeneration of the macula, the portion of the retina responsible for fine vision. It is basically caused by hardening of the arteries that nourish the retina, depriving the tissue of oxygen and nutrients. Macular degeneration is the leading cause of severe visual loss in the United States and Europe in people over fifty-five years old. This loss of vision may appear suddenly or it may progress slowly. Usually peripheral and color vision are unaffected.

There are two types of macular degeneration: atrophic (or “dry”), which is the more common (90 percent of cases); and exudative (“wet”). In the latter type, the degeneration of the macula is accompanied by hemorrhaging or leaking of fluid from a network of tiny blood vessels that develop under the center of the retina. This results in scarring and loss of vision. In both cases, because the macula alone is affected, central vision is lost but total blindness is avoided. Some side vision usually is retained.

Macular degeneration is probably the result of free radical damage similar to the type of damage that induces cataracts. Factors that predispose a person to developing macular degeneration include aging, atherosclerosis, hy-

pertension, and environmental toxins. Heredity may play a role as well.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily.  As directed on label.	Powerful antioxidants protect against macular degeneration.
Grape seed extract	As directed on label.	A powerful antioxidant that protects against free radical damage.
Selenium	400 mcg daily.	An important antioxidant.
Shark cartilage	1 gm per 15 lbs of body weight daily, divided into 3 doses. If you cannot tolerate taking it orally, it can be administered rectally in a retention enema.	To prevent and possibly halt the progression of exudative macular degeneration by inhibiting the growth of tiny blood vessels in the eye that contribute to vision loss.
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Potent antioxidant and important in eye function.  Use an emulsion form for easier assimilation and greater safety at high doses. The macula selectively concentrates zeaxanthin and lutein to levels over 1,000 times greater than those found in any other body tissues. The macula places zeaxanthin in its center, where the greatest protection is required and which is the last to degenerate.
Vitamin C plus bioflavonoids	1,000–2,500 mg 4 times daily.	An important antioxidant and a necessary free radical destroyer. Prevents eye damage; also relieves pressure from cataracts.
Vitamin E	200 IU daily.	An important antioxidant and free radical destroyer. Use d-alpha-tocopherol form.
Zinc  plus copper	45–80 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Deficiency has been linked to eye disorders. Use zinc picolinate form. Needed to balance with zinc.

### Herbs

□ Taking bilberry extract (160 milligrams and up daily) and eating fresh blueberries (8 to 10 ounces per day), plus taking ginkgo biloba extract and zinc, can help halt the loss of vision. Blueberries are rich in valuable bioflavonoids. Treatment at an early stage is most effective.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

### Recommendations

□ Increase your consumption of green, leafy vegetables—especially collard greens, kale, mustard greens, spinach,

and turnip greens—legumes; yellow vegetables; flavonoid-rich berries—such as blueberries and blackberries—cherries; and foods rich in vitamins E and C, such as raw fruits and vegetables.

□ Avoid alcohol, cigarette smoke, all sugars, saturated fats, and foods containing fats and oils that have been subjected to heat and/or exposed to the air, such as fried foods, hamburgers, luncheon meats, and roasted nuts.

□ Broccoli contains sulforaphane, which may help prevent macular degeneration, according to Peter Gehlbach, assistant professor of ophthalmology at Johns Hopkins University School of Medicine. Some doctors recommend as many as five servings of broccoli a day, along with the green vegetables listed above.

□ Reduce dietary fat to less than 24 grams per day and trans fats to less than ½ gram per day. Eat more nuts and fish (to increase omega-3s) and less animal fat in general. Eating fish one to three times a week supplied omega-3 fats and was associated with a 40 to 75 percent reduction in macular degeneration. No association was found for butter, margarine, or nuts. Another study showed that eating fish just once a week reduced the chance of getting macular degeneration by 50 percent.

### Considerations

□ In a study reported in the *Archives of Ophthalmology*, ophthalmologists at Louisiana State University Medical School tested the effects of supplemental zinc on people suffering from macular degeneration. Half the group received a 100-milligram tablet of zinc twice a day; the other half received a placebo. After twelve to twenty-four months, the zinc group showed significantly less deterioration than the placebo group.

□ In general, eating a low-glycemic-load, healthy diet (fruit, vegetables, whole grains) was related to a 53 percent lower risk of macular degeneration. The risk was even lower—77 percent—when vitamin C supplements were used.

□ Eating a diet rich in sugars and refined grains increases the risk of developing a worse form of macular degeneration. Specifically, retinal pigment abnormalities, characteristics of the condition, were associated with the high-glycemic-load diet but not the total carbohydrate dietary intake.

□ Antioxidant nutrients are known to protect against macular degeneration, but two in particular—lutein and zeaxanthin—are believed to play critical roles in the prevention of the disease. A study by Johanna M. Seddon, M.D., of the Massachusetts Eye and Ear Infirmary in Boston, compared the diets of 356 patients with macular degeneration with 520 patients with other eye diseases. The data revealed that beta-carotene was not especially effective, but that lutein and zeaxanthin were. Some foods that contain lutein and zeaxanthin are collard greens, kale, mustard greens, and turnip greens. In a subsequent study, the risk of macular degeneration was reduced 65 percent

with high amounts of lutein and zeaxanthin. Also, zinc was found to be important to lower risk, but at levels of about 13 milligrams per day. This was confirmed in the 2007 major eye and vitamin study in the United States, called AREDS (Age-Related Eye Disease Study). However, other studies have not shown any benefit from antioxidant supplementation to prevent macular degeneration. In a compilation of nine studies including nearly 150,000 people, no effect was seen for the following: vitamins A, C, and E, zinc, lutein, zeaxanthin, and alpha- and beta-carotene. Similarly, taking 6 milligrams of lutein with a vitamin and mineral supplement did not reduce the risk of getting macular degeneration.

The FDA has approved the drug pegaptanib sodium (Macugen). This drug is particularly suited for treatment of wet age-related macular degeneration. The drug must be administered by injection. Macugen was co-developed by Eyetech Pharmaceuticals and Pfizer, Inc.

Coenzyme Q<sub>10</sub> improves retinal function in patients with age-related macular degeneration, according to Dr. Janos Feher, a researcher at the University of Rome, Italy. A small study, reported in the journal *Ophthalmologica*, compared a group getting a Coenzyme Q<sub>10</sub> preparation to a control group getting vitamin E alone. The subjects who received the Coenzyme Q<sub>10</sub> mixture showed slight improvement or no degeneration over two years, while the control group continued to slowly decline.

### Mucus in the Eyes

A number of different conditions can cause mucus to accumulate in the eyes, such as allergies, head colds, and infection (conjunctivitis).

### Herbs

Gently and very carefully wash each eye with diluted alcohol-free goldenseal extract or cool goldenseal tea.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

### Myopia

See under **BLURRED VISION** in this section.

### Photophobia

Photophobia is an abnormal inability of the eyes to tolerate light; exposure to light hurts the eyes. It is more common in people with light-colored eyes, and usually is not a serious problem. In some cases, however, it may be associated with irritation or damage to the cornea, acute glaucoma, or uveitis. It can also be a symptom of developing measles.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for all eye disorders.

### Considerations

- See also **GLAUCOMA** and/or **MEASLES**, both in Part Two.
- See also the discussion of uveitis under **DIMNESS OR LOSS OF VISION** in this section.

### Pinkeye

See **CONJUNCTIVITIS** in this section.

### Retinal Edema

See **DIABETIC RETINOPATHY** in this section.

### Retinal Hemorrhage

See **DIABETIC RETINOPATHY** in this section.

### Retinitis Pigmentosa

Retinitis pigmentosa is a group of inherited diseases that affects approximately 100,000 people in the United States. The retina is the innermost layer that lines the eyeball. It contains photoreceptor cells that are directly connected to the brain by the optic nerve. Retinitis pigmentosa causes these photoreceptor cells to degenerate over time. The first symptom usually is loss of night vision, beginning in adolescence or young adulthood. This is followed by loss of peripheral vision and, ultimately, blindness, which sets in anywhere between the ages of thirty and eighty. Usher syndrome is a variation of retinitis pigmentosa that also impairs hearing. (See **HEARING LOSS** in Part Two.)

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Coenzyme Q <sub>10</sub>	60 mg daily.	A powerful antioxidant that can improve retinitis pigmentosa symptoms.
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Helpful for all eye disorders. Use an emulsion form for easier assimilation and greater safety at higher doses.

**Recommendations**

Get a thorough eye evaluation by an eye care professional who specializes in retinitis pigmentosa. An accurate diagnosis sometimes can be difficult to obtain, but it is getting better through increased awareness and more sophisticated technology.

**Considerations**

High doses of vitamin A may be able to slow the loss of remaining eyesight by about 20 percent per year in some cases, according to a study led by Eliot Berson, M.D., professor of ophthalmology at Harvard Medical School. At the same time, the study found that high doses of supplemental vitamin E (400 international units or more daily) can be detrimental to people with retinitis pigmentosa.

*Caution:* Check with your eye doctor before exceeding the DRI for vitamin A.

Retinal cell transplantation and gene therapy are still in the preliminary stages of research, but both may prove to be effective in treating retinitis pigmentosa. Photoreceptor cells have been transplanted successfully into the retinas of animals. The Foundation Fighting Blindness reports that it remains to be seen whether or not this procedure will be effective with retinitis pigmentosa-type disorders. Meanwhile, researchers have identified many of the mutated genes that contribute to the condition. It may become possible in the future to use gene therapy—to replace defective genes with normal ones—as a treatment for the disorder.

More information on this disorder can be obtained by calling the Foundation Fighting Blindness. (*See Health and Medical Organizations in the Appendix.*)

**Scotoma**

A scotoma is a blind spot in the visual field. Unless a scotoma is large or is located in the center of the field of vision, it may not be noticed. However, a professional can detect scotomas with a type of examination called a visual field test.

Scotomas are considered a symptom of disease, not a disease in themselves. They may be a sign of a problem with the retina or damage to the optic nerve, such as that caused by glaucoma.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily for 2 months. If you are pregnant, do not exceed 10,000 IU daily.  As directed on label.	Essential for eye health. Use emulsion form for easier assimilation and greater safety at higher doses.

**Shingles (Herpes Zoster)**

Shingles is an infection caused by the varicella-zoster virus, a member of the herpes family and the same virus that causes chickenpox. The characteristic symptom is a rash of painful blisters. Shingles can appear anywhere on the body.

If shingles occurs on the forehead near the eyes or on the tip of the nose, the eyes are likely to become involved, and damage to the cornea can occur. Taking the proper supplements when blisters first appear can make the blisters dry up quickly, and the discomfort may be alleviated.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
L-lysine	1,000 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Fights herpesviruses. ( <i>See AMINO ACIDS in Part One.</i> ) <i>Caution:</i> Do not take lysine longer than six months at a time.
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.  As directed on label.	Needed for all eye disorders.
Vitamin B <sub>12</sub>	1,000–2,000 mcg daily, on an empty stomach.	Prevents damage to the nerves in the eyes. Use a lozenge or sublingual form.
Vitamin C with bioflavonoids	2,000–6,000 mg daily and up.	An antiviral and immune system enhancer.
Vitamin E	200 IU daily.	Helps to prevent scarring and tissue damage. Use d-alpha-tocopherol form.

**Recommendations**

- If shingles appear on the forehead near the eyes or on the tip of the nose, seek treatment from an ophthalmologist.
- Apply zinc oxide cream to the blisters and the affected area. After the blisters have healed over, apply aloe vera gel and vitamin E to the area.

**Considerations**

- If zinc oxide, aloe vera gel, and/or vitamin E do not work to heal the blisters within three days, intravenous injections of large doses of vitamin C should provide relief almost immediately. Large intravenous doses of vitamin C can cause diarrhea. Let your doctor decide how much to give. The normal dose given is between 10 and 50 centigrams (a centigram is one-hundredth of a gram).
- See also SHINGLES in Part Two.*

## Stye

A stye is a bacterial infection within an oil gland on the edge of the eyelid. Because the tissues of the eye become inflamed from the infection, the stye takes on the appearance of a small pimple. This pimple gradually comes to a head, opens, and drains. Early treatment speeds the healing process and helps to avoid further complications.

### Herbs

Prepare raspberry leaf tea and use it as an eyewash to alleviate styes.

### Recommendations

Apply a hot compress to the affected area for ten minutes four to six times daily to help relieve discomfort and bring the stye to a head so that it can drain and healing can begin.

If you frequently suffer from styes, supplement your diet with vitamin A. Recurring styes are often a sign of vitamin A deficiency.

### Considerations

If a stye does not heal promptly, it may need to be drained. This is a procedure that must be done by a health care professional. Do not squeeze the lump or attempt to drain it at home. This can cause the infection to spread into the bloodstream, leading to systemic illness.

In severe and/or stubborn cases, treatment with antibiotics may be necessary.

### Thinning Eyelashes

Many problems can lead to a thinning or even the total loss of the eyelashes. Among these are allergies, especially contact allergies to eye makeup; the use of certain drugs; exposure to environmental toxins; hypothyroidism; eye surgery; a poor diet and/or nutritional deficiencies; and trauma.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Promotes healthy skin and hair. Needed for all eye disorders.
Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin) and vitamin B <sub>3</sub> (niacin) plus	50–100 mg daily. As directed on label. As directed on label.	The B vitamins help prevent loss of eyelashes.

brewer's yeast      2 tbsp daily

Can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue if any allergic symptoms occur.

### Recommendations

Gently rub vitamin E oil on your eyelashes and into your eyelids at bedtime. This helps to thicken the lashes and promote normal growth.

### Ulcerated Eye

See CORNEAL ULCER in this section.

### Ulcerated Eyelid

If an eyelid is scratched and the scratch becomes infected, an ulcerated area may develop. Ulcerated eyelids also can occur as a result of chronic blepharitis.

### Xerophthalmia

Xerophthalmia is an inflammation of the cornea that is associated with nutritional deficiency, especially a deficiency of vitamin A. The cornea becomes dry, and infection and/or ulceration may set in. Bitot's spots may appear, and night blindness may occur.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Vitamin A plus carotenoid complex with lutein and zeaxanthin	25,000 daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Specifically for dry eyes. Needed for all eye disorders.
Vitamin B <sub>6</sub> (pyridoxine) and vitamin C with bioflavonoids and zinc	50 mg daily. 2,000–14,000 mg daily, in divided doses. 50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Nutrients that work well together to heal dry eyes. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Considerations

See also BITOT'S SPOTS in this section.

### FABRY'S DISEASE

See under RARE DISORDERS.

### FATIGUE

See CHRONIC FATIGUE SYNDROME.

FEVER

A fever is an elevation in body temperature. Fever is not a disease, but a symptom that may indicate the presence of disease.

Normal body temperature ranges from 97°F to 99°F. It varies from individual to individual. Rectal temperature is usually about 1°F higher than oral temperature, and body temperature varies in the course of the day—it usually increases in the afternoon. Women have a higher temperature after ovulation than before ovulation.

One should not have undue concern unless body temperature rises above 102°F (103°F in children). Often, running a temperature is helpful to the body. This defense mechanism of the body acts to destroy harmful microbes. A part of the brain called the hypothalamus regulates body temperature by regulating heat loss, mainly from the skin.

When destructive microbes or tumor cells invade the body, the immune cells rushing to fight them release proteins that tell the hypothalamus to raise the temperature. Moderate temperatures (under 103°F for adults) encourage the body to manufacture more immune cells.

There are some situations, however, in which fever can cause problems. A high fever (104°F or higher) may pose a risk for people with cardiac problems, since it makes the heart beat faster and work harder, and can cause irregular heart rhythms, chest pain, or heart attack. Fever over 106°F, especially for prolonged periods, can cause dehydration and brain injury.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Inf-zyme Forte from American Biologics	As directed on label.	A balanced, potent enzyme complex that moderates the inflammatory response.
Vitamin A emulsion or capsules with carotenoids	As directed on label. Adults: 25,000 IU daily. If you are pregnant or nursing, do not exceed 10,000 IU daily. Children over 2 years: 1,000–10,000 IU daily.	Essential in immune system function. Needed to fight infection and to strengthen the immune system. Emulsion form is recommended because it enters the system more quickly.
<b>Important</b>		
Bio-Bifidus from American Biologics	As directed on label.	For bowel flora replacement to improve elimination and assimilation.
Free form amino acid (Amino Balance)	As directed on label 3 times daily, on an empty stomach. Take	A readily absorbed form of protein that helps repair tissue damaged by fever.

from Anabol Naturals or Amino Blend from Carlson Labs)	with 50 mg each of vitamins B <sub>6</sub> and C for better absorption.	
Taurine Plus from American Biologics	As directed on label.	An important antioxidant and immune regulator, necessary for white blood cell activation and neurological function. Use the sublingual form.
Vitamin C with bioflavonoids	5,000–20,000 daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	To flush out toxins and reduce fever. For a child, use calcium ascorbate form—it does not produce heavy diarrhea.
<b>Helpful</b>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic and powerful immunostimulant.
Royal jelly	As directed on label 3 times daily.	Has antifungal properties and improves adrenal function.
Spiru-tein from Nature's Plus	As directed on label, between meals.	A protein drink that contains all the amino acids, vitamins, and minerals needed for nourishment.

Herbs

- To bring a high fever down, use catnip tea enemas twice daily. These also relieve constipation and congestion, which keep fever up. (See ENEMAS in Part Three.)
- Catnip tea with dandelion and lobelia, taken in tea or extract form, is good for lowering fever. Lobelia can also be used on its own. Taking ½ teaspoon of lobelia extract or tincture every four hours helps to lower fever. If an upset stomach occurs, cut the dosage back to ¼ teaspoon.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Elderberry tea and hot steam baths may help.
- You can make a poultice from echinacea root to lower fever. (See USING A POULTICE in Part Three.)

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- A combination of hyssop, licorice root, thyme, and yarrow tea can help a fever.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Other beneficial herbs include blackthorn, echinacea, fenugreek seed, feverfew, ginger, and poke root.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to

ragweed. Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding. Do not use feverfew during pregnancy.

### Recommendations

- Replace fluid loss by drinking as much quality water as you can. This will also help to bring down body temperature.
- Get plenty of rest.
- Avoid radical changes in atmospheric temperature.
- Drink plenty of distilled water, broths, and juices, but avoid solid food until the fever breaks.
- While feverish, avoid taking any supplements that contain iron or zinc. When an infection is present, the body attempts to “hide” iron in the tissues in an attempt to keep the infecting organism from using it for nourishment. Taking a supplement containing iron therefore causes undue strain on a body that is fighting an infection. Zinc is not properly absorbed while a fever is present.
- Take cool sponge baths. Do not use rubbing alcohol to cool off, however; it gives off noxious fumes.
- To induce sweating, which may shorten the length of the fever, wrap up in a warm blanket or robe for twenty minutes. Replace lost fluids as soon as you can.
- Belladonna* and *Aconite napellus* are homeopathic remedies used to reduce fever. Use a 123 strength and dilute 5 drops of one or both of these remedies in a glass of water. Take this every half-hour or as needed.
- It should be noted that lowering a fever is not always the best thing to do for an otherwise healthy adult. As long as a fever does not get too high (above 102°F), let it run its course. It helps to fight infection and eliminate toxins.
- If body temperature rises above 102°F (103°F in a child), take measures to reduce the fever, and consult your health care provider. This can be a sign of a serious condition.
- If a baby of three months or under has a temperature of 103°F or higher, take the child to a doctor immediately.
- In a child of any age, fever accompanied by a stiff neck, swelling of the throat, or disorientation needs immediate attention from a physician, as these symptoms may indicate meningitis.
- See a health care professional immediately if you develop a fever associated with any of the following:
  - Frequent urination, a burning sensation while urinating, or blood in the urine.
  - Pain concentrated in one area of the abdomen.
  - Shaking chills or alternating chills and sweats.
  - Severe headache and vomiting.

- Profuse watery diarrhea lasting more than twenty-four hours.
  - Swollen glands or rashes.
- Never give aspirin to a child with a fever. (See REYE'S SYNDROME in Part Two.)

### Considerations

- Lingering or recurring flulike symptoms can be associated with chronic fatigue syndrome, diabetes (especially in children), hepatitis, Lyme disease, or mononucleosis (especially in adolescents). (See CHRONIC FATIGUE SYNDROME; DIABETES; HEPATITIS; LYME DISEASE; and/or MONONUCLEOSIS in Part Two.)
- Vigorous exercise, in which the muscles generate heat faster than the body can dissipate it, can cause a temporary rise in temperature.

### FIBROCYSTIC BREASTS

Fibrocystic breast disease is a noncancerous condition characterized by the presence of cysts, or lumps, in the breasts. This condition is also known as fibrocystic changes, chronic cystic mastitis, mammary dysphasia, and—although it is not actually a disease—fibrocystic breast disease. It is caused by monthly changes in levels of estrogen and progesterone. It affects more than half of all women of childbearing age, most often those between the ages of thirty and fifty.

Fibrocystic breasts are characterized by the presence of round lumps, or cysts, that move freely and are either firm or soft. Symptoms include tenderness and lumpiness in the breasts. The discomfort is usually most pronounced before menstruation.

Normally, fluids from breast tissues are collected and transported out of the breasts by means of the lymphatic system. However, if there is more fluid than the system can cope with, small spaces in the breast may fill with fluid. Fibrous tissue surrounds them and thickens like a scar, forming cysts. Many breast cysts swell before and during menstruation, and the resulting pressure can cause a feeling of fullness, a dull ache, increased sensitivity, or a burning sensation. Some women also experience significant pain.

Breast cysts may change in size, but they are benign. A cyst is tender and moves freely—it feels like an eyeball behind the lid. In contrast, a cancerous growth usually does not move freely, is most often not tender, and does not go away.

Most cysts are harmless. In fact, the normal structure of the breasts has a lumpy texture. However, this does not mean that any lumps should be disregarded. Each woman should be familiar with the normal feel of and cyclical changes in her breasts so that she can easily detect any new lumps. Ideally, she should check her breasts weekly, and if any new lumps become apparent between menstrual cycles, she should consult her health care practitioner promptly.

A physician can diagnose fibrocystic breasts with a sim-

ple office procedure. Using a fine needle, he or she attempts to remove fluid from the lump. If fluid is present, the lump is a cyst. A biopsy may be recommended to determine the risk, if any, of developing cancer. Routine mammograms are recommended as well after the age of thirty-five if you have fibrocystic breasts.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Powerful antioxidants that help to remove toxins from the body, boost the immune system, and improve overall physical and mental processes.
Kelp	1,500–2,000 mg daily, in divided doses.	A rich source of iodine. Iodine deficiency has been linked to fibrocystic breasts.
Primrose oil	1,500 mg daily.	May reduce the size of the lumps.
Vitamin E	200 IU daily.	Protects the breast tissue because of its antioxidant ability. Use d-alpha-tocopherol form.
<b>Very Important</b>		
Vitamin A  plus carotenoid complex with beta-carotene	15,000 IU daily, with meals. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Needed for the ductal system of the breast.  Antioxidants and precursors of vitamin A.
Vitamin B complex  plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	B-complex vitamins are important for all enzyme systems in the body.  Needed for proper fluid balance and hormone regulation.
<b>Important</b>		
Vitamin C with bioflavonoids	2,000–4,000 mg daily, in divided doses.	Needed for proper immune function, tissue repair, and adrenal hormone balance.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	For repair of tissues and immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
<b>Helpful</b>		
Multimineral complex	As directed on label.	Balanced body minerals are important. Take one with iron if you are still menstruating.
Proteolytic enzymes  plus bromelain	As directed on label. Take with meals and between meals. As directed on label.	To reduce inflammation and soreness due to swelling.

### Herbs

The following herbs are good for fibrocystic breasts: echinacea, goldenseal, mullein, pau d'arco, red clover, squaw vine, and turmeric (curcumin).

**Cautions:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Use poke root or sage poultices to relieve breast inflammation and soreness. (See USING A POULTICE in Part Three.)

**Cautions:** Poke root is recommended for external use only. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

### Recommendations

Eat a low-fat, high-fiber diet. Eat more raw foods, including seeds, nuts, and grains. Be sure nuts have not been subjected to heat. Although some newer data does not confirm that a low-fat diet rich in fruits and vegetables is beneficial for someone with fibrocystic breast disease, such a diet is necessary for optimal health and maintaining a healthy body weight. The women in the study followed a diet where dietary fat was 20 percent of total calories; however, a diet with 25 to 35 percent fat is currently recommended. Include in your diet three or more servings daily of apples, bananas, grapes, grapefruit, raw nuts, seeds, fresh vegetables, and yogurt. Whole grains and beans should also be important parts of the diet.

Include in your diet foods that are high in germanium, such as garlic, shiitake mushrooms, and onions. Germanium helps to improve tissue oxygenation at the cellular level.

Do not consume any coffee, tea (except herbal teas), cola drinks, or chocolate. These foods contain caffeine, which has been implicated in fibrocystic breasts. However, newer data published in the *Archives of Internal Medicine* from a rigorous review of the published literature showed there was no association between caffeine consumption and fibrocystic breast disease. Talk to your doctor.

### Considerations

Good results have been achieved using primrose oil to reduce the size of cysts.

In one study, a diet that included one soy food a day was shown to reduce the development of fibrocystic disease.

The drug danazol (Danocrine), a hormone, acts through the pituitary gland, reducing the function of the ovaries. This in turn decreases the amount of estrogen in the breast, shrinking the lumps. Danocrine is not effective for all women, but many notice results within a few weeks. Many report less pain or tenderness. The drug may have some

unpleasant side effects and it should be used only if the suggestions above fail to give the desired results.

Thyroid function is important in fibrocystic breasts; iodine deficiency can cause an underactive thyroid and has also been linked to fibrocystic changes. (See HYPOTHYROIDISM in Part Two.) Other factors include hormonal imbalance and abnormal production of breast milk brought about by high levels of the hormone estrogen.

The National Cancer Institute recommends that all women examine their own breasts once a month. Self-examination should be done five to ten days after menstruation, after all swelling has subsided. Postmenopausal women should conduct a self-examination on the same date every month.

## FIBROIDS, UTERINE

Uterine fibroids (also called leiomyomas or myomas) are benign growths that can form on the interior muscular wall as well as the exterior of the uterus. These tumors can be microscopic to several pounds in size. The disorder involves not only the uterus but sometimes also the cervix. The term *fibroid* may be somewhat misleading because the tumor cells are not fibrous. They are abnormal muscle cells, and their position within the uterus determines what they are called—submucosal, intramural, or subserosal. Fibroids attached to the uterus by a stalk are referred to as pedunculated.

It is estimated that 20 to 50 percent of women of reproductive age have fibroids, although not all are diagnosed. In more than 99 percent of fibroid cases, the tumors are benign; they are not associated with cancer and do not increase a woman's risk for uterine cancer. For reasons not yet understood, they tend to form during a woman's late thirties and early forties, and then shrink after menopause. This would seem to suggest that estrogen is involved in the process. However, while all women produce estrogen, only some develop fibroid tumors. The presence of fibroid tumors does seem to be genetically linked (they are known to run in families). African-American women are over two to five times more likely to develop fibroids than women of other ethnic backgrounds.

Most women who have fibroid tumors never even know it, unless they are discovered during the course of a routine pelvic examination. In roughly half of all cases, fibroid tumors cause no symptoms at all. In other cases, however, these growths can cause abnormally heavy and frequent menstrual periods. Other possible signs and symptoms include anemia, bleeding between periods, fatigue and weakness as a result of blood loss, increased vaginal discharge, and painful sexual intercourse or bleeding after intercourse.

Depending upon their precise location, fibroids can cause pain in the legs, back, and/or pelvis, and exert pressure upon the bowels or the bladder, or even block the urethra and create a kidney obstruction.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Coenzyme Q <sub>10</sub>	30 mg daily.	Promotes immune function and tissue oxygenation.
Floradix Iron + Herbs from Salus Haus	As directed on label. Do not take at the same time as vitamin E; iron depletes vitamin E in the body.	To supply iron in easily assimilable natural formula. Women with heavy menstrual flow as a result of fibroids are often anemic.
Garlic (Kyolic from Wakunaga)	As directed on label.	Powerful immune stimulant and antioxidant. Inhibits tumor growth.
L-arginine  and L-lysine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. 500 mg daily, on an empty stomach.	Enhances immune function and may retard tumor growth. (See AMINO ACIDS in Part One.)  Needed to balance with arginine.
Maitake extract and/or shiitake extract	As directed on label. As directed on label.	To strengthen the body and improve overall health; have potent immunostimulant properties that inhibit tumor growth.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Important in immune function and to promote tissue repair. Use emulsion form for easier assimilation and greater safety at higher doses.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Promotes immune function and acts as an antioxidant.
Zinc  plus copper	30–80 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Needed for a healthy immune system.  Needed to balance with zinc.

## Herbs

Dandelion root, milk thistle, scutellaria (also known as Chinese skullcap) root, and turmeric rhizome are all powerful antioxidants that support the liver while promoting the elimination of toxins.

Green tea is a powerful antioxidant.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Red clover and burdock root both aid in cleansing the bloodstream.

## Recommendations

If you have unpleasant symptoms such as those outlined in this section, or if menstrual bleeding is so heavy

that you saturate a sanitary pad or tampon more often than once an hour, consult your health care practitioner.

☐ If a fibroid is found, do not take oral contraceptives with a high estrogen content. High-estrogen birth control pills may stimulate the growth of fibroid tumors. Consider other forms of contraception, such as condoms and foam, a diaphragm, or a cervical cap.

### Considerations

☐ Fibroids are almost never malignant, so treatment is not usually required as long as they remain relatively small and do not produce unpleasant symptoms.

☐ Women with fibroids may have higher levels of human growth hormone than other women.

☐ A woman's chance of developing fibroids may be decreased if she avoids the use of oral contraceptives.

☐ In the past, it was a matter of general practice to perform surgery to remove fibroids if they grew to a point that the uterus was enlarged to the same extent it would be in a twelfth-week pregnancy. Increasingly, however, physicians are becoming more reluctant to remove these tumors based solely upon the "twelve-week rule" unless they are causing medical problems for the patient. Since these tumors usually shrink with the onset of menopause, the problem may well take care of itself over time.

☐ In the past, the conventional treatment for uterine fibroids was removal of the uterus (hysterectomy). Today, an alternative to hysterectomy is a procedure known as myomectomy. This operation removes the fibroids, but leaves the uterus intact. This is an attractive alternative for a woman who wishes to bear children in the future, although it can be performed on any woman, regardless of age. Myomectomy is a more exacting surgery and places greater demands on the woman during recovery. There is also a slightly higher chance of complications with myomectomy than with hysterectomy, and the results are not always permanent. There is a good chance that new tumors will form later, although they probably will not grow as large as the original fibroid tumors. If fibroids recur and cause symptoms, a repeat myomectomy can be performed.

☐ Laparoscopic myolysis is a procedure that may be recommended for the treatment of larger fibroids. In this technique, the surgeon uses a laser or electric current, delivered by means of special needles, to burn the fibroid and shrink it. This can be done on an outpatient basis.

☐ Uterine fibroid embolization (UFE) is a technique that involves making a tiny incision in the groin and placing a catheter into the femoral artery. The catheter is then guided up into the blood vessels that supply the fibroid. The idea is to cut off the blood supply to the fibroid, thus making it shrink. This technique is relatively new. Certain risks and side effects should be discussed with your doctor if you are considering this path.

☐ Hysteroscopic resection can be used to remove uterine fibroids. In this procedure, a surgical instrument is inserted through the vagina into the uterus, the fibroids are removed vaginally, and the remaining area is cauterized. This can be performed on an outpatient basis.

☐ Any woman pondering a hysterectomy should give the matter close and careful consideration, and should ask her physician about less radical ways to treat fibroids. There are alternative procedures that may be suitable for some women. More than 600,000 hysterectomies are performed each year in the United States, many of them unnecessary. (See HYSTERECTOMY-RELATED PROBLEMS in Part Two.)

### FIBROMYALGIA SYNDROME

Fibromyalgia syndrome (FMS) is a rheumatic disorder characterized by chronic achy muscular pain that has no obvious physical cause. It most commonly affects the lower back, the neck, the shoulders, the back of the head, the upper chest, and/or the thighs, although any area or areas of the body may be involved. The pain is usually described as burning, throbbing, shooting, and stabbing. The pain and stiffness are often greater in the morning than at other times of day, and may be accompanied by chronic headaches, strange sensations in the skin, insomnia, irritable bowel syndrome, and temporomandibular joint syndrome (TMJ). Other symptoms often experienced by people with fibromyalgia include premenstrual syndrome, painful periods, anxiety, palpitations, memory impairment, irritable bladder, skin sensitivities, dry eyes and mouth, a need for frequent changes in eyeglass prescription, dizziness, and impaired coordination. Such activities as lifting and climbing stairs are often very difficult and painful. Depression often accompanies this disorder, and stress may trigger the development of problems similar to those associated with cardiovascular disease and adrenal gland disorders.

Because the immune system is typically compromised in this disorder, opportunistic viral and bacterial infections are common as well.

The most distinctive feature of fibromyalgia, one that differentiates it from similar conditions, is the existence of certain "tender points"—eighteen specific spots where the muscles are abnormally tender to the touch. The eighteen points tend to cluster around the neck, shoulders, chest, knees, elbow region, and hips, and include the following:

- Around the lower vertebrae of the neck.
- At the insertion of the second rib.
- Around the upper part of the thigh bone.
- In the middle of the knee joint.
- In muscles connected to the base of the skull.
- In muscles of the neck and upper back.
- In muscles of the mid-back.

- On the side of the elbow.
- In the upper and outer muscles of the buttocks.

There are approximately 5 million people known to be suffering from FMS in the United States. However, the real number of cases is probably much higher, as this condition is often misdiagnosed. Fibromyalgia manifests itself in similar ways to chronic fatigue syndrome (CFS), chemical sensitivities, rheumatoid arthritis, and chronic myofascial pain (shortened muscle fiber syndrome). As a result, it often takes a long time for a proper diagnosis to be made. In the past, FMS was known as fibrositis or fibromyositis, but both of these terms are now considered inappropriate because they imply inflammation of some sort (the suffix *-itis* is medical terminology for “inflammation”) and inflammation is not a major factor in fibromyalgia.

Most people with fibromyalgia also have an associated sleep disorder known as alpha-EEG anomaly. In this disorder, the individual’s deep sleep periods are interrupted by bouts of waking-type brain activity, resulting in poor sleep. Some people with fibromyalgia are plagued by other sleep disorders, such as sleep apnea, restless leg syndrome, bruxism, and sleep myoclonus (a sudden rapid contraction of a muscle or a group of muscles during sleep or as one is falling asleep). Not surprisingly, given all these sleep difficulties, people with fibromyalgia often suffer from chronic fatigue that can range from mild to incapacitating.

Other disorders common in people with fibromyalgia include the following:

- Chemical and/or food allergies.
- Dizziness and loss of balance.
- Extreme fatigue.
- Headaches.
- Irritable bowel syndrome (diarrhea and/or constipation, often alternating).
- Jaw pain.
- Memory loss and difficulty in concentrating.
- Menstrual pain.
- Sensitivity to bright lights or loud noises.
- Sensitivity to dairy products.
- Skin sensitivities.
- Stiffness in the morning and, often, when walking.

Fibromyalgia is much more common in females than in males, and most often begins in young adulthood. For unknown reasons, between 80 and 90 percent of those diagnosed with fibromyalgia are women. In most cases, symptoms come on gradually and slowly increase in intensity. They can be triggered (or made worse) by a number of different factors, including overexertion, stress, lack of exercise, anxiety, depression, lack of sleep, grief, trauma, extremes of temperature and/or humidity, and infectious

illness. In the majority of cases, symptoms are severe enough to interfere with normal daily activities; a significant number of people with fibromyalgia are actually disabled by the condition.

The course of the disorder is unpredictable. Some cases clear up on their own, some become chronic, and some go through cycles of flare-ups alternating with periods of apparent remission.

The cause or causes of fibromyalgia are not known, and there are no tests that can diagnose FMS with complete certainty. It is thought by some that the disorder, which was only recognized as such in 1990, is caused by a disruption in the brain’s ability to process pain. Some evidence also points to a problem with the immune system. Certain immunologic abnormalities are common among people with fibromyalgia. Their significance and relationship to the syndrome are, however, not understood. A disturbance in brain chemistry may also be involved; many people who develop fibromyalgia have a history of clinical depression. Some research has found FMS is more likely to occur in people who have a history of sexual abuse, domestic violence, and even alcoholism. Other possible causes that have been proposed include infection with the Epstein-Barr virus (EBV), the virus that causes infectious mononucleosis, or with the fungus *Candida albicans*; chronic mercury poisoning from amalgam dental fillings; anemia; parasites; hypoglycemia; and hypothyroidism. Some experts believe that fibromyalgia may be related to chronic fatigue syndrome (CFS), which causes similar symptoms, except that in fibromyalgia, muscle pain predominates over fatigue, whereas in CFS, fatigue predominates over pain. FMS has even been misdiagnosed as multiple sclerosis or Parkinson’s disease.

Because malabsorption problems are common in people with this disorder, it is best to use sublingual vitamins and other supplements because they are more easily absorbed than tablets or capsules.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Acidophilus (Kyo-Dophilus from Wakunaga) or bifidus (Bifido Factor from Natren)	As directed on label.	Candida infection is common in people with fibromyalgia. Probiotics replace “friendly” bacteria destroyed by candida. Use a nondairy formula.
Coenzyme Q <sub>10</sub>	75 mg daily.	Improves oxygenation of tissues, enhances the effectiveness of the immune system, and protects the heart.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works with coenzyme Q <sub>10</sub> to increase energy supply to the cells.
Lecithin	As directed on label, with meals.	Promotes energy, enhances immunity, aids in brain function, and improves circulation.

Malic acid and magnesium	As directed on label.	Involved in energy production in many cells of the body, including the muscle cells. Needed for sugar metabolism.
Manganese	5 mg daily. Take separately from calcium.	Influences the metabolic rate by its involvement in the pituitary hypothalamic-thyroid axis.
Nicotinamide adenine dinucleotide (NADH) (Enada)	10–15 mg first thing in the morning, on an empty stomach.	Increases level of energy.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label, 6 times daily, with meals, between meals, and at bedtime.	Reduces inflammation and improves absorption of foods, especially protein, which is needed for tissue repair.
Vitamin A with mixed carotenoids plus vitamin E or ACES + Zn from Carlson Labs	25,000 IU daily for 1 month, then slowly reduce to 10,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily.  As directed on label.	Powerful free radical scavengers that protect the body's cells and enhance immune function. Use emulsion forms for easier assimilation. Use d-alpha-tocopherol form.  Contains vitamins A, C, and E plus the minerals selenium and zinc, to protect immune function.
Vitamin C with bioflavonoids	5,000–10,000 mg daily.	Has a powerful antiviral effect and increases the body's energy level. Use a buffered form.
<b>Very Important</b>		
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	50 mg 3 times daily.	Enhances oxygen utilization by the muscles and destroys free radicals that can damage cells.
5-Hydroxy L-tryptophan (5-HTP)	50 mg daily for 1 week, then increase to 100 mg daily.	Enhances synthesis of serotonin in the brain. Excellent for pain relief. <i>Caution:</i> Do not use if you take an MAO inhibitor, commonly prescribed for depression.
Free form amino acid (Amino Balance from Anabol Naturals or Amino Blend from Carlson Labs)	As directed on label.	To supply protein essential for repair and rebuilding of muscle tissue and for proper brain function. Use a formula containing all the essential amino acids.
Garlic (Kyolic from Wakunaga) plus Kyo-Green from Wakunaga	2 capsules 3 times daily, with meals.  As directed on label.	Promotes immune function and increases energy. Also destroys common parasites. To improve digestion and cleanse the bloodstream.
Grape seed extract or Pycnogenol	As directed on label.  As directed on label.	Powerful antioxidants that protect the muscles from free radical damage and enhance immunity.
Methylsulfonyl-methane (MSM)	As directed on label.	Provides support for tendons, ligaments, and muscles. <i>Note:</i> Because this supplement contains sulfur, you may notice an odor to your urine.
Methylsulfonyl-methane (MSM) cream	As directed on label.	Relieves pain.

S-Adenosylmethionine (SAMe)	As directed on label.	Aids in relief of stress and depression, eases pain, and produces antioxidant effects that can improve the health of your liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex injections	2 cc twice weekly for 1 month or as prescribed by physician.	Essential for increased energy and normal brain function. Injections (under doctor's supervision) are best. All injectables can be combined in a single syringe.
plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	¼ cc twice weekly for 1 month or as prescribed by physician.  1 cc twice weekly for 1 month or as prescribed by physician.	
plus raw liver extract	2 cc twice weekly for 1 month or as prescribed by physician.	A source of B vitamins and iron. <i>Caution:</i> Do not take a supplement containing iron unless prescribed by your physician.
or vitamin B complex	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	If injections are not available, or once the course of injections has been completed, use a sublingual form of all the B vitamins listed.
<b>Important</b>		
Calcium and magnesium and vitamin D	2,000 mg daily.  1,000 mg daily.  400 IU daily.	Needed for proper functioning of all muscles, including the heart; relieves muscle spasms and pain. Deficiencies are common in people with this disorder.
Chromium	200–400 mcg daily.	To help balance blood sugar levels and aid in preventing night sweats.
Creatine	As directed on label. Do not take with fruit juices, as this combination produces creatinine, which is difficult for the kidneys to process.	To combat muscle depletion. Should be used in conjunction with a balanced, nutritious diet.
DL-phenylalanine (DLPA)	500 mg daily every other week.	Can be very effective for controlling pain. Also increases mental alertness. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or suffer from panic attacks, diabetes, high blood pressure, or PKU.
Essential fatty acids (black currant seed oil, flaxseed oil, Kyolic-EPA from Wakunaga, or primrose oil)	As directed on label 3 times daily, with meals.	Protects against cell damage. Helps to reduce pain and fatigue.
Fibroplex from Metagenics	As directed on label.	A formula containing vitamins B <sub>1</sub> and B <sub>6</sub> plus magnesium, manganese, and malic acid.
Fibro-X from Olympian Labs	As directed on label.	To relieve pain. Contains many nutrients listed in this table, plus shark cartilage.

Gamma-amino-butyric acid (GABA)	As directed on label.	For proper control of brain function and to control anxiety.
Kelp	As directed on label.	Contains minerals that support the thyroid.
L-leucine plus L-isoleucine and L-valine plus L-carnitine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. As directed on label.	These amino acids are found primarily in muscle tissue. They are available in combination formulas. (See AMINO ACIDS in Part One.)  Increases energy.
L-tyrosine	500–1,000 mg daily, at bedtime.	Helps to relieve depression and aids in relaxing the muscles. <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug.
Melatonin	As directed on label, 1–2 hours or less before bedtime.	Promotes sound sleep. A sustained-release formula is best. Take a sublingual form during the night if you wake up and cannot go back to sleep.
Multivitamin and mineral complex plus carotenoid complex (Advanced Carotenoid Complex from Solgar)	As directed on label. 15,000 IU daily.	All nutrients are necessary in balance. Use a high-potency hypoallergenic formula.
Ocu-Care from Nature's Plus	As directed on label.	Contains essential nutrients to protect and nourish the eyes.
Raw thymus glandular and raw spleen glandular plus multiglandular complex	As directed on label.  As directed on label.	To boost the immune system. (See GLANDULAR THERAPY in Part Three.)
Reishi extract	As directed on label.	A mushroom extract that helps the body deal with stress and increases energy levels.
Taurine	500 mg daily, on an empty stomach.	An important antioxidant and immune system regulator necessary for white blood cell activation and neurological function.
Vanadyl sulfate	As directed on label.	Protects the muscles and reduces overall body fatigue.

## Herbs

- Astragalus and echinacea enhance immune function.

*Cautions:* Do not take astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- Black walnut and garlic aid in removing parasites.
- Boswellia is excellent for morning stiffness and joint pain.
- Teas brewed from burdock root, dandelion, and red clover promote healing by cleansing the bloodstream and

enhancing immune function. Combine or alternate these herbal teas, and drink 4 to 6 cups daily.

- Calendula or rosemary oil (or a combination of the two), diluted with an equal amount of water or vegetable oil and massaged into the skin, helps to relieve pain.

Topical applications of cayenne (capsicum) powder mixed with wintergreen oil can help relieve muscle pain. Cayenne contains capsaicin, a substance that appears to inhibit the release of neurotransmitters responsible for communicating pain sensations. Use 1 part cayenne powder to 3 parts wintergreen oil. Cayenne can also be taken orally, in capsule form.

- Put 4 to 6 ounces of ginger powder into a moderately hot bath. This will induce sweating and help remove toxins from the body. Drinking hot ginger tea will have the same effect.

- Ginkgo biloba improves circulation and brain function.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Kava kava decreases anxiety and elevates the mood.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

- Licorice root supports the glandular system, especially the adrenal glands.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Milk thistle protects the liver.

- Pau d'arco, taken in tea or tablet form, is good for treating candida infection.

- Skullcap and valerian root improve sleep.

## Recommendations

- Eat a well-balanced diet of 50 percent raw foods and fresh "live" juices. The diet should consist mostly of vegetables, fruits, whole grains (primarily millet and brown rice), raw nuts and seeds, soy products, skinless turkey or chicken, and deepwater fish. These quality foods supply nutrients that renew energy and build immunity.

- Include pomegranates and pomegranate juice in your diet. They have anti-inflammatory and antioxidant properties.

- Eat four to five small meals daily to keep a steady supply of protein and carbohydrates available for proper muscle function. If the body does not have enough fuel for energy, it will rob the muscles of essential nutrients, causing muscle wasting and pain.

- Drink plenty of liquids to help flush out toxins. The best choices are steam-distilled water and herbal teas. Fresh vegetable juices supply necessary vitamins and minerals.
- Limit your consumption of green peppers, eggplant, tomatoes, and white potatoes. These foods contain solanine, which interferes with enzymes in the muscles, and may cause pain and discomfort.
- Do not eat meat, dairy products, or any other foods that are high in saturated fats. Saturated fats raise cholesterol levels and interfere with circulation. Also avoid fried foods, processed foods, shellfish, and white flour products such as bread and pasta. Make up your calcium, magnesium, and vitamin D needs from supplements.
- In one study there seemed to be no benefit from eating a vegetarian diet for those with fibromyalgia. Still, another study showed that a raw, pure vegetarian diet—consisting mainly of raw fruits, salads, carrot juice, tubers, grain products, nuts, seeds, and a dehydrated barley grass juice product—improved quality of life, reduced pain, and improved range of motion and flexibility in people with the disease.
- Do not consume any caffeine, alcohol, or sugar. Eating sugar in any form—including fructose and honey—promotes fatigue, increases pain, and disturbs sleep. If these substances have been a regular part of your diet, your symptoms may actually get worse for a short period as a result of the “withdrawal” effect, but after that, you should experience a noticeable improvement in your condition.
- Avoid wheat and brewer’s yeast until your symptoms improve.

*Caution:* Brewer’s yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

- Use wheatgrass retention enemas to detoxify the system. To make the enema, add 1 ounce of wheatgrass juice to 1 cup of warm water. If fresh wheatgrass is not available, powdered Sweet Wheat from Sweet Wheat, Inc., is a good substitute. Use this treatment every other day for two weeks. (See ENEMAS in Part Three.)
- Maintain a regular program of moderate exercise. A daily walk followed by some gentle stretching exercises is good. If you have been sedentary before, start slowly and be careful not to overexert yourself; this can aggravate symptoms. Keep in mind that what you need is some amount of daily exercise, not a strenuous workout two or three times a week. Once your body is accustomed to regular exercise, symptoms are likely to improve. Moderate exercise and stretching help to keep muscles flexible and prevent joints from stiffening up.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Be sure to give your body sufficient rest. Set aside at least eight hours for sleep each night.

- Take a hot shower or a bath upon arising to stimulate circulation and help relieve morning stiffness. Or alternate between hot water and cold water while showering. Recent studies have shown cold showers to be beneficial for relieving the pain of fibromyalgia. Hot baths help to relax the muscles.
- Consider trying massage therapy, which can help to relax muscles and reduce stiffness of the joints.
- Take chlorophyll in tablet form or in “green drinks” such as Kyo-Green from Wakunaga of America. Spiru-tein from Nature’s Plus is a good protein drink to use between meals to aid in maintaining energy levels and to reduce muscle pain. Chlorella pyrenoidosa, a unicellular freshwater green algae rich in protein, vitamins, and minerals, was shown to help with the management of symptoms for patients with fibromyalgia.
- Have your doctor check your thyroid function. Symptoms of hypothyroidism can mimic those of FMS.

### Considerations

- Chronic pain sufferers, especially those with fibromyalgia and chronic fatigue syndrome, tend to be deficient in magnesium.
- Common painkillers such as aspirin, acetaminophen, and ibuprofen are not usually effective at relieving the pain of fibromyalgia. Other approaches, including attention to diet, exercise, and nutritional supplementation, are more likely to be of benefit.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- There are two FDA-approved treatments for fibromyalgia—Lyrica and Savella. Sevella is a selective serotonin and norepinephrine reuptake inhibitor (SNRI). It was shown to reduce pain, fatigue, and improve cognition. In addition, two studies indicate that a majority of people who suffer from the disorder can find relief by taking duloxetine (Cymbalta), an antidepressant drug. A report on the latest study of the drug was reported in the medical journal *Arthritis and Rheumatism*. Duloxetine may be effective because it works by boosting levels of two neurotransmitters that play a role in pain processing. New drugs such as sodium oxybate are under study.
- Many different disorders can cause symptoms similar to those of fibromyalgia, including anemia, depression, hepatitis, and Lyme disease, among others. Anyone who experiences muscular pain and/or fatigue that persists for longer than a week or two should consult a health care professional. There may be an underlying medical disorder that requires treatment.
- Recent research points to the possible involvement of chemical and/or food sensitivities in fibromyalgia, chronic fatigue syndrome, and the pain associated with these dis-

orders. This would hardly be surprising, as humans have been exposed to more chemicals in the last fifty years than in all the rest of our history combined.

Studies are being conducted on the possible role of a genetic defect that interferes with the formation of adenosine triphosphate (ATP, the source of cellular energy) in this disorder.

Some experts suggest that people with fibromyalgia should avoid salt-free diets.

Plant sterols and sterolins (plant fats that are present in fruits, vegetables, seeds, and nuts) stimulate the immune system, thus helping the body fight off infection.

Because malabsorption problems are common in this disorder, all nutrients are needed in greater than normal amounts, and a proper diet is essential. Colon cleansing is recommended to rid the gastrointestinal tract of mucus and debris, and to improve nutrient absorption. (See COLON CLEANSING in Part Three.)

A vegetarian, Mediterranean-type diet and intermittent fasting were tested for their effect on changing bowel bacteria and immune function; neither therapy affected the flora or serum IgA levels.

Many doctors prescribe low-dose antidepressants for fibromyalgia. These drugs can be beneficial in some cases, but can also cause a number of side effects, such as drowsiness. Other medical treatments that may or may not be of help to any given individual include muscle relaxants and/or local anesthetic sprays or injections for relief of pain. Antianxiety drugs are sometimes prescribed as well. These drugs can cause a loss of equilibrium.

Physical therapy, relaxation techniques, exercise therapy, massage therapy, deep heat therapy, and biofeedback are all helpful in some cases. Massage therapy is particularly beneficial for improved muscle function and pain relief. Acupuncture has also been shown to be effective at reducing pain and improving quality of life. Neither Reiki nor touch therapy, frequently used by patients with fibromyalgia, were shown to improve symptoms of the condition. If you are diagnosed with fibromyalgia, it is wise to seek out a health care practitioner who has specific experience in the management and treatment of this condition.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

In one study, children (aged eight to eighteen years) who underwent an aerobic exercise program experienced improved physical function, fewer fibromyalgia symptoms, better quality of life, and less pain. Another group participated in qi gong, which did not show these improvements.

An eight-month supervised program led to both physical and mental improvements. Women who exercised in warm water experienced significant improvements in physical function, and had less pain, stiffness, and anxiety. In another study, older women who were postmenopausal

had reduced fatigue and increased strength by undergoing an exercise program that incorporated weights, strength-training equipment, and speed walking.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Food allergies can exacerbate the discomfort of many disorders. (See ALLERGIES in Part Two.)

See CHRONIC FATIGUE SYNDROME and DEPRESSION in Part Two. See also PAIN CONTROL in Part Three.

For names and addresses of organizations that can provide further information about fibromyalgia, see Health and Medical Organizations in the Appendix.

## FLU

See influenza.

## FOODBORNE/WATERBORNE ILLNESS

Food- or waterborne illness occurs when a person consumes substances containing harmful toxins, chemicals, parasites, or microorganisms (usually bacteria). Foodborne illness, commonly referred to as food poisoning, causes some 76 million cases of illness and 5,000 deaths every year in the United States according to the U.S. Centers for Disease Control and Prevention (CDC). The actual number of cases is almost certainly well above any reported number, because people often mistake the symptoms of food poisoning for a simple upset stomach.

There are different types of food poisoning, depending on the agent that causes it. (For a quick summary of some of these, see Types of Food Poisoning on page 443.)

One type is salmonellosis, or *Salmonella* infection. *Salmonella* bacteria are part of the natural intestinal flora of many animals. They are easily transmitted through the food supply, the hands of food preparers, and the surfaces of objects such as knives and tabletops. Salmonellosis is typically associated with eggs.

External contamination from fecal matter, once a common source of salmonellosis, has almost been eliminated as a cause due to more stringent testing and inspection regimens implemented in the 1970s. The principal danger now comes from eggs because *Salmonella enteritidis*, the organism responsible for the majority of *Salmonella* infections, is now present in the ovaries of a significant percentage of egg-producing hens in the United States, and it contaminates the eggs before the shells form. Thus, eggs do not need to be cracked or unclean on the outside to be contaminated.

Foods made from raw eggs, including Caesar salad dressing, eggnog, hollandaise sauce, and ice cream, have also been found to contain these bacteria. Salmonellosis as a result of the consumption of raw clams, oysters, and sushi made from raw fish has also been reported. Although

this does not occur as often as *Salmonella* infection from fresh produce, eggs, meat, and poultry, it does happen.

Symptoms of *Salmonella* infection can range from mild abdominal pain to severe diarrhea and dehydration to typhoid-like fever. Symptoms usually develop within eight to thirty-six hours of eating contaminated foods. Diarrhea is often the first sign. *Salmonella* can also weaken the immune system and cause kidney and cardiovascular damage as well as arthritis.

Outbreaks of salmonellosis occur primarily in the warmer months. Most cases are the result of the consumption of contaminated foods, primarily chicken, eggs, beef, and pork products. People who eat raw or incompletely cooked meats are at greater risk of developing the disorder.

Cooks who first handle raw meat or poultry and then handle other foods, without washing their hands in between, endanger others; cooks who lick their hands or fingers after handling raw meat or poultry put themselves at risk of *Salmonella* infection. People taking antibiotics are also at greater risk.

*Salmonella* infections usually resolve in five to seven days and often do not require treatment other than oral fluids. Persons with severe diarrhea may require rehydration with intravenous fluids. Antibiotics, such as ampicillin, trimethoprim-sulfamethoxazole, or ciprofloxacin, are not usually necessary unless the infection spreads from the intestines. Some *Salmonella* bacteria have become resistant to antibiotics, largely as a result of the use of antibiotics to promote the growth of food animals. Antibiotics can also promote infection by destroying good, competing bacteria and permitting the growth of bacteria that are antibiotic-resistant. A Taiwanese strain of *Salmonella*, called the "super *Salmonella*" by some, is completely resistant to all known antimicrobials.

*Staphylococcus aureus* is another cause of foodborne illness. *Staphylococcus* (staph) infection can manifest itself in a variety of ways, from food poisoning to skin infections to septicemia (blood infection). In severe cases, it can be life-threatening. This microorganism is commonly found in the nose and throat, but if a food product becomes contaminated with the bacteria (by being sneezed or coughed on, for example), the bacteria can grow and produce an enterotoxin, a toxin that specifically targets the cells of the intestines.

It is this toxin, rather than the bacteria itself, that causes the food poisoning. Symptoms include diarrhea, nausea, vomiting, abdominal cramps, and prostration, usually beginning from two to eight hours after consumption of the contaminated food. Staphylococcal toxin is found most often in meat, poultry, egg products, tuna, potato and macaroni salads, and cream-filled pastries.

The bacterium *Clostridium botulinum*, which commonly inhabits the soil in the form of harmless spores, can cause a particularly dangerous type of food poisoning. Of the various types of food poisoning, botulism is among the most severe. It affects the central nervous system. As with *Staph-*

*glococcus*, it is not the bacteria but rather nerve toxins produced by the bacteria that cause the poisoning—and like staph, the bacteria can infect surface wounds. Woundborne botulism is not common, but it can occur if an open sore becomes infected with the botulism bacteria. People who use intravenous drugs can also be infected by using dirty or shared needles. Infant botulism is a type of the disorder that usually affects children under twelve months of age. It can occur if a young child ingests anything contaminated by botulism spores. This can include soil, cistern water, dust, and even some foods, such as honey.

The toxins produced by *C. botulinum* block the transmission of impulses from nerves to muscles, thus paralyzing the muscles. The paralysis often begins with the muscles that are responsible for eye movement, swallowing, and speech, and progresses to those in the torso and the extremities. Early symptoms of botulism include extreme weakness, double vision, droopy eyelids, and trouble swallowing. These symptoms typically appear twelve to forty-eight hours after ingestion of the contaminated food. Eventually, muscle weakness affecting the entire body, including the muscles required for breathing, can result. Paralysis and death may occur in severe cases.

There are seven recognized types of botulin bacteria, designated A, B, C, D, E, F, and G. The A, B, E, and F varieties cause human botulism. Types C and D are isolated to animals. Type G has been found in soil samples in Argentina, but no cases of illness involving type G have yet been reported. A total of about 145 cases of botulism are reported each year. Of these, 65 percent are infant botulism, 15 percent are foodborne botulism, and 20 percent are woundborne botulism.

Botulin toxin has been found in home-canned foods with a low acidity level, such as asparagus, beets, corn, and green beans. Less common sources include chopped garlic in oil, tomatoes, baked potatoes that have been improperly handled and then kept in aluminum foil, and home-canned or fermented fish. A bulging lid or cracked jar can be a sign that the food within is contaminated, but botulism can occur even if a food container shows no signs of damage. Keeping certain foods at room temperature for prolonged periods also can be a problem. In one reported case, a restaurant allowed a large batch of sautéed onions to be kept out throughout the day, instead of keeping them refrigerated, and small amounts were used as needed. Several people became very ill from botulin toxin in the onions.

Freezing, drying, and treatment with chemicals such as sodium nitrite prevent *C. botulinum* spores from growing and producing toxins. Although it does not kill the spores themselves, heating food to a temperature of at least 176°F for thirty minutes prevents food poisoning by destroying the lethal toxins.

Another microorganism that can cause food poisoning is *Campylobacter jejuni*. With this type of food poisoning, people tend not to associate the illness with food because it

takes three to five days for the bacteria to produce symptoms, which include abdominal cramps, diarrhea, fever, and possibly blood in the stool. *C. jejuni* can be present in the intestinal tracts of apparently healthy cattle, sheep, chickens, turkeys, dogs, and cats, and can be contracted by eating or drinking food or water that has somehow become contaminated by the feces of an infected person or animal.

Chickens, turkeys, and waterfowl are the most common carriers. Fortunately, heat destroys these bacteria, so it is possible to avoid this type of food poisoning by eating meat only if has been cooked thoroughly.

Another type of bacteria that can cause food poisoning is *Clostridium perfringens*, sometimes called the “food service germ.” It is one of the most common causes of foodborne illness. This microorganism thrives in previously cooked food that is kept for a long time at room temperature. Meat products and gravy are the most likely sources of the toxin. As foods cool, the bacteria multiply, forming spores and generating toxins. The toxins are often heat resistant. The symptoms of *C. perfringens* poisoning usually are limited to mild nausea and vomiting that last a day or less, but that can be a very serious problem for older adults or people with Crohn’s disease or HIV.

Not all foodborne illness is the result of bacterial contamination. *Giardia lamblia* is a protozoan (single-celled parasitic microorganism) that infects the small intestine. Giardiasis is associated with the consumption of contaminated water. It can also be transmitted to raw foods that have grown in contaminated water. Cool, moist environments are conducive to the growth of this microorganism. Symptoms generally occur within one to three weeks of infection and include diarrhea, constipation, abdominal pain, flatulence, loss of appetite, nausea, and vomiting.

Norwalk virus is a very common virus that can be transmitted in food and water, and causes many cases of nausea, fever, headache, stomachache, vomiting, and diarrhea in both children and adults. The Norwalk virus is getting a reputation as the “cruise ship virus” because of the great number of recent shipboard outbreaks. The symptoms usually start one or two days after infection and last from one to ten days.

Hepatitis A and E viruses can be transmitted by direct contact with fecal matter or with foods contaminated by fecal matter. They can also be transmitted by contaminated water.

*Trichinella spiralis* is a parasitic roundworm that causes the infection known as trichinosis. It is most often the result of eating raw or improperly cooked or processed pork or pork products (ham and sausage) and wild game.

*Escherichia coli* (*E. coli*) is a type of bacteria naturally found in the intestines of humans and some animals, where it actually serves a useful function—it helps to suppress harmful bacteria and aid in the absorption of vitamins. But sometimes, under the right circumstances, *E. coli* can cause serious illness. The reason for the change from benign or friendly to pathogenic is not known. But this can be a very

serious illness, particularly for the very young, the elderly, and those with compromised immune systems. This bacteria has been found in meat, vegetables, and some unpasteurized juices and fruits. In 2006, a specific strain, 0157:H7, was found in spinach.

Scombroid poisoning (also called histamine poisoning) is a relatively rare type of food poisoning that can occur after the consumption of fish such as tuna, mackerel, mahi mahi, sardines, bluefish, and abalone. After a fish is caught, decomposition carried on by bacteria in the fish can trigger the production of high levels of a chemical called histamine. When the fish is eaten, in a matter of minutes the histamine can cause symptoms including facial flushing, nausea, vomiting, abdominal pain, and/or hives. Fortunately, symptoms usually subside in twenty-four hours. Vibriobacteria, which comprise a group of different species of bacteria that can cause food poisoning, are mostly found in raw or improperly cooked fish and shellfish.

Thanks to our food safety, labeling, and inspection laws, our supermarket shelves are stocked with a nearly endless variety of foods that must meet strict government standards. Yet the truth is that food poisoning remains a major problem in this country, and it strikes with a frequency that is both surprising and alarming. The CDC offers several reasons for this. First, food animals are now raised in very close, confined quarters, a situation that is conducive to the spread of bacteria such as *Salmonella*. At the same time, food processing is becoming more and more centralized, so a single ingredient that is tainted with a contaminant can eventually show up in a multitude of different products. The United States now also imports record amounts of food from overseas, often from developing countries where proper hygiene in food production may not be as reliable as it is in this country.

Then there is the matter of food preparation. An increasing number of Americans are simply unaware of the prevalence of potentially dangerous microorganisms in the food supply, and lack knowledge of basic techniques for handling, preparing, and storing food safely. Most cases of food poisoning are easily preventable, provided you know how (see Tips for Preventing Food Poisoning on page 444). Also, more and more Americans, rather than eating meals prepared at home, purchase ready-made food at restaurants and from takeout establishments. Younger workers, who have no experience with or education in the consequences of improper food handling and the diseases that can be transmitted, staff many of these establishments.

If you contract food- or waterborne illness, the following supplements should be helpful. Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Charcoal tablets	5 tablets at first signs of illness and again 6 hours later. Take separately from other medications and supplements.	Removes toxic substances from the colon and bloodstream.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	A powerful detoxifier that also destroys bacteria in the colon.
Potassium	99 mg daily.	To restore proper electrolyte balance.
Vitamin C with bioflavonoids plus vitamin E	8,000 mg daily, in divided doses.  200 IU daily.	Detoxifies the body and aids in removing bacteria and toxins.  Reduces symptoms by enhancing immune function. Use d-alpha-tocopherol form.
<b>Important</b>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label, twice daily, on an empty stomach.	Replaces essential intestinal bacteria. Use a nondairy source.
Aerobic 07 from Aerobic Life Industries	20 drops in a glass of water every 3 hours.	Destroys harmful bacteria such as <i>Salmonella</i> .
Fiber (ABC Aerobic Bulk Cleanse from Aerobic Life Industries or oat bran)	As directed on label 6 hours after second dose of charcoal tablets and twice daily thereafter. Take separately from other supplements and medications.	Removes bacteria that have attached themselves to the colon walls, preventing them from entering the bloodstream; this reduces symptoms and speeds recovery.
Kelp	1,000–1,500 mg daily.	Contains needed minerals to restore electrolytes.
L-cysteine and L-methionine and selenium and superoxide-dismutase (SOD) plus glutathione	500 mg each daily, on an empty stomach. Take with 50 mg each of vitamins B <sub>6</sub> and C for better absorption. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily. 5,000 mg daily.  500 mg daily.	All of these nutrients are essential in immune function.  A powerful antioxidant.

## Herbs

At the first sign of food poisoning, take a dropperful of alcohol-free goldenseal extract. Repeat this every four hours for one day. Goldenseal is a natural antibiotic that aids in destroying bacteria in the colon.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Milk thistle and red clover aid in liver and blood cleansing.

Use lobelia tea enemas to rid the body of the poison. (See ENEMAS in Part Three.) Adding a dropperful of alcohol-free goldenseal extract to the enema is beneficial as well.

*Cautions:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

- If you suspect food poisoning, call your regional poison control center immediately. Poison control centers can be reached twenty-four hours a day, and can provide you with up-to-date information regarding treatment. It is a good idea to keep the number of your local center posted by your telephone and/or entered into your telephone's automatic dialing program.
- At the first suspicion of food poisoning, protect your immune system by taking 6 charcoal tablets. These are available at most health food stores and should be kept on hand for emergencies. The agents in these tablets circulate through the bloodstream and help to neutralize and eliminate poisons. After six hours, take 6 more tablets. Consume a lot of quality water to aid in flushing toxins from the system.
- Use cleansing enemas to remove toxins from the colon and bloodstream. (See ENEMAS in Part Three.)
- If vomiting occurs, make sure that the individual does not choke. If vomiting does not subside in twenty-four hours, collect a sample of the vomit for analysis to aid in pinpointing the cause of the illness.
- If you have been vomiting and have diarrhea, you may become seriously dehydrated. Replace lost fluids and electrolytes with clean water or other liquids designed specifically for rehydration. If you become lethargic or dizzy, have diarrhea for more than three days, or a fever over 101.5°F, seek medical attention right away. You may require intravenous fluids and electrolytes.
- If you suspect that you have been poisoned by food from a public restaurant or other eating place, contact your local health department right away. It may be possible to save others from food poisoning.
- For some cases of poisoning, it may be desirable to induce vomiting to help expel the toxin that is the cause of the problem. Keep syrup of ipecac (available in drugstores) on hand for this purpose.

## Types of Food Poisoning

There are many different types of food poisoning, some more common than others. The following is a summary of

some of these, together with the relative incidence and typical symptoms of each.

Type	Relative Incidence	Symptoms	Time Between Exposure and Onset of Symptoms
<b>Bacterial Origin</b>			
Botulism	Rare.	Double vision; difficulty speaking, breathing, and swallowing; nausea, vomiting, and abdominal pain; diarrhea; muscular weakness.	12–48 hours, but may be as long as 8 days.
<i>Campylobacter</i> infection	Common.	Muscular pain, nausea, vomiting, fever, abdominal cramps.	2–10 days.
<i>Clostridium perfringens</i> poisoning	Common.	Diarrhea, abdominal cramps.	9–15 hours.
<i>Escherichia coli</i> ( <i>E. coli</i> ) poisoning	Common.	Diarrhea, abdominal cramps, vomiting.	1–7 days.
Listeriosis	Rare.	Flulike symptoms, including fever, chills; can cause spontaneous abortion or stillbirth; can cause severe illness in newborns and immune-depressed people. Spreads to the nervous system; stiff neck, confusion, and loss of balance can occur.	2–4 weeks.
Salmonellosis	Common.	Nausea, vomiting, diarrhea, abdominal cramps, fever, headache.	6–48 hours.
Staphylococcal food poisoning	Common.	Vomiting, diarrhea; occasionally weakness, dizziness.	30 minutes–8 hours.
Vibriobacteria	Not common, but occurs in occasional outbreaks during warmer months.	Diarrhea, fever, chills, cramps, headache, vomiting.	4–96 hours.
<b>Parasitic Origin</b>			
Giardiasis	Common.	Nausea, gas, abdominal pain and/or cramping, diarrhea; in severe cases, malabsorption problems and weight loss.	1–3 weeks.
Trichinosis	Rare.	Fever, edema of eyelids, muscle pain.	1–2 days.
<b>Viral Origin</b>			
Hepatitis A/ hepatitis E	Sporadic outbreaks.	Fever, nausea, lethargy, and pain in abdominal area. Hepatitis A infection may cause jaundice.	Hepatitis A: 10–50 days. Hepatitis E: 2–9 weeks.
Norwalk virus infection	Common.	Nausea, vomiting, diarrhea, headache.	1–2 days.
Rotavirus infection	Common.	Vomiting, diarrhea, possible temporary lactose intolerance.	1–3 days.
Toxin-caused scombroid poisoning	Uncommon.	Headache, dizziness, burning throat, hives, nausea, vomiting, abdominal pain.	5 minutes–1 hour.

## Tips for Preventing Food Poisoning

Here are some fast, easy rules to help prevent food poisoning at home and while eating out:

- Keep food either hot or cold. Leaving food at room temperature encourages the growth of bacteria.
- Keep perishable products refrigerated. Oils containing herbs or garlic should also be refrigerated.
- Refrigerate leftovers as soon as possible. Do not refrigerate foods in the same containers they were cooked or served in; transfer leftovers into clean containers so that they will cool more quickly. Most foods should be discarded after twenty-four to thirty-six hours.
- Organize your refrigerator so that raw meats are kept away from, or do not drip blood onto, other foods. Do not leave raw meats in the refrigerator for more than forty-eight hours. If you are not using it right away, freeze it.
- Cook meat, poultry, and seafood thoroughly. Meats should be cooked to an internal temperature of at least 165°F.
- If you bake potatoes in aluminum, keep them either hot or refrigerated.
- Never use raw eggs that are cracked.
- Wash your hands before handling food, and after handling raw meat or poultry. Harmful bacteria can be transmitted if you handle food after diapering a baby or blowing your nose.
- Keep two cutting boards, one for meat and the other for vegetables. This will prevent the transfer of bacteria from meat to vegetables. At least three times a week, wash your cutting boards with a solution of ¼ cup of 3 percent hydrogen peroxide and 2 gallons of water. As an alternative, you can use a mixture of ½ cup of chlorine bleach and 1 quart of water, then rinse the board thoroughly with clean water.
- Go home directly after grocery shopping, especially in warm weather. Store foods immediately according to the instructions on the labels.
- Clean any utensil that has come in contact with raw hamburger, poultry, eggs, or seafood. Such utensils should not be allowed to come into contact with other foods until they have been disinfected.
- Wash out lunch boxes and Thermos bottles after every use.
- Beware of bulging cans, cracked jars, or loose lids on products. These can indicate botulism. Throw away cans that are bulging, rusted, bent, or sticky. Beware of cracks in jars and leaks in paper packaging, and exercise caution when consuming home-canned foods.
- When reheating food, bring it to a rapid boil, if possible, and cook it at that temperature for at least four minutes.
- Set your refrigerator temperature at 40°F or below. Freezers should be set at 0°F or below.
- Wash kitchen towels and sponges with a bleach-and-water solution (1 part bleach to 20 parts water) daily.
- Do not leave foods such as mayonnaise, salad dressing, and milk products at room temperature or, worse, out in the sun. Be especially careful at picnics and cookouts.
- Do not give honey to a young baby. This can lead to infant botulism, in which botulinal spores colonize the digestive tract and produce botulin toxin there. Honey is safe for babies after age one.
- Mold commonly grows on spoiled food products. The following foods should be avoided if mold is growing on them: bacon, bread, cured luncheon meats, soft dairy products, flour, canned ham, hot dogs, dried nuts, peanut butter, roast poultry, soft vegetables, and whole grains. Throw away any cooked or raw foods that are covered with mold.
- Thaw all frozen foods, especially meats and poultry, in the refrigerator, not at room temperature.
- Eat hamburger and other meats only if they have been cooked at least until they turn brown. Meat or poultry that is even a little pink in color may still harbor bacteria. To ensure that all bacteria have been destroyed, it is best to cook meat until it is well done.
- When preparing a chicken or turkey with dressing, do not stuff the bird until you are ready to put it in the oven. Either cook the stuffing separately or place it in the poultry immediately before putting it in the oven and then remove it as soon as the bird is done.
- Exercise caution when eating at restaurants and salad bars. Do not eat at salad bars that do not look fresh and clean or that do not have protective glass over them. Avoid the following foods when eating at salad bars: chicken, fish, creamed foods, foods containing mayonnaise, undercooked foods, and soups that are not kept at near-boiling temperatures.
- Before eating out, take 2 garlic tablets to help prevent food poisoning, as well as a product called ACES + Zn from Carlson Labs to destroy any free radicals created by unknown toxins and oxidized fats in the food.

*Caution:* Syrup of ipecac should be used only at the direction of a physician or poison control center.

If symptoms of food poisoning are severe or prolonged, consult your health care provider.

### Considerations

David Hill, a microbiologist at Musgrove Park Hospital in Somerset, England, monitored all the bacteria present in the intestines and found that in the presence of garlic,

disease-causing microbes were eliminated. According to Hill, the sulfur compounds in garlic are the secret weapon that knocks out dangerous bacteria.

❑ It was once believed that nylon or plastic cutting boards were preferable to the wooden variety. Since then, research has indicated that wood is probably better after all. Researchers have discovered that when cutting boards are contaminated with organisms that can cause food poisoning, almost all the bacteria on the wooden boards die off within three minutes, while almost none die on the plastic ones. For added security, you can wash your wooden cutting board periodically with hydrogen peroxide and water or a bleach-and-water solution. The ideal solution is to use one cutting board exclusively for vegetables and one for meat (see *Tips for Preventing Food Poisoning* on page 444). Glass or polished ceramic cutting boards are probably safest of all.

❑ Certain strains of bacteria found in eggs are not destroyed if the eggs are poached or prepared over-easy or sunny-side up.

❑ Food allergies are a common cause of illness and stomach upsets. For instance, a person who experiences severe headache and vomiting soon after eating may be suffering from food allergies. If this is the case, you should be able to develop a pattern associated with certain foods. (See ALLERGIES in Part Two.) In the meantime, charcoal tablets and a coffee retention enema can help rid the body of substances that cause allergic reactions. (See ENEMAS in Part Three.)

**FOOD POISONING**

See **FOODBORNE/WATERBORNE** illness.

**FRACTURE**

A fracture is a break or a crack in a bone. If the skin over the bone remains intact, a fracture is referred to as a closed or simple fracture; if the bone breaks the skin, it is termed an open or compound fracture. A fracture may cause extreme pain and tenderness in the injured area; swelling; a protruding bone or blood under the skin; and numbness, tingling, or paralysis below the fracture. A major fracture, such as of an arm or leg, may also cause a loss of the pulse below the fracture, as well as weakness and an inability to bear weight. Broken arms, fingers, or legs may be bent out of alignment.

Fractures occur most often in the very young and in older adults. Indeed, fractures pose an increasing problem as we grow older and our bones become more brittle. Falls account for more than 90 percent of all fractures in people aged sixty-five or older. An estimated 300,000 hip fractures occur in people over fifty years of age each year. People aged eighty-five or older are ten to fifteen times more likely to suffer from a fracture if they fall than people between sixty and sixty-five. Osteoporosis is a factor in many of

these cases. Hip fractures are by far the most troublesome fractures for older adults, and, unfortunately, many cannot live an independent life after a hip fracture. In fact, about one out of every five hip fracture patients dies within a year of their injury.

A broken bone calls for prompt professional help. After a bone has been set, the following supplements and other recommendations will aid in healing. Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Bone Builder with Boron from Ethical Nutrients	As directed on label.	A microcrystalline hydroxyapatite concentrate (MCHC) that contains the organic protein-calcium matrix of raw bone. Available only through health care professionals.
Bone Defense from KAL	As directed on label.	To supply essential nutrients for bone health.
Boron	3 mg daily. Do not exceed this amount.	Important in bone health and healing. Studies show boron can increase calcium uptake by as much as 30 percent.
Calcium and magnesium and potassium	1,000–2,000 mg daily, in divided doses, after meals and at bedtime. 1,000 mg daily. 99 mg daily.	Vital for proper bone repair.  Needed to balance with calcium.  Useful for maintaining good muscle and heart function.
Glucosamine and chondroitin plus methylsulfonylmethane (MSM)	As directed on label.  As directed on label.	Helps the body maintain joint flexibility by building cartilage.  Makes cell walls permeable, allowing water and nutrients to freely flow into cells and allowing wastes and toxins to properly flow out.
Kelp	1,000–1,500 mg daily.	Rich in calcium and minerals in a natural balance.
Neonatal Multi-Gland from Biotics Research	As directed on label.	Promotes healing. See <b>GLANDULAR THERAPY</b> in Part Three for its benefits.
Proteolytic enzymes	As directed on label. Take between meals and with meals.	Taken between meals, reduces inflammation. Taken with meals, aids digestion of proteins. <i>Caution:</i> Do not give this supplement to a child under sixteen years of age.
S-Adenosylmethionine (SAME)	As directed on label.	A natural alternative to prescribed antidepressants. Can also be used in a lower dose as an anti-inflammatory agent for joint stiffness.

*Caution:* Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.

Silica	As directed on label.	Supplies silicon, needed for calcium uptake and connective tissue repair.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Important in repair of bones, connective tissue, and muscles.
Vitamin D	400–1,000 IU daily.	Needed for calcium absorption and bone repair. May help to prevent fractures.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in tissue repair. Use zinc gluconate lozenges or zinc methionate (OptiZinc) for best absorption.

**Helpful**

Free form amino acid (Amino Balance from Anabol Naturals or Amino Blend from Carlson Labs)	As directed on label.	Speeds healing.
Octacosonal	3,000 mg daily.	Improves tissue oxygenation.
Raw liver extract	As directed on label.	Supplies balanced B vitamins and other needed vitamins and minerals. (See GLANDULAR THERAPY in Part Three.)
Vitamin B complex	As directed on label.	Helps maintain healthy muscle tone and proper brain function. Important for older adults because these nutrients are less well absorbed as we age. Antistress vitamin. Aids in vitamin utilization.
plus extra vitamin B <sub>5</sub> (pantothenic acid) and folic acid	100 mg 3 times daily. 400–600 mcg per day from all sources.	Reduces homocysteine, high levels of which raise the risk of osteoporosis-related fractures.

**Herbs**

- Boswellia, an herb used commonly in Ayurvedic medicine, aids in the process of recovery from a fracture, easing pain and acting as an excellent anti-inflammatory.
- Turmeric paste makes a good poultice. Combine turmeric with a little hot water and apply it to the site of the injury on a gauze dressing. This is also good for bruises and helps to reduce swelling. A poultice of fresh mullein leaves is also good. (See USING A POULTICE in Part Three.)

**Recommendations**

- Eat half of a fresh pineapple every day until the fracture is healed. Pineapple contains bromelain, an enzyme that acts to reduce swelling and inflammation. Use only fresh pineapple, not canned or processed. If you don't like pineapple, the food supplement bromelain will provide the same benefits. Bromelain should be taken on an empty stomach.

- Avoid red meat, as well as colas and any other products containing caffeine. Foods with preservatives should also be avoided due to their phosphorus content. Phosphorus can lead to bone loss.
- Use clay poultices for bruises and swelling.
- Make your home safer by taking measures such as the following:
  - Use nonslippery floor coverings. If you have carpets that are not fitted, make sure the edges are taped down.
  - Make sure you have enough light so that you can see properly.
  - Keep your path clear. If you have pets, they should be trained to keep out of your way. Do not leave things on the floor.
  - Wipe up any spilled liquids immediately.
  - Wear shoes or slippers with rubber soles.
  - Take extra precautions when using stairs. Install handrails if necessary.
  - Keep the telephone in a readily accessible place. Do not rush to answer it. Portable phones are available with a simple large red button that will connect you directly with the 911 emergency number.
  - Medical alert devices that are worn around the neck are also available for people living alone.
  - Talk to your physician about the medications you are taking and discuss whether they might impair your balance or orientation.
- If you are in any discomfort after a fall, have an X-ray taken of the painful area. If there is a fracture, you need to have it attended to immediately.
- If you suffer a hip fracture, ask your physician about nerve blocks before you have an operation to fix it. A nerve block can lessen the amount of oral analgesic administered during surgery.

**Considerations**

- Ultrasound therapy after a fracture may speed healing. If you want to try this at home, there is an FDA-approved device called Sonic Relief. Check with your doctor first.
- See also OSTEOPOROSIS and SPRAINS, STRAINS, AND OTHER INJURIES OF THE MUSCLES AND JOINTS in Part Two.

**FRIEDREICH'S ATAXIA**

See ATAXIA under RARE DISORDERS.

**FUNGAL INFECTION**

Certain types of fungi (most commonly *Candida* and *Tinea*) can infect the skin and/or mucous membranes; they can

also grow under the nails, between the toes, or on internal surfaces of the colon and other organs. Fungal infection of the skin is most common in places where skin tends to be moist and one skin surface is in contact with another, such as the groin area (“jock itch”) and between the toes (“athlete’s foot”). A type of scalp infection known as tinea capitis is found mainly in schoolchildren, although adults also may be affected. Moist, possibly itchy, red patches anywhere on the body can indicate fungal infection. In babies, a fungal infection can manifest itself as diaper rash that makes the skin bright red in light-skinned babies and darker brown in dark-skinned babies.

Fungal infection of the mouth is referred to as oral thrush, a condition in which creamy-looking white patches form on the tongue and the mucous membranes of the mouth. If the patches are scraped off, bleeding may result. This condition is most common in infants and in those with compromised immune systems.

Nursing mothers sometimes develop a candida infection of the nipples that causes severe pain while feeding. This can be further complicated if the baby develops oral thrush; it can lead to a “ping-pong” effect in which mother and baby continually reinfect each other.

Fungal infection under the nails (paronychia) or between the toes may cause discoloration and swelling, and the nails may become raised above the surface of the nail bed. In fungal infection of the vagina (yeast infection), a cheesy discharge is present, usually accompanied by intense itching.

Ringworm, also known as tinea infection, is a fungal infection of the skin or scalp. Caused by various species of fungi—mainly microspora, trichophyta, and epidermophyta—it is characterized by the development of small red spots that grow to a size of about one-quarter inch in diameter.

As the spots expand, the centers tend to heal and clear while the borders are raised, red, and scaly, giving them a ringlike appearance. Like other fungal infections, ringworm can be very itchy.

Recurrent fungal infections are a common sign of depressed immune function. The people most likely to be affected are those who have diseases such as diabetes or cancer, or who are infected with human immunodeficiency virus (HIV). Women who use oral contraceptives and people taking antibiotics are at higher risk as well, as are people who are obese and/or who perspire heavily.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	To supply the “friendly” bacteria that are usually deficient in people with fungal infections.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Neutralizes most fungi.
Kyolic-EPA from Wakunaga	As directed on label.	For relief of pain and inflammation.
<i>Important</i>		
Colostrum (Colostrum Plus from Symbiotics or Colostrum Prime Life from Jarrow Formulas)	As directed on label.	Possesses healing properties, boosts the immune system, and fights fungal infection.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid)	50 mg 3 times daily, with meals. 50 mg 3 times daily.	Needed for correctly balanced “friendly” bacteria in the body. Plays a role in the formation of antibodies and aids in the utilization of nutrients.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Needed for proper immune function.
Vitamin E	200 IU daily.	Needed for proper immune function. Use emulsion form for easier assimilation. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for proper immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Helpful</i>		
Essential fatty acids (black currant seed oil, primrose oil, or salmon oil)	As directed on label.	For relief of pain and inflammation.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Aids healing of skin and mucous membranes. Needed for proper immune function.

## Herbs

Berberine is a phytochemical that has antifungal action. Goldenseal, a berberine-containing herb, works against a variety of fungi, including candida. Bloodroot, another herb that contains berberine, has shown action against skin fungi and is also an anti-inflammatory. Other herbs that contain berberine and are recommended for fungal infections include barberry, Oregon grape, and yellowroot.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor’s supervision.

Horopito, or pepper tree (*Pseudowintera colorata*), a shrub native to New Zealand, contains polygodial, an anti-fungal agent that has been shown to act against bacteria as well. The leaves can be bruised, steamed, and applied topically to treat skin diseases such as ringworm. *Licaria puchuri-major*, a medicinal plant found in the Brazilian rain forest, has been found to augment the antifungal activity of polygodial and increase its effectiveness against fungal infection.

Kolorex from Nature's Sources is an herbal product that has been shown to be effective in treating ringworm and tinea fungi infections. It is available in both capsule and cream form.

Pau d'arco has strong antifungal properties. Drink 3 cups of pau d'arco tea daily.

For toenail or fingernail fungus, soak nails in a mixture of pau d'arco and goldenseal. In a wide pan, make pau d'arco tea using 6 tea bags and a gallon of water. Bring to a boil, then allow to cool to a very warm but tolerable temperature. Add the contents of 4 capsules of goldenseal. Soak your feet or hands in this mixture for fifteen minutes twice a day.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Tea tree oil is a natural antifungal for external use. It can be applied to the affected area several times a day, either full strength or diluted with distilled water or cold-pressed vegetable oil. For trichomonal vaginitis or vaginal candidiasis, apply a few drops of the oil on a tampon, or mix it with water and use it as a douche. You can also use black walnut extract.

Wild oregano oil is a powerful antifungal agent that has the ability to destroy even resistant forms of fungi.

### Recommendations

Eat a diet of 60 to 70 percent raw foods. Eat plenty of fresh vegetables and moderate amounts of broiled fish and broiled skinless chicken.

Do not eat any foods containing sugar or refined carbohydrates. Fungi thrive on sugar.

Eliminate those foods from the diet that tend to promote secretion of mucus, especially meat and dairy products.

Avoid cola drinks, grains, processed foods, and fried, greasy foods.

See FASTING in Part Three and follow the program.

Keep the skin clean and dry. Expose the affected area to the air as much as possible.

Wear clean cotton clothing and underwear. Do not wear clothing or use towels more than once without wash-

ing them, preferably in hot water with chlorine bleach added.

To replace necessary "friendly" bacteria in the colon, use a *B. bifidus* retention enema. (See ENEMAS in Part Three.)

Try not to allow an infected area of the body to come in contact with healthy skin. People who have fungal infections in one area often also have infections in other areas.

If you are nursing a baby and your baby has thrush, or you develop sharp, shooting pains during feedings, or both, consult both your child's and your own health care provider. You may have a fungal infection. Both you and your baby should be treated to ensure a cure.

To treat ringworm, use a sterile pad and apply colloidal silver to the affected area. Hands and feet can also be soaked in this solution, a natural antibiotic that destroys some 650 different microorganisms.

For ringworm, mix ½ clove crushed garlic with ¼ cup vegetable oil. Coat the affected area with honey, then apply the garlic mixture (avoid healthy skin). Cover loosely with sterile gauze that allows air to penetrate. Leave in place for four hours.

If you have been treating a fungal infection on your own and you develop symptoms of a worsening infection, such as increased redness and swelling or fever, consult your physician. You may have developed a bacterial infection on top of the fungal infection.

For fungal infections underneath the fingernails, soak your nails in a mixture of 50 percent white distilled vinegar and 50 percent pure water for ten to twenty minutes daily.

### Considerations

There are numerous topical antifungal preparations available in drugstores.

See also ATHLETE'S FOOT; CANDIDIASIS; and/or YEAST INFECTION in Part Two.

### GALLBLADDER DISORDERS

The gallbladder is a three- to four-inch-long pear-shaped organ located on the right side of the body, directly under the liver. One of the functions of the liver is to remove poisonous substances from the blood so that they can be expelled from the body. The liver excretes all these gathered toxins mixed with a digestive agent called bile. Bile also contains cholesterol, bile salts, lecithin, and other substances. The bile—about one pint of it every day—goes first to the gallbladder, which holds it until food arrives in the small intestine. The gallbladder then releases the bile, which passes through the cystic and bile ducts into the small intestine. Ultimately, the toxins are passed out of the body through the feces.

Abnormal concentration of bile acids, cholesterol, and phospholipids in the bile can cause the formation of gall-

stones. The presence of gallstones is known to doctors as cholelithiasis. It has been estimated that over 25 million Americans have gallstones and almost 1 million new cases are diagnosed each year. As many as one in ten people might have gallstones without knowing it. However, if a stone is pushed out of the gallbladder and lodges in the bile duct, this can cause nausea, vomiting, and pain in the upper right abdominal region. These symptoms often arise after the individual has eaten fried or fatty foods.

Gallstones can range from the size of a tiny grain of sand to larger than a pea-sized mass. More than 75 percent of gallstones are cholesterol stones, with the remaining being pigment stones. Pigment stones are composed of calcium salts. Although the cause of pigment stones is unknown, factors such as intestinal surgery, cirrhosis of the liver, and blood disorders can increase the rate risk.

The presence of gallstones creates a possibility that cholecystitis, or inflammation of the gallbladder, may develop. This can cause severe pain in the upper right abdomen and/or across the chest, possibly accompanied by fever, nausea, and vomiting. Other symptoms of gallbladder disease include constant pain below the breastbone that shoots into the right or left shoulder area and radiates into the back.

The pain can last from thirty minutes to several hours. The urine may be tea- or coffee-colored, and there may be shaking, chills, and jaundice (a yellowish discoloration of the skin and eyes). Gallbladder attacks often occur in the evening and can take place sporadically. Abdominal pain that occurs on a daily basis might be a problem unrelated to the gallbladder. A gallbladder attack may mimic a heart attack, with severe pain in the chest area. Biliary dyskinesia is a condition in which all the symptoms of gallbladder disease are present, but there are no stones.

Inflammation of the gallbladder requires immediate treatment. If left untreated, it can be life-threatening. If you experience pain in your upper abdomen that lasts for more than an hour, your doctor may recommend an ultrasound to confirm signs of gallbladder disease.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Alfalfa		See under Herbs, below.
Essential fatty acid complex or Kyolic-EPA from Wakunaga	As directed on label.	Important constituents of every living cell. Needed for repair and prevention of gallstones.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	A fat emulsifier; aids digestion of fats.
L-glycine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg	Essential for the biosynthesis of nucleic and bile acids. (See AMINO ACIDS in Part One.)

	vitamin C for better absorption.	
Magnesium	400 mg daily.	Magnesium may reduce insulin levels that are associated with gallbladder disease.
Multienzyme complex with ox bile (D.A. #34 from Carlson Labs)	As directed on label. Take before meals.	Aids in digestion if too little bile is secreted from the gallbladder. Ox bile is needed especially if you have had gallbladder removal surgery. <i>Caution:</i> Do not give this supplement to a child. If you have a history of ulcers, do not use a formula containing HCl.
Taurine Plus from American Biologics	As directed on label.	Necessary for the formation of an important bile acid and may prevent the formation of gallstones. Use the liquid form.
Vitamin A with carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for repair of tissues. Use emulsion form for easier assimilation.
Vitamin B complex plus extra vitamin B <sub>12</sub> and choline and inositol	50 mg 3 times daily, with meals. 2,000 mcg daily. 500 mg daily. 500 mg daily.	All B vitamins are necessary for proper digestion. Use a high-potency formula. Important in cholesterol metabolism and liver and gallbladder function.
Vitamin C with bioflavonoids	3,000 mg daily.	Deficiency can lead to gallstones.
Vitamin D	400 IU daily.	Gallbladder malfunction interferes with vitamin D absorption.
Vitamin E	200 IU daily.	Prevents fats from becoming rancid. Use d-alpha-tocopherol form.

### Herbs

Alfalfa cleanses the liver and supplies necessary vitamins and minerals. Twice a day for two days, take 1,000 milligrams in tablet or capsule form with a glass of warm water.

Fumitory (*Fumaria officinalis*) has long been used in traditional medicine to treat liver disorders. Research has shown that it does stimulate the flow of bile. However, this antispasmodic contains many alkaloids and is toxic in large doses. Dry extracts found as capsules, tablets, or drops are available, especially in Europe. It is recommended that these be taken before meals. If the dried leaves are available, a tea can be made by pouring ½ cup of boiling water over 1 to 2 teaspoons of fumitory. Steep for ten minutes, strain, and drink at least one-half hour before meals.

*Caution:* Consult with your physician before using fumitory.

Peppermint oil capsules are used in Europe to cleanse the gallbladder.

If you have gallstones, or are prone to developing them, turmeric can reduce your risk of further problems.

❑ Other beneficial herbs include barberry root bark, catnip, cramp bark, dandelion, fennel, ginger root, parsley, and wild yam.

### Recommendations

- ❑ If you have an attack, drink 1 tablespoon of apple cider vinegar in a glass of apple juice. This should relieve the pain quickly. If the pain does not subside, go to the emergency room to rule out other disorders such as gastroesophageal reflux disease (GERD) or heart problems.
- ❑ For inflammation of the gallbladder, eat no solid food for a few days. Consume only distilled or spring water. Then drink juices such as pear, beet, and apple for three days. Then add solid foods: shredded raw beets with 2 tablespoons of olive oil, fresh lemon juice, and freshly made uncooked applesauce made in a blender or food processor. Apple juice aids in softening gallstones.
- ❑ For gallstones, take 3 tablespoons of olive oil with the juice of a lemon before bed and upon awakening. Stones are often passed and eliminated in the stool with this technique—look for them. You can substitute grapefruit juice if desired.
- ❑ To relieve acute pain, call your doctor. You can ask him or her about using hot castor oil packs on the gallbladder area. Place castor oil in a pan and heat but do not boil it. Dip a piece of cheesecloth or other white cotton material into the oil until the cloth is saturated. Apply the cloth to the affected area and cover it with a piece of plastic that is larger in size than the cotton cloth. Place a heating pad over the plastic and use it to keep the pack warm. Keep the pack in place for one-half to two hours, as needed.
- ❑ Eat a diet consisting of 75 percent raw foods. Include in the diet applesauce, eggs, yogurt, cottage cheese, broiled fish, fresh apples, and beets.
- ❑ Eat protein from vegetable sources. This is particularly important for men. The iron (called heme) in meats (fish, poultry, and beef) accumulates in men and is associated with a 20 percent increased risk of gallbladder disease. Postmenopausal women would also likely benefit from eating a diet low in animal products.
- ❑ The kind of dietary fat consumed also is important. In one study, those who ate polyunsaturated and monounsaturated fats, while maintaining a healthy weight, had an 18 percent reduction in risk of developing gallstones.
- ❑ To cleanse the system, consume as much pure apple juice as possible for five days. Add pear juice occasionally. Beet juice also cleanses the liver.
- ❑ Avoid sugar and products containing sugar. People who consume an excessive amount of sugar are much more likely to form gallstones. Avoid all animal fat and meat, saturated fats (found primarily in meat), full-fat dairy products, fried foods, spicy foods, margarine, soft drinks, commercial oils, chocolate, and refined carbohydrates.

- ❑ While you have pain, nausea and/or vomiting, and fever, follow a fasting program and use coffee enemas for a few days. The coffee enema is important. You can also use garlic in the enema. (See ENEMAS and FASTING in Part Three.)
- ❑ A detoxification program for the liver and colon is important for improved gallbladder function. Use cleansing enemas if you have chronic problems.
- ❑ Do not overeat. Obesity and gallbladder disease are related. Females age forty and over who are overweight and who have had children are more likely than most people to suffer from disorders of the gallbladder.

### Considerations

- ❑ Rapid weight changes can cause gallbladder problems. A study published in the *Annals of Internal Medicine* revealed that “yo-yo” dieting—repeatedly losing and gaining weight due to dieting—increases the risk of gallstones and the necessity for surgery by as much as 70 percent.
- ❑ The recommended treatment for gallstones used to be surgical removal of the gallbladder. However, if gallstones show up on an X-ray but do not cause symptoms, there may be no need for surgery.
- ❑ A gallstone may slip into a bile duct, one of the structures that drain the gallbladder and the liver. If this occurs, extraction or surgical removal by a technique called laparoscopic cholecystectomy may be necessary. Also known as keyhole surgery, this is now the most common method of removing the gallbladder. The surgeon uses a trocar (a hollow tube) and enters the abdomen through the navel. Three more of these tubes are inserted into the abdomen so that instruments can be inserted through them. The surgeon inserts a laparoscope (a small camera) through one of these tubes, so that he or she can see inside the patient without the large incision normally required to remove a gallbladder. The procedure requires four small incisions in total, instead of a single six- to nine-inch incision, and recovery time is greatly reduced. However, research from Washington University suggests that people with a history of gallbladder inflammation or ten or more gallbladder attacks, or who are over sixty-five years of age, may be more likely to have complications with this type of surgery. The risk is mitigated if your surgeon is adept at the procedure. If complications do arise after surgery, this may be because the gallbladder was not in fact the source of the initial problem, or because of a bile leak.
- ❑ Sometimes stones in the gallbladder can be fragmented or dissolved without surgery, using the drug deoxycholic acid or lithotripsy (the use of sound waves to break up stones). Bile acid preparations used to dissolve stones work very slowly and can be used only on small stones.
- ❑ Eighty percent of gallstones produce no symptoms and require no treatment. Discuss any recommended treatment

with your doctor and surgeon and make sure an operation is absolutely necessary before proceeding.

- Physical activity may reduce the risk of gallstones.
- A study reported in the *Journal of the American Medical Association* found that drinking three cups of coffee a day might lower men's (and possibly women's) risk of developing gallstones. However, it is not recommended that you start drinking more coffee due to the results of one study.
- People with pigment stones, which consist of calcium salts, should probably avoid using calcium supplements, although some researchers believe it is all right for them to continue taking calcium supplements.
- In one study, men who took 400 milligrams per day of magnesium had 33 percent less chance of developing gallbladder disease compared to men who took less than 288 milligrams a day. The magnesium can come from food or supplements.
- Gallstones run in families, and women are twice as likely to form gallstones as men.

**GANGRENE**

Gangrene is a condition in which body tissues die, and ultimately decay, as a result of an inadequate oxygen supply. It can affect any body part, but most frequently affects extremities—the toes, feet, fingers, hands, and arms. Gangrene of the internal organs is especially dangerous.

There are two types of gangrene: wet gangrene and dry gangrene. Wet gangrene is the result of a wound or injury that becomes infected with bacteria. The infection prevents adequate venous drainage, depriving the area of needed blood supply and oxygen. The disruption in oxygen supply in turn promotes the infection. Symptoms of wet gangrene include severe and rapidly worsening pain, swelling, and tenderness in the area. As the infection progresses, the affected tissue changes color, usually from pink to deep red to gray-green or purple. Left untreated, wet gangrene can lead to shock and death in a matter of days. Fortunately, careful hygiene can usually prevent this type of gangrene.

Dry gangrene does not involve bacterial infection. It is caused by stopped or reduced blood flow, which results in oxygen-deprived tissue. Reduced blood flow may be caused by injury, hardening of the arteries, poor circulation, diabetes, or blockage in a blood vessel. The condition most often occurs in the feet and toes. Symptoms of the most common type of dry gangrene are a dull, aching pain and coldness in the area. Pain and pallor of the affected area are early signs.

Sometimes gangrene is caused by frostbite. In frostbite, the oxygen-deprived area dies, but the gangrene does not spread to any other area. As the flesh dies, it may be painful, but once the skin is dead, it becomes numb and slowly darkens.

The risk of developing gangrene is higher than normal

for people with diabetes, who smoke or drink excessively, or who have poor circulation in general. Proper nutrition and a healthy lifestyle decrease the likelihood of developing gangrene and also aid in recovery should you require surgery for this condition.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	100 mg 3 times daily.	Enhances oxygen utilization by affected tissue.
Dioxychlor	As directed on label.	Antiviral, antifungal, and antibacterial. Assists the immune system in defending against invading microorganisms, with little or no toxicity to normal tissues.
Garlic (Kyolic from Wakunaga)	As directed on label.	Speeds healing and increases circulation. Cleanses the blood. Use the liquid form.
Methylsulfonylmethane (MSM)	As directed on label.	Aids in the healing of injuries and can help to detoxify the body on a cellular level. It has also been found to be an aid to the organs, connective tissue, and immune functions.
plus vitamin C with bioflavonoids	5,000–20,000 mg daily. (See ASCORBIC ACID FLUSH in Part Three.)	For tissue repair and improved circulation. Improves the benefits of MSM.
Silicon (JarroSil from Jarrow Technologies)	As directed on label.	Needed for skin and tissue repair.
<i>Very Important</i>		
Liquid chlorophyll	As directed on label.	A source of minerals, enzymes, and vitamins. Also used as a blood detoxifier and nutrient.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Powerful antioxidants that help to improve circulation and boost the immune system.
Essential fatty acids (flaxseed oil, primrose oil, or salmon oil)	As directed on label.	Protects and aids in the repair of new tissues and cells.
Free form essential amino acid plus extra L-arginine	As directed on label.	For repair of tissues.
	As directed on label.	Facilitates natural synthesis of nitric oxide, which promotes healthy blood vessels.

*Note:* Do not use if you are pregnant or have cataracts, colitis, or a viral infection such as herpes.

Kyo-Green from Wakunaga	As directed on label.	Acts as a blood cleanser and builds up the blood supply.
Micellized Vitamin A and E from American Biologics	As directed on label.	Vitamin A is essential for tissue repair; vitamin E (see below) improves circulation. Both enhance immune function. Use emulsion form for easier assimilation and safety at higher doses.
Proteolytic enzymes	As directed on label. Take with meals and between meals.	Aids in damaged tissue "cleanup" and repair. <i>Caution:</i> Do not give this supplement to a child under sixteen years of age.
Vitamin E	200 IU daily.	Improves circulation. Use d-alpha-tocopherol form.
<b>Important</b>		
Kelp	1,000–1,500 mg daily.	A rich source of chlorophyll and minerals good for circulation. A blood cleanser.
<b>Helpful</b>		
Aerobic 07 from Aerobic Life Industries	As directed on label. Also apply a few drops directly on the affected area.	A stabilized oxygen product. Kills infecting bacteria.
Beta-1,3-D-glucan	As directed on label.	Helps to recruit immune T cells to the site of infection and aids in the growth of new blood vessels.
Calcium and magnesium	2,000 mg daily. 1,000 mg daily.	For connective tissue repair. Dilates blood vessels, improving blood flow. Needed to balance with calcium.
Multivitamin and mineral complex with potassium	As directed on label.	All nutrients are necessary for healing. Helps reduce tissue swelling.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Speeds healing. Necessary for tissue repair and immune function. Use zinc gluconate lozenges or zinc methionate (OptiZinc) for best absorption.

## Herbs

- Butcher's broom is important for circulation.
- Bromelain and turmeric (curcumin) are good for reducing swelling and inflammation.
- Olive leaf is good for fighting infections.
- Other beneficial herbs include bayberry, cayenne (capsicum), echinacea, ginkgo biloba, goldenseal, and red seal.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

- Eat a high-protein, high-calorie diet to promote fast tissue repair.
- Include in the diet foods that are high in germanium, such as garlic, shiitake mushrooms, and onions. Germanium helps to improve tissue oxygenation.
- Drink six to eight 8-ounce glasses of quality water (preferably steam-distilled) every day.
- Add "green drinks" made from vegetables to your diet. (See JUICING in Part Three.)
- If you smoke, stop. Avoid all contact with tobacco.
- If you have diabetes, be vigilant in your treatment.
- If an injured area becomes red, swollen, and painful, or develops an odor, see your health care practitioner without delay.

## Considerations

- The only treatment for established gangrene is surgical removal of the affected area.
- For wet gangrene, treatment with antibiotics and surgical removal of the dead tissue are usually necessary. Hyperbaric oxygen therapy may be employed as well. (See HYPERBARIC OXYGEN THERAPY in Part Three.)
- Slowly developing dry gangrene may be reversed by arterial surgery. Chelation is an alternative. (See CHELATION THERAPY in Part Three.) If an acute arterial obstruction is involved, emergency surgery must be performed.
- See also ARTERIOSCLEROSIS and CIRCULATORY PROBLEMS in Part Two.
- Raynaud's syndrome, a condition that affects the small arteries of the fingers and toes, can lead to gangrene if not treated. See RAYNAUD'S DISEASE/RAYNAUD'S PHENOMENON in Part Two for a more complete discussion of this condition.

## GAS

See HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE (GERD); INDIGESTION (DYSPEPSIA). See also under PREGNANCY-RELATED PROBLEMS.

## GASTROENTERITIS

See FOODBORNE/WATERBORNE ILLNESS. See also under INFLUENZA.

## GASTROESOPHAGEAL REFLUX DISEASE (GERD)

See HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE (GERD).

## GERMAN MEASLES (RUBELLA)

German measles, or rubella, is a contagious viral disease that generally produces mild symptoms but is potentially dangerous to a fetus if a pregnant woman contracts the disease during the first trimester. Before a rubella vaccine was developed in the late 1960s, thousands of babies in the United States were born with severe birth defects because their mothers were exposed to the virus. Today, most children receive a vaccine (the MMR vaccine) that protects against measles, mumps, and rubella, but the virus exists worldwide and outbreaks still occur sporadically, usually in large population areas.

German measles mostly affects children, adolescents, and young adults. It initially causes swelling of the lymph glands in the neck and behind the ears. Other symptoms include coughing, fatigue, headache, mild fever, muscle aches, and stiffness, mainly in the neck. A pink rash often develops, usually starting on the face and neck and then spreading to the rest of the body. The rash typically lasts for about three days, thus the old name *three-day measles*. The virus usually runs its course in five to seven days, and is generally not treated since the patient gradually gets well. A person who has had German measles has a lifetime immunity against the virus. This disease is *not* related to regular measles and is caused by a different virus.

The communicable period probably begins two to four days before the rash appears, and the virus most often disappears from the nose and throat by the time the rash on the body disappears, one to three days after the onset of symptoms. However, because of the danger it poses to pregnant women, German measles should be considered contagious from one week before the rash appears until one week after the rash fades.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Bio-Strath from Nature's Answer	As directed on label.	Acts as a tonic. Contains the vitamin B complex. Use the liquid form.
Calcium and magnesium	As directed on label.	Needed for tissue repair.
	As directed on label.	

Essential fatty acids (flaxseed oil, Kyolic-EPA from Wakunaga, primrose oil, or salmon oil)	As directed on label.	Helps prevent scarring and promotes healing of tissue cells.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Improves immune function.
Kyo-Dophilus from Wakunaga	As directed on label.	Aids in normal bowel function. Allows survival and rapid passage of "friendly" bacteria through the stomach into the small intestine. Use a dairy-free, yeast-free formula.
Micellized Vitamin A and E from American Biologics	As directed on label.	Supplies vitamins A and E, needed to reduce infection and repair tissues. For a child under ten, substitute cod liver oil.
Proteolytic enzymes	As directed on label. Take on an empty stomach. Also take between meals.	Reduces infection and aids digestion. <i>Caution:</i> Do not give this supplement to a child.
Raw thymus glandular plus adrenal glandular	500 mg twice daily.	To stimulate the immune system. <i>Caution:</i> Do not give these supplements to a child.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Very important for immune function. Controls fever and infection. Has antiviral properties. Use ascorbate or esterified form.
Zinc lozenges	1 15-mg lozenge 3 times daily for 4 days. Then reduce to 1 lozenge daily. Use this dosage for adults and for children over five.	For immune response and tissue repair.

### Herbs

- If necessary, catnip tea or garlic enemas can be used to lower fever. (See ENEMAS in Part Three.)
- Clove and peppermint tea are useful in relieving symptoms.
- Alcohol-free goldenseal extract, placed directly under the tongue, aids in destroying bacteria and viruses and also relieves coughing. Use 3 drops for a child from three to ten years of age; for an adult or a child over ten, use one drop-perful. Hold the extract under the tongue for a few minutes, then swallow. Repeat this three times daily for three days. As an alternative, use an echinacea and goldenseal combination extract, available in health food stores. Echinacea is good for the immune response.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardio-

vascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Take ½ teaspoon of lobelia extract every four to five hours for pain.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Maitake, reishi, and shiitake mushrooms are all effective in boosting the body's immune system.

Olive leaf extract is good for reducing symptoms and controlling the virus.

### Recommendations

Drink plenty of fluids such as water, juices, and vegetable broths.

Avoid processed foods.

Rest until the rash and fever have disappeared.

Avoid contact with healthy individuals, especially women of childbearing age and their children, until one week after the rash disappears.

Do not give aspirin to a child with German measles. See REYE'S SYNDROME in Part Two.

### Considerations

Antibiotics are useless against viruses, so they are not called for in the treatment of German measles.

A person infected with German measles should be kept isolated in a dimly lit room. Extra care should be taken if a rash breaks out close to the eyes. Be sure your child does not go to school.

A woman who has had German measles will pass immunity to any child she has for the first year of his or her life.

Immunity to German measles can be determined by a blood test. Any woman who wishes to become pregnant and who is not sure whether she has achieved immunity to German measles should be tested and vaccinated, if necessary. Pregnancy must then be avoided for at least three months following immunization.

It is a good idea for any woman who is (or who may be) pregnant to take precautions to avoid exposure to anyone who has, or has recently been exposed to, German measles. A pregnant woman who suspects she may have been exposed to German measles and who knows she has not achieved immunity (either through vaccination or from having the disease) should consult her doctor immediately concerning a gamma-globulin injection. If given soon after exposure, gamma-globulin may reduce the severity of the

illness or even prevent it from developing, although it is not known how effective this approach is.

Many doctors believe that children should be immunized against German measles at about fifteen months of age and again a few years later. Non-pregnant women of childbearing age also should be immunized. People who should not be immunized include women who may be pregnant and individuals with impaired immune function, such as those with AIDS or cancer, or those currently taking cortisone or anticancer drugs or undergoing radiation therapy. Those with an illness that causes a fever should defer vaccination until healthy.

### GIGANTISM

See under GROWTH PROBLEMS.

### GINGIVITIS

See under PERIODONTAL DISEASE.

### GLAUCOMA

Glaucoma is a group of diseases that affect the optic nerve and can lead to irreversible vision loss. It is usually, but not always, associated with elevated fluid pressure within the eye. All forms of glaucoma can cause damage to the optic nerve and lead to vision loss, even blindness, if left untreated.

More than 2 million Americans have been diagnosed with glaucoma and as many as 2 million more could have it and not yet know. It is the second leading cause of blindness, and is expected to become more prevalent in years to come due to the growing population of older adults. Those at greatest risk are people over the age of sixty; people of African ancestry; and people with diabetes, high blood pressure, severe myopia (nearsightedness), or a family history of glaucoma. Smokers also have an elevated risk, as do those who have sustained eye injuries or who have used steroids for an extended period of time.

Open-angle glaucoma is the most common form of the disease; it is estimated that 4 million people have it. Yet because this disorder causes no symptoms until it is quite advanced, only about half of those who have it are aware of it. In open-angle glaucoma, there is no physical blockage and the structures of the eye appear normal, but the drainage of fluid nevertheless is inadequate to keep the intraocular pressure at a normal level. The most pronounced symptoms of open-angle glaucoma are the gradual loss or "darkening" of peripheral vision and a marked decrease in night vision or the ability of the eye to adjust to darkness. Peripheral vision is the ability to see "out of the corner of the eye." The loss of this ability leaves a person with "tunnel vision." Other possible symptoms include chronic low-grade headaches (often mistaken for tension headaches),

the need for frequent changes in eyeglass prescription, and/or seeing halos around electric lights.

A far less common, yet more serious, form of glaucoma is closed-angle glaucoma. Closed-angle glaucoma is much more insidious than open-angle forms because it almost never manifests any symptoms until very late in the condition. By that time, vision may be irreversibly damaged.

Attacks of this type of glaucoma occur when the channels through which the eye's fluids drain suddenly become constricted or obstructed. This is usually due to narrowing or hardening of the exit channels from the eyes, and it results in extreme pain, poor vision, and even blindness. It is considered a medical emergency. Early warning signs that a problem may be developing include eye pain or discomfort mainly in the morning, blurred vision, seeing halos around lights, and inability of the pupils to adjust to a dark room. Symptoms of the acute attack itself include throbbing eye pain and loss of sight, especially peripheral vision; pupils that are fixed in a mildly dilated condition and do not respond to light properly; and a sharp increase in the pressure in the inner eye, especially on one side. These symptoms come on very rapidly and may be accompanied by nausea and even vomiting. Permanent vision damage can occur in as little as three to five days, making treatment within the first twenty-four to forty-eight hours imperative.

In some cases, glaucoma manifests itself even though there is normal fluid pressure within the eye. This form of glaucoma is called normotensive (normal-tension) glaucoma, or NTG. With this condition, the optic nerve is damaged and vision is impaired much the same way as in open-angle glaucoma, but without the increased fluid pressure. This has led many researchers to shift their focus in recent years to the optic nerve itself. Mechanisms other than pressure may cause changes in the eye that can cause damage to the optic nerve.

Glaucoma probably has many causes. Many scientists believe it may be closely linked to stress and nutritional problems, or disorders such as diabetes and high blood pressure. Some suspect that excessive amounts of glutamic acid, a nonessential amino acid also known as glutamate, may be involved. Glaucoma has also been linked with a deficiency in nitric oxide, a molecule that is critical for healthy blood vessels. Problems with collagen, the most abundant protein in the human body, have been linked to glaucoma.

Collagen acts to increase the strength and elasticity of tissues in the body, especially those of the eye. Collagen and tissue abnormalities at the back of the eye contribute to the "clogging" of the tissues through which intraocular fluid normally drains. The result is elevated inner eye pressure that leads to glaucoma and related vision loss. Conditions characterized by errors of collagen metabolism are frequently associated with eye disorders.

Experts now believe that a simple pressure test is inadequate for diagnosis of glaucoma. An eye exam should also

include a close examination of the optic nerve itself while the pupil is dilated, plus a test of the peripheral vision to see if any vision loss has occurred. People who are at risk for glaucoma should be tested frequently so that any loss of peripheral vision can be documented early.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Choline and inositol or lecithin	1,000–2,000 mg daily.  As directed on label.	Important B vitamins for the eyes and brain.  A good source of choline and inositol.
Essential fatty acids (flaxseed oil, Kyolic-EPA from Wakunaga, primrose oil, or salmon oil)	As directed on label. Take with meals.	Protects and aids repair of new tissues and cells.
Glutathione	500 mg twice daily, on an empty stomach. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A powerful antioxidant that protects the lens and maintains the molecular integrity of the lens fiber membranes.
Rutin	50 mg 3 times daily.	An important bioflavonoid that works with vitamin C and aids in reducing pain and intraocular pressure.
Vitamin A  plus carotenoid complex with lutein and zeaxanthin	50,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.  As directed on label.	Needed for good eyesight. Essential in formation of visual purple, the substance necessary for night vision.
Vitamin B complex  plus extra vitamin B <sub>5</sub> (pantothenic acid)	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).  100 mg 3 times daily.	B vitamins work best when taken together. Use a sublingual form or injections (under a doctor's supervision). Whenever stress is a factor, B-complex injections are a good idea. Antistress vitamin needed for the adrenal glands, and an essential constituent of coenzyme A, needed for many vital metabolic processes.
Vitamin C with bioflavonoids	10,000–15,000 mg daily, in divided doses. Under a doctor's supervision, you can increase the dose to 30,000 mg daily.	Reduces intraocular pressure.
Vitamin E plus	200 IU daily.	Helpful in removing particles from the lens of the eye. Has antioxidant properties to protect the lens and other eye tissues. Use d-alpha-tocopherol form.
L-arginine	As directed on label.	Facilitates natural synthesis of nitric oxide, which promotes healthy blood vessels.

*Note:* Avoid arginine if you are pregnant or have cataracts, colitis, or a viral infection such as herpes.

Helpful		
Alpha-lipoic acid	150 mg daily.	An important antioxidant. Improves visual functions.
Magnesium	500–1,000 mg daily.	Dilates blood vessels, enhancing flow to the eyes.
Multivitamin and mineral complex with selenium	As directed on label. 200 mcg daily.	All nutrients are needed to aid in healing and to reduce intraocular pressure. A potent antioxidant that works with vitamin E.
Taurine Plus from American Biologics	As directed on label.	An antioxidant that protects the lens of the eye.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Essential in activating vitamin A from the liver. Very beneficial in glaucoma therapy. Use zinc sulfate form.

## Herbs

- Bilberry contains flavonoids and nutrients needed to protect the eyes from further damage. Fresh blueberries and red raspberry leaf can be used also.
- Chickweed and eyebright are good for all eye disorders.
- Coleus forskohli*, an Ayurvedic herb, has been shown to reduce eye pressure.
- Eye baths using warm fennel tea, alternating with chamomile and eyebright, are helpful. Or use an eye dropper and apply three drops to each eye three times a day. Always dilute any herbal preparations used in the eyes with high-quality water.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- A combination of ginkgo biloba extract and zinc sulfate may slow progressive vision loss.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Jaborandi is a rain-forest herb that contains pilocarpine, used for more than 120 years to relieve intraocular pressure in glaucoma.

*Caution:* Do not use this herb if you have pleurisy, are nursing, or have excess fatty tissue around the heart.

- Rose hips supply valuable flavonoids and vitamin C.
- Completely avoid the herb ephedra (ma huang), no longer legally sold in the United States, and licorice.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

## Recommendations

- Follow the supplementation program outlined above.
- Exercise regularly. Research has shown that people with open-angle glaucoma who exercise at least three times a week may reduce intraocular pressure. If they stop exercising, the pressure again begins to build up. Exercise does not appear to have the same benefits for people with closed-angle glaucoma.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Control blood pressure and blood sugar levels through diet and exercise, if they are elevated.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- If your ophthalmologist recommends medication to control glaucoma and it is working to your satisfaction, continue to use it faithfully. Also take vitamin C in high doses, but only under supervision.
- If you are using eye drops to reduce intraocular pressure, make sure you know how to administer the eye drops properly to ensure that your eyes receive a sufficient amount of the medication. If improperly administered, eye drops can roll off the eye, spill down your cheek, or even get absorbed into your own tear duct. It can be difficult to gauge how effective you are at administering your own eye drops. Ask your ophthalmologist for help in finding the best method. It also helps to occasionally have someone watch you administer the drops to make sure they are getting into the eye. It is also a good idea to close your eye gently for a minute or two after administering eye drops to give time for the medication to be absorbed.
- Avoid prolonged eye stress such as watching television, reading, and using a computer for long periods. If you must engage in close work for any length of time, take periodic "focus breaks." Every twenty minutes or so, raise your eyes and focus on something in the distance for a minute or so.
- Avoid tobacco smoke, coffee, alcohol, nicotine, and all caffeine.
- Drink only small amounts of liquid at any given time.
- Avoid taking high doses of niacin (over a total of 200 milligrams daily).

## Considerations

- There is no cure for glaucoma, and any damage to vision is irreversible. Chronic open-angle glaucoma can often be controlled through the use of medication, usually in the form of eye drops. Several types of these medications are available. Often an ophthalmologist has to experiment a little to find the specific one that works most effectively

for a particular individual. However, many people with glaucoma find that the eye drops cause severe headaches and other side effects. This problem can often be alleviated by changing the prescription. If headaches persist, it may help to adjust the schedule for taking the medication so that it interferes with normal activities as little as possible.

❑ Several studies have shown that smoking marijuana can help reduce intraocular pressure. However, marijuana is not recommended in the treatment of glaucoma for a variety of reasons, not least of which is its illegal status. Marijuana tends to increase the heart rate and lower blood pressure, which could compromise blood flow to the optic nerve. Also, the mechanisms by which marijuana lowers intraocular pressure are not fully understood, nor has it been shown that marijuana can work as safely and effectively as many FDA-approved drugs currently on the market.

❑ If eye drops fail to control intraocular pressure, a doctor may use a procedure called argon laser trabeculoplasty, or ALT. With this technique, a laser beam makes tiny holes in the meshwork through which the aqueous fluid normally drains, opening up blocked drainage channels.

❑ A technique called selective laser trabeculoplasty, or SLT, is used to lower pressure inside the eye. The outpatient procedure works by activating only pigment-containing cells, which through a series of events causes the release of cytokines that lead to microphage recruitment, along with other changes, to lower the pressure within the eye. SLT can zero in on specific cells without causing thermal damage to surrounding tissue; thus it can be repeated if necessary. The older argon laser therapy can be used only twice in a lifetime due to collateral damage.

❑ Surgery has certain advantages over medication, such as reduced out-of-pocket costs. However, it has disadvantages as well. An estimated 60 to 80 percent of people who undergo surgery for glaucoma experience improvement, although the procedure may have to be repeated.

❑ For acute closed-angle glaucoma attacks, surgery is usually necessary. Even though only one eye may be affected initially, the ophthalmologist performing the surgery will likely recommend that you have the surgical procedure on both eyes to prevent a second attack.

❑ The conventional treatment for acute closed-angle glaucoma is to immediately reduce eye pressure by employing an osmotic diuretic agent, followed by surgery. These osmotic agents (applied as eye drops) almost always act immediately to alleviate symptoms. However, surgery is still recommended because without it, the attacks are likely to recur, and each attack can cause additional irreversible vision damage. Using only osmotic agents can lull a person into thinking that his or her condition is improving while in fact it is worsening rapidly.

❑ Agents that act to dilate the pupils, such as belladonna, should be avoided at all costs.

❑ Vitamin C supplementation has been demonstrated to lower intraocular pressure in several clinical studies. Nearly normal tension levels have been achieved in some people who were unresponsive to conventional therapies. Intravenous administration of vitamin C has yielded even greater initial pressure reduction, but close monitoring by a physician is necessary to determine the required dosage. The role vitamin C plays in collagen formation may be the key to its action.

❑ Bioflavonoid supplementation prevents the breakdown of vitamin C in the body before it is metabolized. It also improves capillary integrity and stabilizes the collagen matrix by preventing free radical damage. The bioflavonoid rutin is known to help in lowering ocular pressure when used in conjunction with conventional drugs. Bilberry extract is particularly rich in this beneficial flavonoid compound. It is also good for diabetic retinopathy.

❑ Corticosteroids can induce glaucoma by destroying collagen structures in the eye. If you must take corticosteroids, you should take the smallest amount possible and for the shortest possible time. If you have glaucoma, you should avoid these medications entirely.

❑ There are many types of glaucoma medications available. Most are in eye drop form and are administered several times a day. Types of medications your doctor may prescribe include:

- Miotics, which increase the outflow of aqueous (liquid) from the eye. Examples include pilocarpine (Isopto Carpine, Pilopine, and others) and carbachol (Carboptic or Isopto Carbachol).
- Beta-blockers, which can reduce the amount of aqueous humor produced in the eye. Examples include betaxolol (Betoptic) and timolol (Timoptic-XE).
- Carbonic anhydrase inhibitors and alpha-adrenergic agonists, which also work to reduce the amount of aqueous humor. Examples include acetazolamide (Sequels, Diamox, and others) and dorzolamide (Trusopt).
- Prostaglandin analogs, which work near the drainage area of the eye to increase the secondary route of aqueous outflow to lower pressure. Travoprost (Travatan) is one such drug.

❑ Many of the same medications used to treat open-angle glaucoma are also used to treat closed-angle glaucoma. Several medications that help to reduce intraocular pressure can have potentially serious side effects, such as headaches or respiratory problems.

❑ Beta-blocking eye drops, which are often prescribed for people with glaucoma, have some undesirable side effects. Talk to your doctor if you experience any ill effects.

❑ Some laser surgery treatments are being used to improve fluid drainage in the eyes, frequently in conjunction with other medications. Other surgical procedures have a

fairly high success rate, but are usually used only when traditional medications fail.

❑ The best way to prevent vision loss due to glaucoma is to receive regular eye exams from a qualified ophthalmologist—especially if you fall into one of the risk categories mentioned earlier in this section.

❑ For names and addresses of organizations that can provide additional information about glaucoma, see Health and Medical Organizations in the Appendix.

**GLOMERULONEPHRITIS**

See under KIDNEY DISEASE (RENAL FAILURE).

**GOUT**

Gout is a common type of arthritis that occurs when there is too much uric acid (sodium urate) in the blood, tissues, and urine. Uric acid is the end product of the metabolism of a class of chemicals known as purines. In people with gout, the body does not produce enough of the digestive enzyme uricase, which oxidizes relatively insoluble uric acid into a highly soluble compound. As a result, uric acid accumulates in the blood and tissues and, ultimately, crystallizes. When it crystallizes, uric acid takes on a shape like that of a needle and, like a needle, it jabs its way into the joints.

Uric acid seems to prefer the joint of the big toe, but other joints can be vulnerable as well, including the mid-foot, ankle, knee, wrist, and even the fingers. Uric acid is more likely to crystallize at lower temperatures, which may explain why roughly 90 percent of gout attacks affect cooler extremities like the big toe.

Acute pain is usually the first symptom. Then the affected joints become inflamed, almost infected-looking—red, swollen, hot, and extremely sensitive to the touch. Repeated attacks of gout over a long period of time can lead to joint damage.

It should be noted that uric acid is not a fundamentally harmful substance, but a powerful antioxidant, almost as effective as vitamin C, that helps to protect cells from oxidative damage. It is only when levels become abnormally elevated that it becomes a problem. Elevated levels of uric acid in the blood can also be an indicator of poor kidney function.

Uric acid is a by-product of certain foods, so gout is closely related to diet. Obesity and an improper diet increase the risk of developing gout. Gout has been called the rich man's disease, since it is associated with too much rich food and alcohol. But in fact it affects people from all walks of life, most commonly men between the ages of forty and fifty. It may be inherited or brought on by crash dieting, drinking, certain medications, overeating, stress, surgery, or injury to a joint. Approximately 90 percent of the people who suffer from gout are male. Uric acid kidney stones may be a related problem.

Diagnosing gout can be difficult when the symptoms appear in the joints—several other diseases can mimic gout, including rheumatoid arthritis and infections. Pseudogout (false gout), another form of arthritis, produces joint inflammation, redness, and swelling in the larger joints (usually the knees, wrists, or ankles) caused by the development of calcium pyrophosphate dihydrate crystals in one or more joints. The best way to get a definitive diagnosis of gout is for a physician to insert a needle into the affected joint, remove some fluid, and examine the fluid under a microscope for the characteristic uric acid crystals.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Essential fatty acids (Kyolic-EPA from Wakunaga)	As directed on label. Take with meals.	Needed to repair tissues, aid in healing, and restore proper fatty acid balance. An excess of saturated fats is often behind this disorder.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Stress reducer. Antioxidant free radical quencher. Excellent for joint problems.
Proteolytic enzymes (Inf-zyme Forte from American Biologics)	2 capsules with meals and 2 capsules between meals.	Taking with meals improves digestion of protein; taking between meals reduces inflammation.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and folic acid	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary). 500 mg daily, in divided doses. 400–800 mcg daily.	Needed for proper digestion and all bodily enzyme systems. The antistress vitamin. An important aid in nucleoprotein metabolism.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Lowers serum uric acid levels.
Vitamin E	200 IU daily.	Improves circulation. Use d-alpha-tocopherol form.
<i>Important</i>		
Free form amino acid	As directed on label.	Uric acid production increases if essential amino acids are lacking. Use a supplement containing all the essential amino acids.
Kelp or alfalfa	1,000–1,500 mg daily.	Contains complete protein and vital minerals to reduce serum uric acid. See under Herbs, below.
Micellized Vitamin A and E from American Biologics	As directed on label.	Aids in reducing uric acid in the blood and is a potent antioxidant.
Potassium	99 mg daily.	Needed for proper mineral balance.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Powerful antioxidants.

Superoxide dismutase (SOD)	As directed on label, on an empty stomach (first thing in the morning is best). Take with a full glass of water.	An antioxidant and potent free radical destroyer.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in protein metabolism and tissue repair. Use zinc gluconate lozenges or OptiZinc for best absorption.
<b>Helpful</b>		
Calcium and magnesium	1,500 mg daily. 750 mg daily.	To reduce stress caused by this disorder. Works well during sleep. Use chelate forms.
Glucosamine and chondroitin plus methylsulfonylmethane (MSM)	As directed on label. As directed on label.	Important for joint tissue. Has anti-inflammatory and pain-relieving properties.
Sea cucumber (bêche-de-mer)	As directed on label.	Marine animals that have been used as an arthritis treatment in China for thousands of years.

## Herbs

- Alfalfa is a good source of minerals and other nutrients that help to reduce serum uric acid. Take 2,000 to 3,000 milligrams daily in tablet or capsule form.
- Bilberry extract is a good source of anthocyanidins and proanthocyanidins—powerful antioxidant compounds.
- Boswellia and turmeric (curcumin) have powerful anti-inflammatory properties.
- Apply cayenne (capsicum) powder, mixed with enough wintergreen oil to make a paste, to affected areas to relieve inflammation and pain. This may cause a stinging sensation at first, but with repeated use, pain should diminish markedly. Cayenne can also be taken in capsule or liquid form.
- Celery seed extract contains numerous anti-inflammatory compounds.
- Try using chamomile, lady's mantle (yarrow), peppermint, or skullcap, in either capsule or tea form.

**Caution:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Devil's claw and yucca can aid in relieving pain.
- Other beneficial herbs include birch, burdock, colchicum tincture, hyssop, and juniper.

## Recommendations

- When an attack of gout strikes, eat only raw fruits and vegetables—especially those rich in vitamin C—for two weeks. Juices are best. Frozen or fresh cherry juice is excel-

lent. Also drink celery juice diluted with distilled water—use distilled water only, not tap water. Blueberries, cherries, and strawberries neutralize uric acid and have antioxidant properties, so eat lots of them. Also include grains, seeds, and nuts in your diet.

Maintain a diet low in purines at all times. Purines are organic compounds that contribute to uric acid formation. Purine-rich foods to avoid include anchovies, mackerel, shellfish, asparagus, consommé, herring, meat gravies and broths, mushrooms, mussels, sardines, peanuts, baker's and brewer's yeast, mincemeat, and sweetbreads. Thyme and thyroid extracts can also pose a problem if taken for long periods of time.

Enjoy foods like rice, millet, starchy vegetables, green vegetables, corn, cornbread, fruit, cheese, eggs, nuts, and milk.

Consume plenty of quality water. Fluid intake promotes the excretion of uric acid.

Eat no meat of any kind, including organ meats. Meat contains extremely high amounts of uric acid. Increase your intake of vegetarian protein sources.

Consume no alcohol. Alcohol both increases the production of uric acid and reduces uric acid elimination. Beer and wine also contain yeast.

Do not eat any fried foods, roasted nuts, or any other foods containing (or cooked with) oil that has been subjected to heat. When heated, oils become rancid. Rancid fats quickly destroy vitamin E, resulting in the release of increased amounts of uric acid.

Avoid rich foods such as cakes and pies. Leave white flour and sugar products out of your diet.

Avoid the amino acid glycine. Glycine can be converted into uric acid more rapidly in people who suffer from gout.

Limit your intake of caffeine, cauliflower, dried beans, lentils, fish, eggs, oatmeal, peas, poultry, spinach, and yeast products.

If you are overweight, lose the excess pounds and lower your serum uric acid levels. Avoid very restricted weight-loss diets (crash diets), however. Abruptly cutting back on foods or fasting for longer than three days may result in increased uric acid levels.

Consider using homeopathic remedies. One helpful homeopathic regimen for gout involves using a combination of *Belladonna* for severe pain, *Arnica* for less intense pain, and *Rhus toxicodendron* for joint pain and itching. Use 33 to 123 strength and take one dose of each three times each day.

Avoid taking high doses of niacin (over 50 milligrams daily).

## Considerations

- Very few women develop gout. Most of those who do are in their seventies, when estrogen levels are low.
- Some people can have high levels of uric acid with no gout symptoms.
- Dimethylsulfoxide (DMSO) is helpful for flare-ups of gout. This oily liquid is applied topically and is reportedly very effective at relieving pain and reducing swelling.
- Treatment with honeybee venom has provided relief for some gout sufferers. In this practice, called apitherapy, honeybee venom is administered by injection, either with a hypodermic needle or by the bees themselves. The venom appears to act as both an anti-inflammatory and immune system stimulant.
- Deficiencies of certain nutrients can provoke an attack. A deficiency of pantothenic acid (vitamin B<sub>5</sub>) produces excessive amounts of uric acid. A study in animals found that a diet deficient in vitamin A could produce gout. Vitamin E deficiency causes damage to the nuclei of cells that produce uric acid, causing more uric acid to form.
- New research from the *Archives of Internal Medicine* shows that getting 1,500 to 2,000 milligrams of vitamin C a day from food and supplements reduces the risk of gout by 45 percent.
- People who have candida infections, or who have taken antibiotics on and off for long periods, often have increased levels of uric acid in their blood.
- Because of the cellular destruction associated with chemotherapy in cancer treatment, uric acid is often released in extreme amounts, resulting in gouty arthritis.
- In rare cases, a secondary type of gout called saturnine gout can result from a toxic overload in the body.
- Allopurinol (Zyloprim), which inhibits uric acid synthesis, is often prescribed for gout. This drug has been linked directly to skin eruptions, inflammation of the blood vessels, and liver toxicity. If you have kidney problems, treatment with this drug should be carefully monitored.
- Colchicine, a drug derived from the autumn crocus (*Colchicum autumnale*), is used to both alleviate acute attacks and prevent further attacks from occurring. While often dramatically effective, this drug can cause serious side effects such as nausea and vomiting and toxicity, especially when taken in high doses and/or for prolonged periods.
- Other medications sometimes prescribed for gout are nonsteroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen (Advil) and naproxen (Aleve).
- Cortisone is commonly prescribed for relief of acute attacks. However, this may put added strain on the adrenal glands, which are already under stress as a result of this painful disorder.
- For pseudogout, injections of NSAIDs and steroids directly into the joint may provide relief. Unfortunately, there

is no thorough procedure to extract the calcium crystals that cause this condition.

- See also ARTHRITIS in Part Two and PAIN CONTROL in Part Three.

## GRAVES' DISEASE

See under HYPERTHYROIDISM.

## GROWTH PROBLEMS

Growth problems usually occur when the pituitary gland fails to function as it should. The pituitary gland distributes hormones, including the growth hormone somatotropin, to various parts of the body. Somatotropin stimulates the growth of muscle and bone in growing children.

Either overproduction or underproduction of this hormone can cause growth abnormalities. The secretion of too little growth hormone by the pituitary causes dwarfism; too much causes the body to grow in an exaggerated fashion, resulting in abnormally large hands, feet, and jaw. Some cases of malfunction of the pituitary are caused by the growth of a tumor on the gland.

In some cases, growth problems are caused by the failure of the thyroid gland to function properly. The thymus gland may also be involved. If the thymus gland of an infant is damaged, development can be retarded. The child can then develop a greater than normal susceptibility to infection. Nutrition can also play a significant role in the growth and development of a child.

Dwarfism is a condition characterized by abnormally short stature. In some cases, individuals are very small, but normally proportioned; in others, the limbs are short as compared to the size of the rest of the body. Causes of dwarfism include unrecognized or untreated congenital hypothyroidism (once known as cretinism), Down syndrome, achondroplasia, hypochondroplasia, and spinal tuberculosis.

Achondroplasia is a primary bone disorder caused by chemical changes within a single gene. People with achondroplasia have large heads and arms and legs that are short in comparison with the length of the trunk. They usually also have a large forehead, a flat area between the eyes, and a protruding jaw. Often, the teeth are crowded together. In most cases, intelligence is normal, although motor development may occur a bit more slowly than normal. Both children and adults with achondroplasia must be particularly attentive to diet and nutrition, as obesity can be a problem. People with achondroplasia are at greater than normal risk for a number of other health problems, including certain neurologic and respiratory problems, orthopedic problems, fatigue, and numbness or pain in the lower back and thighs.

Congenital hypothyroidism is a condition characterized by the absence of sufficient quantities of thyroxine, a hormone secreted by the thyroid gland. In most cases, this is a

result of the absence of a thyroid gland, an inborn defect. If congenital hypothyroidism is not detected and treated within a very short time, a number of developmental abnormalities may result, including short stature, disproportionately short arms and legs, coarse hair, and mental retardation.

Gigantism is a growth disorder characterized by an abnormally great height, usually due to excessive cartilage and bone formation at the ends of the long bones. Pituitary gigantism is the most common form of this condition. It is a result of the pituitary gland secreting excessive amounts of growth hormone. (For further information, see GIGANTISM under RARE DISORDERS in Part Two.)

Nutritional imbalances, delayed puberty, obesity, and certain diseases (including congenital heart disorders and chronic kidney failure) can be other factors involved in growth problems. If you are concerned about your child's growth rate, you should have him or her examined by an endocrinologist to determine if there is a problem and, if so, what the exact nature of the problem is. It is important to remember that some people are just naturally shorter or taller than average.

Unless otherwise specified, the dosages recommended here are for adults and teenagers over age seventeen. For children between ages twelve and seventeen, use three-quarters of the recommended amount. For children between six and twelve, use half the recommended dose. For children under six, use a quarter of the recommended dose.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Alfalfa		See under Herbs, below.
Cod liver oil	As directed on label.	Contains vitamins A and D, needed for proper growth and for strong tissues and bones.
Essential fatty acid complex or primrose oil	As directed on label.	For normal growth.
Kelp	As directed on label.	Contains natural iodine. An iodine deficiency can cause growth problems.
L-lysine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed for normal growth and bone development. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement for longer than six months at a time.
Zinc	As directed on label. Do not exceed a total of 100 mg daily from all supplements.	Deficiency has been linked to growth problems. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Important</i>		
Calcium and magnesium	As directed on label.	Needed for normal bone growth.

Free form amino acid	As directed on label.	Deficiency has been linked to growth disorders.
Raw pituitary glandular	As directed on label.	For children. Stimulates growth.
<i>Helpful</i>		
Bio-Bifidus from American Biologics	As directed on label.	For bowel flora replacement to improve assimilation and elimination.
L-ornithine	As directed by physician.	Helps to promote release of growth hormone. Use only under a physician's supervision.
Multiglandular complex	As directed on label.	For the endocrine, hormonal, and enzyme systems.
Vitamin B complex	50 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	B vitamins work best when taken together.
plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg 3 times daily, with meals.	Needed for uptake of the amino acids and for proper growth.

**Herbs**

- Alfalfa is a valuable source of vitamins, minerals, and other nutrients that promote the proper functioning of the pituitary gland. It can be taken in tablet or capsule form, as well as eaten in a natural form such as alfalfa sprouts.

**Recommendations**

- Eat a well-balanced diet high in healthful sources of protein. Protein is necessary for growth.
- Include in the diet foods high in the amino acid arginine. Arginine is used by the body to synthesize another amino acid, ornithine, which promotes the release of growth hormone. Good food sources of arginine include carob, coconut, dairy products, gelatin, oats, peanuts, soybeans, walnuts, wheat, and wheat germ.

**Considerations**

- When evaluating a child's growth, it is the overall growth pattern, rather than size, that is important. If a child seems to "fall off" a previously steady growth curve, he or she should be evaluated for possible nutritional deficiencies and other underlying health problems.
- There is currently no treatment to promote growth in people with achondroplasia. Therapy is directed toward prevention and treatment of complications.
- Surgery is now being performed on an experimental basis to lengthen the arms and legs of those with achondroplasia. It is an arduous procedure, often involving many complications.
- The addition of iodine to public drinking water supplies has shown a decrease in the occurrence of neonatal

and congenital hypothyroidism in some areas of the United States.

❑ If growth is slowed because of insufficient growth hormone production, a doctor may prescribe growth hormone therapy.

❑ If growth problems are the result of a tumor of the pituitary gland, surgical removal or treatment of the tumor with drugs or by other means may be recommended.

❑ Kwashiorkor is a protein deficiency disorder that causes children to grow slowly and have very little resistance to disease. It is most common among very poor people in developing countries. However, it can occur anywhere if a child's protein requirements are not met over a period of time. If detected early, it can be treated. Malabsorption syndromes, such as that associated with celiac disease, can cause similar problems even though nutritional intake appears to be adequate.

❑ High levels of lead, a toxic metal, may cause growth problems. A hair analysis can be done to rule out this metal toxicity. (See LEAD POISONING in Part Two and HAIR ANALYSIS in Part Three.)

❑ A large amount of research is being done on growth problems. Interestingly, some studies have indicated that shorter people may live longer than people of average height.

❑ See also HYPERTHYROIDISM and HYPOTHYROIDISM in Part Two.

## GUM DISEASE

See under PERIODONTAL DISEASE. See also BLEEDING GUMS under PREGNANCY-RELATED PROBLEMS.

## HAIR LOSS

Baldness or loss of hair is referred to as *alopecia*. *Alopecia totalis* means loss of all the scalp hair. *Alopecia universalis* means loss of all body hair, including eyebrows and eyelashes. If hair falls out in patches, it is termed *alopecia areata*. This condition is usually temporary and rarely leads to baldness. Factors that are involved in hair loss include heredity, hormones, and aging. Researchers have yet to determine the exact cause of hair loss, but some scientists believe the body's immune system mistakes hair follicles for foreign tissue and attacks them. Many suspect a genetic component.

A less dramatic, but more prevalent, type of hair loss is *androgenetic alopecia* (AGA), or male pattern baldness. AGA is common in men. As the name implies, a genetic or hereditary predisposition to the disorder and the presence of androgens—male sex hormones—are involved in this condition. Research indicates that the hair follicles of individuals susceptible to AGA may have receptors programmed to slow down or shut off hair production under the influence of androgens.

Women sometimes have the same type of hair loss, but it is not usually as extensive and most often does not occur until after menopause. All women experience some hair thinning as they grow older, especially after menopause, but in some it begins as early as puberty. In addition, most women lose some hair two or three months after having a baby because hormonal changes prevent normal hair loss during pregnancy.

A species of tiny mite, *Demodex follicularum*, may be the cause of, or a contributing factor to, balding. These mites are present in virtually all hair follicles by the time a person reaches middle age, and in most cases cause no harm. Researchers believe that the difference between people who lose their hair and those who do not may lie in how the scalp reacts to the presence of these mites. If the body initiates the inflammatory response as it tries to reject the mites, this may close down the hair follicles, thus killing the mites but also killing the hair.

In addition to heredity, factors that promote hair loss include poor circulation, acute illness, surgery, radiation exposure, skin disease, sudden weight loss, high fever, iron deficiency, diabetes, thyroid disease, drugs such as those used in chemotherapy, stress, poor diet, ringworm and other fungal infections, chemicals such as hair dyes, and vitamin deficiencies.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Essential fatty acids (flaxseed oil, Kyolic-EPA from Wakunaga, primrose oil, or salmon oil)	As directed on label.	Improves hair texture. Prevents dry, brittle hair.
Raw thymus glandular	500 mg daily.	Stimulates immune function and improves functioning capacity of glands. <i>Caution:</i> Do not give this supplement to a child.
Ultra Hair from Nature's Plus	As directed on label.	Contains nutrients necessary to stimulate hair growth. If the condition is not severe, you can use this complex alone.
Vitamin B complex with vitamin B <sub>3</sub> (niacin) and vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) plus extra biotin	50 mg 3 times daily.	B vitamins are important for the health and growth of the hair.
and inositol and methylsulfonylmethane (MSM)	300 mcg daily. Also use hair care products containing biotin. 100 mg twice daily.	Deficiencies have been linked to skin disorders and hair loss. Vital for hair growth.
	As directed on label.	Aids with the manufacture of keratin, a protein that is the major component of hair.

Vitamin C with bioflavonoids	3,000–10,000 mg daily.	Aids in improving scalp circulation. Helps with the antioxidant action in hair follicles.
Vitamin E	200 IU daily, or 400 IU every other day.	Increases oxygen uptake, which improves circulation to the scalp. Improves health and growth of hair. Use d-alpha-tocopherol form.
Zinc	50–100 mg daily. Do not exceed this amount.	Stimulates hair growth by enhancing immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Important

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	Improves scalp circulation. Increases tissue oxygenation.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	100 mg daily.	Good for circulation to the scalp.
Kelp	500 mg daily.	Supplies needed minerals for proper hair growth.

### Helpful

Copper	3 mg daily.	Works with zinc to aid in hair growth. Use a chelate form.
Dioxychlor	5 drops in water twice daily.	Destroys harmful bacteria and supplies oxygen to the tissues.
Grape seed extract	As directed on label.	A powerful antioxidant to protect hair follicles from free radical damage.
L-cysteine and L-methionine plus glutathione	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Improves quality, texture, and growth of hair. Helps prevent hair from falling out, and also promotes blood supply to the scalp. (See AMINO ACIDS in Part One.)
Methylsulfonylmethane (MSM)	As directed on label.	Required for the building blocks of protein, which provides stronger hair.
Silica (Body Essential Silica gel from NatureWorks or JarroSil from Jarrow Formulas).	As directed on label.	Aids in hair growth and also makes the hair stronger.

### Herbs

- Use apple cider vinegar and sage tea as a rinse to help hair grow.
- Ginkgo biloba improves circulation to the scalp.
- Green tea, pygeum, and saw palmetto may aid in reducing hair loss in men.
- Tea tree oil combats bacteria and mites that may cause hair loss. Massage 10 drops into the scalp, then shampoo your hair in the usual fashion.

### Recommendations

Eat a diet high in fruits and vegetables and low in starch. This may help to slow down the process of hair loss. Fruits and vegetables contain flavonoids, many of which are antioxidants that may provide protection for the hair follicles and encourage hair growth.

Eat plenty of foods high in biotin and/or take supplemental biotin as recommended under Nutrients in this entry. Biotin is needed for healthy hair and skin, and may even prevent hair loss in some men. Good food sources of biotin include brewer's yeast, brown rice, bulgur, green peas, lentils, oats, soybeans, sunflower seeds, and walnuts.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Include soy foods such as soybeans, tempeh, and tofu in your diet. Soy foods appear to inhibit the formation of dihydrotestosterone, a hormone implicated in the process of hair loss.

Do not eat foods containing raw eggs. Raw eggs not only pose a risk of *Salmonella* infection (see **FOODBORNE/WATERBORNE DISEASE** in Part Two), but are high in avidin, a protein that binds to biotin and prevents it from being absorbed. Cooked eggs are acceptable.

Lie head down on a slant board fifteen minutes a day to allow the blood to reach your scalp. Massage your scalp daily.

Use shampoos and conditioners that contain biotin and silica. Aloe vera gel, vitamins C and E, and jojoba oils also are very good for the hair. Conditioners containing chamomile, marigold, ginseng, and/or passionflower help to keep hair healthy as well.

Be careful of using products that are not natural on the hair. Allergic reactions to chemicals in these products occur frequently. Alternate among several different hair care products, using only all-natural and pH-balanced formulas. Most health food stores carry a variety of natural hair care products.

Hair is fragile when it is wet. Gently pat your hair dry and squeeze out remaining moisture with a towel.

Cover your hair when it is exposed to sunlight. Long exposure to sunlight and seawater can damage the hair.

Avoid rough treatment. Do not use a brush or fine-toothed comb, or towel-dry your hair. Also, do not use a blow-dryer or other heated appliances on your hair; let it dry naturally. Do not comb your hair until it is dry, as wet hair tends to break off. Use a pick to put wet hair in place. Do not wear tight ponytails, cornrows, or other styles that pull on the hair.

Avoid crash diets and diets that neglect any of the food groups. These can cause deficiencies in nutrients that are detrimental to the hair.

If you are losing large amounts of hair, see a physician.

Considerations

- It is normal to lose 50 to 100 hairs a day.
- Taking large doses of vitamin A (100,000 IU or more daily) for a long period can trigger hair loss, but stopping the vitamin A will reverse the problem. Often the hair grows back when the cause is corrected.
- Pregnancy, a high concentration of metals in the body, and autoimmune diseases can sometimes cause hair loss.
- Hypothyroidism can cause hair loss. (See HYPOTHYROIDISM in Part Two.)
- Hair transplantation can be a very successful treatment for hair loss if you have enough of your own hair to graft onto the bald area. Make sure to find a physician skilled in the technique if you decide to pursue a hair transplant.
- Rogaine, a topical solution containing 5 percent minoxidil, has been approved by the FDA for the treatment of male pattern baldness. Five percent minoxidil topical solution is not intended for frontal baldness or receding hairline. This product is available over the counter in drugstores. There is also a 2 percent minoxidil solution available for women. Rogaine may cause heart changes if used for long periods of time. Read the warning label on the box carefully and tell your doctor if you have heart disease. Also, although using minoxidil does result in hair growth, the quality of the hair is usually poor and hair growth ceases when use is discontinued.
- Finasteride (Propecia), a prescription medication, is said to be effective for younger men with male pattern baldness who have at least half of their hair remaining. It usually takes at least three months to be effective, and results last only as long as the medication is continued.
- In some people with alopecia areata, cortisone injections into the hairless patches of the head can trigger hair growth. Anthralin (Dritho-Scalp) cream, applied to the scalp and washed off after an hour, can sometimes stimulate hair growth after a few months of use. For extensive alopecia areata, a treatment called psoralen plus ultraviolet A radiation therapy, abbreviated PUVA, may be recommended. It involves the administration of light-sensitizing medication followed by exposure to ultraviolet-A light rays. In clinical trials, approximately 55 percent of people achieve cosmetically acceptable hair growth using this method. However, the relapse rate is high, and patients must go to a treatment center where the equipment is available at least two to three times per week. Furthermore, the treatment carries the risk of developing skin cancer.
- Research conducted at Cornell University suggests that gene therapy may someday be used to stimulate hair growth. Researchers discovered that hair follicles that have genetically been "turned off" can, in effect, be "turned on" again.
- For names and addresses of organizations that can provide more information on treatments for alopecia areata, see Health and Medical Organizations in the Appendix.

HALITOSIS (BAD BREATH)

Halitosis is typically caused by poor dental hygiene. However, other factors may be involved, including gum disease, tooth decay, heavy metal buildup, infection of the respiratory tract (throat, lungs, nose, and windpipe), improper diet, constipation, smoking, fever, diabetes, foreign bacteria in the mouth, indigestion, inadequate protein digestion, liver or kidney malfunction, postnasal drip, stress, and too much unfriendly bacteria in the colon. Halitosis can also be caused by a buildup of toxins in the gastrointestinal tract, salivary gland disorders, chronic bronchitis, sinusitis, or diabetes. Dieting, alcohol abuse, or fasting can cause bad breath as well. "Morning breath" results from dehydration and a reduction in the amount of saliva, which is needed to wash away bacteria in the mouth. Dieters and people who are fasting may experience bad breath because the lack of food causes the body to break down stored fat called ketones and protein for fuel; metabolic wastes resulting from that process have an unpleasant odor as they are exhaled from the lungs.

NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
ABC Aerobic Bulk Cleanse from Aerobic Life Industries or oat bran or psyllium husks or rice bran	1 tbsp in juice or water twice daily, on an empty stomach. Take separately from other supplements and medications.	For needed fiber. Fiber removes toxins from the colon that can result in bad breath.
Chlorophyll (alfalfa liquid, wheatgrass, or barley juice are good sources) or Kyo-Green from Wakunaga	1 tbsp in juice twice daily. Chlorophyll can also be used as a mouth rinse—add 1 tbsp to ½ glass of water.	"Green drinks" are one of the best ways to combat bad breath.
Vitamin C with bioflavonoids	As directed on label.	Contains chlorophyll to cleanse the body of toxins.
	2,000–6,000 mg daily.	Important in healing mouth and gum disease and in preventing bleeding gums. Also rids the body of excess mucus and toxins that can cause bad breath.
<i>Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	Needed to replenish "friendly" bacteria in the colon. Insufficient "friendly" bacteria and an overabundance of harmful bacteria can cause bad breath.
Garlic (Kyolic from Wakunaga)	2 capsules 4 times daily, with meals and at bedtime.	Acts as a natural antibiotic, destroying foreign bacteria in both the mouth and colon. Use an odorless form.

Zinc	30 mg 3 times daily. Do not exceed 100 mg daily.	Has an antibacterial effect and neutralizes sulfur compounds, a common cause of mouth odor.
------	--	---

### Helpful

Bee propolis	As directed on label.	Aids in healing the gums, aids control of infection in the body, and has an antibacterial effect.
Vitamin A plus carotenoid complex	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for control of infection and in healing of the mouth.
Vitamin B complex	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	Needed for proper digestion.
plus extra vitamin B <sub>3</sub> (niacin)	50 mg 3 times daily. Do not exceed this amount.	Dilates tiny capillaries to help blood flow to infection sites. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
and vitamin B <sub>6</sub> (pyridoxine)	50 mg daily.	Needed for all enzyme systems in the body.

### Herbs

Alfalfa supplies chlorophyll, which cleanses the bloodstream and colon, where bad breath often begins. Take 500 to 1,000 mg in tablet form or 1 tablespoon of liquid in juice or water three times daily.

Gum disease is a major factor in bad breath. If infection is present, place alcohol-free goldenseal extract on a small piece of cotton and place the cotton over infected gums or mouth sores. Do this for two hours per day for three days. It should quickly heal the infected parts.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Use myrrh (to brush your teeth and rinse your mouth), peppermint, rosemary, and sage.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Chewing a sprig of parsley after meals is an excellent treatment for bad breath. Parsley is rich in chlorophyll, the active ingredient in many popular breath mints.

Other herbs that may be helpful for bad breath include anise, cloves, and fennel.

### Recommendations

Go on a five-day raw foods diet. After the fast, eat at least 50 percent of your food raw every day. This is a good routine diet to adhere to on an ongoing basis.

Drink generous amounts of quality water.

Avoid spicy foods, whose odors can linger for hours. Foods like anchovies, blue cheese, Camembert, garlic, onions, pastrami, pepperoni, Roquefort cheese, salami, and tuna leave oils in the mouth that can release odor for up to twenty-four hours, no matter how much you brush or gargle. Beer, coffee, whiskey, and wine leave residues that stick to the soft, sticky plaque on teeth and get into the digestive system. Each exhalation releases their odor back into the air.

Avoid foods that get stuck between the teeth easily or that cause tooth decay, such as meat, stringy vegetables, and sweets, especially sticky sweets.

Go on a cleansing fast with fresh lemon juice and water to detoxify the system. (See FASTING in Part Three.)

Brush your teeth *and tongue* after every meal.

Use a tongue scraper to help remove bacterial plaque and shed dead cells and food debris from the surface of the tongue.

Replace your toothbrush every month, as well as after any infectious illness, to prevent bacteria buildup.

Use dental floss and a chlorophyll mouthwash daily. Use a small brush or rubber-tipped dental tool in between teeth to remove any remaining food after you have flossed.

Use Stim-U-Dent wooden toothpicks, available in most drugstores, after every meal to massage between the teeth and remove plaque. This is important for the prevention of gum disease.

Keep your toothbrush clean. Between uses, store it in hydrogen peroxide or grapefruit seed extract to kill germs (if using hydrogen peroxide, rinse it well before brushing). There are bacteria-destroying toothbrush sanitizers available that turn on automatically at intervals throughout the day.

Do not use commercial mouthwashes. Most contain nothing more than flavoring, dye, and alcohol. While they may kill the bacteria that cause bad breath, the bacteria soon return in greater force. Mouthwashes can also irritate the gums, tongue, and mucous membranes in the mouth.

Have your teeth professionally cleaned every six months.

Bad breath may be a sign of an underlying health problem. Consult your health care provider for a thorough checkup if the suggestions in this section do not improve the condition.

### Considerations

See also PERIODONTAL DISEASE; SINUSITIS; and/or SORE THROAT in Part Two.

### HAMBURGER DISEASE

See HEMORRHAGIC COLITIS *under* RARE DISORDERS.

## HAY FEVER

Hay fever (allergic rhinitis) is an allergy to proteins in the pollen of trees, grasses, some plants, or mold that affects the mucous membranes of the nose, eyes, and air passages. Symptoms include itchy, red eyes; watery discharge from the nose and eyes; sneezing; fatigue; and nervous irritability. Many of the symptoms of hay fever are similar to those of the common cold. However, allergies cause a distinctive clear, thin nasal discharge, whereas secretions caused by colds usually become thick and yellow-greenish as the illness progresses. Also, colds are often associated with mild fever and are usually gone within a week, while allergy sufferers often have a feeling of being “wiped out” for weeks on end.

At least 50 million Americans suffer from the seasonal sneezes, runny nose, and itchy eyes that come with hay fever. There are actually three hay fever seasons, distinguished by the different types of pollen present at different times. Tree pollens appear first, usually between February and May, depending on the local climate. The biggest problems come later in spring and in summer, when trees, weeds, and grass pollens—and people—are out at the same time. The fall is ragweed pollen season. Depending on which pollen or pollens an individual is allergic to, hay fever may be present at any or all of these times. Following is a more detailed summary of the types of plants according to the times of year they are most likely to cause problems (again, blooming times are somewhat approximate, as they depend on the climate where you live):

- February through May: Alder, hazelnut, and elm trees.
- March through June: Birch, maple, and oak trees.
- April through June: Beech and spruce trees.
- April through August: Horse chestnut trees.
- April through September: Asters, pine trees, plantain, sorrel, stinging nettle, and various grasses.
- May through July: Buttercups.
- June through September: Goosefoot.
- July through September: Mugwort.

People who suffer from hay fever often also suffer from other so-called *atopic disorders*, such as asthma and dermatitis. Those who suffer from hay fever symptoms throughout the year are said to have *perennial rhinitis*. Animal hair, dust, feathers, fungus spores, molds, and/or some other environmental agent may trigger the symptoms. A susceptibility to hay fever tends to be inherited.

People who are prone to allergies are most often aware of the time of year and conditions under which they are most sensitive. For a definitive diagnosis, the radioallergosorbent (RAST) test is easily done and gives reliable results.

The nutrient program outlined below is beneficial for hay fever. Hay fever sufferers should always choose hy-

poallergenic supplements. Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Bromelain (Ultra Bromelain from Nature's Plus)	1,000 mg 3 times daily, between meals.	Reduces inflammation associated with hay fever symptoms.
Coenzyme Q <sub>10</sub>	30 mg twice daily.	Improves oxygenation and immunity.
Quercetin	400 mg twice daily, before meals.	A bioflavonoid that stabilizes the membranes of the cells that release histamine, which triggers allergic symptoms.
or Activated Quercetin from Source Naturals	As directed on label.	Contains quercetin plus bromelain and vitamin C for better absorption.
or Anti-Allergy formula from Freeda Vitamins	As directed on label.	A combination of quercetin, calcium pantothenate, and calcium ascorbate.
Raw thymus glandular plus adrenal glandular	500 mg twice daily. As directed on label.	To promote immune function. <i>Caution:</i> Do not give these supplements to a child under sixteen years of age.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Powerful immunostimulants. An emulsion form is recommended for easier assimilation and greater safety at high doses.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	As directed on label. 100 mg 3 times daily. 50 mg twice daily.	All B vitamins are necessary for proper functioning of the immune system. Use hypoallergenic formulas.
Vitamin C with bioflavonoids	3,000–10,000 mg 3 times daily.	A potent immunostimulant and anti-inflammatory. Use an esterified or buffered form.
<i>Important</i>		
Proteolytic enzymes	As directed on label. Take with meals and between meals.	Necessary for digestion of essential nutrients that boost immune function. <i>Caution:</i> Do not give this supplement to a child.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Boosts immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Helpful</i>		
Aller Bee-Gone from CC Pollen	As directed on label.	A combination of herbs, enzymes, and nutrients to fight acute symptoms.

Calcium and magnesium	1,500 mg daily. 1,000 mg daily.	Minerals that have a calming effect on the system.
Dioxychlor or Aerobic 07	5 drops in water twice daily. Also use topically: Mix 30 drops in 2 oz water and instill 1 dropperful in each nostril. As directed on label.	To supply stabilized oxygen and fight bacteria, fungi, and viruses.
Garlic (Kyolic from Wakunaga)	As directed on label.	Helpful for sinus inflammation. Use a liquid formula.
Kelp	As directed on label twice daily.	A rich source of minerals.
Manganese	10–30 mg daily. Take separately from calcium.	Aids in metabolism of vitamins, minerals, enzymes, and carbohydrates.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Powerful free radical scavengers that also act as anti-inflammatories and enhance the activity of vitamin C.
Superoxide dismutase (SOD) (Cell Guard from Biotec Foods)	As directed on label.	A powerful antioxidant.
Vitamin E	200 IU daily or 400 IU every other day.	Boosts the immune system. Use d-alpha-tocopherol form.

## Herbs

- Alfalfa supplies chlorophyll and vitamin K. Use a liquid form. Take 1 tablespoon in juice or water twice daily.
- For red, itchy eyes, place slices of cool cucumber over the eyes. Rotate this treatment with steeped, cooled black tea bags placed directly on the eyelids.
- Eucalyptus oil can relieve congestion if used in a steam inhalation (see STEAM INHALATION in Part Three) or added to bathwater.
- Alcohol-free eyebright and lady's mantle (yarrow) liquid extracts are good for relieving hay fever symptoms. Use 20 to 30 drops two times daily to make a tea or place the extract under your tongue and hold it there for a few minutes before swallowing. Drink a glass of water after you take the extract.
- If your throat is itchy or you feel a need to cough, use alcohol-free goldenseal extract. Hold a dropperful in your mouth for a few minutes, then swallow. This will halt a sore throat.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Horehound, mullein leaf, stinging nettle, and/or wild cherry bark help to ward off severe allergic reactions.

- Use turmeric to reduce inflammation.
- Nettle leaf is very good for all types of allergies.
- Noni juice aids in relieving symptoms of hay fever.

## Recommendations

The best defense against hay fever is to try to avoid the substance that is causing your allergies. Following are some tips to help you avoid contact with pollen:

- When allergy season arrives, spend as little time as possible outdoors, particularly after 10:00 A.M. Grasses generally pollinate in midday, and the wind keeps the pollen floating until it drops to the ground at night.
- Try to avoid working in the yard. If you must do so, wear a mask and goggles to keep the pollen from getting into your eyes.
- Keep windows and doors shut during your local blossoming season. Use air conditioning if possible.
- Keep all car windows closed while driving. Use your car air conditioner instead.
- Shower thoroughly, wash your hair, and change your clothes when you come indoors after spending time outside to remove pollen collected during the day. Pollen can stick to your hair, skin, and clothing, especially on a windy day. A shower before bedtime is also a good idea.
- Have your lawn mown regularly—before the grass flowers.
- Avoid placing laundry outdoors to dry, as the pollen collects on the surface of fabrics.
- Keep pets either inside or outside. Dogs and cats can pick up pollen on their fur and bring it indoors with them.
- Eat more fruits (especially bananas), vegetables, grains, and raw nuts and seeds. Stay on a high-fiber diet.
- If you enjoy the flavor of horseradish, use it liberally. Horseradish is good for a runny nose and congestion.
- Eat yogurt or any soured products three times a week. Homemade yogurt is best. However, beware of the possibility that you may be allergic to casein, the principal protein found in milk.
- Consume no cakes, chocolate, coffee, dairy products (except yogurt), packaged or canned foods, pies, soft drinks, sugar, tobacco, white flour products, or any junk food.
- Avoid tobacco smoke, which irritates the lungs and eyes, and alcohol, which increases the production of mucus.
- Consider using homeopathic remedies. *Sabadilla* is good for watery eyes, runny nose, and a dry throat. Another good choice for these symptoms is *Wyethia*.
- Perform a cleansing fast. (See FASTING in Part Three.)

❑ Try using a good-quality air purifier and filter in your home. The Air Supply personal air purifier from Wein Products is a miniature unit that is worn around the neck. It sets up an invisible pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants) in the air. It also eliminates vapors, smells, and harmful volatile compounds in the air.

**Considerations**

❑ The best and safest way to control allergies is the natural way—by avoiding allergens and taking steps to normalize immune function and prevent or lessen the symptoms. Allergies can usually be controlled if you are willing to make changes in your lifestyle, diet, and mental state.

❑ A study conducted at the University of California–Davis found that eating yogurt every day significantly reduced the incidence of hay fever attacks, especially those triggered by grass pollens.

❑ If you are a man with facial hair, cleaning your mustache and/or beard with soap and water or shampoo twice a day will cut down on the symptoms associated with hay fever.

❑ Researchers at Giessen University in Germany found that three bananas contain enough magnesium—180 milligrams—to quell a hay fever attack. Other foods rich in magnesium are kidney beans, soybeans, almonds, lima beans, whole wheat flour, brown rice, molasses, and peas. Magnesium can also be taken in supplement form.

❑ Antihistamines are the most commonly recommended conventional treatment for hay fever. They can reduce itching in the eyes, ears, and throat; dry up a runny nose; and reduce sneezing attacks. However, they can also cause drowsiness, depression, and other side effects. Antihistamines such as fexofenadine (Allegra) and loratidine (Claritin) do not cause drowsiness and depression. But they are expensive and they might not work for everyone. Do not take these with grapefruit juice.

❑ Some physicians recommend desensitization shots for people with hay fever. These are expensive, painful, and not risk-free. And a disappointingly low percentage of people experience satisfactory relief, even after years of injections. The typical person requires weekly shots for up to a year and monthly shots for up to five years, at a total cost that can run into thousands of dollars.

❑ The following types of treatments are available for hay fever sufferers: antihistamines, decongestants, topical corticosteroids, leukotriene antagonists, immunotherapy, and surgery (for those with structural problems in which airways are open, making medications ineffective). Unfortunately, most of these treatments have drawbacks. You should consider them only if your symptoms substantially interfere with the quality of your daily life.

❑ See also ALLERGIES in Part Two and ASCORBIC ACID FLUSH in Part Three.

**HEADACHE**

Virtually everyone gets a headache at one time or another. Headaches are as common—and as difficult to cure—as the common cold and flu. Common causes of headache include stress; tension; anxiety; allergies; constipation; coffee consumption; eyestrain; hunger; sinus pressure; muscle tension; hormonal imbalances; temporomandibular joint (TMJ) syndrome; trauma to the head; nutritional deficiencies; the use of alcohol, drugs, or tobacco; fever; and exposure to irritants such as pollution, perfume, or aftershave lotions. (See Types of Headaches on page 470.) Migraines result from a disturbance in the blood circulation in the head. (See MIGRAINE in Part Two.)

Headache experts estimate that about 90 percent of all headaches are tension headaches and 6 percent are migraines. Tension headaches, as the name implies, are caused by muscular tension. Another type of headache is the cluster headache. These are severe, recurring headaches that strike about 1 million Americans, and are widely considered to be the most painful type of headache.

Headaches can also be a sign of an underlying health problem. People who suffer from frequent headaches may be reacting to certain foods and food additives, such as wheat, chocolate, monosodium glutamate (MSG), sulfites (used in restaurants on salad bars), sugar, hot dogs, luncheon meats, dairy products, nuts, citric acid, fermented foods (cheeses, sour cream, yogurt), alcohol such as spirits and red wine, vinegar, and/or marinated foods. Other possibilities to consider are anemia, bowel problems, brain disorders such as tumors, bruxism (tooth-grinding), hypertension (high blood pressure), hypoglycemia (low blood sugar), sinusitis, spinal misalignment, toxic overdoses of vitamin A, vitamin B deficiency, and diseases of the eye, nose, and throat. Dehydration also can cause headaches—often accompanied by a feeling of being flushed, a warm face, and a sense of heaviness in the head.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Bromelain	500 mg as needed.	An enzyme that helps to regulate the inflammatory response.
Calcium and	1,500 mg daily.	Minerals that help to alleviate muscular tension. Use chelated forms.

magnesium	1,000 mg daily.	Deficiency may be a cause of migraines. Relaxes muscles and blood vessels.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	30 mg twice daily. As directed on label.	Improves tissue oxygenation. Supports the immune detoxification of many dangerous substances, increases energy, and facilitates the manufacture of connective tissue.
Dimethylglycine (DMG) (Aangamik FoodScience of Vermont)	125 mg twice daily.	Improves tissue oxygenation. Use a sublingual form.
DL-Phenylalanine (DLPA)	750 mg daily.	For pain relief. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing a baby, or if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
5-Hydroxy L-tryptophan (5-HTP)	As directed on label.	Many clinical studies have shown excellent results with both tension headaches and migraines.
Glucosamine sulfate	As directed on label.	A natural alternative to aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs).
L-tyrosine plus L-glutamine plus quercetin	As directed on label. 500 mg twice daily. 500 mg twice daily.	For relief of cluster headaches. <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug, commonly prescribed for depression.
Methylsulfonyl-methane (MSM)	As directed on label.	Relieves pain.
Potassium	99 mg daily.	For the proper sodium and potassium balance, which is needed to avoid water retention. Water retention may put undue pressure on the brain.
Primrose oil	500 mg 3–4 times daily.	Supplies essential fatty acids, which promote healthy circulation, help regulate the inflammatory response, and relieve pain.
Vitamin B <sub>3</sub> (niacin) and niacinamide	Up to 300 mg combined daily. Do not exceed this amount. Stop and maintain the dosage that provides relief.	Improves circulation and aids in the functioning of the nervous system. Professional supervision is advised. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	B vitamins work best when taken together. Use a yeast-free formula. In severe cases, injections (under a doctor's supervision) may be advisable. Removes excess water from tissues.
Vitamin C with bioflavonoids	2,000–8,000 mg daily, in divided doses.	Protects against harmful effects of pollution and aids production of antistress hormones. Use an esterified or buffered form.
Vitamin E	200 IU daily or 400 IU every other day.	Improves circulation. Use d-alpha-tocopherol form.

## Herbs

Cayenne thins the blood, which reduces pain and allows beneficial blood flow.

Chamomile relaxes muscles and soothes tension.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

A salve made from ginger, peppermint oil, and wintergreen oil rubbed on the nape of the neck and temples can help to relieve tension headaches. For sinus headaches, rub the salve across the sinus area.

Ginkgo biloba extract improves circulation to the brain, and may be helpful for certain types of headache.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Guarana can alleviate cluster headaches. It has caffeine in it, so don't use this herb if you are sensitive to caffeine.

Several clinical studies have shown ginger to be helpful for pain relief.

Jamaica dogweed is good for sinus headaches.

Kava kava is helpful for tension headaches.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

Meadowsweet is an anti-inflammatory agent.

Periwinkle flower has been found to increase the cerebral flow of oxygen, which helps to alleviate headache pain.

Skullcap acts as an antispasmodic agent and has a sedative effect. It is good for headaches related to muscular tension and spasms.

Valerian root is a good sedative to take during a headache.

Other herbs that may help relieve headache pain include brigham, burdock root, fenugreek, feverfew, goldenseal, lavender, lobelia, marshmallow, mint, rosemary, skullcap, and thyme.

*Cautions:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver

## Types of Headaches

Headaches come in a number of forms, differentiated by their causes and specific symptoms. The appropriate treatment depends on the type of headache. The table below lists

some of the more common types of headaches and possible treatments for them.

Type of Headache	Symptoms	Causes/Triggers	Treatment
Aneurysm-associated headache	Early symptoms mimic those of cluster headaches and migraines. If an aneurysm ruptures, it can cause sudden extreme pain, double vision, rigid neck, and stroke leading to unconsciousness.	A balloonlike bulge or weak spot on a blood vessel wall; high blood pressure.	Keep blood pressure low. If found early, surgery may be necessary.
Arthritis headache	Pain at the back of the head or neck, made worse by movement; inflammation of joints and shoulder and/or neck muscles.	Unknown.	Take feverfew supplements. <i>Caution:</i> Do not use feverfew during pregnancy.
Bilious headache	Dull pain in forehead and throbbing temples.	Indigestion; overeating; lack of exercise.	Colon cleansing may be helpful. (See COLON CLEANSING in Part Three.)
Caffeine headache	Throbbing pain caused by blood vessels that have dilated.	Caffeine withdrawal.	Ingest a small amount of caffeine, then taper off.
Cluster headache	Severe, throbbing pain on one side of the head around the eye area, flushing of the face, tearing of eyes, nasal congestion, occurring 1–3 times a day over a period of weeks or months and lasting from a few minutes to several hours each time. One of the most painful headaches.	Stress, alcohol, smoking.	Take supplemental L-tyrosine, DL-phenylalanine, ginkgo biloba extract, L-glutamine, quercetin. <i>Caution:</i> Do not take L-tyrosine if you are taking an MAO inhibitor drug. Do not take phenylalanine if you are pregnant or suffer from panic attacks, diabetes, high blood pressure, or phenylketonuria (PKU).
Exertion headache	Generalized headache during or after physical exertion such as running or sexual intercourse, or passive exertion such as sneezing or coughing.	Usually related to migraine or cluster headaches. About 10 percent are related to organic diseases such as tumors or blood vessel malformation.	Take nutritional supplements; apply ice packs at the site of pain. If the pain worsens in intensity and duration after exercising and exertion, see your physician.
Eyestrain headache	Usually frontal pain on both sides.	Overuse of the eyes; eye muscle imbalance; uncorrected vision; astigmatism.	Correct vision.
Fever headache	Headache develops with fever due to inflammation of blood vessels of the head.	Infection.	Reduce fever, apply ice packs.
Hangover headache	Migraine-like, with throbbing pain and nausea.	Alcohol causes dehydration and dilation of blood vessels in the brain.	Drink plenty of quality water. Take a B-complex supplement. Apply ice to neck.
Hunger headache	Strikes just before mealtime due to low blood sugar, muscle tension, and rebound dilation of blood vessels.	Skipping meals; too-stringent dieting.	Eat regular meals with adequate amounts of complex carbohydrates and protein.

Hypertension headache	Dull, generalized pain affecting a large area of the head and aggravated by movement or exertion.	Severe high blood pressure.	Get blood pressure under control.
Menstrual headache	Migraine-type pain shortly before, during, or after menstruation, or at midcycle, at time of ovulation.	Variation in estrogen levels.	Take supplements of vitamin B <sub>6</sub> , potassium, and extra magnesium.
Migraine, classic	Similar to common migraine, but preceded by auras such as visual disturbances, numbness in arms or legs, smelling of strange odors, hallucinations.	Excessive dilation or contraction of blood vessels of the brain.	See MIGRAINE in Part Two.
Migraine, common	Severe throbbing pain, often on one side of the head; nausea; vomiting; cold hands; dizziness; sensitivity to light and sounds.	Excessive dilation or contraction of blood vessels of the brain.	See MIGRAINE in Part Two.
Sinus headache	Gnawing, nagging pain over nasal/sinus area, often increasing in severity as the day goes by. Fever and discolored mucus may be present.	Allergies, infection, nasal polyps, food allergies. Often caused by blocked sinus ducts or acute sinus infection.	Increase intake of vitamins A and C; use moist heat to help get sinuses to drain.
Temporal headache	Jabbing, burning, boring pain; pain in temple or around ear on chewing; weight loss; flulike symptoms; problems with eyesight. Usually seen in people over fifty-five. Untreated, can lead to blindness, stroke, heart attack, or a tear in the aorta.	Inflammation of temporal arteries.	Consult physician for steroid therapy.
Temporo-mandibular joint (TMJ) headache	Temporal, above-ear, or facial pain; muscle temple pain upon awakening.	Stress, contraction of one side of face; clicking or malocclusion (poor bite); jaw clenching, gum chewing; jaw, neck or upper back popping.	Reduce stress; use relaxation techniques, biofeedback, nutritional supplements, ice packs.
Tension headache	Constant pain, in one area or all over the head; sore muscles with trigger points in neck and upper back; light-headedness; dizziness. The most common type of headache.	Emotional stress, anxiety, worry, depression, anger, food allergies, poor posture, too-shallow breathing.	Apply ice packs on neck and upper back; take supplements of vitamin C with bioflavonoids, DLPA, bromelain, magnesium, primrose oil, and ginger for relief of muscle spasms.
Tic douloureux	Short, jabbing pains around the mouth, jaw, or forehead. More common in women over fifty-five years old.	Unknown.	Take nutritional supplements. In some cases, surgery may be necessary.
Tumor headaches	Progressively worsening pain; projectile problems with vision, speech, and equilibrium; personality changes.	Usually unknown.	Surgery and/or radiation.
Vascular headaches	Throbbing on one side of the head, sensitivity to light, and often nausea. Related to cluster headaches and migraines.	Disturbances in the blood vessels.	Lie down and keep your blood pressure under control.

disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

### Recommendations

Eat a well-balanced diet, including protein with every meal. Avoid chewing gum; do not consume ice cream, iced beverages, or salt (unless you suspect that your headache is caused by dehydration); and guard against excessive sun exposure.

Try eliminating foods containing tyramine and the amino acid phenylalanine. Then reintroduce one food at a time and see which ones produce headaches. Phenylalanine is found in aspartame (sold in the form of Equal, NutraSweet, and other products), monosodium glutamate (MSG), and nitrites (preservatives found in hot dogs and luncheon meats). Foods that contain tyramine include alcoholic beverages, bananas, cheese, chicken, chocolate, citrus fruits, cold cuts, herring, onions, peanut butter, pork, smoked fish, sour cream, vinegar, wine, and fresh-baked yeast products. Tyramine causes the blood pressure to rise, resulting in a dull headache.

Practice deep-breathing exercises. A lack of oxygen can cause headaches. (See BREATHING EXERCISES under PAIN CONTROL in Part Three.)

Maintain good posture habits.

Use fiber daily and a cleansing enema weekly. (See COLON CLEANSING and ENEMAS in Part Three.)

*Note:* Always take supplemental fiber separately from other supplements and medications.

If you feel a headache coming on, drink a large glass of water every three hours until symptoms subside. If you tend to get headaches after travel by plane, it is probably due to dehydration. Try to drink at least a cup of water or other non-caffeine-containing beverage each hour of the flight.

When a headache strikes, take a cleansing enema. This removes the toxins that cause many headaches. If not eliminated, toxins can be absorbed into the bloodstream and circulated throughout the body. For a headache brought on by fasting, use a coffee retention enema. (See ENEMAS in Part Three.)

Apply cold compresses to the spot from which the pain is radiating. This helps to relieve headaches by constricting blood vessels and easing muscle spasms. To make a cold compress, place a damp washcloth in the freezer for ten minutes or use a cold gel-pack.

Use a heating pad, hot water bottle, or hot towel to relax neck and shoulder muscles, which can cause tension headaches when they are too tight.

Use a homeopathic remedy suitable for the particular headache symptoms you are experiencing. *Belladonna* helps with sudden, severe pain that is worse on the right side of the body. *Natrum muriaticum* is recommended for tension

headaches and periodic headaches. *Sanguinaria* is good for pain that is sharp and splitting. *Arsenicum album*, *kali bichromium*, *Mecurius solubilis*, and *Pulsatilla* all encourage drainage of the sinuses.

Acupressure is helpful for tension headaches and pain. Take your thumb and press up firmly underneath your skull, at the back of your neck, for one to two minutes.

For headaches caused by sinus congestion, try self-massage. By applying pressure to specific areas of the head, you can open up the sinuses and ease tension. Rub the area surrounding the bones just above and below the eyes, and massage the cheeks directly in line with these points. Lean your head forward slightly to facilitate sinus drainage. Applying heat to the sinuses, either with compresses or with steam inhalation, can also be beneficial.

Always seek and treat the cause of the headache, not the symptom. Long-term overreliance on aspirin, acetaminophen, and other nonprescription painkillers can make chronic headaches worse by interfering with the brain's natural ability to fight headaches. If you are using nonprescription painkillers more than four times a week, talk to your health care provider about other ways to control the pain.

If you experience a headache that does not subside, but instead progressively worsens over the course of a week, consult your physician. This can be a sign of an underlying organic problem such as a tumor.

To help prevent headaches, eat small meals and eat between meals to help stabilize wide swings in blood sugar. Include almonds, almond milk, watercress, parsley, fennel, garlic, cherries, and pineapple in your diet.

Be sure to get sufficient sleep. Inositol and/or calcium, if taken before bedtime, aid sleeping. A grapefruit half also helps. Do not eat sweet fruit or anything else sweet after 5:00 P.M.

If you suffer from headaches while taking birth control pills, talk to your doctor about switching to a low-estrogen formulation or going off the pills for a while. Oral contraceptives can cause a vitamin B<sub>6</sub> deficiency that results in headaches and migraines.

If you must eat a food to which you suspect you may be sensitive, use charcoal tablets (available in health food stores). Take five tablets within an hour before eating and three tablets after eating. As soon as possible, take a cleansing enema and a coffee retention enema. If you have severe headaches after consuming a food, this will relieve it quickly by eliminating the allergenic substances. Do not take charcoal tablets daily, however, as they also absorb the good nutrients.

If any of the following symptoms accompany the headache, consult your health care provider: blurred vision, confusion or loss of speech, fever and stiffness in the neck, sensitivity to light, pressure behind the eyes that is relieved by vomiting, pressure in the facial sinus area, throbbing of the head and temples, a pounding heartbeat, visual color

changes, and feeling as though your head will explode. Seek immediate medical attention if you experience a sudden, severe headache like a “thunderclap,” or if you experience a headache after a head injury, even a minor fall or bump. Chronic headache pain that worsens after coughing, exertion, straining, or sudden movement is also reason to seek professional attention.

❑ If you suffer from more than the occasional tension headache, keep a headache log to help your health care provider diagnose your condition. Keep the log for at least two months, noting the time of each headache and describing the pain (throbbing or dull), its severity, location, and duration.

❑ If you get a headache every time you exercise, see your health care provider to rule out heart problems. A headache that begins with exercise and then subsides after rest can be a cardiac headache.

### Considerations

❑ Headaches are often caused by allergies. A food allergy diary can help identify offending foods. (See ALLERGIES in Part Two.)

❑ Poor vertebral alignment may cause reduced blood flow to the brain. This is often caused by flat feet or by wearing high heels. Chiropractic adjustment can help.

❑ Routine chiropractic spinal manipulation and deep neck muscle massage can reduce the frequency of headaches and the need for pain-relieving medications.

❑ Regular exercise can help prevent headaches caused by tension and may also reduce the frequency and severity of migraines. But headaches with organic causes can be made worse by exercise. Talk to your health care provider about your headaches before using exercise to control the pain.

❑ Cluster headaches occur when a nerve pathway in the base of the brain (the trigeminal nerve pathway) is activated. The trigeminal nerve is the main nerve of the face responsible for sensations such as pain. When activated, the trigeminal nerve causes eye pain associated with cluster headaches. It becomes activated by a part of the brain called the hypothalamus. Serotonin causes the blood vessels in the head to contract, and this lowers the pain threshold. Before a migraine, serotonin levels are high, but during the attack, they drop. The low serotonin levels cause the blood vessels to be unusually large. The expansion of the blood vessels is thought to cause the throbbing pain in the temple or behind the eye. The area around the expanded blood vessels becomes inflamed and irritates the nerve endings. These dramatic changes in serotonin levels and reduced blood flow may cause headaches, but also nausea and distorted speech and vision.

❑ The FDA has approved three over-the-counter medications to treat migraines: Excedrin Migraine (a combination aspirin, acetaminophen, and caffeine), Advil Migraine (ibuprofen), and Motrin Migraine Pain (ibuprofen).

❑ Prescription medications for treating the pain of a migraine include: Dihydroergotamine (DHE) injection and as a nasal spray (Migranal); a combination product containing DHE plus isometheptene (Midrin) is not very effective. Triptans (5-hydroxytryptamine [5-HT], serotonin, agonists) are a class of medications used to treat migraines that are categorized as acute. They include: Sumatriptan (Imitrex), an injection, nasal spray, and rapid-dissolving tablet; almotriptan (Axert); naratriptan (Amerge); rizatriptan (Maxalt); zolmitriptan (Zomig); frovatriptan (Frova); and eletriptan (Relpax). These migraine-specific therapies are most effective when taken early in an attack. The goal is to relieve the pain and associated symptoms. Triptans should not be used by those who have a past history of, or risk factors for, heart disease, high blood pressure, high cholesterol, angina, peripheral vascular disease, impaired liver function, stroke, or diabetes.

❑ The FDA has approved four drugs for migraine prevention: propranolol (Inderal), timolol (Blocadren), topiramate (Topamax), and divalproex sodium (Depakote). Amitriptyline is also sometimes used. If patients have frequent migraine attacks, attacks that do not respond consistently to the treatments above, or if the migraine-specific medications are ineffective or contraindicated because of other medical problems, then these preventive medications should be given to reduce the migraine frequency and improve the response to the acute migraine medicines.

❑ Some doctors prescribe the drug lidocaine (Anestacon, Xylocaine) for cluster headaches and migraines. Used in nose drop form, it gives relief in minutes.

❑ In one study, twenty adults suffering from long-term cluster headaches squirted a capsaicin solution in their noses daily for five days. Within ten days of the last dose, there was a 67 percent drop in the number of attacks.

❑ Research shows that sleeping in a bedroom kept at a cooler temperature can help to prevent cluster headaches. Headaches are more frequent when environmental heat increases body temperature, which causes blood vessels to dilate.

❑ One study reported that taking 10 milligrams of melatonin near bedtime was effective in reducing the frequency of episodic cluster headaches. Chronic cluster headaches did not show improvement with this treatment, however.

❑ Women who suffer from migraines may benefit from using progesterone cream topically. Check with your health care provider first, as this cream may also affect hormones in your body unrelated to headaches.

❑ There are a number of common misdiagnoses of headache, including sinus pain, allergies, and temporomandibular joint syndrome (TMJ). What many people think are sinus headaches are really migraines. Sinus infections can cause brief, intense bouts of head pain, but recurring headaches are more likely to be tension headaches, migraines, or cluster headaches. Facial pain, pain in the temples, or pain above

the ear is sometimes diagnosed as TMJ headache, caused by the joint of the jawbone being out of alignment. But this too may actually be one of the common types of headache, which may be triggered or aggravated by the joint.

❑ Carbon monoxide poisoning can cause headache, in addition to nausea, vomiting, and neurological problems. Some 400 Americans die each year, and another 20,000 are treated in emergency rooms, for carbon monoxide exposure from leaking furnaces, gas ranges, and water heaters. Early signs of carbon monoxide poisoning are sometimes misdiagnosed. One way to protect yourself is to invest in a carbon monoxide detector. These can be purchased at hardware stores.

❑ See HYPOGLYCEMIA; MIGRAINE; and TMJ SYNDROME, all in Part Two. See also PAIN CONTROL in Part Three.

❑ For the names and addresses of organizations that can provide additional information and other services for people with headaches, see Health and Medical Organizations in the Appendix.

## HEARING LOSS

Loss of hearing occurs when the passage of sound waves to the brain is impaired. Hearing loss may be partial or complete, temporary or permanent, depending on the cause. Hearing loss is not technically the same thing as deafness, or hearing deficit. While hearing loss can lead to hearing deficit, deafness is an inability to hear that most often occurs at, or before, birth or as a result of a major illness or infection.

An estimated 50 to 60 percent of hearing loss has a genetic component. Hearing loss can occur at any age, but it is most commonly diagnosed in the very young or very old.

Hearing loss is divided into three categories: conductive hearing loss, sensorineural hearing loss, and central hearing loss. Conductive hearing loss occurs when the passage of sound waves is impeded in the external or middle ear. It may result from factors such as earwax buildup, middle ear infection and inflammation, Paget's disease, arthritis, or trauma to the eardrum. Sensorineural hearing loss is a consequence of damage to the structures or pathways of the inner ear. It may result from damage to the acoustic nerve (the eighth cranial nerve, also known as the auditory nerve), which carries information from the inner ear to the brain, or from damage to tiny cells called hair cells in the inner ear. The hair cells are responsible for translating sound waves into nerve impulses for transmission to the brain. If the hair cells die, they are unable to repair themselves and the resulting hearing loss is permanent. Sensorineural hearing loss can be present from birth, or it can be caused by certain prescription medications, including certain antibiotics, nonsteroidal anti-inflammatory drugs (NSAIDs), aspirin taken over a long period of time in high doses, quinine, viral infection of the inner ear, and Ménière's disease. This type of hearing loss affects both the acuity and clarity of hearing. Initially, it is noticed at higher pitches, and then, as it progresses, it is noticed at lower pitches, where speech is

heard. It is also possible to have mixed hearing loss, in which both conductive and sensorineural loss are present. Neural hearing loss usually occurs as a result of a brain tumor or stroke. Central hearing loss is very rare and is usually due to severe brain damage.

Hearing loss can be sudden or gradual, occurring over a period of days, weeks, or years. Infection, trauma, changes in atmospheric pressure, and earwax buildup or impaction can cause a sudden loss of hearing. Infection and inflammation often follow an upper respiratory tract infection or trauma to the ear, such as from the overuse or improper use of cotton swabs. Bathing or swimming in water that is overly chlorinated or contains high levels of bacteria and/or fungi can also lead to ear infections. Persistent and recurrent ear infections are often linked to fungal infection (candidiasis) and are frequently seen in people with allergies, cancer, diabetes, or other chronic diseases.

If hearing loss develops gradually, the individual experiencing it may be unaware of it until it reaches a fairly advanced stage. In fact, it is not uncommon for friends and family members to notice signs of hearing loss before the person experiencing it does. Some signs that may point to a hearing problem include perceived inattentiveness, unusually loud speech, irrelevant comments, inappropriate responses to questions or environmental sounds, requests for statements to be repeated, a tendency to turn one ear toward sound, and unusual voice quality.

Aging is the major factor in loss of the ability to hear the full range of frequencies in everyday communication. Eighteen percent of American adults forty-five to sixty-four years old, 30 percent of adults sixty-five to seventy-four years old, and 47 percent of adults seventy-five years old or older have a hearing impairment. Loss of the ability to hear high-frequency noises usually comes first. This type of age-related hearing impairment is called *presbycusis*. Presbycusis can be caused by a change in the blood supply to the ear due to heart disease, some diabetic conditions, or circulatory problems.

Suspected hearing deficits in infants deserve close and immediate attention, as an undiagnosed hearing impairment can lead to delayed and/or diminished acquisition of language skills and, possibly, learning disabilities. Risk factors for hearing loss in infancy include a family history of hearing loss; known hereditary disorders; congenital abnormalities of the ears, nose, or throat; maternal exposure to rubella or syphilis, or to the 130 or so ototoxic drugs such as tobramycin (Nebcin), streptomycin, gentamicin (Garamycin), quinine (Quinamm), furosemide (Lasix), or ethacrynic acid (Edecrin); chemotherapy agents such as cisplatin and carboplatin; glucocorticosteroids (cortisone, steroids); and birth-related problems such as prematurity, trauma and/or lack of oxygen during delivery, low birth weight, Usher syndrome, or jaundice. Otitis media (middle ear infection) is the most common cause of hearing loss in children. For the most part, this is temporary, but chronic or recurrent ear infections can cause permanent hearing loss

due to inflammation and infection of the middle ear. (See EAR INFECTION in Part Two.)

Sensorineural hearing loss in children can also be caused by childhood diseases such as meningitis, mumps, and rubella. Signs of hearing problems in infancy include failure to blink or startle at loud noises; failure to turn the head toward familiar sounds; a consistent ability to sleep through loud noises; greater responsiveness to loud noises than to voices; a failure to babble, coo, or squeal; and monotonal babbling. In toddlers, warning signs include failure to speak clearly by age two, showing no interest in being read to or in playing word games, habitual yelling or shrieking when communicating or playing, greater responsiveness to facial expressions than to speech, shyness or withdrawal (often misinterpreted as inattentiveness, dreaminess, and/or stubbornness), and frequent confusion and puzzlement. In older children, signs of hearing loss are similar to those in adulthood—a failure to respond to verbal requests, inappropriate responses to questions or other sound stimuli, and a seeming inattentiveness.

Many children suffer from auditory processing disorders (APD), which are disruptions, or dysfunctions, in the neural pathways that transmit hearing information from the ear to the brain. A child with APD might have excellent hearing but cannot effectively process what is heard. Despite having normal hearing, they often miss what people are saying. Signs of APD are:

- Frequent response is “What?” or “Huh?”
- Trouble following or inability to follow multistage directions.
- Considerable difficulty understanding speech in the presence of background noise.

Hearing loss caused by exposure to loud noises (noise pollution) is an increasing problem in our society today. When the delicate mechanisms of the inner ear are assaulted by loud noises, a phenomenon called *temporary threshold shift* (TTS) occurs. If you have ever walked away from a concert or a construction site with a buzzing or hissing in your ears, or with everything sounding as if you are underwater, you have experienced temporary threshold shift. When this condition occurs, you hear only noises above a certain level. While overnight rest usually restores normal hearing, this is a sign that damage has occurred to the hair cells in your inner ear. If this type of damage is lengthy and/or repeated, permanent threshold shift (PTS), with permanent damage and hearing loss, is the result. There are a number of terms—some clinical, some informal—used to distinguish among the sources of noise-related hearing loss. Boilermaker’s ear is a condition caused by heavy exposure to broad-band noise. The affected individual loses the ability to hear high-frequency sounds and has difficulty understanding spoken words. Diplacusis is a form of hearing loss experienced as sound distortion—the pitch of a given tone is heard differently by each ear. Hy-

peracusis is an extreme sensitivity to loud noises that can be caused by damage to the eardrum. Sociocusis is a term used to denote hearing loss from non-work-related exposure to noise. Most people who develop noise-related hearing loss say they were unaware that anything was wrong until they developed tinnitus or speech became inaudible, but in fact, the damage begins long before that and temporary threshold shift is a clear sign of it.

Noise-related hearing loss is common in train engineers, military personnel, and workers subjected to constant industrial noise, as well as in hunters and musicians, especially rock musicians. National Institutes of Health (NIH) statistics indicate that 15 percent of Americans between the ages of twenty and sixty-nine have high-frequency hearing loss due to exposure to loud sounds or noise. Be sure your child does not blast the music in headphones. If you can hear the radio or CD player when he or she is wearing headphones, the volume is too loud.

Tinnitus is a condition that occurs in about 25 million people with hearing loss. Tinnitus is experienced as constant or recurring ringing, buzzing, or hissing noises not caused by anything in the external environment. It is now thought that the noise originates in the brain and not in the ear, as was previously believed. If the ear is damaged by exposure to loud noises or certain medications (including aspirin), the brain may try to compensate and end up producing electrical signals that a person hears as a ringing noise in the ears. Experts at the University of Iowa claim that listening strategies could break the pattern responsible for the problem in the brain.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For a child between six and twelve, use one-half the recommended dose, and for a child under the age of six, use one-quarter the recommended amount.

## Hearing Loss Self-Test

The following is a quick test for hearing loss that you can do easily on your own: Rub your thumb and index finger together a few inches from your ear. If you can hear a scratching sound, your hearing is probably intact. If not, you may be experiencing hearing loss. Consult a doctor or audiologist for further evaluation.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Coenzyme Q <sub>10</sub>	30 mg daily.	Powerful antioxidant. Crucial in the effectiveness of the immune system and circulation to the ears.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works well with coenzyme Q <sub>10</sub> in supporting the immune system.

Magnesium	1,500 mg daily.	Prevents damage to the hair cells in the inner ear.
Manganese	10 mg daily.	Deficiency has been linked to ear disorders.
Multivitamin and mineral complex	As directed on label.	To provide a balance of all nutrients.
Potassium	99 mg daily.	Important for a healthy nervous system and transmission of nerve impulses.
Ultimate Oil from Nature's Secret	As directed on label.	A blend of essential fatty acids. Helps to reduce the tendency to produce excessive amounts of earwax.
Vitamin A	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	To boost immunity, increase resistance to infection, and strengthen mucous membranes. Studies have shown benefits to hearing-impaired people from taking vitamin A.
plus carotenoid complex	15,000 IU daily.	Antioxidants and precursors of vitamin A.
Vitamin B-complex injections or vitamin B complex	As prescribed by physician.  50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Essential for healing; reduces ear pressure. Injections (under a doctor's supervision) are best. If injections are not available, use a sublingual form.
plus extra folic acid and vitamin B <sub>12</sub>	400 mcg daily.  1,000–2,000 mcg daily.	Often depleted in people with hearing loss.
Vitamin C with bioflavonoids plus N-acetylcysteine	3,000–6,000 mg daily.  As directed on label.	Needed for proper immune function and to aid in preventing ear infections.  To remove excess fluids from the ear canal.
Vitamin E	200 IU daily, or 400 IU every other day.	Powerful antioxidant that increases circulation. Use d-alpha-tocopherol form.
Zinc lozenges	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Quickens immune response; aids in reducing infection.

## Herbs

Bayberry bark, burdock root, goldenseal, hawthorn leaf and flower, and myrrh gum purify the blood and counteract infection.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Echinacea aids equilibrium and reduces dizziness. It also fights infection and helps reduce congestion. It can be taken in tea or capsule form.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Eucalyptus, hyssop, mullein, and thyme have decongestant properties, which may help to alleviate ringing in the ears.

Ginkgo biloba helps to reduce dizziness and improve hearing loss related to reduced blood flow. Other herbs that may help to improve circulation and blood flow to the ear area include butcher's broom, cayenne, chamomile, ginger root, turmeric, and yarrow.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

To soothe inflammation and fight infection, mullein oil can be used as ear drops. If mullein is not available, garlic oil or liquid extract (Kyolic) may be substituted.

Take supplemental antioxidants. According to research published in the medical journal *Laryngoscope*, supplemental antioxidants may protect the inner ear from traumatic and age-related hearing loss.

## Recommendations

Eat fresh pineapple frequently to reduce inflammation. Also include plenty of garlic, kelp, and sea vegetables in your diet.

Limit your consumption of alcohol and sugars, which encourage the growth of yeast. This is particularly important if you have recurrent ear infections and have been treated with antibiotics. Also eliminate or keep to a minimum your intake of caffeine, chocolate, and sodium.

For earwax buildup, clean or irrigate your ears using either a solution of 1 part vinegar to 1 part warm water, or a few drops of hydrogen peroxide. Using an eyedropper, place a few drops in your ear, allow them to settle for a minute, then drain. Repeat the process with the other ear. Do this two or three times a day. Do not use cotton swabs to clean inside the ear canal, as this can push wax farther into the ear canal and exacerbate the problem. If the wax is hard and dry, apply garlic oil for a day or two to soften it. Then wash out the ear with a steady stream of warm water. Be patient, continue to irrigate the ear canal, and flush with warm water. Most cases of earwax buildup can be treated by this method. Another method of removing excess earwax, called ear candling, uses special candles available at health food stores. Instructions for the procedure are included with the candles. The candling procedure requires assistance, so do not attempt this by yourself.

For an ear infection, put 2 to 4 drops of warm (not hot) liquid garlic extract in the affected ear. (If both ears are infected,

do not use the same dropper for both ears, as it may spread the infection.) This treatment is very helpful for children.

If you are experiencing ear pain, tug on your earlobe. If this tug makes the ear hurt, you probably have an ear infection and should seek medical treatment. If the tug on the lobe does not hurt, the pain may be due to a dental problem.

When flying, chew gum during the plane's descent to prevent the discomfort and hearing loss associated with changes in atmospheric pressure. Or pop your ears by holding your nose and *gently* blowing air through your closed mouth. This clears the eustachian tubes. A decongestant such as pseudoephedrine (found in Sudafed and other products) may also be helpful, but remember, these medications are dehydrating (and so is the lack of humidity in an airplane cabin). If you use them, be sure to drink plenty of water and juice during the flight, and skip the cocktail and coffee, as alcohol and caffeine also are dehydrating.

Always wear ear protection (disposable plugs or an earphone-style headset) when using loud appliances such as power tools or lawn mowers and when you know you will be exposed to sudden loud noises, such as when shooting a gun.

Protect your hearing when listening to music. A general guideline is to keep the volume low enough that you can easily hear the telephone and other sounds over the music. If you are using a personal stereo unit with headphones, you should be the only one able to hear your music. If someone standing next to you can hear it, it's too loud.

Take measures to reduce your cholesterol level. Studies suggest that people with high cholesterol levels have greater hearing loss as they age than people with normal cholesterol levels. (See HIGH CHOLESTEROL in Part Two.)

If you are prone to ear infections, wear earplugs while swimming.

If you are planning to become pregnant, make sure you have achieved immunity to German measles, either through having had the disease or through vaccination. A doctor can perform a blood test to determine immunity. If vaccination is necessary, you must guard against becoming pregnant for at least three months to avoid the risk of serious birth defects, such as hearing loss.

If you become ill during pregnancy and medication is required, question your doctor or pharmacist thoroughly about possible effects on the developing fetus and do some research on your own. This will reduce the risk of giving birth to a child with impaired hearing.

If you have an infant, pay very close attention to his or her reactions to noises. If you have any doubt about your child's hearing, consult your physician. Be aware, however, that many physicians fail to pick up on hearing loss. If your doctor seems too quick to dismiss your concerns, talk to another doctor. Keep in mind that early detection is vitally important; detection of hearing loss before a child's

first birthday greatly reduces the chances that he or she will be disadvantaged by hearing problems in the years to come.

If you have experienced permanent hearing loss, advise family members, friends, and coworkers to speak slowly and distinctly, and avoid shouting. Depending on the nature of the hearing loss, a hearing aid may be helpful. There are now several different types of hearing aids on the market, including the following:

- Behind-the-ear (BTE) devices. These hook behind the ear and a tube carries the sound to a microphone fitted in the ear. The earpiece can also be attached to a pair of glasses. BTE devices work well, but some people find them aesthetically unappealing.
  - In-the-ear (ITE) devices. These are placed partly in the outer portion of the ear and partly in the ear canal. They are less obvious than BTE hearing aids. They can cause problems with feedback, however, because the microphone part is so close to the receiver and the controls are rather small.
  - In-the-canal (ITC) devices. As the name suggests, these are placed in the ear canal so they are difficult to see. This makes them very popular, but they too have problems with feedback due to the close proximity of the microphone and the receiver.
  - Digital devices. These represent the most exciting potential advance in hearing aid technology. They are able to suppress background noise, which is something other hearing aids cannot do. Unfortunately, the price of these devices, at least at present, is prohibitively high, and more work is needed before they exceed the efficacy of the older analogue hearing aids. For information on affordable, digital hearing aids, see [www.project-impact.net](http://www.project-impact.net).
- Hearing loss due to infection that has destroyed or damaged the sound-conducting mechanism of the inner ear can now be corrected with surgery. Surgeons can rebuild the damaged section with artificial bone and restore the eardrum to its original state.

### Considerations

Appropriate treatment for hearing loss depends on the underlying cause. Sometimes a high dose of steroids is given to see if sudden hearing loss can be rectified.

Food allergies, especially allergies to wheat and dairy products, can be the culprit in recurrent middle ear infections. (See ALLERGIES in Part Two.)

In one study, women aged sixty-one to seventy who had low B<sub>12</sub> and folic acid levels were found to be more likely to have impaired hearing. Those who took supplements of these vitamins were less likely to experience hearing loss.

If your infant is suffering from atopic dermatitis, eczema of the external ear, resulting in red, itchy, and

scaling skin of the pinna, then avoid common food triggers such as eggs, peanuts, soy, wheat, and milk. Speak to your child's pediatrician before removing any foods from your child's diet.

❑ You can minimize the level of hearing loss you will experience as you grow older if you reduce your exposure to loud noises in the earlier years of your life. Hearing can also be improved with proper diet and supplements.

❑ If you have to raise your voice to be heard over your surroundings, your environment is too noisy. You should try to limit your exposure to such places. If such exposure cannot be avoided, you should wear ear protection.

❑ Most cases of early childhood hearing deficit are first detected by the parents, not health care providers.

❑ The Occupational Safety and Health Administration (OSHA) has established guidelines for workplace noise levels. For any eight-hour day, the noise level should not be above 90 decibels (dBA). Protective headphones should be provided if noise levels exceed 85 dBA for any period of time.

❑ The average rock concert or stereo headset set at full blast (about 100 decibels) can damage your hearing in as little as half an hour. Similar damage can occur after about two hours spent in a video game arcade.

❑ Some researchers say that in addition to causing hearing loss, constant exposure to noise may lead to (or exacerbate) impaired vision, heart disease, psychological disorders, and other health problems.

❑ Any hearing loss that does not resolve on its own within two weeks should be evaluated by a health care professional. Some of the symptoms associated with hearing loss can be a sign of a serious health problem that requires treatment.

❑ If you are concerned about your hearing, you can arrange to take a free hearing test over the telephone. The Dial-a-Hearing Screening Test is provided as a public service by Occupational Hearing Services (800-222-3277). It is not a definitive test, but can give some indication as to whether you have a hearing problem you may need to talk to a hearing specialist about.

❑ Researchers at the Massachusetts Institute of Technology (MIT) have developed a cochlear implant, which is an electronic device containing electrodes that are surgically inserted into one of the structures of the inner ear to activate nerve fibers and allow sound signals to be transmitted to the brain. Hearing-impaired individuals who are candidates for this device are able to hear normal, everyday sounds.

See also EAR INFECTION and MÉNIÈRE'S DISEASE in Part Two.

## HEART ATTACK

The heart is a muscle that pumps blood around the body. It is made up of four separate chambers, two *atria* and two

*ventricles*. Between the four chambers are valves that allow the blood to flow in one direction only—forward. With each beat of the heart, the right ventricle pumps deoxygenated blood to the lungs while the left ventricle pumps oxygenated blood into the arteries for circulation around the body. The heart in turn depends on oxygenated blood coming to it through the coronary arteries (the arteries around the heart) for necessary oxygen and nutrients. If the coronary arteries are constricted due to atherosclerosis (the deposit of fatty plaques in the arteries), an embolus (a piece of tissue or air lodged in the artery), or a thrombus (a blood clot in the artery), the heart may be deprived of sufficient oxygen, causing a heart attack. The medical term for a heart attack is *myocardial infarction* (death of cardiac tissue). When the supply of blood to the heart is sharply reduced or cut off, the heart is deprived of needed oxygen. If blood flow is not restored within minutes, portions of the heart muscle begin to die, permanently damaging the heart muscle. Because this happens when the coronary arteries cannot provide the heart with sufficient oxygen, physicians also commonly refer to a heart attack as a "coronary."

With the onset of a heart attack, the primary symptom is usually a consistent deep, often severe, discomfort or pain in the chest (often described as a heavy substernal pressure that makes it feel as if the chest is being squeezed). Also common are discomfort in the arm(s), back, neck, jaw, or stomach, plus shortness of breath, breaking out in a cold sweat, nausea, vomiting, and light-headedness. It is important to know, however, that heart attack symptoms for men can be different than symptoms for women, the latter manifesting themselves as back pain, flulike symptoms, or a sense of impending doom. Heart attack symptoms may be present for up to twelve hours. In addition, a heart attack can cause abnormal heartbeat rhythms called *arrhythmias*. But the symptoms often are not at all as clear as this. They may also vary from person to person, and from heart attack to heart attack. This cannot be emphasized enough—especially for women, who are more likely to have "atypical" symptoms such as pain between the shoulder blades rather than crushing chest pain, and who therefore tend to delay seeking treatment or help.

There are three basic scenarios that can produce a heart attack. The first, and by far the most common, is partial or complete blockage of one of the arteries that supply the heart with oxygen, most often by a blood clot. Usually the arteries have been narrowed by years of coronary artery disease in which plaque, which is composed of cholesterol-rich fatty deposits, proteins, calcium, and excess smooth muscle cells, builds up on the arterial walls. The arterial walls thicken, inhibiting the flow of blood to the heart muscle. The roughening of arterial walls by deposits of plaque not only narrows the arteries, but also makes it easier for blood clots to form along their inner surfaces. When a clot grows, or detaches from its place of origin and travels through the blood vessels, it may block a coronary artery completely, resulting in a heart attack.

In the second heart attack scenario, an arrhythmia may set in, so that the heart is no longer pumping enough blood to ensure its own supply.

In the third, a weak spot in a blood vessel, called an aneurysm, may rupture, causing internal bleeding and disrupting normal blood flow.

No one knows exactly why some people develop heart disease and others do not, but a number of significant clues and risk factors have been identified. One risk factor that has been receiving a great deal of attention is homocysteine, an amino acid formed as a result of the metabolism of another amino acid, methionine, which is essential for normal growth and normal metabolism. Homocysteine in turn is converted back into methionine in a constant recycling process. The proper balance between homocysteine and methionine is essential. Too much homocysteine is toxic to the vascular system, and is very strongly associated with atherosclerosis. High homocysteine levels can be detected in over 20 percent of people with heart disease.

High levels of blood fats—specifically, certain lipoproteins and triglycerides—are also associated with an increased risk of heart disease. Lipoproteins are molecules that transport cholesterol in the bloodstream. There are two principal types: low-density lipoprotein (LDL) and high-density lipoprotein (HDL). High levels of LDL can lead to the formation of fatty plaques that can narrow the arteries and cause reduced blood flow. Lipoprotein(a) is a cholesterol-carrying protein closely related to LDL. It appears to be an important contributing factor in atherosclerosis, although the reason for this is not clear. High levels of HDL, on the other hand, appear to carry cholesterol away from the arteries and back to the liver for processing. Triglycerides are lipids (fats) that bind to proteins to form the high- and low-density lipoproteins. As with LDL, high triglyceride levels are associated with atherosclerosis and heart attack. Eating too many fatty foods, drinking too much alcohol, or having high insulin levels can result in elevated triglyceride levels.

Another possible factor in heart disease is an insufficient supply of antioxidants. Antioxidants render free radicals harmless and help the body dispose of toxic substances that may cause cellular damage. High levels of fibrinogen, a blood-clotting protein, may also be involved. If fibrinogen levels are high, the blood is more likely to form clots that obstruct blood flow, resulting in heart attack or stroke.

Still other research into the origins of heart disease focuses on the possible role of infectious bacteria. The presence of the bacteria *Helicobacter pylori* (*H. pylori*), normally associated with ulcers, has been found to be present in a significant number of people who have suffered heart attack. *Chlamydia pneumoniae*, a type of bacteria responsible for nearly 10 percent of cases of pneumonia, may also be associated with an increased likelihood of developing heart disease. Researchers believe that the chronic presence of low levels of these bacteria may result in chronic low-level inflammation in the blood vessels, which in turn makes

them more vulnerable to developing deposits of fatty plaques. In support of this hypothesis, high levels of a substance called C-reactive protein (CRP) have been found helpful in predicting an individual's potential for developing heart disease. CRP is released into the bloodstream when the blood vessels serving the heart have been damaged due to inflammation. Another sign of inflammation is a substance known as intracellular adhesion molecule (ICAM-1) or CD54. A type of molecule found on the surface of certain cells, ICAM-1 interacts with other body chemicals to trigger the inflammatory process. The more prevalent ICAM-1 is, the more likely you are to develop atherosclerosis, although CRP levels are still considered a better indicator of inflammation than ICAM-1 levels.

In general, people who are considered to be at greater than normal risk of heart attack are those with a family history of heart disease; those who smoke and/or abuse drugs; people with diabetes, high blood pressure, high blood cholesterol and/or triglyceride levels, or high homocysteine levels; sedentary people; and those who are under stress and/or who have "type A" personalities.

Some heart attacks occur without warning. The remainder are preceded by months or even years of symptoms, most commonly angina pectoris—chest pain that is typically aggravated by stress or physical exertion and relieved by rest. Like a heart attack, angina is caused by a lack of oxygen in the heart muscle, but the extent of oxygen deprivation is not sufficient to actually damage heart tissue. Many people complain of intermittent angina, shortness of breath, and/or unusual fatigue in the days or weeks leading up to a heart attack. A constant sensation of heartburn that persists for days and from which antacids provide no relief can be a sign of an impending heart attack.

The dietary, nutritional, and lifestyle recommendations in this section are designed to help prevent, or to support recovery from, a heart attack. They are not meant as a substitute for proper emergency treatment. If you think you may be having a heart attack, do not waste any time in seeking medical assistance. Any delay in obtaining help can result in greater damage to the heart.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Alpha-linolenic acid (ALA)	As directed on label.	An omega-3 fatty acid found in a long-term French study to lower the risk of a fatal heart attack by over one-third.

Alpha-lipoic acid	As directed on label.	An antioxidant; lowers LDL levels.
Chinese red yeast rice extract	As directed on label.	Promotes blood circulation and regulates cholesterol levels.
Coenzyme Q <sub>10</sub> or Q-Gel	100 mg daily.  As directed on label.	Improves heart muscle oxygenation and may help to prevent second heart attacks. A patented form of coenzyme Q <sub>10</sub> that is more easily absorbed than standard forms, so you can take less with the same effect.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works well with coenzyme Q <sub>10</sub> to streamline metabolism, ease depression and fatigue, increase energy, support adrenal glands, process fats, remove toxins from the body, and boost the immune system.
Grape seed extract or Pycnogenol	150–300 mg daily.  As directed on label.	Powerful antioxidants. Reduce the clotting tendency of the blood. Best used in combination with phosphatidylcholine, a natural component of lecithin.
Inositol hexaphosphate (IP <sub>6</sub> )	As directed on label.	Protects the heart by preventing blood clots and reducing cholesterol and triglyceride levels.
L-arginine	As directed on label.	An amino acid that boosts production of nitric oxide, which dilates the arteries to allow better blood flow. <i>Note:</i> If you are prone to herpes outbreaks, do not take L-arginine without L-lysine.
Lecithin	As directed on label.	Contains choline and inositol, important parts of the vitamin B complex. Aids in lowering cholesterol levels.
Potassium	99 mg twice a day.	Needed to maintain regular heart rhythm. Lowers cholesterol.
S-Adenosylmethionine (SAME)	As directed on label.	A natural antidepressant (depression has been linked to heart disease). Lowers homocysteine levels. <i>Note:</i> If you take SAME, be careful to maintain a correct balance of vitamins B <sub>6</sub> and B <sub>12</sub> and folic acid. Is converted into SAME in the body. Lowers homocysteine levels.
or Trimethylglycine (TMG)	As directed on label.	<i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Selenium	300 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Deficiency has been implicated in heart disease.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	B vitamins work best when taken together.
plus extra vitamin B <sub>3</sub> (niacin)	50 mg daily.	B vitamins that lower homocysteine levels. Sublingual forms are best.
and		

vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> and folic acid	50 mg daily.  1,000–2,000 mcg daily.  400 mcg daily. If you take anticonvulsant medication for epilepsy, do not exceed 400 mcg of folic acid per day from all sources, as it may induce seizures.	Deficiency of folic acid in the heart muscle leads to heart disease. Low folate levels may be more dangerous than high cholesterol for people with heart disease.
or No Shot B-6/B-12/ Folic from Superior Source	As directed on label.	A combination of these three important B vitamins.
Vitamin E capsules or liquid vitamin E with tocotrienols	200 IU daily, or 400 IU every other day. As directed on label.	A powerful antioxidant that improves circulation and thins the blood, reducing the risk of clots. Use d-alpha-tocopherol form. <i>Note:</i> If you take prescription blood-thinners, consult your doctor before taking supplemental vitamin E.

### Very Important

Acetyl-L-carnitine or L-carnitine plus L-cysteine and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To reduce blood lipid levels, increase cellular glutathione and coenzyme Q <sub>10</sub> , protect against lipid peroxidation, and assist in the breakdown of fats, preventing fatty buildup in the arteries, which helps restore blood flow to the heart.
Calcium and magnesium	1,500 mg daily.  1,000 mg daily, in divided doses, between meals and at bedtime.	Important for maintaining proper heart rhythm and blood pressure. Use chelate or citrate forms.
Cardio Logic from Wakunaga	As directed on label.	Increases oxygenation of heart tissue.
Chromium	100 mcg daily.	Helps raise levels of HDL (“good”) cholesterol.
Essential fatty acids (Kyolic-EPA from Wakunaga, primrose oil, or salmon oil)	As directed on label.	Protect heart muscle cells. Reduce triglyceride levels in the blood.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Beneficial for the heart, promotes circulation, and aids in reducing high blood pressure.
Glucosamine Plus from FoodScience of Vermont	As directed on label.	Plays an important role in the formation of heart valves.
Heart Science from Source Naturals	As directed on label.	Contains antioxidants, cholesterol-fighters, herbs, and vitamins that work together to promote cardiovascular function.
Multienzyme complex	As directed on label. Take with meals.	For proper digestion and to prevent heartburn.
Proteolytic enzymes	As directed on label 3 times daily. Take between meals for better protein absorption.	Anti-inflammatory agents that prevent free radical damage to the arteries.

Sea mussel	As directed on label.	Aids in the functioning of the cardiovascular system, the lymphatic system, and the endocrine system.
7-Keto DHEA	As directed on label.	Has been found to reduce depression.
Vitamin A with mixed carotenoids	As directed on label. If you are pregnant, do not exceed 10,000 IU daily.	Helps to prevent free radical damage to the arteries. Use emulsion form for easier assimilation.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Necessary for proper balance with copper and for thiamine utilization. Use a chelate form. Deficiency has been linked to heart disease.

### Important

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Improves oxygenation of heart tissue.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Aids in thinning the blood. Prevents blood clots and free radical damage.

## Herbs

Alfalfa, borage seed, nettle, and pau d'arco are rich in minerals necessary for proper regulation of heart rhythm.

Black cohosh, oat straw, passionflower, valerian root, skullcap, and wood betony are calming herbs that may help to regulate arrhythmias.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Butcher's broom, hawthorn berries and leaf, motherwort, and red sage strengthen the heart muscle.

*Caution:* If you are taking a blood-thinning medicine, consult your health care professional first before using red sage.

Cayenne (capsicum), ginger root, and ginkgo biloba strengthen the heart and are helpful for chest pain.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Cordyceps is a Chinese herb that lowers both blood pressure and LDL ("bad") cholesterol levels.

Gotu kola, primrose, and rosemary are helpful in managing angina.

Green tea has superb antioxidant properties and may provide protection against heart disease and many other illnesses.

*Note:* If you take prescription blood-thinners, consult your doctor before taking green tea in capsule form. Green

tea capsules—not the tea itself—contain fairly large quantities of vitamin K, which promotes blood clotting.

Turmeric contains curcumin, an anti-inflammatory that also lowers blood cholesterol.

## Recommendations

If you experience any of the following warning signs of heart attack, seek emergency medical care *immediately*:

- Chest discomfort in the center of the chest that lasts more than a few minutes or that goes away and then comes back. Discomfort can be defined as pressure, squeezing, fullness, or pain.
- Pain or discomfort in one or both arms, the back, neck, jaw, or stomach.
- Shortness of breath.
- Sweating (possibly profuse).
- Nausea and/or vomiting.
- Light-headedness.

If you think you may be having a heart attack, follow the steps outlined below:

- Stop what you are doing and sit down.
- Assess the situation. Try to remain calm. If there is someone else around you, let him or her know what is happening. If there is no one else there and you are still feeling pain or discomfort after a few minutes, or if you are sweating and weak without any other obvious symptoms, call for emergency help and tell the person on the other end of the line that you may be having a heart attack. *Do not* drive yourself to the hospital. *Do not* delay getting treatment.
- After calling for medical help, if you are unable to leave your telephone number and address, you may want to leave the telephone off the hook so that your number and address can be traced. If you have given your address and telephone number successfully, hang up and call a friend or relative who may be of assistance.
- If you have nitroglycerin tablets, take one every five minutes, up to three tablets in total. If you have aspirin in the house, take one and chew it. This may prevent a blood clot.
- Perform a technique called *cough CPR*, which involves vigorous coughing. This may help you to remain conscious long enough to call for help. Obviously, it is something that must be learned before it is needed; if you are considered at increased risk of a heart attack, discuss this with your health care professional.
- If a friend or relative is with you, have him or her check your pulse and respiration (breathing) at regular intervals. If your pulse or breathing stops, this person should

start cardiopulmonary resuscitation (CPR) immediately. He or she should then call the emergency number again, so that when the ambulance arrives, emergency personnel know that this is indeed a heart attack.

- If it is later established that the episode was *not* a heart attack, consider having your potential for a heart attack assessed by a doctor to relieve any doubts and concerns you may have.

If you have suffered a heart attack, or if you are considered at risk for a heart attack, modify your diet. Important dietary measures include the following:

- Make sure your diet is high in fiber. Not all types of fiber decrease the risk of heart attack, however. The most beneficial fiber appears to come from whole grains, fruits, and vegetables.
- Eat lots of foods that are rich in vitamins B<sub>6</sub> and B<sub>12</sub> and folic acid, which are needed to keep homocysteine levels in check. Vitamins B<sub>6</sub> and B<sub>12</sub> come naturally from leafy green vegetables and fruits. Folic acid can be found in some breakfast cereals, asparagus, spinach, chickpeas, and beans.
- Include almonds, brewer's yeast, grains, and sesame seeds in your diet.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

- Enjoy onions frequently. Onions—especially red onions—contain valuable antioxidants. Chop them and allow them to stand for ten minutes before cooking for optimal benefit.
- Add kelp and sea vegetables to your diet for necessary minerals.
- Drink fresh vegetable juices.
- Drink steam-distilled water only.
- Do not eat red meat, salt, sugars, or white flour. A diet high in red meat can elevate homocysteine levels. Eat soy-based protein foods instead. Soy protein can effectively lower high LDL cholesterol levels.
- Avoid salt, sugars, and white flour. Refined sugars produce adverse reactions in all cells by causing wide variations in blood sugar. The high surges are followed by hypoglycemic drops, causing dangerous instability in vital intracellular sugar levels.
- Eliminate fried foods, coffee, black tea, colas, and other stimulants from the diet.
- Refrain from excessive alcohol use, as it has an adverse effect on the heart. Drinking alcohol in moderation may actually be heart-healthy, but do not start to drink if you have not done so before—the potential benefit simply does not justify it.

- Sip barley water throughout the day for its healing and fortifying properties. (See THERAPEUTIC LIQUIDS in Part Three.)

Learn to make heart-smart food substitutions, such as the following:

- Instead of whole or 2 percent milk and cream, use 1 percent or skim milk.
- Instead of fried foods, eat baked, steamed, boiled, or broiled foods.
- Instead of lard, butter, palm oil, or coconut oils, cook with unsaturated vegetable oils such as corn, olive, canola, safflower, sesame, soybean, sunflower, or peanut.
- Instead of eating fatty cuts of meat, choose extra-lean cuts or cut off the fatty parts. Or substitute skinless chicken or fish.
- Instead of one whole egg in recipes, use two egg whites.
- Instead of sauces, butter, and salt, season vegetables with herbs and spices.
- Instead of regular hard and processed cheeses, eat low-fat, low-sodium cheeses.
- Instead of salted potato chips, eat low-fat, unsalted tortilla and potato chips and unsalted pretzels and popcorn.
- Instead of sour cream and mayonnaise, use plain low-fat yogurt, low-fat cottage cheese, or low-fat, light sour cream.

Fast three days a month to cleanse and detoxify the body. (See FASTING in Part Three and follow the program.)

To relieve stress and promote relaxation, add a few drops of lavender, sandalwood, or ylang ylang essential oil to a bath, or simply place a few drops on a tissue and inhale the aroma from time to time throughout the day.

*Arnica* is a homeopathic remedy used to support recovery from a heart attack.

Do not smoke. Avoid secondhand smoke.

The tests you'll need to diagnose your heart disease depend on what condition your doctor thinks you might have. No matter what type of heart disease you have, your doctor will likely perform a physical exam and ask about your personal and family medical history before doing any other tests. If you think you may be at risk for cardiovascular disease, you should discuss the following tests with your doctor: blood tests, chest X-ray, electrocardiogram (ECG), Holter monitoring, echocardiogram, catheterization, cardiac computerized tomography (CT) scan, and cardiac magnetic resonance imaging (MRI). (See box "Common Heart Problems and Procedures" under CARDIOVASCULAR DISEASE in Part Two.)

## Considerations

❑ Research has shown that people typically wait two hours or more before seeking emergency care after the onset of heart attack symptoms. It could be because they are uncertain about their symptoms or are concerned that it might be a false alarm. However, clot-busting medications and other effective treatments that restore blood flow and save heart muscle are most effective in the first hour following a heart attack.

❑ Heart attacks are directly related to a number of other conditions, such as arteriosclerosis, circulatory problems, hypertension (high blood pressure), high cholesterol, and cardiovascular disorders (including aneurysms, angina pectoris, and arrhythmias). These conditions are discussed separately in Part Two. It is advisable to refer to all of the sections on these interrelated diseases to learn about all aspects of, and contributing causes to, heart attacks.

❑ The severity of first heart attacks has dropped significantly in the United States—propelling a decline in coronary heart disease deaths, researchers reported in *Circulation: Journal of the American Heart Association*. This study suggests that better prevention and better management in the hospital have contributed to the reduction in deaths.

❑ Similarly, a study published in *The Journal of the American Medical Association (JAMA)* found that the chance of dying thirty days after a heart attack dropped from 18.8 percent in 1995 to 15.8 percent in 2006. The drop can be attributed in part to the fact that treatment in hospitals across the United States has become more consistent.

❑ Heart attacks are not, as many think, a male disorder. In fact, women account for nearly half of all heart attack deaths. Forty-four percent of women die within a year, whereas only 27 percent of men do. Heart attacks, not cancer, are the leading cause of death for American women. Twice as many women die of heart attacks each year as die from all forms of cancer combined.

❑ New guidelines call for women to maintain HDL levels above 50 mg/dL, a 25 percent increase over the previous recommendation, 40 mg/dL. Women are also advised to keep triglycerides below 150 mg/dL, rather than the previously recommended 200 mg/dL.

❑ Women experience a heart attack on average nine years later than men. However, many of the risk factors for having one are the same in men and women. These include high cholesterol, smoking, abdominal obesity, poor diet, and stress. These factors explain more than 90 percent of the risk for heart attack, and all are controllable.

❑ A guide to some of the language doctors use in talking about cardiovascular disease and heart attacks appears on page 311. This is not a definitive list, but it may provide a handy reference guide for major terms and tests for heart attacks.

❑ It is highly recommended that at least one person in every household receive thorough training in CPR.

## Stress Testing

Many physicians recommend that certain individuals undergo stress testing to determine the fitness and health of their hearts and cardiovascular systems. There are actually a number of different variations on stress testing. Following are some points you should know about them.

The most common stress test is an exercise test, which involves walking on a treadmill that increases in speed and grade (steepness) every three minutes. This test normally is stopped when the person undergoing it becomes fatigued or is short of breath, or experiences chest pressure. Heart rhythm and blood pressure are continuously monitored during the test.

Traditional stress testing sometimes can be combined with other techniques to take images of the heart before and after exercise. An exercise (treadmill or bicycle) echocardiogram, informally known as an echo, can be made that takes ultrasound pictures of the heart to see how it responds.

A nuclear thallium or sestamibi test is another type of imaging stress test. In this procedure, an intravenous (IV) line is placed in the arm and a small amount of radioactive material is injected before and after exercise. Images of the heart's blood supply then can be made.

For those who are unable to exercise, a medicine such as dobutamine or dipyridamole is given via an IV to gradually increase the workload of the heart, just as if it were exercising. Echo or nuclear images of the heart are then made to determine how well the heart's overall pumping action increases and whether or not there are any problems with blood supply to one of the walls of the heart.

An angiogram looks at the blood vessels around the heart and can also give information concerning the heart muscle and heart valves. A special catheter is threaded into the body through a blood vessel in the groin or arm. This catheter reaches the arteries around the heart. Dye is injected via the catheter into the blood vessels while pictures are being shot with an X-ray machine. These X-rays will show blockages in the arteries and their severity.

Your doctor will choose the best stress test for you, if needed, based on your symptoms, risk factors, and a physical exam. Regular checkups by a health care professional, regular exercise, eating lots of fruits and vegetables, and quitting smoking are key to a healthy heart.

❑ A technique known as thermography can be used to test for the presence of atherosclerosis by detecting fluctuations in the temperature of the arteries. In healthy arteries, the temperature remains constant, while in arteries that contain plaque, the temperature is different in diseased areas and the healthy areas. Another test for detecting harmful levels of calcium or plaque buildup in the arteries is gated helical computerized tomography (GHCT) scanning. Ask your doctor if he or she thinks either of these is a test you should have.

Tirofiban (Aggrastat) is an injectable drug that may help people recover from acute cardiac episodes, including severe angina or severe chest pain. It is a type of agent called a glycoprotein blocker that stops blood from clotting. Trials conducted in New Zealand found that tirofiban was more effective at preventing a second heart attack than aspirin or heparin. Tirofiban was recommended by the American Heart Association in 2007 for patients who have had a type of heart attack called non-ST-segment elevation myocardial infarction (NSTEMI).

Some compounds known as plant sterols and stanols have been shown to lower LDL cholesterol levels and can be found in some types of margarine and salad dressing. They are also available in tablet form.

Carnitine, coenzyme Q<sub>10</sub>, fish oil, magnesium, and antioxidants are recommended for the prevention of cardiac arrhythmia, heart attack, and angina. Carnitine protects the heart muscle from damage due to poor circulation or partial arterial blockage.

An Austrian study found that coughing vigorously (“cough CPR”) until help arrives can help to save the lives of people experiencing heart attack or cardiac arrest.

The omega-3 fatty acids docosahexaenoic acid (DHA) and eicosapentaenoic acid (EPA) help to reduce the risk of heart attack. Taking both DHA and EPA supplements was shown to reduce the chances of dying from all causes, including heart disease. These data were based on twelve studies including more than 32,000 individuals. Although the best dose is not yet known, the FDA is getting closer to making a DRI for omega-3s. The recommendation will likely be between 250 milligrams and 500 milligrams a day.

Diet is important after a heart attack. Both a low-fat diet and a Mediterranean diet, which is also low in fat but has more omega-3s, were shown to reduce the chance of having a second heart attack or dying from a heart attack.

Very large doses of vitamin D—over 1,000 international units daily—can be dangerous for people with heart disease. In large quantities, vitamin D is toxic and can cause hypercalcemia (excessively high levels of calcium in the blood), which in turn may lead to deposits of calcium in the arteries.

Among the more recently identified risk factors that may be linked to cardiovascular disease is C-reactive protein (CRP). This is a compound produced by the liver in response to injury or infection, and is a sign of inflammation in the body. Research correlates high levels of CRP with an increased risk of heart attack and stroke. Although the evidence is conflicting, some researchers believe that CRP itself is not a risk factor, but elevated levels of CRP could mean that some part of the cardiovascular system is inflamed, which can lead to stroke or heart attack. Information about CRP and other new risk factors is still emerging.

There is ongoing debate about whether or not taking synthetic estrogen protects the heart after menopause.

Some studies have suggested that it may, but there have also been studies showing it may actually increase the risk of a heart attack.

There are many different medications that may be prescribed for people with heart disease. These include the following:

- Angiotensin-converting enzyme (ACE) inhibitors inhibit the formation of the hormone angiotensin, which narrows the blood vessels. Angiotensin II receptor blockers interfere with the action, rather than the formation, of the same hormone.
- Anticoagulants (blood-thinners) are commonly prescribed for people in particular danger of developing blood clots, such as people who are bedridden, cancer patients, people with certain types of arrhythmias, and those who have had heart valve replacement surgery. There are also newer drugs known as platelet-aggregation inhibitors that may be prescribed for the same purposes. Sometimes just an aspirin is recommended when a patient is at risk for heart disease, but does not need anticoagulation drugs. The dose is small (81 milligrams per day) and less likely to cause stomach erosion, but effective enough to slightly thin the blood.
- Beta-blockers induce the heart to beat more slowly and with less force.
- Calcium channel blockers relax blood vessel muscle.
- Central adrenergic inhibitors (central-acting agents) prevent the nervous system from increasing heart rate and narrowing blood vessels.
- Diuretics (water pills) help the kidneys get rid of sodium and water, reducing the volume of blood in the body and, therefore, the strain on the heart.

Most people who have heart attacks experience the characteristic chest pain. However, not all do. Some people have a sensation that feels like indigestion; others have no noticeable symptoms at all. This phenomenon is often referred to as a “silent” heart attack. Older adults and people with diabetes are probably more likely than others to have this type of heart attack.

Many illnesses can mimic heart attacks, such as a gallbladder attack, fibromyalgia that causes pain in the chest wall, or gastroesophageal reflux disease (GERD), but if you have chest pain, you must see a physician. Chest pain or even ill-defined symptoms that you cannot explain just may be a heart attack—these are not conditions you can afford to ignore.

People with high blood pressure should avoid cold weather, which might trigger heart attacks because the lower temperatures increase blood pressure, putting more strain on the heart.

In some cases, heart attacks are caused by spasms of the arteries that suddenly shut off the flow of blood to the heart.

☐ Sensible, moderate exercise and a proper diet with nutritional supplements can prevent arteriosclerosis of the coronary arteries and myocardial infarction.

*Caution:* If you are over thirty-five and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

☐ Studies have shown that people who take supplemental coenzyme Q<sub>10</sub> following a heart attack are less likely to have a second attack within five years than those who do not.

☐ Researchers have found that eating just an ounce of walnuts a day (about seven nuts) may reduce the risk of a heart attack by 8 to 10 percent.

☐ A heart attack is not the same thing as heart failure. In heart failure, the heart does not supply enough blood to the body; in a heart attack, the heart does not receive enough blood to meet its needs. However, the damage produced by a heart attack can lead to heart failure.

☐ An underactive thyroid may increase the risk of heart attacks. An article in the *Annals of Internal Medicine* reported that women who had a condition termed *subclinical hypothyroidism* were about two times more likely to suffer from blockage in the aorta that could lead to a heart attack than women who had normally functioning thyroids.

☐ Depression and heart attacks often go hand in hand. It is therefore wise to actively treat depression.

☐ See ARTERIOSCLEROSIS/ATHEROSCLEROSIS; CARDIOVASCULAR DISEASE; CIRCULATORY PROBLEMS; HIGH BLOOD PRESSURE (HYPERTENSION); HIGH CHOLESTEROL; and RHEUMATIC FEVER, all in Part Two.

☐ See also CHELATION THERAPY in Part Three.

## HEART DISEASE

See CARDIOVASCULAR DISEASE; HEART ATTACK.

## HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE (GERD)

Heartburn is a burning sensation and pain in the stomach and/or chest, behind the breastbone. It may be accompanied by bloating, gas, nausea, shortness of breath, and/or an acidic or sour taste in the throat. Most people suffer from heartburn at some time in their life. It often occurs when hydrochloric acid, which is used by the stomach to digest food, backs up into the esophagus (the tube between the throat and stomach), causing sensitive tissues to become irritated.

Normally, the esophageal sphincter muscle pinches itself shut and prevents stomach acid from surging upward. However, if the sphincter is not functioning properly, the acid can slip past it and into the esophagus. This is gastroesophageal reflux. Conditions that affect the esophagus and

cause a reflux of stomach acids into the esophagus are now referred to as *gastroesophageal reflux disease* (GERD) rather than dyspepsia, chronic heartburn, or acid indigestion.

GERD can strike anyone, at any age. GERD can scar the esophagus, and if stomach acids make their way into the lungs, it can cause asthma-like symptoms. GERD can also lead to a condition called *Barrett's esophagus*, which is characterized by changes in the cells lining the esophagus that can induce cancer.

People with hiatal hernia often experience heartburn. It can also be triggered by certain foods. Common trigger foods include alcohol, caffeine, chocolate, citrus fruits and products, fats and fatty or fried foods, peppermint, spicy foods, and tomatoes and tomato-based foods. Gallbladder problems, stress, allergies, and enzyme deficiencies are other possible contributing factors.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Pancreatin plus bromelain	As directed on label. Take with meals. 80 mg daily, in divided doses. Do not exceed a total of 100 mg daily from all supplements.	Enzymes necessary for proper digestion.
Papaya tablets	As directed on label.	To relieve symptoms. Use chewable tablets from a health food store.
Vitamin B complex plus extra vitamin B <sub>12</sub>	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 1,000–2,000 mcg daily.	Needed for proper digestion. Use lozenge or sublingual forms.
<i>Helpful</i>		
Acid-Ease from Enzymatic Therapy	As directed on label.	A soothing plant enzyme and herb formula that aids in the breakdown and assimilation of foods.
Acidophilus	As directed on label.	Replaces "friendly" bacteria in the stomach.
Calcium and magnesium and potassium	300 mg twice daily. 150–200 mg twice daily. 100 mg twice daily.	These minerals have an alkalinizing effect that binds up stomach acid. Take these together between meals. Use calcium carbonate or calcium chelate form.
Methylsulfonylmethane (MSM)	As directed on label.	Relieves hyperacidity without disturbing the normal acid-alkaline balance.

## Herbs

- Aloe vera juice aids healing of the intestinal tract.
- Catnip, fennel, ginger, marshmallow root, and papaya tea all aid in proper digestion and act as buffers to stop heartburn.
- Drinking chamomile tea can relieve esophageal irritation.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Deglycyrrhizinated licorice (DGL) has effectively treated both heartburn and ulcers of the stomach and esophagus.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

## Recommendations

- At the first sign of heartburn, drink a large glass of water. This often helps.
- Try raw potato juice. Do not peel the potato—just wash it and put it in a juicer. (See JUICING in Part Three.) Mix the juice with an equal amount of water. Drink it immediately after preparation, three times a day.
- Try drinking a glass of fresh cabbage or celery juice every day.
- Change your eating habits. Eat more raw vegetables. Eat smaller, more frequent meals. Chew your food well. Eat slowly and enjoy your food. Following a disciplined diet is an important aspect of managing GERD.
- Sip 1 tablespoon of raw apple cider vinegar, mixed with a glass of water, while eating a meal. Do not drink any other liquids with meals.
- Eat fresh papaya and/or pineapple to aid digestion. Chew a few of the papaya seeds as well.
- Do not eat for three hours before bedtime. Wait at least three hours after eating before lying down.
- Avoid acidic foods such as citrus fruits and juices (see ACID/ALKALI IMBALANCE in Part Two).
- Do not consume caffeine-containing products, carbonated beverages, creamy cheeses, desserts, eggnog, fats, fried foods, gravies, rich sauces, marbled meats, onions (especially raw), peppermint, poultry skin, processed foods, spearmint, spicy or highly seasoned foods, sugar, tobacco, or tomatoes. These seem to be the main cause of heartburn.
- Avoid overeating at a meal.
- If you are overweight, weight loss may help reduce symptoms.
- See FASTING in Part Three and follow the instructions.

*Also see* the self-tests *under* ACID/ALKALI IMBALANCE and CARDIOVASCULAR DISEASE in Part Two.

- Do not take a multienzyme complex containing hydrochloric acid (HCl).
- Maintain an exercise program that includes walking, biking, or low-impact aerobics. Avoid running and weight lifting, as these activities put pressure on the stomach. Do not exercise after eating, however.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Elevate the head of your bed.
- As much as possible, avoid stress and anger.
- If you are taking any medications, ask your doctor if heartburn may be a side effect.
- Do not wear clothes that fit tightly around the waist. Do not wear tight clothing to bed.
- Do not ignore symptoms of GERD. This condition can cause serious health problems. If heartburn lasts longer than two weeks, you should seek medical attention.
- The early symptoms of angina and heart attack sometimes mimic those of "acid stomach." If symptoms persist, if the pain begins to travel down into your left arm, or if the sensation is accompanied by a feeling of weakness, dizziness, or shortness of breath, seek emergency medical help at once. (See HEART ATTACK in Part Two.)

## Considerations

- Estrogens can weaken the esophageal hiatus muscle, which keeps stomach acids in the stomach. Women who are pregnant and women who take birth control pills that contain estrogen and progesterone are therefore more likely to suffer from heartburn.
- Some nutrients such as melatonin, L-tryptophan, vitamins B<sub>6</sub> and B<sub>12</sub>, folic acid, methionine, and betaine were shown to be just as effective as drug therapy in reducing symptoms.
- People with certain illnesses, such as cancer, often have excessive amounts of acid in their systems. The consumption of too much processed and cooked food can also create an acidic environment in the body.
- Aspirin and ibuprofen can cause heartburn.
- Lying on your left side can help relieve heartburn. This keeps the stomach below the esophagus, helping to keep it acid-free.
- Antacids often provide relief of symptoms. However, in so doing, they may mask an underlying problem. In addition, many over-the-counter antacids contain excessive amounts of sodium, aluminum, calcium, and magnesium. With prolonged use of these products, dangerous mineral imbalances can occur. Excess sodium can aggravate hyper-

tension, and excess aluminum has been implicated in Alzheimer's disease. Reading the label of the antacids you intend to use will provide you with information concerning possible harmful ingredients contained in the product. Some types of antacids and the products they are found in are:

- Aluminum salts or gels: AlternaGEL, Amphojel.
- Aluminum-magnesium mixtures: Aludrox, Di-Gel, Gaviscon, Gelusil, Maalox, Mylanta, Riopan.
- Calcium carbonate: Alka-Mints, Chooz, Titalac, Tums.
- Calcium-magnesium mixtures: Roluids.
- Magnesium salts or gels: Phillips' Milk of Magnesia.
- Sodium bicarbonate: Alka-Seltzer, Bromo Seltzer, Citro-carbonate.

Calcium carbonate works as an antacid and contains no aluminum.

A product called Acid-Ease, from Enzymatic Therapy, has shown promising results. It can be purchased at health food stores. Acid-Ease is aluminum-free.

Drugs that suppress the production of stomach acid are sometimes recommended for people who suffer from frequent heartburn. These include cimetidine (Tagamet), famotidine (Pepcid), nizatidine (Axid), omeprazole (Prilosec), and ranitidine (Zantac). It has been suggested that long-term use of these medications may lead to damage to the stomach lining, thus increasing the risk of benign or malignant tumors. According to an item in the *Johns Hopkins Medical Letter*, excessive (more than 3 grams a day) and prolonged use of the heartburn medication cimetidine may lower the libido or cause breast enlargement. These conditions usually go away when the medication is discontinued.

The prescription drug famotidine (Pepcid) is now available in generic form. The over-the-counter Pepcid-AC is also now available as a generic.

One study showed that 57 percent of heartburn sufferers had hiatal hernias, almost half had damage to the esophageal lining, and 6 percent had developed *Barrett's esophagus*.

If you are taking antacids more than three times a week, you should consult your physician.

Free information about GERD is available from the International Foundation for Functional Gastrointestinal Disorders. (See Health and Medical Organizations in the Appendix.)

See PEPTIC ULCER in Part Two. Also see under PREGNANCY-RELATED PROBLEMS in Part Two.

## HEEL OR BONE SPUR

A bone spur is a pointed growth on a bone, most commonly in the heel. Extreme stress and strain on the heel bone and

soft tissues are the main causes of heel spurs. The stress results in inflammation of the plantar fascia, a ligament on the bottom of the foot that attaches the ball of the foot to the heel bone. This condition is known as plantar fasciitis. If it is not relieved, the repeated pulling of the ligament aggravates the heel bone and eventually the body, in an attempt to protect itself, forms a bone spur. The most common sign of a bone spur is severe pain with the first step in the morning and after periods of inactivity.

Bone spurs can be caused by, or be associated with, physical injury, obesity, gout, lupus, muscle inflammation, nerve problems (such as tarsal tunnel syndrome), strain of the plantar arch, or excessive exercise, standing, or walking. Heel spurs are also common in people who have alkalosis, arthritis, neuritis, or tendinitis. A bone spur may be caused by calcium deposits in unwanted areas of the body. Most people who have heel disorders are middle-aged or overweight. Shoes that are uncomfortable, fit poorly, or lack cushioning for the heel may contribute to the pain.

X-rays may reveal a bony spur within the heel. The presence of this may lead to the formation of tiny tumors at the end of several nerves, and these may be very painful.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Betaine hydrochloride (HCl)	As directed on label.	Needed for proper calcium uptake. A deficiency of HCl is more common in older people. <i>Caution:</i> Do not use HCl if you have a history of ulcers.
Calcium and magnesium	1,500 mg daily. 750 mg daily.	A proper balance of calcium and magnesium helps prevent abnormal calcium deposition. Use chelate or aspartate forms.
<b>Important</b>		
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label.	To aid in absorption of nutrients and in control of inflammation and irritation. <i>Caution:</i> Do not give these supplements to a child.
Intenzyme Forte from Biotics Research	As directed on label.	
Vitamin C with bioflavonoids	2,000–4,000 mg daily.	
<b>Helpful</b>		
Bioflavonoids	100 mg daily.	Vitamin C activators that also help relieve pain.
Methylsulfonylmethane (MSM)	As directed on label. It can be applied as a	Very effective for pain relief.

	cream or taken by mouth in the pill form.	
Vitamin B complex	50–100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	B vitamins work best when taken together.
plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg daily.	Necessary for production of hydrochloric acid, which helps prevent bone spurs by aiding proper calcium absorption.

## Herbs

- Use arnica and chamomile to bathe the foot. You can also wrap the herbs in a cloth and apply it to the affected area as a poultice. (See USING A POULTICE in Part Three.)
- Bromelain, derived from pineapple, and curcumin, from turmeric, reduce pain and inflammation.

## Recommendations

- Drink steam-distilled water only.
- Do not eat any citrus fruits, especially oranges. Eliminate alcohol, coffee, and sugar from your diet. These inhibit the healing process and upset the body's mineral balance.
- To alleviate pain, try stretching exercises; deep, localized massage; physical therapy; and anti-inflammatory herbs. You can also use hot linseed oil packs. Place linseed oil in a pan and heat but do not boil it. Dip a piece of cheesecloth or other white cotton material into the oil until the cloth is saturated. Apply the cloth to the affected area and cover it with a piece of plastic that is larger in size than the cotton cloth. Place a heating pad over the plastic and use it to keep the pack warm. Keep the pack in place for one-half to two hours, as needed.
- Ice massages on the bottoms of the feet can be helpful. Alternate between hot and cold foot baths.
- Select well-made, rubber-heeled shoes; these are better for the feet than leather. Choose footwear for comfort—not for looks. Some jogging shoes can be very comfortable. Adding heel cushions to footwear helps to relieve pain.
- Use night splints to provide a mild, constant stretching function across the sole of the foot at night while sleeping.
- If you normally walk or jog for exercise, try bicycling or swimming instead.
- Avoid walking on hard surfaces such as concrete, wood, or hard floors without carpeting.

## Considerations

- A two-week raw food fast or a cleansing fast can be beneficial. (See FASTING in Part Three.)

- It is best not to have a heel spur surgically removed unless it is extremely irritating or painful.
- Steroid injections have been used to treat this condition. They are not without potential complications, however. They may cause loss of the fatty tissue pad at the bottom of the heel and bring about a condition that is painful and irreversible.
- Foot surgery is a last-resort option that is usually reserved for extremely rare, severe cases. An incision is made over the heel to release the attached fascia from the heel bone. Recovery time is approximately six to ten weeks before walking can be resumed comfortably. However, if you find that you are unable to exercise or engage in normal activities because of a heel or bone spur, you should consider surgery. Lack of exercise could lead to weight gain and other problems such as diabetes and heart disease.
- See also ARTHRITIS in Part Two.

## HEMOPHILIA

In a healthy individual, a minor bump can damage a blood vessel, causing blood to leak into the surrounding tissue, producing a bruise. A process called hemostasis (coagulation) plugs the hole in the damaged vessel and forms a clot that stops the blood loss and limits the size of the bruise.

In people with hemophilia and related problems, bleeding can take a very different course. The blood does not clot normally because one or another of the blood proteins that collaborate to repair damaged vessels and form clots is defective, deficient, or totally absent. Approximately 20,000 people in the United States suffer from hemophilia.

There are two main types of hemophilia. They are classified according to the particular protein, or clotting factor, that is deficient. Hemophilia A, caused by a deficiency of factor VIII, accounts for almost 80 percent of people with this disorder. It is usually inherited by male children of mothers who are carriers. Hemophilia B, sometimes called *Christmas disease*, is caused by a problem with clotting factor IX. It too is passed on by carrier mothers to male children. It is also possible to have a bleeding disorder due to factor XI deficiency. Unlike hemophilia A and B, this problem can be carried by either the male or female parent, and can be passed on to both male and female offspring.

The idea that people with hemophilia can bleed to death from a minor cut or injury is a misconception. In fact, external bleeding is seldom a serious problem. People with hemophilia may bleed somewhat longer than other people, but minor bleeding episodes can generally be controlled by ordinary first aid measures.

Injuries also commonly cause bleeding inside the body—bleeding we may neither see nor feel. Unchecked internal bleeding can be serious—even life-threatening—for a person with hemophilia. Blood that leaks into the knee joint, a common site of internal bleeding, can cause painful swell-

ing. Repeated bleeding eventually destroys the cartilage that enables the knee to work smoothly and easily. The joint becomes permanently stiff and painful, the result of hemophilic arthritis. Other joints—the ankle, wrist, or elbow—can be similarly affected by internal bleeding. People with hemophilia can also bleed into muscle and other soft tissue. Internal bleeding can ultimately obstruct air passages or damage the brain or other vital organs.

Hemophilia can be mild, moderate, or severe, depending on how impaired an individual's production of clotting factors is. In severe hemophilia, clotting factor activity is less than 1 percent of normal. Injury, surgery, or dental care can present significant problems for such people. Spontaneous bleeding can require infusion of clotting factor concentrate as often as several times a week. People with moderate hemophilia (factor levels between 1 and 5 percent of normal) do not usually experience spontaneous bleeding, but even a minor injury, if untreated, can cause prolonged bleeding. In mild hemophilia, factor activity ranges between 5 and 50 percent of normal. Bleeding can be expected from surgery, major dental care, or trauma. These individuals rarely bleed into joints, and their disease usually does not interfere with normal living.

The National Hemophilia Foundation estimates that nearly 450 American boys with hemophilia are born each year. The number of females with hemophilia is not known. Hemophilia primarily affects males and is passed down through females because the two primary genes involved in the production of clotting factors are located on the X chromosome. And while females have two X chromosomes, males have only one. For a female to develop the disease, both of her X chromosomes would have to carry the defective gene (which is unlikely), whereas a male has only a single X chromosome, so if one of its clotting factor genes is defective, he will be affected.

A woman who has one defective gene will not develop hemophilia herself, but is a carrier of the condition. All children of (female) carriers have a 50 percent chance of inheriting the defective gene. For sons, this means a 50 percent chance of developing the disease; for daughters, it means a 50 percent chance of being carriers, like their mothers. For the children of (male) hemophiliacs, the story is somewhat different. Sons are not affected (unless the mother is a carrier), but daughters always become carriers. For hemophilia to occur in a female, she would have to have both a father with the condition and a mother who either has hemophilia or is a carrier.

People with hemophilia are commonly treated with plasma concentrates prepared from pooled blood plasma. As a result, as many as two-thirds of all Americans with hemophilia became infected with HIV before the virus was identified and a screening test developed. Blood donors are now screened for HIV, and clotting factor products are routinely subjected to heat to minimize, if not eliminate, the risk of transmission of the virus, but the chance of con-

tracting HIV understandably remains a source of concern for people with hemophilia. Hepatitis viruses had also been a problem for people using blood products.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Calcium and magnesium	1,500 mg daily.	Essential for blood clotting.
	1,000 mg daily.	Needed to balance with calcium.
Liver extract injections or raw liver extract	1 cc once weekly or as prescribed by physician. As directed on label.	Contains vital nutrients for blood clotting.
Multivitamin and mineral complex	As directed on label.	Provides necessary vitamins and minerals.
Vitamin B complex plus extra	As directed on label.	All B vitamins are essential in blood formation and clotting. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
vitamin B <sub>3</sub> (niacin) and niacinamide	As directed on label.	
	As directed on label.	
Vitamin C with bioflavonoids	3,000 mg daily.	Important in normal blood coagulation.
Vitamin K or alfalfa	300 mcg daily.	Essential in blood-clotting mechanism. See under Herbs, below.

### Herbs

Alfalfa is a good source of vitamin K, which is vital in the process of blood clotting. It can be taken in tablet form or eaten in a natural form, such as alfalfa sprouts.

### Recommendations

Eat a diet high in vitamin K. Foods that contain a measurable amount of this vitamin are alfalfa, broccoli, cauliflower, egg yolks, kale, liver, spinach, and all green leafy vegetables.

"Green drinks" made from the vegetables listed above are very healthful. Drink one of these each day for vitamin K and other essential clotting factors.

Be alert for early warning signs of internal bleeding, including a bubbling or tingling sensation or a feeling of warmth, tightness, or stiffness in the affected area. A blow to the head, headache, confusion, drowsiness, or other evi-

dence of neurological impairment may signal intracranial bleeding.

- Wear an identity bracelet so that, in an emergency, people will know that you have hemophilia.
- Do not take aspirin. Aspirin is an anticlotting agent.
- If you care for an infant or toddler with hemophilia, be alert for signs of joint or muscle pain caused by internal bleeding. The child may cry for no apparent reason, refuse to use an arm or leg, refuse to walk, or have swelling or excessive bruising. If you suspect internal bleeding, seek treatment immediately.

### Considerations

- Treatment of hemophilia consists of intravenous infusions of the missing clotting factor. This is now usually done at home. How much antihemophilic factor an individual needs and when depends on the severity of his or her disease.
- Gene therapy may hold the key to curing hemophilia, although the factor VIII gene is extremely complex, and it may be some time before scientists are able to replace these defective genes in people with hemophilia.
- For names and addresses of organizations that may be of assistance in obtaining information and/or treatment options, see Health and Medical Organizations in the Appendix.

### HEMORRHOIDS

Hemorrhoids are swollen veins around the anus and in the rectum (the very lowest portion of the colon) that may protrude from the anus. The word *hemorrhoid* comes from *hemo* (Greek for "blood") and *rrhoos* ("discharging"). They are also known as piles, from the Latin word *pila*, meaning "ball." Hemorrhoids are very much like varicose veins; they enlarge and lose their elasticity, resulting in saclike protrusions into the anal canal. They are not tumors or growths. They can be caused, and aggravated, by sitting or standing for prolonged periods, violent coughing, lifting heavy objects (or lifting even relatively light objects improperly), and straining at bowel movements (especially when constipated, although bouts of diarrhea accompanied by involuntary spasms can exacerbate the problem). Other factors that can cause or contribute to the formation of hemorrhoids include obesity, lack of exercise, liver damage, food allergies, and insufficient consumption of dietary fiber. Hemorrhoids are common during pregnancy and after childbirth. Hormonal changes and pressure exerted by the growing fetus may be the reasons. Approximately half of all Americans have had hemorrhoids by the age of fifty. The incidence increases with age until age seventy, then begins to decrease again.

The most common symptoms of hemorrhoids include itching, burning, pain, inflammation, swelling, irritation,

seepage, and bleeding. The bleeding, which is usually bright red during bowel movements, can be startling, even frightening. Although it does signal that something is amiss in the digestive system, rectal bleeding is not necessarily an indication of serious disease.

There are different types of hemorrhoids, depending on their location, severity, and the amount of pain, discomfort, or aggravation they cause. These are:

- *External*. These develop under the skin at the opening of the anal cavity. They may form a hard lump and cause painful swelling if a blood clot forms. When an external hemorrhoid swells, the tissue in the area becomes firm but sensitive and turns blue or purple in color. This type of hemorrhoid most often affects younger people and can be extremely painful.
- *Internal*. Internal hemorrhoids are located inside the rectum. They are usually painless, especially if located above the anorectal line, because rectal tissues lack nerve fibers. Internal hemorrhoids do, however, tend to bleed. When they do, the blood appears bright red.
- *Prolapsed*. A prolapsed hemorrhoid is an internal hemorrhoid that collapses and protrudes outside the anus, often accompanied by a mucous discharge and heavy bleeding. Prolapsed hemorrhoids can become *thrombosed*—that is, they can form clots within that prevent their receding. Thrombosed hemorrhoids can also be excruciatingly painful.

As far as we know, hemorrhoids are unique to human beings. No other creature develops this problem. This can be taken as an indication that our dietary and nutritional habits probably play a greater role in this disorder than anything else. Hemorrhoids can occur at any age, but they tend to become more common as people age. Among younger people, pregnant women and women who have had children seem to be the most susceptible. The tendency to develop hemorrhoids also appears to be hereditary. Although hemorrhoids can be quite painful, they do not usually pose a serious threat to health.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
ABC Aerobic Bulk Cleanse from Aerobic Life Industries	As directed on label. Mix with ½ glass fruit juice and ½ glass aloe vera juice, and drink it down quickly before the fiber thickens. Take separately from other supplements and medications.	Keeps the colon clean, relieving pressure on the rectum.

Calcium	1,500 mg daily.	Essential for blood clotting. Helps prevent cancer of the colon. Use calcium chelate or aspartate form.
and magnesium	750 mg daily.	Needed to balance with calcium.
Vitamin C plus mixed bioflavonoids with hesperidin and rutin	3,000–5,000 mg daily. 100 mg 3 times daily.	Aid in healing and normal blood clotting.
Vitamin E	200 IU daily or 400 IU every other day.	Promotes normal blood clotting and healing. Use d-alpha-tocopherol form.

**Important**

Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> plus choline and inositol	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily, with meals. 1,000 mcg twice daily. 50 mg each twice daily.	All B vitamins are vital for digestion. Improved digestion results in reduced stress on the rectum. Use lozenge or sublingual forms.
--	---	--

**Helpful**

Coenzyme Q <sub>10</sub>	100 mg daily.	Increases cellular oxygenation and assists in healing.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	125 mg twice daily.	Improves cellular oxygenation.
Garlic (Kyolic from Wakunaga)	As directed on label.	A natural antibiotic and immune system stimulant. Use the liquid form.
Key-E Suppositories from Carlson Labs	As directed on label.	Shrinks inflamed hemorrhoidal tissue. Check with your doctor before placing anything transrectally.
Potassium	99 mg daily.	Constipation, which can cause hemorrhoids, is common in those with potassium deficiencies.
Shark cartilage	1 gram per 15 lbs of body weight daily, divided into 3 doses. Can be taken either orally or rectally, in a retention enema.	Treats pain and inflammation.
Vitamin A with mixed carotenoids	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Aids in healing of mucous membranes and tissues.
Vitamin D	600 IU daily.	Aids in healing of mucous membranes and tissues. Also needed for calcium absorption.

**Herbs**

Aloe vera gel, applied directly on the anus, has properties similar to aspirin. It can relieve pain and soothe the burning sensation. The fresh pulp is best.

Bayberry, goldenseal root, myrrh, and white oak, used in a salve form, work like conventional hemorrhoid preparations—possibly better.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

A paste made from powdered comfrey root can be used in a poultice to heal bleeding hemorrhoids.

*Caution:* Comfrey is recommended for external use only.

An elderberry poultice can relieve the pain associated with hemorrhoids. A mullein poultice can be used as well. (See USING A POULTICE in Part Three.)

Brew a strong, warm tea using the herb lady's mantle (yarrow), and apply with a cotton ball several times a day.

Witch hazel is helpful because of its astringent properties. Apply it three times daily with a sterile cotton pad to shrink the swollen vein.

Other beneficial herbs include buckthorn bark, collinsonia root, parsley, red grapevine leaves, and stone root. These can be taken in capsule or tea form.

**Recommendations**

Eat foods that are high in dietary fiber, such as wheat bran, fresh fruits, and nearly all vegetables. Apples, beets, Brazil nuts, broccoli, foods in the cabbage family, carrots, green beans, guar gum, oat bran, lima beans, pears, peas, psyllium seed, and whole grains are recommended. A high-fiber diet is probably the most important consideration in the treatment and prevention of hemorrhoids. Psyllium has been shown to be particularly effective in patients with internal bleeding hemorrhoids. It may take one month to take effect, but its continued use is advised.

To help bleeding hemorrhoids, eat foods such as alfalfa, blackstrap molasses, and dark green leafy vegetables, which are high in vitamin K.

Drink plenty of liquids, especially water (preferably steam-distilled). Water is the best, most natural stool softener in existence. It also helps prevent constipation.

Avoid animal products, coffee, alcohol, and hot spices. Red meat and high-protein diets are especially hard on the lower digestive tract.

Eat a healthy low-fat diet that is rich in fruits and vegetables. Include protein at each meal, mostly from vegetable sources, fish, or lean poultry.

Take 1 or 2 tablespoons of flaxseed oil daily. Flaxseed oil helps to soften stools.

If you decide to use a fiber supplement, start with a moderate amount and increase your intake gradually. If you take too much at first, this will cause painful bloating, gas, and possibly diarrhea.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Use cayenne (capsicum) and garlic enemas to keep the bowels clean. A plain warm-water enema is fast-acting and relieves discomfort in most cases. (See ENEMAS in Part Three.) Check with your health care provider before using.

Use a peeled clove of garlic as a suppository three times a week. Raw potato suppositories help heal hemorrhoids and relieve pain. Cut a peeled potato into small cone-shaped pieces.

If you are bothered by persistent bleeding, take vitamin and mineral supplements to prevent anemia. An iron supplement together with a powerful vitamin B complex and vitamin C will keep the blood healthy. Coenzyme B Complex from Source Naturals is among the most efficiently absorbed forms of the B vitamins. Consult your physician before taking iron.

*Caution:* See your physician if bleeding persists.

Learn not to strain when moving the bowels. Keep the bowels clean and avoid constipation. Don't sit on the commode for longer than ten minutes at a time, as this causes blood to pool in the hemorrhoidal veins.

Cleanse the problem area frequently with warm water. A hot bath for fifteen minutes a day is quite helpful. Do not add bath beads, oils, or bubbles to the water, as this can irritate sensitive tissues. Many people add Epsom salts, but this has no proven clinical value. It is the warm water that reduces swelling and eases the pain. Avoid using soap products to cleanse the anus.

Warm sitz baths are especially beneficial. Take a mineral sitz bath daily. (See SITZ BATH in Part Three.) I recommend Batherapy from Queen Helene, a powder that contains many valuable minerals and is added to bathwater. This can be found in many health food stores.

Sit on a soft cushion, not on hard surfaces. Use an ordinary cushion, not a donut-shaped one. The old-fashioned inflated doughnut cushion actually increases pressure upon the hemorrhoidal blood vessels, aggravating the swelling and bleeding.

Learn proper lifting techniques. Bend your knees, not your back. Do not hold your breath as you lift; this puts enormous strain and pressure upon the hemorrhoidal vessels. Instead, take a deep breath and exhale at the moment of lifting. Make your thighs do the work, not your back. Avoid heavy lifting as much as possible.

Get regular moderate exercise.

*Caution:* If you are thirty-five or older and/or have been

sedentary for some time, consult with your health care provider before beginning an exercise program.

Avoid strong or harsh laxatives. Most of these products induce unnecessary straining at bowel movements and often "overdo" their jobs by creating a condition similar to diarrhea. Also, using chemical laxatives does not provide the healthful benefits that natural substances provide. Laxative products can also cause the bowels to become dependent upon them for normal functioning, much like an addiction. Instead of chemical preparations, use a stool softener such as aloe vera or prune juice if constipation or straining at defecation is a problem.

Avoid using rough toilet paper. Use moistened toilet paper or baby wipes instead.

Avoid sitting or standing for prolonged periods of time. If sitting for extended periods of time cannot be avoided, take frequent breaks to stretch and move around (this is also good for circulation, the back, and the legs).

Do not use products containing ibuprofen or aspirin for hemorrhoid pain—they can encourage bleeding. Instead, choose pain medications such as acetaminophen (in Tylenol, Datril, Anacin, Valadol, and other products).

If home treatments bring no relief, consult your health care provider, especially if the problem is recurrent and bleeding persists for more than three days. Although the amount of blood loss might seem insignificant, even a slow loss of blood will eventually result in anemia and its associated problems. (See ANEMIA in Part Two.) In addition, persistent rectal bleeding can lead to infections and even a compromised immune system. If the blood is dark red, it can indicate a more serious problem such as an abscess, an anal fissure, a fistula, or cancer. Anal fissures are common in people with Crohn's disease.

## Considerations

Depending upon the location and severity of the problem, physicians today use the following treatment approaches in dealing with hemorrhoids:

- *Bipolar electrocoagulation.* Also called BiCap coagulation, this procedure uses spurts of electrical current to shrink hemorrhoids. It is comparable to infrared photocoagulation in that it has the equivalent advantages and disadvantages.
- *Conservative measures.* A dietary regimen with fiber supplements and self-help treatments is helpful in most cases, except in instances where a hemorrhoid has thrombosed.
- *Infrared photocoagulation.* This involves the employment of infrared heat to treat minor internal hemorrhoids. It is less painful than ligation but is not always as effective.
- *Injection sclerotherapy.* In this procedure, used to shrink internal hemorrhoids and stop bleeding, a solution con-

taining either quinine and urea or phenol is injected directly into the hemorrhoids.

- *Laser coagulation.* This approach has gained popularity over the last several years as the easiest and least painful method of dealing with internal hemorrhoids. There is controversy about its efficacy, however. Repeated treatments are frequently required. Most researchers believe that more study should be done to improve effectiveness before laser treatment is routinely recommended.
- *Ligation.* This is now the most common treatment approach for internal hemorrhoids. A small rubber band is used to tie off the base of the blood vessel. Once blood circulation is eliminated from the offending vessel, it soon detaches and the rubber band is eliminated with body waste. This approach often requires repeat treatments and is painful.
- *Surgery.* Some hemorrhoids are not helped very much by any of the above approaches and respond to nothing short of aggressive surgery. If you have very painful hemorrhoids or are losing significant amounts of blood, you should receive a thorough examination from a physician, preferably a proctologist, as soon as possible. Improved surgical techniques have resulted in less painful operations and quicker recovery periods than in the past. In most cases surgery is successful. However, additional surgery may be required if the hemorrhoids recur.

Anurex is a chemical-free product that helps give prompt, soothing, and lasting relief from the burning, itching, and bleeding caused by hemorrhoids. It is a small plastic device that contains a permanently sealed cold-retaining gel. It works best if kept in the freezer. When placed at the site of pain, it imparts a controlled degree of cooling to the inflamed tissue. Each Anurex device is reusable for up to six months. This product can be found in many pharmacies and health food stores, or can be ordered directly from Anurex Labs. (See Manufacturer and Distributor Information in the Appendix.)

Eating certain foods, especially beets, can cause the stool to become reddish and can be mistaken for blood.

The most common cause of anal itching is tissue trauma resulting from the use of harsh toilet paper. *Candida albicans*, allergies, and parasitic infections can also cause anal itching.

See also under PREGNANCY-RELATED PROBLEMS in Part Two.

## HEPATITIS

Hepatitis is an inflammation of the liver, usually caused by a viral infection. The liver is responsible for filtering out from the bloodstream harmful substances such as dead cells, toxins, fats, an overabundance of hormones, and a yellowish substance called bilirubin that is a by-product of the breakdown of old red blood cells. If the liver is in-

flamed, tender, and enlarged, it becomes unable to function normally. As a result, toxins that would normally be filtered out by the liver build up in the body, and certain nutrients are not processed and stored as they should be. The symptoms of hepatitis include fever, weakness, nausea, vomiting, headache, appetite loss, muscle aches, joint pains, drowsiness, dark urine, light-colored stools, abdominal discomfort, and often, jaundice (yellowing of the skin due to an accumulation of bilirubin) and elevated liver enzymes in the blood. Flulike symptoms may be mild or severe.

There are different types of hepatitis, classified according to the virus that causes the condition. Scientists have identified the viruses responsible for three leading types of the disease, called hepatitis A, hepatitis B, and hepatitis C. There are also other, less common types known as hepatitis D, hepatitis E, and hepatitis G. All are contagious to some extent.

Hepatitis A virus (HAV), also known as *infectious hepatitis*, can cause acute liver disease. In most cases, however, the liver heals within a few months. Hepatitis A can develop without sudden signs or symptoms. It is easily spread through person-to-person contact, fecal contamination of food or water, and raw shellfish taken from polluted water. It is contagious between two to three weeks before, and one week after, jaundice appears.

Hepatitis B virus (HBV), also referred to as serum hepatitis, is spread through contact with infected blood (for example, from mother to child at birth or through the use of contaminated syringes, needles, and transfused blood) from adults to children living together in close contact, through sexual activity, and through blood transfusions. Most people—85 percent—recover from hepatitis B, although 15 percent go on to develop cirrhosis or cancer of the liver.

Hepatitis C virus (HCV), the most serious form of hepatitis, accounts for approximately 10,000 deaths a year in America. It is estimated that 4 million Americans are infected with HCV, 3.2 million of them chronically. Hepatitis C is the primary reason for liver transplants in this country. Hepatitis C is four times more prevalent than AIDS and twenty times easier to contract. About 85 percent of infections lead to chronic liver disease. Currently, 1 to 5 out of 100 people with HCV die. The virus causes slowly progressing but ultimately devastating damage to the liver. In addition, people with hepatitis CV often have elevated levels of iron in the liver. This also can cause liver damage. Tests can detect HCV antibodies in donated blood, but an infected individual may take up to six months to develop the antibodies, so it is still impossible to identify all infected blood. The U.S. Food and Drug Administration (FDA) maintains that only 7 percent of current hepatitis C cases were acquired as a result of blood transfusions, and that the risk of contracting the virus from a unit of blood is near zero. The incidence of hepatitis C infection from blood transfusions or the use of blood products has dropped substantially since 1992, when screening was introduced, but

there is always a minuscule risk—and the lack of testing before 1992 has left a huge legacy of HCV-infected people. You may be at risk for hepatitis C if you have:

- Had a blood transfusion prior to 1992, when screening for HCV antibodies started.
- Shared needles for intravenous (IV) drug use (even one incident, years ago).
- Shared straws for inhaling cocaine.
- Had body piercing or tattoos with nonsterile equipment.
- Had hemodialysis (used a kidney machine).
- Had frequent exposure to blood products (due to hemophilia, chronic renal failure, chemotherapy, organ transplantation, or any other reason).
- Had a needle-sticking incident (health care workers are at high risk).
- Used an infected person's toothbrush, razor, or other item that had blood on it.
- Engaged in high-risk sexual behavior, such as having multiple partners and using no protection.

Hepatitis D virus (HDV), or delta hepatitis, occurs in some people already infected with hepatitis B. It is the least common of all the hepatitis viruses, but the most serious because it means that there are two types of hepatitis working together. It can be transmitted through sexual contact or from mother to child at birth.

Hepatitis E virus (HEV) is rare in the United States, but more common in other parts of the world, notably Mexico, India, and Asian and African countries. It is usually spread through fecal contamination and appears to be dangerous for pregnant women, but generally does not lead to chronic hepatitis in others.

It is also possible to develop hepatitis as a result of exposure to certain toxins or alcohol or drug use, including the overuse of over-the-counter medications such as acetaminophen or ibuprofen. This is called *toxic hepatitis*. Environmental toxins absorbed through the skin can also damage the liver. Chlorinated hydrocarbons and arsenic are examples of toxic agents. In toxic hepatitis, the amount of exposure to the toxin determines the extent of liver damage.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Alpha-lipoic acid (ALA)	As directed on label.	Has antioxidant properties that protect the liver.

Beta-1,3-D-glucan	As directed on label.	An excellent antioxidant. Stimulates the activity of macrophages, which surround and digest cellular debris.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply necessary protein. The liver breaks down protein; taking free form amino acids takes strain off the liver.
Glutathione plus L-arginine and L-cysteine and L-methionine	500 mg twice daily, on an empty stomach. As directed on label.	Protects the liver. Detoxifies the liver.
	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Detoxifies harmful hepatotoxins and protects glutathione. (See AMINO ACIDS in Part One.)
Inositol hexaphosphate (IP <sub>6</sub> )	As directed on label.	A powerful antioxidant that has many positive effects on the body, including protecting the liver. Also known as phytic acid.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Powerful liver protectors and potent antioxidants.
Raw liver extract or desiccated liver	As directed on label. As directed on label.	Promotes liver function. (See GLANDULAR THERAPY in Part Three.) Consider injections (under a doctor's supervision).
S-Adenosylmethionine (SAME)	As directed on label.	Promotes the health of the liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give SAME to a child under twelve.
or Trimethylglycine (TMG)	As directed on label.	Needed for conversion of harmful homocysteine into methionine, the basis for production of SAME.
Selenium Forte from American Biologics	As directed on label.	Studies have shown selenium to protect against liver cancer.
<b>Very Important</b>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	Counteracts immuno-suppression and enhances tissue oxygenation.
Dimethylglycine (DMG)(Aangamik DMG from FoodScience of Vermont)	As directed on label.	Improves cellular oxygen concentration.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Protects cells of the liver and is a fat mobilizer. Aids in preventing fatty liver.
Multivitamin complex with vitamin B complex	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). Do not exceed a total of 100 mg vitamin B <sub>3</sub> (niacin) in any one day until healing is complete.	All nutrients are necessary in balance. All B vitamins are absolutely essential for normal liver function. Sublingual forms are recommended. Injections (under a doctor's supervision) may be necessary, especially of vitamin B <sub>12</sub> and folic acid.

plus extra vitamin B <sub>12</sub>	1,000 mcg twice daily. As directed on label.	
plus choline and inositol	As directed on label.	
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods or Oxy-5000 Forte from American Biologics	As directed on label.	Powerful antioxidants that neutralize damaging superoxide free radicals, improving liver function.
Vitamin C with bioflavonoids	5,000–10,000 mg daily and up.	A powerful antiviral agent. Studies show improvement quickly with high doses.
Vitamin E	200 IU daily, or 400 IU every other day over the course of one month.	A potent antioxidant. Use d-alpha-tocopherol form.

**Important**

Calcium and magnesium	1,500 mg daily. 1,000 mg daily.	Essential for blood clotting, which is a problem for people with liver disease. Use chelated forms. Do not use bone meal.
Essential fatty acids (primrose oil or salmon oil) or shark liver oil or squalene or Kyolic-EPA from Wakunaga	As directed on label.	Important sources of essential lipids. To combat inflammation of the liver and lower serum fats.
Multienzyme complex with betaine hydrochloride (HCl)	As directed on label.	Important for proper digestion.

**Helpful**

Maitake extract or reishi extract or shiitake extract	As directed on label.	To boost the immune system and fight viral infection.
Raw pancreas glandular	As directed on label.	Aids in digestion and pancreatic function.
7-Keto DHEA	50–75 mg daily.	Increases antibody and interleukin-2 formation.
Vitamin A (Micellized Vitamin A and E from American Biologics)	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for healing. Use an emulsion form for easier assimilation and greater safety. Avoid using beta-carotene or capsule forms of vitamin A until healing is complete.

**Herbs**

- Artichoke increases the effectiveness of liver function.
- Ayurvedic medicine has used beets to promote the regeneration of liver cells.

Burdock and dandelion are important for cleansing the liver and the bloodstream.

Fumitory has been shown to stimulate bile flow and strengthen the liver.

*Caution:* Consult with your physician before using fumitory.

Studies have shown licorice to be effective in treating viral hepatitis, particularly chronic active hepatitis, due to its well-documented antiviral activity.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Ligustrum is a good immune restorative and anti-inflammatory agent.

Milk thistle extract contains silymarin, a flavonoid that has been shown to aid in healing and rebuilding the liver. It can be taken in capsule or alcohol-free extract form. Take 200 to 400 milligrams three times daily.

Olive leaf extract is a potent antifungal agent.

Phyllanthus, an Ayurvedic herb, is useful for hepatitis B. After an initial bout with the virus, you can become symptom-free but still remain a carrier of the disease. This herb is said to eradicate carrier-status hepatitis B in some cases.

Schizandra is a Chinese herb used to protect the liver.

Scutellaria, also known as Baikal skullcap or Chinese skullcap, is a Chinese herb that is a powerful antioxidant.

Turmeric is a potent anti-inflammatory.

Other herbs beneficial for hepatitis include black radish, green tea, red clover, and yellow dock.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

**Recommendations**

Eat a raw vegetable and fruit diet for two to four weeks. Start this diet with a cleansing fast. (See FASTING in Part Three.)

Include artichokes in the diet. Artichokes protect the liver. Globe artichoke extract also is available.

Drink “green drinks,” carrot juice, and beet juice. (See JUICING in Part Three.)

Drink only steam-distilled water.

Consume no alcohol in any form. Propylene glycol is a compound related to alcohol that is commonly used in medicines that are supposed to be alcohol-free. It too should be avoided.

Avoid most fats, sugar, and highly processed foods.

- Avoid all raw fish and shellfish, and eat no animal protein. Also avoid chemicals and food additives.
- Get plenty of bed rest.
- Use chlorophyll-containing enemas such as fresh wheatgrass juice or Kyo-Green from Wakunaga, three times a week. Use one pint and retain it for fifteen minutes. (*See ENEMAS in Part Three.*)
- Keep a person with hepatitis A in isolation to avoid spreading the infection. Wash hands and all clothing often. The clothing and bed linens of a person with hepatitis A require special handling. Wash them separately from other laundry in hot water with chlorine bleach or a disinfectant added. Because the feces are infectious, bathrooms should be decontaminated frequently. Clean toilets and floors with a disinfectant.
- Especially when traveling, beware of contaminated water or foods from polluted waters.
- Do not take any drugs that have not been prescribed by your doctor. Read package inserts carefully for information regarding liver toxicity.

### Considerations

- Taking excessive amounts of vitamin A over long periods may cause liver enzyme levels to become elevated. Anyone who has been taking over 50,000 international units of vitamin A daily for over a year should reduce his or her intake or switch to an emulsion form, which is less harmful to the liver.
- If you have hepatitis C, it is best to reduce the iron levels in the body before starting any treatment. High iron levels inhibit therapy for the liver.
- Catechin, a flavonoid found in green and black Indian teas, has been shown to decrease serum bilirubin levels in people with all types of acute viral hepatitis.
- Liver extract supplements contain nutritional substances that aid liver regeneration. Only products derived from organically raised beef should be used.
- In laboratory experiments, injections of whole liver cells have rapidly repaired liver tissue in experimental animals with lethal, acute liver failure.
- Silymarin, the active ingredient in milk thistle, has been known to lower liver enzymes and reverse the kind of liver damage common in people with hepatitis C. Some studies have found that milk thistle can cure liver cancer in rats.
- Ribavirin (Virazole) and interferon may be prescribed for hepatitis C and are proving to be effective in the treatment of this disease.
- Adefovir dipivoxil (Hepsera) tablets slow the progression of chronic hepatitis B by blocking an enzyme needed for the virus to reproduce within the body.

*Caution:* Do not stop taking adefovir dipivoxil unless under guidance by a physician.

- Hepatitis is diagnosed by means of a blood test. In some cases, it may be necessary to double-check a test for the hepatitis C virus by means of a test called the RIBA HCV 3.0 Strip Immunoblot Assay (SIA).
- A home test called the Home Access Hepatitis C Check is available. It can be purchased in drugstores or ordered directly from the manufacturer, Home Access Health. (*See Manufacturer and Distributor Information in the Appendix.*)
- If you require surgery and may need a blood transfusion, discuss this with your doctor or surgeon. You may be able to bank your own blood or the blood of a relative or friend before the procedure.
- There is a vaccine available to protect against hepatitis A. It is recommended for members of high-risk groups such as those suffering from liver disease, those in contact with hepatitis A-infected people, those who engage in anal sex with multiple partners, and those traveling to areas where hepatitis A is common, including Africa, the Middle East, the Caribbean, and South and Central America. The U.S. Centers for Disease Control (CDC) now recommends that children living in high-risk states in this country be vaccinated against this disease as well. The high-risk states include Arizona, Alaska, California, Idaho, New Mexico, Oregon, South Dakota, and Washington. Some other states have *areas* where hepatitis A is common. Ask your health care provider about possible side effects from the vaccine.
- There is a vaccine available that gives protection against hepatitis B. Ask your health care provider about both the benefits and side effects. If you work in a hospital, you will likely need to get vaccinated.
- Because the hepatitis C virus has many genotypes, or forms, and can mutate rapidly, no vaccine has yet been developed to successfully protect against this virus. Likewise, there are no vaccines against hepatitis D or E.

### HEREDITARY FRUCTOSE INTOLERANCE

*See under RARE DISORDERS.*

### HERPES INFECTION

There are at least seven types of herpesviruses. Herpes simplex type 1 (HSV-1) and type 2 (HSV-2) cause cold sores and genital herpes. Many experts suspect HSV-1 may be involved in Bell's palsy and some other neurological disorders. Herpes zoster is responsible for chickenpox and shingles. Cytomegalovirus, another member of the herpes family, can cause some cardiovascular diseases and eye disorders, and is particularly dangerous to developing fetuses, newborns, and people with depressed immune systems. The Epstein-Barr virus (EBV) is the virus that causes infectious mononucleosis. Human herpesvirus type 6 (HHV-6) and 7 (HHV-7) are suspected of being capable of

triggering autoimmune disorders, including multiple sclerosis, and roseola, a common illness of early childhood. Human herpesvirus type 8 (HHV-8) is very closely related to the Epstein-Barr virus, and may lead to cancer of the bone, chronic fatigue syndrome, Kaposi's sarcoma, and infection of the lymphatic system. This section primarily addresses genital herpes.

Genital herpes is the most prevalent sexually transmitted disease in the United States. More than 45 million Americans—one out of every five persons over the age of twelve—have it, though more than half never develop serious symptoms. This viral infection can range in severity from a silent infection to a serious inflammation of the liver with fever. It is more common among blacks than whites, and more likely to infect women than men. It is especially dangerous to infants. A baby whose mother is infected can pick up the virus in the birth canal, creating a risk of brain damage, blindness, and death.

For those whose symptoms do not remain dormant, genital herpes causes outbreaks of red, sensitive skin; itching; burning; and painful, fluid-filled blisters that are highly infectious until they are completely healed, which can take up to three weeks. It is, however, fairly common to have virtually no symptoms of the infection.

A mild tingling and burning in the vaginal area may be the first sign of genital herpes in women. Within a matter of a few hours, blisters develop around the rectum, clitoris, and cervix, and in the vagina. There is often a watery discharge from the urethra and pain when urinating. In men, blisters break out on the penis, groin, and scrotum, often with a urethral discharge and painful urination. Sometimes the penis and foreskin swell. A man may also have tender, swollen lymph nodes in the groin.

The first attack of genital herpes usually comes within twenty days after exposure to the virus. It may be so mild that it isn't noticed, or it may cause itching and burning at the site of viral entry as well as painful sores that can last a week or more, plus fever, headache, and other flulike symptoms. After a few days, pus erupts from the blisters and painful ulcers form. These sores crust over and dry while healing. Usually, they leave no scars.

It has traditionally been believed that HSV-1 causes cold sores and skin eruptions and HSV-2 is responsible for genital herpes. The difference between HSV-1 and HSV-2 is often debated, however. The current theory is that the two viruses are more alike than once was thought—the two viruses share about 50 percent of their DNA—but that they do have different characteristics. For example, when HSV-1 is in a dormant state, the virus usually establishes its home in the nerve cells near the ear, so it is more inclined to cause an outbreak around the mouth. HSV-2, on the other hand, prefers to live near the base of the spine, so when an outbreak occurs, it is more likely to occur in the genital area. The two viral agents can, however, live in either place, and it has been suggested that social pressures are the real reason we like to think of the two as being very different.

Many people have a tendency to associate genital herpes with a promiscuous lifestyle (which in fact is not justified), but the same stigma is not attached to cold sores.

If HSV-1 exchanges its usual site with HSV-2, or vice versa, outbreaks are normally less severe. If you have a sexual partner who has a genital HSV-1 infection and you have genital HSV-2, you can contract HSV-1, but it is extremely rare that HSV-1 is transmitted to a person who already has HSV-2. Oral sex with a person who has genital HSV-2 is unlikely to result in an HSV-2 infection affecting the mouth. HSV-2 is almost wholly transmitted through genital sex.

Experts now believe that HSV-2 can be transmitted even when an infected individual is experiencing no symptoms. In the first year after infection, people shed the virus between 6 and 10 percent of the time when there are no visible signs of the infection, a phenomenon called *asymptomatic viral shedding*.

There is growing evidence that people with genital herpes are at greater than normal risk of contracting human immunodeficiency virus (HIV) if they have unprotected sex with someone who is HIV-positive. HIV-infected people who are also infected with genital herpes are more likely to have more frequent and severe herpes outbreaks, which may result in episodes that are more difficult to treat.

It is now possible to diagnose herpes by means of a blood test, even if no symptoms are apparent or after sores have healed. While there is no cure for herpes, antiviral drugs have been approved that greatly reduce the frequency of outbreaks and shorten their duration and severity. Although it is a serious illness, herpes is not normally life-threatening. Having the virus means that you have to adjust your lifestyle to protect yourself and others, but there are few cases of herpes infecting other organs of the body. If you already have the infection, it is equally important to protect yourself as much as you can from repeated outbreaks and to avoid passing the infection on to others.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Beta 1,3-D-glucan	As directed on label.	Useful for treating any bacterial, viral, or fungal disease. Stimulates the activity of macrophages, immune cells that surround and digest invading microorganisms and cellular debris.

Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Herp-Eeze from Olympian Labs	As directed on label.	Possesses antiviral, anti-inflammatory, and antioxidant properties for the treatment of herpes.
L-lysine	1,500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	If the amount of lysine present in the body exceeds the amount of arginine, the growth of the herpesvirus is inhibited. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement for longer than 6 months at a time without a break. Resume the therapy again if you have further outbreaks.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Important for healing. Prevents spreading of infection. Use emulsion form for easier assimilation and greater safety at higher doses.
Vitamin B complex	50 mg and up of each major B vitamin, 3 times daily (amounts of individual vitamins in a complex will vary).	Combats the virus and helps to keep it from spreading. Also works with lysine to prevent outbreaks. Use hypoallergenic form.
Vitamin C plus bioflavonoids	5,000–10,000 mg daily.  30–60 mg daily, in divided doses.	Needed to prevent sores and inhibit the growth of the virus. Use esterified or buffered form. Work with vitamin C.
Zinc	50–100 mg daily, in divided doses. Do not exceed 100 mg daily from all supplements.	Boosts immune function. For genital herpes, use chelate form. For oral herpes, use zinc gluconate lozenges.

**Important**

Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label, 3 times daily, on an empty stomach.	Needed for the production of the B vitamins. Prevents overgrowth of harmful microorganisms in the intestines. Use nondairy formula.
Dioxychlor	As directed on label.	An important antiviral, antibacterial, and antifungal agent.
Egg lecithin	As directed on label.	Helps to control the virus.
Essential fatty acids (primrose oil, salmon oil, or Kyolic-EPA from Wakunaga)	As directed on label.	Needed for cell protection.
Garlic (Kyolic from Wakunaga)	3 tablets 3 times daily, with meals.	An immune system stimulant and a natural antibiotic.
Superoxide dismutase (SOD) or Cell Guard from Biotech Foods	As directed on label.  As directed on label.	Reduces infection and speeds healing. A powerful free radical destroyer.  An antioxidant complex that contains SOD.
Vitamin E	200 IU daily.	Important in healing. Prevents spread of the infection. Use emulsion form for easier assimilation. Use d-alpha-tocopherol form.

**Helpful**

Calcium and magnesium	1,500 mg daily.  750 mg daily.	To relieve stress and anxiety. Use chelated forms.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	2 tablets dissolved in the mouth twice daily.	Enhances utilization of oxygen by tissue.
Maitake extract or shiitake extract or reishi extract	As directed on label.  As directed on label.  As directed on label.	Mushroom extracts that have immune-boosting and antiviral properties.
Multivitamin and mineral supplement	As directed on label.	Needed to enhance healing. Take hypoallergenic form.
Proteolytic enzymes	As directed on label 2–3 times daily. Take between meals.	Helps to protect against infection; works on undigested food remaining in the colon. <i>Caution:</i> Do not give this supplement to a child.
Raw thymus glandular	500 mg twice daily.	Enhances immune function. <i>Caution:</i> Do not give this supplement to a child.

**Herbs**

Astragalus, or huang qi, enhances the immune system and acts as an antibiotic.

*Caution:* Do not use astragalus in the presence of a fever.

Applying black walnut or goldenseal extract to the affected area may help.

Cat's claw has immune-enhancing properties and acts against viral infection.

*Caution:* Do not use cat's claw during pregnancy.

Goldenseal is a natural antibiotic. It can be taken in capsule or tea form.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Licorice root inhibits both the growth and cell-damaging effects of herpes simplex. If you are using licorice, increase your potassium intake.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Olive leaf extract appears to help curb the growth of viral diseases such as herpes.

- Red marine algae contains antiviral carbohydrates that are effective, both topically and orally, for the treatment of herpes.
- Spirulina contains phytonutrients that appear to boost the immune system.
- Tea tree oil is a powerful natural antiseptic. During a herpes outbreak, dab it lightly on the affected area several times a day, either full strength or, if that is too strong, diluted with distilled water or cold-pressed vegetable oil. Do not get tea tree oil close to the eye area.
- Other herbs useful for herpes treatment include cayenne (capsicum), echinacea, myrrh, red clover, and St. John's wort.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

### Recommendations

- Avoid alcohol, processed foods, colas, white flour products, sugar, refined carbohydrates, coffee, and drugs to lessen the chance of an outbreak. Herbal teas are beneficial (*see Herbs, above*), but all other teas should be avoided.
- Drink steam-distilled water.
- Eat the following in moderation during outbreaks: almonds, barley, cashews, cereals (grains), chicken, chocolate, corn, dairy products, meat, nuts and seeds, oats, and peanuts. These contain L-arginine, an amino acid that suppresses L-lysine, the amino acid that retards virus growth.
- Do not consume citrus fruits and juices while the virus is active.
- Get plenty of rest. Stress reduction is important.
- To ease swelling and pain in the genital area, use ice packs. Warm Epsom salts or baking soda baths help itching and pain. After the bath, pat dry gently and keep the lesions dry.
- Apply vitamin E and vitamin A, alternately, directly on the sores. Or try using L-lysine cream from a health food store.
- Wear cotton underwear. Practice good genital hygiene—keep clean and dry.
- If you have active lesions, refrain from sex until the sores have completely healed. Do not have intercourse with a person with visible genital lesions of any kind.
- If you are pregnant and know you have genital herpes, tell your health care provider. If an attack occurs late in the pregnancy, your baby may have to be delivered by cesarean section to protect against exposure during birth. If there are no lesions present, the risk to the baby is probably low.

### Considerations

- Genital herpes infections in women increase the risk of cervical cancer. Women with herpes should be conscientious about having Pap smears done periodically, as recommended by a qualified health care provider.
- A virus identified by the National Cancer Institute as the human B cell lymphotropic virus (HBLV) is believed to be a member of the herpes family and may also be a factor in fatigue.
- L-lysine has been shown to be effective in treating symptoms. In one study, a dose of 1,248 milligrams a day decreased the recurrence rate of herpes and the severity of symptoms if an outbreak occurred.
- Research suggests that capsaicin may be able to prevent outbreaks of genital lesions.
- High levels of the amino acid arginine may cause outbreaks of herpes. Foods containing arginine include chocolate, peanuts, and soybeans.
- One study in the UK looked at differences in dietary intake of fruits, vegetables, and selected micronutrients. Those with the herpesvirus who ate fewer servings of fruits (one per week) had three times the risk of getting herpes. In individuals over sixty years of age, those who consumed five or more servings of vegetables a day and got adequate iron from food, antioxidants (zinc, vitamin A, and vitamin B<sub>6</sub>), folic acid, vitamin C, and vitamin E had the lowest risk of developing herpes. The immune system weakens with age, so a healthy diet and supplementation are important.
- Dimethylsulfoxide (DMSO), a by-product of wood processing, is a liquid that can be applied topically to relieve pain and promote the healing of herpes outbreaks.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

- There are a number of antiviral drugs that may be recommended to relieve symptoms and/or to reduce the severity and frequency of genital herpes outbreaks. All are available by prescription only. They include the following:
  - Acyclovir (sold in generic form or under the brand name Zovirax or generic) may be prescribed for the initial infection at a dosage of 200 milligrams taken five times a day for ten days. Thereafter, for acute outbreaks, the usual dosage is 200 milligrams five times a day for five days; and to suppress future outbreaks, 400 milligrams twice a day for one year, after which your doctor should reassess your condition. Acyclovir comes in both capsule and lotion forms. Applying the lotion when an imminent outbreak is first sensed usually weakens the attack.

- Famcyclovir (Famvir) generally is not used for initial infection. To combat acute outbreaks, the usual prescription is for 125 milligrams taken twice a day for five days; to suppress future outbreaks, 250 milligrams a day for up to one year, after which your doctor should reassess your condition.
- Valcyclovir (Valtrex) may be prescribed for the initial infection at a dosage of 1,000 milligrams (1 gram) taken twice a day for ten days. Thereafter, for acute outbreaks, the usual prescription is for 500 milligrams taken twice a day for three days; to suppress future outbreaks, 1 gram once a day (for those who have a history of nine or fewer recurrences per year, an alternate dosage of 500 milligrams once a day may be used). As with the other antivirals, your doctor should reassess your condition after a year of suppressive therapy.

You should exercise caution if you use one of these drugs on a regular basis, however. When the drug is stopped, a “rebound” effect may result in a more serious outbreak than usual. Discuss with your doctor the correct method for discontinuing the medication—don’t just stop taking it on your own.

A vaccine for prevention of genital herpes in women called Herpevac is currently undergoing testing. As of July 2009, the study was fully enrolled, and results should be forthcoming within a couple of years. Approximately 7,550 women were enrolled from forty states and Canada.

Some physicians have used butylated hydroxytoluene (BHT) to treat herpes. This can have dangerous consequences, however, especially if taken on an empty stomach. Irritation and even perforation of the stomach can result. We do not recommend this treatment for herpes.

Choraphor is a trademarked topical antiseptic formula containing ammoniated acid sulfate and trace minerals that is said to promote an immune response to herpes and clear up outbreaks. It has not yet undergone clinical testing, however.

See also COLD SORES; SEXUALLY TRANSMITTED DISEASE; and SHINGLES in Part Two.

## HERPES ZOSTER

See SHINGLES. See also under EYE PROBLEMS.

## HIATAL HERNIA

See under HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE (GERD).

## HIGH BLOOD PRESSURE (HYPERTENSION)

When the heart pumps blood through the arteries, the blood presses against the walls of the blood vessels. In peo-

ple who suffer from hypertension, this pressure is abnormally high. If blood pressure is elevated, the heart must work harder to pump an adequate amount of blood to all the tissues of the body.

Whether blood pressure is high, low, or normal depends on several factors: the output from the heart, the resistance to blood flow of the blood vessels, the volume of blood, and blood distribution to the various organs. All of these factors in turn can be affected by the activities of the nervous system and certain hormones.

Blood pressure is represented as a pair of numbers. The first is the *systolic* pressure, which is the pressure exerted by the blood when the heart beats, forcing blood into the blood vessels. This reading indicates blood pressure at its highest. The second reading is the *diastolic* pressure, which is recorded when the heart is at rest in between beats, when the blood pressure is at its lowest. Both figures represent the height (in millimeters, or mm) that a column of mercury (Hg) reaches under the pressure exerted by the blood. The combined blood pressure reading is then expressed as a ratio of systolic blood pressure to diastolic blood pressure, such as 120/80.

About 73.6 million people in the United States—or one in every three American adults age twenty and older—have hypertension. From 1995 to 2005, the death rate from high blood pressure increased 25.2 percent, and the actual number of deaths rose 56.4 percent.

While high blood pressure was once thought of as a “man’s disease,” in fact women are as likely to suffer from this condition as men are—30.3 percent of American women and 31.8 percent of American men have high blood pressure. Furthermore, more women than men die from complications of high blood pressure because women and, to some extent, their medical practitioners, often ignore or fail to detect their high blood pressure until it is too late.

Because high blood pressure usually causes no symptoms until complications develop, it is known as the “silent killer.” According to a national survey, 78 percent of Americans with high blood pressure are aware of it, 69 percent are being treated, and 45 percent have it under control. Unfortunately, many people stop taking their medications because they don’t feel sick and it takes effort and is expensive. Warning signs associated with advanced hypertension may include headaches, sweating, rapid pulse, shortness of breath, dizziness, and visual disturbances.

High blood pressure is usually divided into two categories, designated *primary* and *secondary*. Primary hypertension is high blood pressure that is not due to another underlying disease. The precise cause is unknown, but a number of definite risk factors have been identified. These include cigarette smoking, stress, obesity, excessive use of stimulants such as coffee or tea, drug abuse, and high sodium intake. The use of oral contraceptives used to be considered a contributing factor, but with the low-dose pills now available, this is not as much of a problem as it once

was. Because too much water retention can exert pressure on the blood vessels, those who consume foods high in sodium may be at a greater risk for high blood pressure. Elevated blood pressure is also common in people who are overweight. Blood pressure can rise due to stress as well, because stress causes the walls of the arteries to constrict. Also, those with a family history of hypertension are more likely to suffer from high blood pressure.

When persistently elevated blood pressure arises as a result of another underlying health problem, such as a hormonal abnormality or an inherited narrowing of the aorta, it is called secondary hypertension. A person may also have secondary hypertension because the blood vessels are chronically constricted or have lost elasticity from a buildup of fatty plaque on the inside walls of the vessel, a condition known as atherosclerosis. Arteriosclerosis and atherosclerosis are common precursors of hypertension. In addition, high blood pressure is often associated with coronary heart disease, arteriosclerosis, kidney disorders, obesity, diabetes, hyperthyroidism, and adrenal tumors.

The narrowing and/or hardening of the arteries makes circulation of blood through the vessels difficult. As a result, blood pressure becomes elevated. Secondary hypertension can also be caused by poor kidney function, which results in the retention of excess sodium and fluid in the body. This increase in blood volume within the vessels causes elevated blood pressure levels. The kidneys may also elevate blood pressure by secreting substances that cause blood vessels to constrict.

To diagnose high blood pressure, a physician uses a device called a *sphygmomanometer*. It is impossible, however, for a health care provider to make a correct diagnosis of high blood pressure with a single reading. The test must be repeated throughout the day to be accurate. Home testing is best because it enables you to monitor your condition periodically. Measuring blood pressure at home on a regular schedule may:

- Help to determine whether your blood pressure is high only when taken during a medical visit.
- Enable you to collaborate with your health care provider in controlling your high blood pressure.
- Reduce the frequency with which you need to visit your health care provider for blood pressure evaluation.

Blood pressure monitoring devices fall into two basic categories: mechanical gauges and automated electronic gauges. The mechanical gauge is the type most often used in physicians' offices. It consists of an instrument to measure the pressure, an air bladder (inflatable cuff), and a pressure bulb with a release valve to pump up the cuff. The standard-size arm cuff on blood pressure monitors fits arms up to thirteen inches around (if your arm is larger than this, you will need to obtain a larger cuff). With most of these devices, the pressure is read on a gauge dial.

Mechanical gauges are much less expensive than electronic ones and many physicians feel they give more accurate readings, at least in the hands of an experienced user. However, if you use this type of device to take your own blood pressure, you must pump up the cuff with one hand, read a dial, and listen with a stethoscope more or less simultaneously. (See *How to Measure Your Blood Pressure* on page 505.) In other words, using these devices correctly requires dexterity, good eyesight, acute hearing, and some training and practice.

An alternative to the mechanical gauge is the digital sphygmomanometer. With this device, the machine automatically gauges your blood pressure when the cuff is inflated and presents the result in a digital format. These are more expensive than the mechanical types, but because they are much easier to use accurately, they are generally preferred for home use.

There are also other electronic devices available, including wrist and finger cuff monitors. Although they are easy to operate, most doctors do not recommend them because they tend to be less accurate and also more sensitive to the effects of temperature and poor blood circulation.

Basic guidelines for what the blood pressure numbers mean, as revised in 2004 by the National Heart, Lung, and Blood Institute (NHLBI) are as follows:

- Normal: Lower than 120 (systolic) over lower than 80 (diastolic)—lower than 120/80.
- Prehypertension: 120–139 (systolic) over 80–89 (diastolic)—120–139/80–89.
- Stage 1 hypertension: 140–159 (systolic) over 90–99 (diastolic)—140–159/90–99.
- Stage 2 hypertension: 160 or higher (systolic) over 100 or higher (diastolic)—higher than 160/100.

Treatment seeks to lower blood pressure to less than 140 systolic and less than 90 diastolic for most people. Treatment for those with diabetes and chronic kidney disease aims to lower blood pressure to less than 130 systolic and less than 80 diastolic. For people aged fifty and older, systolic blood pressure may be a more important cardiovascular risk factor than diastolic pressure.

Studies have found that an increased risk of death from cardiovascular causes (heart attack and stroke) can begin at pressures as low as 115/75, and that it doubles for each additional 20/10 increase. High blood pressure also can lead to kidney failure and heart failure.

Unless otherwise specified, the nutrient and other dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Calcium and magnesium and potassium	1,500–3,000 mg daily. 750–1,000 mg daily. As directed on label.	Deficiencies have been linked to high blood pressure. If you take cortisone or high blood pressure medication, take extra potassium to counteract depletion of this mineral.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label. As directed on label.	Improves heart function. Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Essential fatty acids (black currant seed oil, flaxseed oil, olive oil, primrose oil, or Kyolic-EPA from Wakunaga)	As directed on label.	Important for circulation and for lowering blood pressure.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Effective in lowering blood pressure.
L-arginine	As directed on label.	Shown to play an increasingly important role in heart health by lowering blood pressure and cholesterol levels.
L-carnitine plus L-glutamic acid and L-glutamine	500 mg twice daily, on an empty stomach. 500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Transports long fatty acid chains. Together with L-glutamic acid and L-glutamine, aids in preventing heart disease. To detoxify ammonia and aid in preventing heart disease. ( <i>See AMINO ACIDS in Part One.</i> )
Selenium	200 mcg daily.	Deficiency has been linked to heart disease.
Vitamin E and/or octacosanol	100 IU daily for first month, then increase to 200 IU daily. As directed on label.	Improves heart function. Vitamin E also acts as a blood-thinning agent; use with caution if you are taking prescription blood-thinners. Use d-alpha-tocopherol form. Use emulsion form for easier assimilation and greater safety at high doses.

**Very Important**

Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Improves adrenal function; reduces blood-clotting tendencies.
------------------------------	---	---

**Important**

Lecithin granules or capsules or lipotropic factors	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals. As directed on label.	To emulsify fat, improve liver function, and lower blood pressure.
---	---	--

**Helpful**

Bromelain	As directed on label.	An enzyme that aids in the digestion of fats.
Chinese red yeast rice extract	As directed on label.	Has cholesterol-lowering properties.
Kelp	1,000–1,500 mg daily.	A good source of minerals and natural iodine.
Kyo-Green from Wakunaga	As directed on label twice daily.	This concentrated barley and wheatgrass juice contains important nutrients.
Maitake extract or shiitake extract or reishi extract	As directed on label. As directed on label. As directed on label.	To help reduce high blood pressure and prevent heart disease.
Multivitamin and mineral complex with vitamin A and zinc	As directed on label. 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 50 mg daily.	All nutrients are needed in balance.
Proteolytic enzymes	As directed on label. Take with meals and between meals.	Aids in cleansing the circulatory system. Completes protein digestion.
Raw heart glandular plus Heart Science from Source Naturals	As directed on label. As directed on label.	Strengthens the heart. Contains antioxidants, cholesterol-fighters, herbs, and vitamins that work together to promote cardiovascular function.
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin) and choline and inositol	100 mg of each major B vitamin twice daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg twice daily. 50 mg twice daily. 50 mg twice daily.	Important for circulatory function and for lowering blood pressure. Take niacin only under the supervision of a physician.
Vitamin B <sub>6</sub> (pyridoxine)	50 mg 3 times daily.	Reduces water content in tissues to relieve pressure on the cardiovascular system.

**Herbs**

Use cayenne (capsicum), chamomile, fennel, hawthorn berries, parsley, and rosemary for high blood pressure.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Hops and valerian root are good for calming the nerves.
- Studies show that mistletoe can reduce symptoms of high blood pressure, especially headaches and dizziness.
- Drink 3 cups of suma tea daily.
- Avoid licorice, as this herb can elevate blood pressure.

## Recommendations

Follow a strict salt-free diet. This is essential for lowering blood pressure. Lowering your salt intake is not enough; eliminate all added salt from your diet. Read labels carefully and avoid those food products that have “salt,” “soda,” “sodium,” or the symbol “Na” on the label. Some foods and food additives that should be avoided on this diet include monosodium glutamate (Accent, MSG); baking soda; canned vegetables (unless marked sodium- or salt-free); commercially prepared foods; over-the-counter medications that contain ibuprofen (such as Advil or Nuprin); diet soft drinks; foods with mold inhibitors, preservatives, and/or sugar substitutes; meat tenderizers; softened water; and soy sauce.

Eat a high-fiber diet and take supplemental fiber. Oat bran is a good source of fiber.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Eat plenty of fruits and vegetables, such as apples, asparagus, bananas, broccoli, cabbage, cantaloupe, eggplant, garlic, grapefruit, green leafy vegetables, melons, peas, prunes, raisins, squash, and sweet potatoes.

Include fresh “live” juices in the diet. The following juices are healthful: beet, carrot, celery, currant, cranberry, citrus fruit, parsley, spinach, and watermelon.

Eat grains like brown rice, buckwheat, millet, and oats.

Drink steam-distilled water only.

Take 2 tablespoons of flaxseed oil daily.

Avoid all animal fats. Bacon, beef, bouillons, chicken liver, corned beef, dairy products, gravies, pork, sausage, and smoked or processed meats are prohibited. The only acceptable animal foods are broiled whitefish and skinless turkey or chicken, and these should be consumed in moderation only. Get protein from vegetable sources, grains, and legumes instead.

Avoid foods such as aged cheeses, aged meats, anchovies, avocados, chocolate, fava beans, pickled herring, sherry, sour cream, wine, and yogurt.

Avoid all alcohol, caffeine, and tobacco.

If you are taking an MAO inhibitor (one of a class of drugs prescribed to counter depression, lower blood pressure, and treat infections and cancer), avoid the chemical tyramine and its precursor, tyrosine. Combining MAO inhibitors with tyramine causes the blood pressure to soar and could cause a stroke. Tyramine-containing foods include almonds, avocados, bananas, beef or chicken liver, beer, cheese (including cottage cheese), chocolate, coffee, fava beans, herring, meat tenderizer, peanuts, pickles, pineapples, pumpkin seeds, raisins, sausage, sesame seeds, sour cream, soy sauce, wine, yeast extracts (including brewer’s yeast), yogurt, and other foods. In general, any high-protein food that has undergone aging, pickling, fermentation, or simi-

lar processes should be avoided. Over-the-counter cold and allergy remedies should also be avoided.

*Caution:* Brewer’s yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Keep your weight down. If you are overweight, take steps to lose the excess pounds. (See OBESITY in Part Two.) Losing 10 percent of your body weight will reduce blood pressure, and may even allow you to use less of your medications, if you are currently taking medications—or avoid them altogether, if you are not.

*Caution:* You should not stop taking your medication without consulting your physician.

Fast for three to five days each month. Periodic cleansing fasts help to detoxify the body. (See FASTING in Part Three.)

Get regular light to moderate exercise. Take care not to overexert yourself, especially in hot or humid weather.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Be sure to get sufficient sleep.

Have your blood pressure checked at least every four to six months. Because hypertension often shows no signs, regular blood pressure checks by a professional are important, especially if you are in a high-risk category.

Take your blood pressure at home. This is a good way to track your blood pressure levels throughout the day. Any minute your blood pressure is elevated, there is stress on your blood vessels, which increases your chance of a stroke.

If you are pregnant, have your blood pressure monitored frequently by your health care provider. Untreated hypertension in pregnancy can progress suddenly and pose a serious threat to both mother and child.

Do not take antihistamines except under a physician’s direction.

Do not take supplements containing the amino acids phenylalanine or tyrosine. Also avoid the artificial sweetener aspartame (Equal, NutraSweet), which contains phenylalanine.

As much as possible, avoid stress.

## Considerations

The most vital lifestyle changes you can make to reduce hypertension can be summarized as follows:

- Maintaining a normal weight.
- Eating plenty of fruits, vegetables, and low-fat dairy products.
- Eating less saturated fat and salt.

- Getting a minimum of thirty minutes of aerobic exercise per day. Walking is an excellent exercise.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Limiting consumption of alcohol to a maximum of two drinks per day for men and one drink per day for women.

The DASH diet (Dietary Approaches to Stop Hypertension) was developed by scientific experts in the field to help patients with high blood pressure lower it. The diet recommends:

- less than or equal to 27 percent of calories from fat,
- less than or equal to 6 percent saturated fat as a percentage of calories,
- more than or equal to 18 percent of calories as protein,
- less than or equal to 150 milligrams of cholesterol a day,
- more than or equal to 31 grams of fiber,
- at least 4,700 milligrams of potassium,
- 500 milligrams of magnesium, and
- 1,240 milligrams of calcium.

If you have high blood pressure or wish to prevent it, it is important to follow the DASH diet guidelines and be aware of any personal food preferences you have that may keep you from meeting these guidelines. In another study (the PREMIER study), researchers looked at patients with high blood pressure and found that a 12 to 14 percent reduction in heart disease risk was possible by following the DASH diet or just a simpler version of a low-salt diet combined with regular exercise and weight loss.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Fruits and vegetables cause the release of a hormone that opens up blood vessels. Eating up to six servings a day of both fruits and vegetables can reduce blood pressure.
- Hypertension is directly related to a number of other conditions, such as arteriosclerosis, cardiovascular disease, heart attack, and high cholesterol. These conditions are discussed separately in Part Two. It is advisable to refer to all of the sections on these interrelated conditions mentioned, even if you are concerned with only one of these illnesses.
- Because the use of diuretic drugs causes increased urinary excretion of magnesium, it can cause hypomagnesemia (magnesium depletion), particularly in older adults. Magnesium is needed in conjunction with calcium to prevent bone deterioration, as well as to maintain a normal heart rhythm and muscular contraction. Losses of potassium due to diuretics also are common and may be dangerous, causing

heart malfunction. Often potassium supplements are prescribed. Consult your physician before using diuretics.

People with hypertension often suffer from sleep apnea, in which they stop breathing for ten seconds or more throughout the night. Apnea is associated with loud snoring and restless sleep, and can cause the individual to feel excessively sleepy during the day. Evaluation and treatment of apnea may help reduce high blood pressure.

Some risks for hypertension cannot be changed—a family history of the disease, for instance. However, many risk factors can be avoided by making changes in diet and lifestyle.

According to the National Stroke Association, hypertension is the most important controllable risk factor for stroke, increasing the risk of stroke by seven times.

Approximately 26 percent of Americans with normal blood pressure and about 58 percent of those with hypertension are salt sensitive.

Research has revealed that people with variations in two specific genes are twice as likely to develop high blood pressure from salt consumption. This discovery may make it possible to identify children prone to high blood pressure; if such people can be identified in early childhood, it may be possible to modify their diets so that they can avoid developing high blood pressure later in life.

Heavy snorers are more likely to have high blood pressure or angina than silent sleepers. Research suggests that snorers may suffer from a malfunctioning of the part of the brain responsible for fluent breathing; this can put an unnatural strain on the heart and lungs due to oxygen shortage.

Researchers at the State University of New York found that the lower the level of magnesium in the body, the higher the blood pressure. This double-blind, placebo-controlled trial showed that taking supplemental magnesium can result in a significant, dose-dependent reduction in both systolic and diastolic blood pressure.

Apple pectin aids in reducing blood pressure.

A synthetic heart hormone that appears to be very effective in lowering blood pressure is currently undergoing testing at some twenty-five medical centers.

Certain colors have a beneficial effect on blood pressure. (See COLOR THERAPY in Part Three.) Music also can be used to reduce stress and thereby lower blood pressure. (See MUSIC AND SOUND THERAPY in Part Three.)

Taking medication for high blood pressure may lead to low blood pressure (hypotension). Hypotension can cause fainting, fatigue, and weakness, possibly with nausea, sweating, and restlessness preceding a loss of consciousness. Postural hypotension, or orthostatic hypotension, a very temporary lowering of blood pressure, is usually caused by standing up too suddenly. This leads to dizziness and wears off quickly. (See Orthostatic Hypotension under RARE DISORDERS in Part Two for further information.) For older adults, low blood pressure can simply result from

## How to Measure Your Blood Pressure

Your blood pressure measurement actually tells you how much pressure it takes to move the flow of blood through your arteries. This is assumed to be equivalent to the pressure at the pump end, the heart.

Blood pressure is measured at two points in the heart's pumping rhythm: *systolic pressure* is taken at the moment the heart beats; *diastolic pressure* is taken when the heart is at rest between beats. To measure blood pressure, the soft, inflatable cuff of the sphygmomanometer is wrapped around the upper arm and inflated. Slowly deflate the cuff. The systolic pressure is measured when the first pounding sound begins. Then the cuff is further deflated and the diastolic pressure is taken when the sound is no longer audible. The combined pressure is usually expressed as a fraction—120/80, for example.

Ideally, blood pressure should be taken with the arm bare. A tight sleeve may constrict the arm or make it impossible to apply the blood pressure cuff properly. The cuff should be placed around the arm about one inch above the bend in the elbow. Before beginning to work with the sphygmomanometer, check the following four items:

1. Be sure that the sphygmomanometer reads 0 when there is no pressure in the system.
2. Check to be sure that the needle stays in place when the valve is closed.
3. Check the valve screw to make sure that it operates smoothly.
4. Inspect your stethoscope for cracks or leaks in the tubing, earpieces, bell, or diaphragm.

Next, use the stethoscope to take the blood pressure. Follow this procedure:

1. Position the disc of the stethoscope snugly against the skin where the elbow bends—a little to the left of center on the right arm, and a little to the right of center on the left arm. There should be no gaps between the stethoscope and the skin, but you should not apply any undue pressure. Make sure that the stethoscope is not touching the cuff at any point.
2. Position the earpieces of the stethoscope in your ears (with the earpieces directed forward).

3. Hold the stethoscope disc snugly in position with one hand while you pump the cuff with the other hand.
4. Pump the cuff until the gauge registers about 180–200 mm Hg.
5. Loosen the valve slightly and permit the pressure to drop slowly. Listen carefully for the first sound of a beat—the number on the scale when you hear the first beat is the systolic pressure. (If you think that you missed the first beat or are unsure, tighten the valve again and pump the cuff up; repeat the process, listening carefully.)
6. Continue to deflate the cuff slowly until the last sound of blood pumping through the blood vessels is heard. When you hear no more blood flowing, the number on the scale is the diastolic pressure.

When taking your blood pressure, follow these general guidelines for best results:

- Avoid eating, smoking, or exercising for at least one-half hour before measuring your blood pressure.
- Test yourself at about the same times each day. Plan ahead to give yourself time to get over any feelings of anger or anxiety.
- Sit quietly and eliminate extraneous noise.
- Follow the manufacturer's instructions carefully.
- Position your arm at heart level, palm up. If you are using a cuff device, wrap the cuff just above the elbow—with your sleeve rolled up above the cuff—and be sure it is not too tight.
- Make sure the hoses from the cuff are not tangled or pinched.
- Take care not to move the hoses during the reading.
- Wait at least five minutes in between readings, with the cuff fully deflated.
- Take the device along on medical visits once a year or more to check its accuracy against your physician's measurements.

eating. This is called *postprandial hypotension*. It happens because blood is diverted to the gastrointestinal tract to help with digesting the food. In older people, the heart is not as efficient at increasing blood flow by pumping more quickly, so, with too much blood going to help with digesting a meal, there is too little traveling to the brain. Drinking lots of fluids increases blood volume, which may alleviate this condition. In some cases, low blood pressure can be a sign of heart disease or blood loss, especially a sudden loss of blood such as in an accident. In very many cases though, moderately low blood pressure is a sign of good health, especially in younger people.

□ See also ARTERIOSCLEROSIS/ATHEROSCLEROSIS; CARDIOVASCULAR DISEASE; CIRCULATORY PROBLEMS; and HEART ATTACK in Part Two.

## HIGH CHOLESTEROL

A high blood cholesterol level, especially elevated low-density lipoproteins (LDL), is considered to be a contributor to plaque building up in the arteries and impeding blood flow to the brain, kidneys, genitals, extremities, and heart. It is among the primary causes of heart disease, because cholesterol produces deposits in arteries. High cholesterol levels may also be implicated in gallstones, erectile dysfunction (although it is often the drugs prescribed to deal with high cholesterol that cause this), mental impairment, and high blood pressure.

Cholesterol is an essential part of every cell structure and is needed for proper brain and nerve function. It is also the basis for the manufacture of sex hormones. Cholesterol is manufactured in the liver and transported through the bloodstream to the sites where it is needed. It is a fatty substance and, because blood is mainly water, it has to latch on to molecules called lipoproteins to travel around successfully. Low-density lipoproteins (LDLs) are the major transporters of cholesterol in the bloodstream and, because LDLs seem to encourage the deposit of cholesterol in the arteries, it is known as bad cholesterol. High-density lipoproteins (HDLs), on the other hand, are considered good cholesterol because they carry unneeded cholesterol away from the cells and back to the liver, where it is broken down for removal from the body. If everything is functioning as it should, this system remains in balance.

However, if there is too much cholesterol for the HDLs to pick up promptly, or if there are not enough HDLs to do the job, cholesterol can form plaque that sticks to artery walls and may eventually cause heart disease.

It is important to distinguish between serum cholesterol and dietary cholesterol. Serum cholesterol is the cholesterol in the bloodstream. Dietary cholesterol is cholesterol that is present in food. While eating foods high in dietary cholesterol can raise serum cholesterol, it is not the only source of serum cholesterol. Indeed, you would have some amount of serum cholesterol even if you never ate any food con-

taining dietary cholesterol because the body produces its own cholesterol.

Cholesterol levels are greatly influenced by diet, but they are also affected by your genetic makeup. The consumption of foods high in cholesterol and/or saturated fat increases cholesterol levels, while a vegetarian diet, regular exercise, and the nutrients niacin and vitamin C may lower cholesterol.

The National Heart, Lung and Blood Institute guidelines for cholesterol levels are:

### LDL cholesterol

Less than 100 mg/dL	Optimal
100–129 mg/dL	Near optimal/less than optimal
130–159 mg/dL	Borderline high
160–189 mg/dL	High
Greater than or equal to 190 mg/dL	Very high

### Total cholesterol

Less than 200 mg/dL	Desirable
200–239 mg/dL	Borderline high
Greater than or equal to 240 mg/dL	High

### HDL cholesterol

Less than 40 mg/dL	Low; a major risk factor for heart disease
60 mg/dL and above	Considered protective against heart disease

If you have an abnormal reading on any of these, speak to your doctor about how to correct them. It will probably involve adjusting your diet, increasing your exercise, and possibly taking medication.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Apple pectin	As directed on label.	Lowers cholesterol levels by binding fats and heavy metals.
Calcium	As directed on label.	To prevent hypocalcemia, or low calcium levels. Use calcium aspartate form.
Chinese red yeast rice extract	2.4 g daily.	Has cholesterol-lowering properties.
Chromium picolinate	400–600 mcg daily.	Lowers total cholesterol levels and improves HDL-to-LDL ratio.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	Improves circulation. Works well with coenzyme Q <sub>10</sub> to streamline metabolism, process fats, remove toxins from the body, and boost the immune system.
Fiber (oat bran or guar gum)	As directed on label, ½ hour before the first meal of the day. Take separately from other supplements and medications.	Helps to lower cholesterol.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Lowers cholesterol levels and blood pressure.

L-carnitine	As directed on label.	Studies conducted using 4 grams of carnitine daily for 12 months showed lowered death rates and lowered cholesterol levels in people who had had heart attacks.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Lowers cholesterol. A fat emulsifier.
Lipotropic factors	As directed on label.	Substances that prevent fat deposits (as in atherosclerosis).
Vitamin A with mixed carotenoids	As directed on label.	If you are taking cholesterol-lowering drugs, your lycopene levels will be reduced. Lycopene is one of the carotenoids that boosts the immune system.
Vitamin B complex plus extra vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>3</sub> (niacin)	As directed on label. 300 mg daily. Do not exceed this amount.	B vitamins work best when taken together. Important in controlling cholesterol levels. Lowers cholesterol. Do not use a sustained-release formula, and do not substitute niacinamide for niacin. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
Vitamin C with bioflavonoids	3,000–8,000 mg daily, in divided doses.	Lowers cholesterol.
Vitamin E	200 IU daily or 400 IU every other day.	Improves circulation. Use an emulsion form for rapid assimilation. Use d-alpha-tocopherol form.

### Helpful

Essential fatty acids (black currant seed oil, borage oil, fish oil, primrose oil, or Kyolic-EPA from Wakunaga)	As directed on label. Take with vitamin E as recommended above.	Thins the blood.
Heart Science from Source Naturals	As directed on label.	Contains antioxidants to lower cholesterol, plus herbs, vitamins, and other nutrients that protect the heart and promote healthy cardiovascular function.
Proteolytic enzymes	As directed on label. Take with meals and between meals.	Aids digestion. <i>Caution:</i> Do not give this supplement to a child.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Deficiency has been linked to heart disease.
Shiitake extract or reishi extract	As directed on label. As directed on label.	Helps to control and lower cholesterol levels.

### Herbs

Cayenne (capsicum), goldenseal, and hawthorn berries help to lower cholesterol.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Cinnamon has been shown to lower cholesterol. Use Cinnulin PF from Nutrivitals rather than the culinary spice.

### Recommendations

Include the following cholesterol-lowering foods in your diet: almonds, apples, bananas, carrots, cold-water fish, dried beans, garlic, grapefruit, oats, olive oil, salmon, strawberries, and walnuts. Strawberries in particular were shown to reduce damage from oxidation to the bad (LDL) cholesterol, thereby lowering the risk of heart disease.

Make sure to take in plenty of fiber in the form of fruits, vegetables, and whole grains. Water-soluble dietary fiber is very important in reducing serum cholesterol. It is found in barley, beans, brown rice, fruits, glucomannan, guar gum, and oats. Oat bran and brown rice bran are the best foods for lowering cholesterol. Whole-grain cereals (in moderation) and brown rice are good as well. Since fiber absorbs the minerals from the food it is in, take extra minerals separately from the fiber.

In 1999, the FDA granted a health claim for products that contain plant stanols and sterol esters from any plant, especially soybeans. Any product containing 0.65 gram of plant sterols or 1.7 grams of plant stanols per serving can claim to reduce the risk of heart disease. Foods such as Minute Maid's HeartWise orange juice or Rice Dream HeartWise rice drink, or supplements are good sources, but they must be consumed as part of a low-saturated-fat and low-cholesterol diet. The sterols and stanols were shown to lower total cholesterol by 9 percent and bad cholesterol by 12 percent. Adding fish oil to the diet along with sterols or stanols had an added benefit of lowering triglycerides.

Drink fresh juices, especially carrot, celery, and beet juices. Carrot juice helps to flush out fat from the bile in the liver and this helps lower cholesterol.

Go on a monthly spirulina fast, with carrot and celery juice or lemon and steam-distilled water. (See FASTING in Part Three.)

Use only unrefined cold- or expeller-pressed oils. Cold-pressed oils are those that have never been heated above 110°F during processing—at this temperature, enzyme destruction begins. Use vegetable oils that are liquid at room temperature, such as olive, soybean, flaxseed, primrose, and black currant seed oil. Olive oil is recommended.

Do not eat any nuts except raw, unsalted pecans, walnuts, and almonds. Almonds are rich in the amino acid arginine, and were found in one study to cut cholesterol levels by sixteen points over a four-week period.

- Reduce the amount of saturated fat and cholesterol in your diet. Saturated fats include all fats of animal origin as well as coconut and palm oils. Eliminate from the diet all hydrogenated fats and hardened fats and oils such as margarine, lard, and butter. Margarine that contains plant sterols, however, is a relatively healthy option. Consume no heated fats or processed oils, and avoid animal products (especially pork and pork products) and fried or fatty foods. Always read food product labels carefully. You may consume nonfat milk, low-fat cottage cheese, and skinless white poultry meat (preferably turkey), but only in moderation.
- Do not consume alcohol, cakes, candy, carbonated drinks, coffee, gravies, nondairy creamers, pies, processed or refined foods, refined carbohydrates, tea, tobacco, or white bread.
- Get regular moderate exercise. Always consult with your health care provider before beginning any new exercise program.
- Try to avoid stress and sustained tension. Learn stress management techniques. (See STRESS in Part Two.)

### Considerations

- High cholesterol is directly related to conditions such as Alzheimer's disease, arteriosclerosis, cardiovascular disease, circulatory problems, heart attack, hypertension, and osteoporosis. These conditions are discussed separately in Part Two. It is advisable to refer to all of the sections on these interrelated diseases to learn about all aspects of, and contributing causes to, high cholesterol.
- Meat and dairy products are primary sources of dietary cholesterol. Grains, vegetables, and fruits are free of cholesterol.
- Many people use margarine or vegetable shortening as substitutes for butter because they contain no cholesterol. Now most products are free of harmful trans fatty acids. These are good alternatives to butter.
- In large amounts, coffee can elevate blood cholesterol levels, more than doubling the risk of heart disease. According to a report published in *The New England Journal of Medicine*, observation of 15,000 coffee drinkers revealed that as the intake of coffee rises, the amount of cholesterol in the blood goes up.
- Cream substitutes (nondairy coffee creamers) are actually poor alternatives to cholesterol-heavy dairy products. Many contain coconut oil, which is a highly saturated fat. Soymilk or almond milk is preferable.
- The body does need some fats, but they must be the right kind. Good fats supply essential fatty acids, which are a very important link in our health chain. Fats supply energy, and they stay in the digestive tract for longer periods than proteins or carbohydrates, giving a feeling of fullness. They act as an intestinal lubricant, generate body heat, and carry the fat-soluble vitamins A, D, E, and K in the body. The protective myelin sheaths that protect nerve

fibers are composed of fats. All cell membranes are composed of fats as well. Unfortunately, most Americans consume much too much of the wrong fats—that is, saturated, hydrogenated, and heated fats—which are linked to obesity, cardiovascular disease, and certain types of cancer.

- Human growth hormone therapy has been found to decrease cholesterol levels. (See GROWTH HORMONE THERAPY in Part Three.)
- Some fast-food restaurants use beef tallow (fat) to make their hamburgers, fish, chicken, and French-fried potatoes. Not only do these fried foods contain high amounts of cholesterol, but this fat is subjected to high temperatures in the deep-frying process, resulting in oxidation and the formation of free radicals. Heating fat, especially frying food in fat, also produces toxic trans-fatty acids, which seem to behave much like saturated fats in clogging the arteries and raising blood cholesterol levels.
- Certain drugs can worsen cholesterol levels. Beta-blockers, often prescribed to control high blood pressure, can cause unfavorable changes in the ratio of LDL to HDL in the blood, by lowering HDL. Check with your physician if you are taking any medications that you suspect might be affecting your cholesterol levels.
- Some people claim that taking charcoal tablets lowers blood cholesterol. However, charcoal also absorbs good nutrients along with the cholesterol. Activated charcoal should not be consumed daily, and it should not be taken at the same time as other supplements or medications. Other experts recommend taking fish oil capsules to lower cholesterol, but fish oil is 100 percent fat, and the evidence is lacking that the ingestion of fish oil reduces serum fats. Although fish oil does not lower cholesterol levels, it can reduce the risk of illness and death from heart disease by other mechanisms related to inflammation and heart rhythm.
- Pure virgin olive oil appears to help reduce serum cholesterol. A monounsaturated-fatty-acid-rich diet that includes olive oil may be the reason for the low serum cholesterol levels found in people living in Italy and Greece.
- Studies have shown that diets consisting of grains, fruits, and vegetables result in lower blood cholesterol levels. In the United States and northern Europe, where people consume large amounts of meat and dairy products, extremely high rates of heart and circulatory disease are present. Even children in these nations show signs of progressive vascular disease due to hypercholesterolemia (an excess of cholesterol in the blood).
- There are a number of cholesterol-lowering drugs on the market. Available by prescription only, these tend to be costly, and they can have serious side effects. We believe that these drugs should be used only as a last resort. The sensible way to keep the serum fats within a safe range is to follow a diet that excludes animal fats (including meat, milk, and all dairy products) and includes ample amounts of fiber and bulk (whole grains, fruits, and vegetables).

- ❑ Sunlight, or rather the lack of it, has been shown to have adverse effects of cholesterol levels.
- ❑ Lowering your blood cholesterol level may help to stop clogging of the arteries.
- ❑ Some people have hereditary disorders that prevent even the healthiest diet from lowering LDL levels. For these people, researchers are working on a device that uses an enzyme to break down LDL and accelerate its removal before it can fasten onto artery walls to form plaque. The device would be implanted under the skin to control the LDL levels in the blood.
- ❑ There are opposing theories about high cholesterol levels. Some medical practitioners believe that it has little to do with heart disease and that a direct correlation has never been fully established. Studies in India, Guatemala, Poland, and the United States claim to have proved that there is no relationship between atherosclerosis and cholesterol levels. However, it is probably best to take cholesterol levels seriously, and also to consider other tests that may help to assess your likelihood of developing heart disease as outlined in HEART ATTACK in Part Two.
- ❑ See ARTERIOSCLEROSIS/ATHEROSCLEROSIS; CARDIOVASCULAR DISEASE; CIRCULATORY PROBLEMS; HEART ATTACK; and HYPERTENSION, all in Part Two. Also see CHELATION THERAPY in Part Three.

## HIV/HUMAN IMMUNODEFICIENCY VIRUS

See AIDS.

## HIVES

Hives, called *urticaria* by the medical profession, is a skin condition that is characterized by sudden outbreaks of red, itchy welts on the skin. Any area of the body may be affected. The welts may vary in appearance, from tiny, goose-bump-like spots to rashes that cover significant areas of the body. Hives usually go away within a few hours to two days, but in rare cases they become chronic and may last for six weeks or more.

Many cases of hives are brought on as allergic reactions and coincide with the release of histamine in the body. The release of histamine into the skin produces an inflammatory reaction, with itching, swelling, and redness. Hives can cause significant discomfort, but it does not cause injury or damage to any vital organs.

The skin is the largest organ of the body. It is an important part of the excretory system. The skin acts in conjunction with other systems in the body to remove toxins and waste. Hives can be a natural reaction to the presence of a foreign substance in the body. However, an offending substance need not enter the body to trigger an outbreak of hives. Merely coming into contact with various substances, such as pesticides, soaps, shampoos, hair sprays, residues from laundry products or dry cleaning chemicals on cloth-

ing, or any other of a vast array of other seemingly innocuous household items can unleash a maddening attack of hives.

The severity of a hives outbreak can vary from case to case as well as from person to person. Some people can break out in hives if they merely touch a certain type of plant or bush; others may develop hives only with considerable exposure, such as overconsumption of a certain food. Chemicals are a major cause of hives for many people; anything from perfumes to household cleaners can trigger a reaction, as can nervous conditions, stress, certain foods, and alcohol.

Viruses also can cause hives. Hepatitis B and Epstein-Barr virus, the virus that causes infectious mononucleosis, are the two most common culprits. Some bacterial infections likewise can cause outbreaks of hives, both chronic and acute. An association between *Candida albicans* and chronic hives has been established in several clinical studies over the past twenty years.

Antibiotics such as penicillin and related compounds are the most common cause of drug-induced hives. Persons who are allergic to penicillin may have various reactions including hives, angioedema (a condition that is similar to hives but affects deeper layers of the skin and causes larger wheals), laryngeal angioedema (angioedema that affects the throat, and can have an adverse effect on breathing), or anaphylaxis (a systemic allergic reaction causing generalized itching and difficulty breathing) if they ingest penicillin. The symptoms get worse with increased use. If you are allergic to penicillin, make sure your health care provider does not give it to you. Also inform your dentist. If you are traveling, make sure someone else knows about your allergy in case you become ill and are unable to communicate the information yourself.

The following are some of the disorders, drugs, and other substances that most commonly cause outbreaks of hives in susceptible people. This list is not exhaustive, and we do not mean to imply that these items *will* cause a hives outbreak, only that they at least contribute to the condition in some people:

- *Allopurinol* (Zyloprim), a gout medication.
- *Animals*, especially animal dander and dog saliva.
- *Antimony*, a metallic element that is present in various metal alloys.
- *Antipyrine*, an agent used to relieve pain and inflammation.
- *Aspirin*.
- *Barbiturates*.
- *BHA and BHT*, preservatives used in many food products.
- *Bismuth*, another metallic element present in certain metal alloys.

- *Cancer*, especially leukemia.
- *Chloral hydrate*, a sedative used in the treatment of tetany.
- *Chlorpromazine* (Thorazine), a tranquilizer and antiemetic.
- *Cologne or perfume*.
- *Corticotropin* (also known as adrenocorticotrophic hormone, or ACTH, and sold for medicinal purposes under the brand names Acthar and Cortrosyn).
- *Environmental factors*, especially heat, cold, water, and sunlight.
- *Eucalyptus*, a tree whose leaves yield an aromatic oil that is used in cough remedies and other medicines.
- *Exercise*.
- *Fluorides*, which are found in certain dental care products and in fluoridated drinking water.
- *Food allergies*, especially allergies to shellfish, eggs, fruits, and various nuts.
- *Food colorings and preservatives*.
- *Gold*.
- *Griseofulvin* (Fulvicin, Grisactin, and others), an antifungal medication.
- *Hyperthyroidism*.
- *Infections*, especially strep infections, hepatitis, and parasites.
- *Insect bites*.
- *Insulin*.
- *Iodines*, used in certain antiseptics and dyes.
- *Liver extract*.
- *Makeup*.
- *Menthol*, an extract of peppermint oil used in perfumes, as a mild anesthetic, and as a mint flavoring in candy and cigarettes.
- *Meprobamate* (Miltown, Equanil, Meprospan), a tranquilizer.
- *Mercury*, a toxic metallic element found in dental fillings, certain antacids, and some first-aid preparations, among other things.
- *Morphine*.
- *Opium*.
- *Para-aminosalicylic acid*, an anti-inflammatory drug.
- *Penicillin*.
- *Phenacetin*, an ingredient in some pain medications.
- *Phenobarbital*, a sedative and anticonvulsant.
- *Pilocarpine*, a glaucoma medication.
- *Plants*.

- *Poliomyelitis vaccine*.
- *Potassium sulfocyanate*, a preservative.
- *Preservatives*.
- *Procaine* (Novocain), an anesthetic.
- *Promethazine* (Phenergan), an antihistamine, sedative, and antiemetic.
- *Quinine*, used in quinine water and antimalaria medications.
- *Reserpine*, a heart medication.
- *Saccharin*, an artificial sweetener found in Sweet 'N Low, many toothpastes, and many dietetic and sugarless products.
- *Salicylates*, chemicals used as food flavorings and preservatives.
- *Shampoo*.
- *Soaps*, including laundry soap.
- *Sulfites*, chemicals used as food preservatives and in the production of dried fruits such as raisins.
- *Tartrazine*, a food dye and an ingredient in Alka-Seltzer.
- *Thiamine hydrochloride*, an ingredient in some cough medicines.

Other hives-provoking substances are being identified with increasing frequency. Meat, dairy, and poultry products, especially in frozen or fast foods, are increasingly being associated with hives, probably because many farmers and ranchers routinely give their livestock antibiotics in an effort to prevent disease or infection. These antibiotics are not affected by subsequent freezing, processing, or cooking. Allergic reactions have been traced to antibiotics in milk, soft drinks, and even frozen dinners.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Acidophilus	As directed on label.	Reduces allergic reactions and helps replenish "friendly" bacteria. Use a nondairy formula.
Flaxseed oil or primrose oil	1,000 mg twice daily.	Has anti-inflammatory effects.
Garlic (Kyojolic from Wakunaga)	As directed on label.	Aids in destroying bacteria.

Herpanacine from Diamond-Herpanacine Associates	As directed on label.	A nutrient and herb combination that supports overall skin health.
Multivitamin and mineral complex	As directed on label.	To correct any nutrient or mineral deficiencies that may be contributing to outbreaks. Use a hypoallergenic formula.
Quercetin or Anti-Allergy formula from Freeda Vitamins	As directed on label.	Reduces inflammation and reactions to substances that may cause hives. A combination of quercetin, calcium pantothenate, and calcium ascorbate.
Vitamin B complex  plus extra vitamin B <sub>5</sub> (pantothenic acid)  and vitamin B <sub>12</sub>	As directed on label, with meals (amounts of individual vitamins in a complex will vary). 250 mg 3–4 times daily at first outbreak. Reduce to 1–2 times daily when hives subside. 1,000–2,000 mcg daily.	Needed for the functioning of the nervous system and for healthy skin. Aids with the body's immune response.  Prevents nerve damage and promotes normal growth of the skin. Use a lozenge or sublingual form.
Vitamin C with bioflavonoids	1,000 mg 3 times daily.	Enhances immune response; acts as an anti-inflammatory.
Vitamin D	400 IU daily.	To reduce outbreaks.
Vitamin E  and zinc	200 IU daily or 400 IU every other day.  50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	A powerful antioxidant that improves circulation to the skin tissues. Use d-alpha-tocopherol form. Promotes a healthy immune system and healing of skin tissues. Needed for proper concentrations of vitamin E in the blood. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Alfalfa, bilberry extract, cat's claw, chamomile, echinacea, ginseng, licorice, nettle, sarsaparilla, and yellow dock are all beneficial to the hives sufferer. Alfalfa can also be used as a preventive blood tonic. It cleanses the blood and helps keep the body free of toxins.

**Cautions:** Do not use cat's claw during pregnancy. Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not use ginseng if you have high blood pressure, or are pregnant or nursing. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Applying aloe vera gel to the affected area can be helpful.

Black nightshade leaves may help. Wash and boil the

leaves in water, put them on a cloth, and apply as a poultice to the affected area. (See USING A POULTICE in Part Three.)

**Caution:** Do not take this herb internally, and avoid getting it in your eyes.

The leaves and the bark of the red alder tree, when brewed into a strong tea, can help hives. Apply it locally to the affected area, and take a couple of tablespoons internally as well. Reapply several times daily until the hives abate. Red alder contains the astringent tannin.

## Recommendations

Avoid alcohol and all processed foods, which put added stress on the body by depleting nutrients. Also avoid dairy products, eggs, chicken, and nuts. Especially avoid foods high in saturated fats, cholesterol, and sugar.

Do not take any medications (including aspirin, pain killers, sedatives, laxatives, cough syrups, and antacids) that are not prescribed for you.

Use only hypoallergenic skin care products.

For the typical case of hives, avoid using prednisone or other steroids. Instead, use the nutrients and herbs listed above. Try nettle first.

For topical treatment, use cornstarch or colloidal oatmeal added to bathwater. A good oatmeal product for this purpose is Aveeno Bath Treatment, available at drugstores. Bathing in cool water with baking soda added also may relieve symptoms.

Take a cool shower when you see the first signs of hives appearing. Make sure that it is cool, not hot. This may slow the spreading of hives.

Wear loose-fitting clothing.

Try using homeopathic remedies. *Bovista*, *Cantharis*, and *Rhus toxicodendron* are homeopathic remedies that may alleviate symptoms of hives.

If you have had hives and they are bothering you or if you are developing an acute case of hives, consult your health care provider.

If sun exposure is the cause of your hives, apply a strong sunscreen—this will usually alleviate the problem.

If hives develop in your mouth or throat, and especially if they cause swelling around the throat or interferes with swallowing or breathing to any extent at all, seek medical help immediately. Go to the emergency room of the nearest hospital or call for emergency assistance. Hives can signal or accompany the onset of anaphylaxis, a dangerous allergic reaction that can block the breathing passages. The possibility of anaphylaxis is what makes allergies to insect stings, such as those from bees, a potentially serious concern. If you have ever had this type of reaction, you should be under a physician's care and have an epinephrine injection kit on hand. Make sure you know how to use it, and keep the kit with you at all times.

## Considerations

❑ Many people who suffer acute attacks find at least temporary relief from the symptoms of hives by taking antihistamines such as hydroxyzine (Atarax, Vistaril), chlorpheniramine (Chlor-Trimeton, Teldrin, and others), or diphenhydramine (Benadryl and others). Chronic sufferers have less success with this approach, as antihistamines are suppressive agents and may actually contribute to the persistence of hives. Antihistamines in gel or spray form can be applied topically for immediate but temporary relief of itchiness or burning.

❑ Depending on the nature and severity of the symptoms, health care providers may prescribe antihistamines, cortisone, or a bronchodilator such as terbutaline or ephedrine for people with hives. They may also prescribe sedatives for anxiety in severe cases.

❑ If a hives outbreak is the result of a food or drug that you have ingested, you obviously do not want that substance in your body again. If you cannot isolate whatever food or drug it might be that causes hives, having a physician do some blood work to find the allergen may be your only solution, even though this approach can be relatively expensive.

❑ Occasionally, hives can persist for weeks or even months, resisting all attempts at treatment. For this reason alone, it is best to learn what the cause of the outbreak is in order to avoid it. If you suffer from chronic hives and cannot isolate the cause, eliminating all the possible allergens from your home may be your only resort. This can be a long, drawn-out, and painstaking process. (See ALLERGIES in Part Two.)

❑ Chronic hives may be linked to *Candida albicans*. If you suspect this may be the cause of hives, adopting a yeast-free diet can be of some benefit. (See CANDIDIASIS in Part Two.)

❑ An elimination diet is important. (See ALLERGIES in Part Two.)

## HOT FLASHES

See under MENOPAUSAL AND PERIMENOPAUSAL PROBLEMS.

## HYPERTENSION

See HIGH BLOOD PRESSURE.

## HYPERTHYROIDISM

This disorder occurs when the thyroid gland produces too much thyroid hormone, resulting in an overactive metabolic state. All of the body's processes speed up with this disorder. Symptoms of hyperthyroidism include nervousness, irritability, a constant feeling of being hot, increased

perspiration, insomnia and fatigue, increased frequency of bowel movements, less frequent menstruation and decreased menstrual flow, weakness, hair and weight loss, change in skin thickness, separation of the nails from the nail bed, hand tremors, intolerance of heat, rapid heartbeat, goiter, and, sometimes, protruding eyeballs. Hyperthyroidism is sometimes also called *thyrotoxicosis*. The most common type of this disorder is Graves' disease.

The thyroid gland is the body's internal thermostat. It regulates the temperature by secreting two hormones that control how quickly the body burns calories and uses energy. If the thyroid secretes too much hormone, hyperthyroidism results; too little hormone results in hypothyroidism. Many cases of hypothyroidism and hyperthyroidism are believed to result from an abnormal immune response. The exact cause is not understood, but the immune system can produce antibodies that invade and attack the thyroid, disrupting hormone production. Hyperthyroidism can also be caused by lumps or tumors that form on the thyroid and disrupt hormone production. Infection or inflammation of the thyroid can cause temporary hyperthyroidism, as can certain prescription drugs.

Hyperthyroidism is not as common as hypothyroidism. Both of these thyroid disorders affect women more often than men. A malfunctioning thyroid can be the underlying cause of many recurring illnesses.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Multivitamin and mineral complex	As directed on label.	Increased amounts of vitamins and minerals are needed for this "hyper" metabolic condition. Use a super-high-potency formula.
Vitamin B complex	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Needed for thyroid function. Injections (under a doctor's supervision) may be necessary.
plus extra		
vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>2</sub> (riboflavin) and	50 mg twice daily.	Needed for blood formation and energy levels.
and	50 mg twice daily.	Required for normal functioning of all cells, glands, and organs in the body.
vitamin B <sub>6</sub> (pyridoxine)	50 mg twice daily.	Activates many enzymes and is needed for immune function and antibody production.
<i>Helpful</i>		
Brewer's yeast	1–3 tbsp and up daily.	Rich in many basic nutrients, especially the B vitamins.

Essential fatty acids (Kyolic-EPA from Wakunaga)	As directed on label.	Needed for correct glandular function.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Aids in digestion of fats and protects the lining of all cells and organs.
Vitamin C with bioflavonoids	3,000–5,000 mg and up daily.	Especially important in this stressful condition.
Vitamin E	200 IU daily or 400 IU every other day.	An antioxidant and necessary nutrient. However, excessive amounts may stimulate the thyroid gland. Use d-alpha-tocopherol form.

### Recommendations

- Eat plenty of the following foods: broccoli, Brussels sprouts, cabbage, cauliflower, kale, mustard greens, peaches, pears, rutabagas, soybeans, spinach, and turnips. These help to suppress thyroid hormone production.
- Avoid dairy products for at least three months. Also avoid stimulants, coffee, tea, nicotine, and soft drinks.

### Considerations

- Along with other bodily processes, digestion speeds up with this disorder. Malabsorption occurs, so a proper diet is important.
- Radioactive sodium iodine (iodine 131, or I-131) is often recommended for treatment of hyperthyroidism. Many people are concerned because the treatment uses radioactive substances. There is no proof that radioactive iodine increases the incidence of tumors, leukemia, thyroid cancer, or birth defects in children born to women who became pregnant later in life and used this therapy. However, this treatment is not for use during pregnancy.
- Researchers in England studied ten people who were being treated for Parkinson's disease and found that all of them also had hyperthyroidism. Once the thyroid condition was treated, the Parkinson's disease improved dramatically.
- If a goiter affects breathing or swallowing, surgery may be needed to remove part or all of the thyroid. It may be necessary to take thyroid hormone pills after surgery.
- The pituitary gland, parathyroid glands, and sex glands all work together and are influenced by thyroid function. If there is a problem in one place, they all may be affected.
- The parathyroid glands, small endocrine glands that are positioned near or within the rear surface of the thyroid, secrete parathyroid hormone (PTH), which aids in controlling calcium levels. Hyperparathyroidism is a rare disorder in which these apple-seed-sized organs become enlarged and overactive. When too much PTH is released,

excess calcium leaches out of the bones and into the blood. Routine blood tests may reveal excess calcium in the blood. If left untreated, it can lead to other problems such as bone pain and kidney stones. The standard treatment for this disorder is surgery. Permanent hoarseness is a possible side effect, if the nerves supplying the voice box are injured.

- An undiagnosed thyroid condition can be mistaken for menopausal symptoms. Symptoms such as fatigue, mood swings, and depression are often present in both circumstances. If you are experiencing menopausal symptoms, you should have your thyroid function tested.
- For names and addresses of organizations that can provide additional information about thyroid disorders, see Health and Medical Organizations in the Appendix.

### HYPOGLYCEMIA (LOW BLOOD SUGAR)

Hypoglycemia, or low blood sugar, is a condition in which there is an abnormally low level of glucose (sugar) in the blood. Reactive hypoglycemia occurs when blood sugar drops to abnormally low levels two to five hours after eating a meal. Symptoms of reactive hypoglycemia include sweating, tremors, rapid heartbeat, anxiety, and hunger. Most often, this results from the oversecretion of insulin by the pancreas. Insulin facilitates the transport of glucose from the bloodstream into the cells, especially those of muscle and fatty tissue, and causes glucose to be synthesized in the liver. If the pancreas is not functioning properly, normal carbohydrate metabolism is impossible. As the blood sugar drops, stress hormones such as adrenaline and cortisol kick in at high levels to prevent the blood sugar level from dropping dramatically. Another type of hypoglycemia is known as *fasting hypoglycemia*. This occurs as a result of abstaining from food for eight or more hours. The symptoms are often more severe than those of reactive hypoglycemia and can include seizures, loss of consciousness, and a loss of mental acuity. Liver disease or a tumor of the pancreas is generally the underlying cause of this type of hypoglycemia.

A person with hypoglycemia may display any or all of the following symptoms: fatigue, dizziness, heart palpitations, nausea, blurred vision, an inability to concentrate, lightheadedness, headache, irritability, fainting spells, depression, nervousness, anxiety, cravings for sweets, confusion, night sweats, weakness in the legs, swollen feet, a feeling of tightness in the chest, constant hunger, pain in various parts of the body (especially the eyes), nervous habits, mental disturbances, and insomnia. If blood sugar levels drop below 40 milligrams (mg) of glucose per 100 cubic centimeter (cc) of blood (80 to 100 is normal), an individual may become unconscious. People with hypoglycemia can become very aggressive and lose their tempers easily. Any or all of these symptoms may occur a few hours after eating sweets or fats. The onset and severity of symptoms are

directly related to the length of time since the last meal was eaten and the type of foods that meal contained.

More and more Americans today may have this condition, due to poor dietary habits that include eating large quantities of simple carbohydrates, sugars, alcohol, caffeine, and soft drinks, and insufficient amounts of complex carbohydrates. High stress levels are believed to be a contributing factor in the increasing incidence of hypoglycemia.

Hypoglycemia can be inherited, but most often it is precipitated by an inadequate diet. This is referred to as *functional hypoglycemia* (FH). Many other bodily disorders can cause hypoglycemic problems as well, among them adrenal insufficiency, stomach surgery, thyroid disorders, pituitary disorders, kidney disease, and pancreatitis and other pancreatic disorders such as pancreatic cancer. Immune deficiency and candidiasis are strongly linked to hypoglycemia. Glucose intolerance and hyperinsulinemia (high blood insulin levels), producing hypoglycemia, frequently occur in people with chronic liver failure. Other common causes are smoking and the consumption of large amounts of caffeine, found in colas, chocolate, and coffee. Though it may seem paradoxical, low blood sugar can also be an early sign of diabetes (high blood sugar).

Diagnosis of hypoglycemia can be difficult because the symptoms often mimic those of other disorders, including adrenal dysfunction, allergies, asthma, candidiasis, chronic fatigue syndrome, digestive or intestinal disorders, eating disorders, food allergies, hypothyroidism, kidney failure, malabsorption syndrome, menopause, mental disorders, neurological problems, nutritional deficiencies, sepsis (blood infection), stress, and weight problems.

To diagnose hypoglycemia, a health care provider may perform a glucose tolerance test (GTT). However, many people have symptoms of hypoglycemia even though the results of a five-hour GTT are within normal limits. A useful diagnostic test may be to follow the dietary and nutritional supplement regimen outlined in this section and see if symptoms improve.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Brewer's yeast	As directed on label.	Aids in stabilizing blood sugar levels.
Chromium picolinate	300–600 mcg daily.	Vital in glucose metabolism. Essential for optimal insulin activity.
Garlic (Kyolic from Wakunaga)	As directed on label.	Very good for relieving low blood sugar when an attack occurs.

Glutathione	As directed on label.	A compound consisting of three amino acids that is associated with the breakdown of glucose into energy.
Kyo-Dophilus from Wakunaga	As directed on label.	To replace the "friendly" bacteria lacking in this disorder. Use the liquid form.
Pancreatin	As directed on label. Take with meals.	For proper protein digestion. Use a high-potency formula.
Proteolytic enzymes	As directed on label. Take between meals.	People with this disorder often fail to digest protein properly, resulting in "leaky gut syndrome" and allergies. <i>Caution:</i> Do not give this supplement to a child.
Quercetin	As directed on label.	Aids in stopping allergic reactions. Helpful if food allergies are a factor.
Vitamin B complex	50–100 mg and up of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	Important in carbohydrate and protein metabolism, and proper digestion and absorption of foods; helps the body tolerate foods that produce low blood sugar reactions. Also helps counteract the effects of malabsorption disorders, common in people with hypoglycemia.
plus extra vitamin B <sub>1</sub> (thiamine)	100 mg daily.	Aids in the production of hydrochloric acid, needed for proper digestion.
and vitamin B <sub>3</sub> (niacin) and vitamin B <sub>5</sub> (pantothenic acid)	100 mg daily. Do not exceed this amount. 1,000 mg daily, in divided doses.	Aids in the functioning of the nervous system and in proper digestion. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
and vitamin B <sub>12</sub>	1,000–2,000 mcg daily, on an empty stomach.	Important in adrenal gland function and conversion of glucose to energy. Crucial for prevention of anemia, common because malabsorption disorders result in deficiency.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for proper release of insulin. People with hypoglycemia are often zinc deficient. Use zinc gluconate lozenges or OptiZinc for best absorption.

*Important*

L-carnitine plus L-cysteine	As directed on label.	Converts stored body fat into energy.
and L-glutamine	As directed on label.	Blocks the action of insulin, which lowers blood sugar.
	1,000 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Reduces cravings for sugar.
Magnesium plus calcium	750 mg daily, in divided doses, after meals and at bedtime. 1,500 mg daily, in divided doses, after meals and at bedtime.	Important in carbohydrate (sugar) metabolism. Works with magnesium.

Manganese	As directed on label. Take separately from calcium.	Important for the maintenance of blood glucose levels. Most people with hypoglycemia have low levels of this trace mineral in their blood.
Vitamin C with bioflavonoids	3,000–8,000 mg daily, in divided doses.	For adrenal insufficiency, common in people with hypoglycemia.
Vitamin E	200 IU daily or 400 IU every other day.	Improves energy and circulation. Use d-alpha-tocopherol form.
<b>Helpful</b>		
ABC Aerobic Bulk Cleanse from Aerobic Life Industries or psyllium husks	As directed on label. Take with aloe vera juice on an empty stomach in the morning. Take separately from other supplements and medications.	Aids in slowing down blood sugar reactions and keeping the colon clean.
Liver extract injections or desiccated liver	1 cc twice weekly for 3 months, then once weekly for 2 months or more, or as prescribed by physician. As directed on label.	Liver glandulars supply B vitamins and other valuable nutrients.
Multivitamin and mineral complex	As directed on label.	All nutrients are required for healing.
Cravex from Natrol	As directed on label.	Controls sugar cravings and helps balance metabolism.

## Herbs

The following herbs help to normalize blood sugar: angostura bitters (or any combination of bitters), artichoke leaf, and gentian root.

To help your body respond to stress, try astragalus or licorice root.

**Cautions:** Do not use astragalus in the presence of a fever. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Dandelion root is an excellent source of calcium and supports the pancreas and liver.

Gudmar (*Gymnema sylvestre*), an Ayurvedic herb, suppresses the intestinal absorption of saccharides, which prevents blood sugar fluctuations.

Licorice nourishes the adrenal glands.

**Caution:** Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Milk thistle rejuvenates the liver.

Other beneficial herbs include echinacea, parsley, pau d'arco, raspberry leaves, and uva ursi.

**Caution:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

## Recommendations

Remove from the diet all alcohol, canned and packaged foods, refined and processed foods, dried fruits, salt, sugar, saturated fats, soft drinks, and white flour. Also avoid foods that contain artificial colors or preservatives.

Avoid sweet fruits and juices such as grape and prune. If you drink these, mix the juice with an equal amount of water.

Sweeten food with natural sweeteners such as stevia, a South American herb available in liquid form that is two hundred times sweeter than sugar. Other acceptable sweeteners include barley malt syrup, molasses, and brown rice syrup.

Eat a diet high in fiber and include large amounts of vegetables, especially broccoli, carrots, Jerusalem artichokes, raw spinach, squash, and string beans. Vegetables should be eaten raw or steamed. Also eat beans, brown rice, lentils, oats, oat bran, potatoes, soy products (tofu), and fruits, especially apples, apricots, avocados, bananas, cantaloupes, grapefruits, lemons, and persimmons.

For protein, eat low-fat cottage cheese, fish, grains, kefir, raw cheese, raw nuts, seeds, skinless white turkey or white chicken breast, and low-fat yogurt.

Eat starchy foods such as corn, hominy, noodles, pasta, white rice, and yams in moderation only.

Include maitake mushrooms in your diet. They are beneficial for helping the body adapt to stress.

Do not eat fatty foods such as bacon, cold cuts, fried foods, gravies, ham, sausage, or dairy products (except for low-fat soured products).

Do not go without food or consume large, heavy meals. Eat six to eight small meals throughout the day. Some people find that eating a small snack before bedtime helps. In addition, if the hypoglycemia is related to a previous stomach surgery, don't take fluids with the meals or snacks—wait thirty to sixty minutes.

Use a rotation diet; food allergies are often linked to hypoglycemia and can make the symptoms more pronounced. (See ALLERGIES in Part Two.)

Try taking 200 micrograms of chromium picolinate daily. This can alleviate many symptoms and raise blood glucose levels if symptoms occur after sugar or a heavy meal is consumed. Chromium, also known as glucose tolerance factor or GTF, has been known to alleviate sudden shock.

During a low blood sugar reaction, eat something that combines fiber with a protein food, such as bran or rice crackers with raw cheese or almond butter.

Instead of eating applesauce, have a whole apple, which has more fiber. The fiber in the apple will inhibit fluctuations in blood sugar. Fiber alone (found in popcorn, oat bran, rice bran, crackers, ground flaxseed, and psyllium husks) will slow down a hypoglycemic reaction. Take fiber

half an hour before meals. Spirulina tablets taken between meals further help to stabilize blood sugar.

Maintain a regular exercise regimen. This helps to maintain steady blood sugar levels. Eat one to three hours prior to exercise.

*Caution:* If you are over thirty-five and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Stress is a major factor in hypoglycemia, as it affects adrenal function and blood sugar levels. Practice stress reduction by meditating, listening to soothing music, getting a massage, or using deep breathing techniques.

Fast once a month with fresh vegetable juices and a series of lemon juice enemas. (See FASTING and ENEMAS in Part Three.) To prevent a low blood sugar reaction while fasting, use spirulina or a protein powder supplement. Many people find this makes them start to feel better very quickly.

### Considerations

Hypoglycemia is usually an indication of any number of health problems, all of which can be serious. If you suspect that you have it, see your physician so he or she can figure out why. The body is very sensitive to fluctuations in blood glucose levels. It metes out insulin based on how much sugar is in the blood. The brain in particular primarily uses glucose for energy, and it likes levels under a tight range. Deviations can usually be diagnosed and treated.

Avocados contain a seven-carbon sugar that depresses insulin production, which make them an excellent choice for people with hypoglycemia.

The production of insulin is affected by the functioning of the adrenal glands. The adrenal glands produce epinephrine, which acts to "turn off" insulin production, among other things. If the adrenal glands are overstressed and exhausted, they cannot function properly and an overabundance of insulin may result. This causes the blood sugar level to sink below normal, creating a low energy syndrome in the body.

Injections of vitamin B complex plus extra vitamin B<sub>6</sub> (pyridoxine) and liver extract have produced good results for those with hypoglycemia. Liver extract supplements contain a nutritional substance that aids liver regeneration. Only liver from organically raised beef should be used.

Hypoglycemia can mimic menopausal symptoms, especially since it often escalates during midlife.

In rare cases, hypoglycemia can be triggered by large doses of aspirin or by sulfonamides (sulfa drugs), a class of antibiotics often prescribed for urinary tract infections.

People who are most prone to hypoglycemia are those taking medications for high blood sugar or diabetes.

Hypoglycemia is often the underlying cause of misdiagnosed cases of attention deficit disorder (ADD). (See

ATTENTION DEFICIT DISORDER [ADD]/ATTENTION DEFICIT HYPERACTIVITY DISORDER [ADHD] in Part Two.)

Caffeine, alcohol, and tobacco cause profound swings in blood sugar levels. Insomnia can result if any type of sugar is consumed after dinner. Consuming sugar at any time tends to cause drowsiness and fatigue.

Some studies have shown that reducing the amount of meat protein in the diet and adding some starches, such as potatoes, may be beneficial.

Milk allergy is common as this disorder progresses. Allergy testing is recommended. (See ALLERGIES in Part Two.)

### HYPOTHYROIDISM

Hypothyroidism is caused by an underproduction of thyroid hormone. Symptoms include chronic fatigue, loss of appetite, inability to tolerate cold, low body temperature, a slow heart rate, easy weight gain, elevated cholesterol, painful premenstrual periods, heavy periods, a milky discharge from the breasts, fertility problems, muscle weakness, muscle cramps, dry and scaly skin, a yellow-orange coloration in the skin (particularly on the palms of the hands), yellow bumps on the eyelids, hair loss (including the eyebrows), recurrent infections, migraines, hoarseness, respiratory infections, constipation, depression, difficulty concentrating, slow speech, goiter, and drooping, swollen eyes. The most common symptoms are fatigue and intolerance to cold. If you consistently feel cold while others around you are hot, you may be suffering from reduced thyroid function.

The thyroid gland is the body's internal thermostat, regulating the temperature by secreting two hormones that control how quickly the body burns calories and uses energy. If the thyroid secretes too much hormone, hyperthyroidism results; too little hormone results in hypothyroidism. It affects an estimated 5 percent of the population in the United States, and women are much more likely than men to develop it. Women between the ages of thirty and fifty seem to be most prone to this condition. It is estimated that one in ten women will develop a thyroid condition at some point in her lifetime. Thyroid problems can cause many recurring illnesses and fatigue. The thyroid can be affected by poor diet, fluoride in the water, excessive consumption of unsaturated fats, endurance exercise, pesticide residues on fruits and vegetables, radiation from x-rays, alcohol, and drugs.

A condition called *Hashimoto's disease* is believed to be the most common cause of underactive thyroid. In this disorder, the body in effect becomes allergic to thyroid hormone. It then produces antibodies against its own thyroid tissue. Hashimoto's disease is a common cause of goiter, a swelling of the thyroid gland, among adults, and it can occur in association with other disorders, such as pernicious anemia, lupus, yeast infections, and rheumatoid arthritis. Congenital hypothyroidism in children, if left untreated,

can lead to mental retardation and dwarfism. Generally, however, hypothyroidism is detected within a baby's first few months, when routine blood tests are performed.

A rare condition that can result from long-term undiagnosed hypothyroidism is called *myxedema coma*. The coma can occur during illness, after an accident, from exposure to cold, or as a result of the ingestion of narcotics and/or sedatives. This is a medical emergency that requires immediate treatment.

Measuring levels of different hormones in the blood can determine if the thyroid gland is working properly. A physician may order a blood test to measure levels of thyroid hormone or thyroid-stimulating hormone (TSH). This hormone is secreted by the pituitary gland and in turn helps regulate thyroid hormone production. Even a minuscule drop in thyroid function registers as a distinctly elevated TSH level. Most endocrinologists believe that TSH levels rise when a person is in the earliest stages of thyroid failure.

An iodine absorption test may also be performed. This test involves ingesting a small amount of radioactive iodine. An X-ray then shows how much of the iodine was absorbed by the thyroid. A low uptake of the iodine may indicate hypothyroidism.

Unless otherwise specified, the dosages recommended in this section are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### Thyroid Self-Test

To test yourself for an underactive thyroid, keep a thermometer by your bed at night. When you awaken in the morning, place the thermometer under your arm and hold it there for fifteen minutes. Keep still and quiet. Any motion can upset your temperature reading. A temperature of 97.6°F or lower may indicate an underactive thyroid. Keep a temperature log for five days. If your readings are consistently low, consult your health care provider.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Kelp	2,000–3,000 mg daily.	Contains iodine, the basic substance of thyroid hormone. <i>Caution:</i> Check with your health care professional before using this if you are diagnosed with thyroid problems.
L-tyrosine	500 mg twice daily, on an empty stomach. Take with water or juice, not with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Low plasma levels have been associated with hypothyroidism. (See AMINO ACIDS in Part One.)

### Very Important

Multi-Glandular from American Biologics	As directed on label.	A nutritional supplement for the endocrine, hormonal, and enzyme systems.
Raw thyroid glandular	As prescribed by physician.	To replace deficient thyroid hormone (see GLANDULAR THERAPY in Part Three). A natural thyroid extract such as Armour Desiccated Thyroid Tablets is best. Available by prescription only.

### Important

Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin) and vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg twice daily. 1,000–2,000 mcg 3 times daily, on an empty stomach.	B vitamins improve cellular oxygenation and energy and are needed for proper digestion, immune function, red blood cell formation, and thyroid function. Use a lozenge or sublingual form for best absorption.
--	--	--

### Helpful

Brewer's yeast	As directed on label.	Rich in basic nutrients, especially B vitamins.
Essential fatty acids (Kyolic-EPA from Wakunaga)	As directed on label.	Necessary for proper functioning of the thyroid gland.
Iron or Floradix Iron + Herbs from Salus Haus	As directed by physician. Take with 100 mg vitamin C for better absorption. As directed on label.	Essential for enzyme and hemoglobin production. Use ferrous chelate form. <i>Caution:</i> Do not take iron unless anemia has been diagnosed. A natural, nontoxic form of iron from food sources.
Selenium	As directed on label. If you are pregnant, do not exceed 40 mcg daily.	A vital antioxidant that protects the immune system.
Vitamin A with mixed carotenoids plus natural beta-carotene or carotenoid complex (Betatene)	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily. As directed on label.	Needed for proper immune function and for healthy eyes, skin, and hair. May be taken in a multivitamin complex. Antioxidant and precursor of vitamin A. <i>Note:</i> If you have diabetes, omit the beta-carotene; people with diabetes cannot convert beta-carotene into vitamin A.
Vitamin C with bioflavonoids	500 mg 4 times daily. Do not exceed this amount.	Needed for immune function and stress hormone production. <i>Caution:</i> Do not take extremely high doses of vitamin C—this may affect the production of thyroid hormone.
Vitamin E	200 IU daily or 400 IU every other day.	An important antioxidant that improves circulation and immune response. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	An immune system stimulant. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Bayberry, black cohosh, and goldenseal can help this thyroid condition.

*Cautions:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Gentian and mugwort extracts are helpful for hypothyroidism.

Herbal bitters such as Swedish bitters may help alleviate the symptoms associated with thyroid malfunctions.

## Recommendations

Include in your diet apricots, dates, egg yolks, molasses, parsley, potatoes, prunes, raw seeds, and whole grains. Eat fish or chicken and raw milk and cheeses.

Eat these foods in moderation: broccoli, Brussels sprouts, cabbage, kale, mustard greens, peaches, pears, radishes, spinach, and turnips. If you have severe symptoms, omit these foods entirely. They may further suppress thyroid function.

Avoid processed and refined foods, including white flour and sugar.

Drink steam-distilled water only.

Begin a moderate exercise program such as yoga or walking.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Do not take sulfa drugs or antihistamines unless specifically directed to do so by a physician.

Avoid fluoride (including that found in toothpaste and tap water) and chlorine (also found in tap water). Chlorine, fluoride, and iodine are chemically related. Chlorine and fluoride block iodine receptors in the thyroid gland, resulting in reduced iodine-containing hormone production and finally in hypothyroidism.

Taking the homeopathic remedy *Calcarea carbonica* may help. It can sometimes increase thyroid function.

Because thyroid medication can interact with other medications, take them several hours apart. Ask your physician if any other medications will interfere with the effectiveness of your thyroid prescription. Aluminum hydroxide (an antacid found in Alu-Tab, Amphojel, and Nephrox) and a drug used to lower cholesterol, cholestyramine (Questran) are a couple of the drugs that affect thyroid medications. Do not take thyroid medication at the

same time you take carbonate supplements or calcium as they can block the absorption of thyroxine (T<sub>4</sub>).

## Considerations

Because sugar intolerance, menopause, and depression can cause many of the same symptoms as thyroid disorders, a simple thyroid test should be considered to rule out any errors in diagnosis.

Treatment for a regular morning temperature of 96°F is 3 to 4 grains of Armour Desiccated Thyroid Tablets (available by prescription) daily. A person with a regular morning temperature of 97°F should take 1 to 2 grains. If you have side effects, speak to your physician about reducing the dosage.

Synthroid and Levothyroid are synthetic versions of T<sub>4</sub> that are most frequently prescribed by physicians for people with hypothyroidism. Some side effects of these medications include headache, irritability, nervousness, loss of sleep, diarrhea, weight loss, and changes in appetite. If a person shows no response to this medication, the physician may prescribe liothyronine (Cytomel). It contains T<sub>3</sub>, which is needed to regulate metabolism. A study done at the University of Massachusetts found that thyroxine can cause a loss of bone mass.

The conventional treatment for Hashimoto's disease is usually a prescription of a thyroid hormone that must be taken for the duration of one's lifetime.

The presence of too much thyroid hormone in the system can cause a condition known as *thyroid storm*. The heart rate increases rapidly and, in exceptionally severe cases, a heart attack can occur.

Recent evidence indicates that an underactive thyroid may put you at an increased risk of heart attack—even if your thyroid is only slightly underactive.

Applying a natural progesterone cream, which is available at most health food stores, may increase thyroid activity.

Lithium, a trace mineral used as a drug to treat bipolar mood disorders, can sometimes cause thyroid malfunction.

Wilson's syndrome is a condition that results from a problem in the conversion of one thyroid hormone, T<sub>4</sub>, to another thyroid hormone, T<sub>3</sub>. This causes symptoms of decreased thyroid function, especially triggered by significant physical or emotional stress. These symptoms can be debilitating, and may persist even after the stress has passed. People with Wilson's syndrome have many of the symptoms of hypothyroidism, including low body temperature, fatigue, headaches, menstrual dysfunction, memory loss, loss of concentration, loss of sex drive, anxiety and panic attacks, depression, unhealthy nails, dry skin, frequent infections, allergies, insomnia, intolerance to cold, and lack of energy and motivation. Their blood test results

are often normal, however. (See WILSON'S DISEASE in Rare Disorders in Part Two.)

□ For names and addresses of organizations that can provide more information about thyroid disorders, see Health and Medical Organizations in the Appendix.

## HYSTERECTOMY-RELATED PROBLEMS

Hysterectomy is the surgical removal of the uterus. This is done for many different reasons. A common reason is fibroid tumors, benign growths in the uterus that can cause problems. More than 30 percent of the hysterectomies performed in the United States are done to remove fibroids. (See FIBROIDS, UTERINE, in Part Two.) Other conditions for which hysterectomy is performed include endometriosis (20 percent) and prolapse of the uterus (16 to 18 percent).

Hysterectomy is the second most common surgery among reproductive-age women in the United States—more than 600,000 are performed each year. One in three women in the United States will have had one by age sixty. Very few of these operations are performed because of a life-threatening situation, and it is likely that many of them are actually unnecessary. Per capita, half as many hysterectomies are performed in Great Britain as in the United States, and, statistically, American women show no health benefits for their higher incidence of surgery. Outside the United States, very few hysterectomies are performed for what doctors often term “quality of life” reasons. Hysterectomy effectively and permanently causes sterility, and this may be a motive (conscious or unconscious) for some women and/or their doctors to make this choice. Financial motives may be another possibility. U.S. Department of Health and Human Services statistics show that far fewer hysterectomies are performed under managed care plans, in which doctors receive a set fee for their services each year, than in situations in which surgeons are compensated directly for each operation performed.

The symptoms that lead women to consider hysterectomy are varied but include the following: a constant heavy, bloated feeling; urinary tract problems or incontinence; unusually long and heavy menstrual periods; unusual swelling in the abdominal region (due to fibroid tumors); infertility (due to fibroid tumors or endometriosis); complications of childbirth; cancer; and intolerance to drug therapy usually prescribed for endometriosis.

The following are three different ways in which hysterectomy may be performed:

- *Total hysterectomy.* In this procedure, the cervix is removed along with the uterus.
- *Partial (also known as subtotal or supracervical) hysterectomy.* In partial hysterectomy, the uterus is removed but the cervix and other female reproductive organs remain intact.
- *Pan (or radical) hysterectomy.* In this, the most extensive form of hysterectomy, the ovaries, cervix, supporting

ligaments, tissues, fallopian tubes, upper portion of the vagina, pelvic lymph nodes, and uterus are removed.

To remove the uterus surgically, doctors may choose one of the following three options:

- *Abdominal hysterectomy.* In some circumstances, the physician may choose to perform the hysterectomy by making an incision in the abdomen. This option is usually chosen if the woman undergoing the procedure has a large ovarian cyst or tumor. It is the most invasive type of hysterectomy, and the most traumatic due to the incision in the abdomen.
- *Total laparoscopic hysterectomy (TLH).* This involves performing the entire operation with a laparoscope (a tiny telescope), inserted through a very small incision in the navel and using small surgical instruments. This is used in situations in which the doctor needs an extensive picture of the pelvic region.
- *Vaginal hysterectomy.* In this type of procedure, the uterus is removed through the vagina. A doctor may choose to perform the procedure using a laparoscope. This method is called the *laparoscopically assisted vaginal hysterectomy (LAH)*.

Many women who have hysterectomies experience significant problems as a result. The most obvious of these occurs when the ovaries are removed together with the uterus; menopause begins abruptly, with its attendant difficulties and discomforts, because the body is suddenly deprived of estrogen. This hormonal loss in turn can lead to a greatly increased risk of bone mass loss, which often precedes osteoporosis, and to an increased likelihood of heart disease, as well as depression, urinary tract problems, joint pain, headaches, dizziness, insomnia, and fatigue.

Even women who retain their ovaries often experience a drastic reduction in estrogen production, and menopause comes earlier—sometimes years earlier—than it would have naturally. This is believed to be because the supply of blood to the ovaries is disrupted and decreased by removal of the uterus. Over half of women who have ovary-sparing “partial” hysterectomies experience early menopause.

Another problem common among women who have undergone hysterectomy is diminished sexual interest and desire after surgery. Research indicates that one-third of all women who have hysterectomies find their sexual desire and enjoyment greatly diminished. Removal of the ovaries may result in loss of sexuality because they secrete about half of a woman's supply of androgens, hormones that are responsible for sex drive in both men and women. However, diminished sexuality may occur whether or not the ovaries are removed. In Finland, studies have shown that the removal of the cervix in hysterectomy also resulted in diminished capacity for orgasm. Hormone replacement therapy can alleviate this problem.

Not all of the problems that can follow hysterectomy are directly hormone related. Some women experience depression because of the knowledge that once the uterus is gone,

it is too late to change one's mind about having children. Also, no surgical procedure is entirely 100 percent safe, foolproof, or guaranteed. There is a 50 percent chance of at least one minor postoperative complication (usually fever, bleeding, or wound trouble). It is estimated that 11 women in 10,000 who have a hysterectomy will die as a result of complications. If there is a possibility that you may require a transfusion as a result of this type of surgery, you should talk to your doctor about donating your own blood for use during the operation. (SEE HEPATITIS in Part Two for information about blood transfusions.)

The following supplements can help to counteract the unpleasant side effects of hysterectomy. The dosages given here are for adults.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Boron	3 mg daily. Do not exceed this amount.	Aids in calcium absorption and prevention of bone loss that can occur after hysterectomy.
Calcium and magnesium	2,000 mg daily, at bedtime. 1,000 mg daily, at bedtime.	Lack of estrogen hinders calcium uptake. Needed for the central nervous system. Enhances calcium absorption.
Essential fatty acids (primrose oil)	1,000 mg 3 times daily.	Helps the body manufacture estrogen.
Garlic (Kyolic from Wakunaga)	As directed on label.	May inhibit tumor growth.
Potassium	99 mg daily.	Needed if hot flashes occur to replace electrolytes lost through perspiration.
Raw thymus glandular	As directed on label.	Potentiates immune function.
Vitamin B complex	100 mg of each major B vitamin twice daily, with meals (amounts of individual vitamins in a complex will vary).	Needed for the nervous system and to reduce stress. Use a high-stress formula. Injections (under a doctor's supervision) may be necessary.
Vitamin C with bioflavonoids	3,000–6,000 mg and up daily, in divided doses.	An antistress vitamin also needed for tissue repair.
Vitamin E	200 IU daily, or 400 IU every other day.	Important in estrogen production. Use d-alpha-tocopherol form. <i>Caution:</i> Do not take this supplement for 2 weeks prior to surgery.
<b>Important</b>		
L-arginine and L-lysine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Essential amino acids important in recovery after surgery. Both are needed to avoid an imbalance in amino acids. (See AMINO ACIDS in Part One.)
Micellized Vitamin A and E from American Biologics	50,000 IU daily.	Important in immune function and to promote tissue repair. Use emulsion

plus carotenoid complex plus zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	form for easier assimilation and greater safety at higher doses. Boosts the immune system. Use zinc gluconate lozenges or zinc methionate (OptiZinc) for best absorption.
-----------------------------------	--	---

<b>Helpful</b>		
Melatonin	As directed on label.	This hormone stimulates the immune system and is important in the production of estrogen, testosterone, and, possibly, other hormones.
Multiglandular complex (Cytzyme-F from Biotics Research)	As directed on label.	Aids in glandular function.
Multivitamin and mineral complex	As directed on label.	Restores the essential vitamins and minerals to balance.

**Herbs**

Herbs that act as natural estrogen promoters include anise, dong quai, fennel, fenugreek, ginseng, licorice, red clover, sage, suma, and wild yam.

*Cautions:* Do not use ginseng if you have high blood pressure or are pregnant or nursing. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

The following herbs may alleviate symptoms of ovarian cysts and uterine fibroids: black cohosh, black haw, blue cohosh, dandelion root, lady's mantle (yarrow), milk thistle, and pau d'arco.

*Caution:* Do not use blue or black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

St. John's wort is helpful for depression.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

**Recommendations**

Adopt a hypoglycemic diet; eat plenty of foods that are high in fiber, such as vegetables, whole grains, and high-fiber fruits, plus fish, skinless white turkey or chicken breast, soy products, and low-fat yogurt, kefir, and cottage cheese for protein. Eat starchy foods in moderation only. Do not consume any refined sugar, white flour, alcohol, processed foods, saturated fats, or foods containing artificial colors, preservatives, or other additives. Eat six to eight small meals spaced regularly throughout the day, rather

than two or three larger meals. (See HYPOGLYCEMIA in Part Two for additional suggestions.)

☐ Add more fiber to your diet. Chronic constipation is a known and accepted complication of radical hysterectomy. In one study, women who had hysterectomies for treatment of cervical cancer and ate a high-fiber diet had more and softer bowel movements without pain or straining, compared to women who followed a low-fiber diet. The high-fiber diet contained 23 grams of fiber versus 12 grams for the low-fiber diet. To increase fiber in your diet eat lots of fruits and vegetables, whole grains, and use a fiber supplement to obtain at least 23 grams a day of fiber.

☐ Avoid caffeine, colas, dairy products (except for low-fat soured products), processed foods, red meat, and sugar.

☐ Use vitamin E to help prevent incisional scarring and relieve itching and discomfort in the area surrounding the stitches. Open a vitamin E capsule and apply the oil along the incision (but not on the stitches themselves).

☐ If you are considering a hysterectomy, give the matter close and careful consideration. Seek wise counsel and second opinions. Check into alternative treatments. Remember, once the operation has been performed, it is impossible to restore the uterus if you find the symptoms unacceptable or unbearable. The results of a hysterectomy are irreversible.

### Considerations

☐ Women over forty who have hysterectomies performed often have their ovaries removed as well, supposedly as a precaution against the later development of ovarian cancer. However, many health care professionals question the logic of doing this; ovarian cancer is relatively rare.

☐ Estrogen replacement therapy is often recommended following a hysterectomy. For some women, it is, unfortunately, unavoidable, because of severe posthysterectomy symptoms. Not all women can tolerate estrogen replacement. In our opinion, synthetic estrogens are potentially dangerous because they are strongly linked to breast cancer and cardiovascular disease. Natural estrogens, on the other hand, are safe and effective. Natural estrogen-promoters include anise, dong quai, fennel, fenugreek, ginseng, licorice, primrose oil, red clover, sage, suma, and wild yam. (See MENOPAUSAL AND PERIMENOPAUSAL PROBLEMS in Part Two.)

*Cautions:* Do not use dong quai if you have a bleeding disorder or take drugs that increase the risk of bleeding. It may increase your sensitivity to sunlight. Do not use ginseng if you have high blood pressure, or are pregnant or nursing. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

☐ A hysterectomy usually requires four or five days in the hospital followed by approximately six weeks of at-home recuperation. Recovery can be more painful if the surgeon makes a vertical incision as opposed to a horizontal one. In addition, the scar that results from a vertical incision acts as a lifelong reminder of the surgery (a horizontal incision can be hidden below the pubic hairline).

☐ Evidence is mounting that there is a higher incidence of cardiovascular disorders, osteoporosis, and Alzheimer's disease among women who have undergone hysterectomies.

☐ Some doctors advocate performing hysterectomies on women with fibroid tumors because they say that the fibroids block access to the ovaries during pelvic exams, which might delay a possible diagnosis of ovarian cancer. This position is no longer valid, however, because technology allows the use of ultrasound to examine the ovaries for any abnormality. If fibroid tumors need to be removed, a myomectomy should be considered and opted for if at all possible. (See FIBROIDS, UTERINE, in Part Two.)

☐ There are instances in which hysterectomy proves advantageous. Some women manage to avoid the major hormonal changes that are so common after surgery, and in addition to no longer being bothered with monthly menses, they may feel liberated because they no longer need to fear becoming pregnant and have more fulfilling sex lives as a result. Others with major pain from fibroid disease have a greatly improved quality of life, and those with cancer live longer after a hysterectomy.

☐ While some women who have their ovaries left in place still experience drastic estrogen loss, this is not always permanent. A vitamin and mineral supplement regimen can reduce the risk of severe estrogen deprivation. Remember the natural estrogen promoters discussed in this section.

☐ If you do require hormone replacement to control symptoms after a hysterectomy, take the lowest dose possible. Ask your doctor for a combined hormone containing estrogen and progesterone to help reduce the risk of cancer.

☐ Dr. Betty Kamen, an expert in women's health problems, says that progesterone, not estrogen, should be the hormone of choice for replacement therapy.

☐ See MENOPAUSE-RELATED PROBLEMS in Part Two.

☐ See also SURGERY: PREPARING FOR AND RECOVERING FROM in Part Three.

See under RARE DISORDERS.

IMPOTENCE

See ERECTILE DYSFUNCTION and SEXUAL DYSFUNCTION IN WOMEN.

INCONTINENCE

Incontinence (loss of bladder control) is a common complaint. There are many factors that can cause this annoying problem. Incontinence can be either acute or persistent. Acute incontinence is most often caused by an infection. Persistent incontinence develops over time and tends to last longer. There are several different types of persistent incontinence, among them stress incontinence, urge incontinence, functional incontinence, reflex incontinence, and total incontinence.

Stress incontinence is the most common bladder control problem. This is leakage that occurs when a person coughs, sneezes, laughs, lifts a heavy object, or otherwise increases pressure in the lower abdomen. The bladder is rarely completely emptied. Dribbling is more common than complete evacuation of the bladder. This problem is a result of weakened pelvic muscles, which can be due to aging, obesity, and/or pregnancy.

Urge incontinence is the result of an overactive bladder. The detrusor muscle, which surrounds the bladder, may involuntarily contract and begin the flow of urine. Frequent urination is common with this type of incontinence, as is nocturnal urination, especially in men. Difficulty urinating may also be due to prostate inflammation. Possible underlying causes of urge incontinence include a history of pelvic inflammatory disease, abdominal surgery, stimulants such as alcohol and coffee, and bladder infection. It may also be due to prostate problems.

Functional incontinence is characterized by an uncontrollable urge to empty the bladder before you can reach the bathroom. It can be caused by stress; changes in environment, such as having to stay in the hospital and not being able to get to the bathroom in time; and mobility restrictions. Some individuals are not aware when their bladders are full, and this loss of sensation can lead to urine leakage. This is reflex incontinence, and it is most often due to spinal cord injury or other neurological impairment. Total incontinence is the unpredictable loss of urine at all times. It can be caused by neurological dysfunction, abdominal surgery, spinal cord injury, or an anatomical defect.

Incontinence is most common in people over fifty, but loss of bladder control can occur at any age, especially in pregnant women. It is wrong to assume that loss of bladder control is an inevitable part of getting older. It is also wrong to assume that nothing can be done about this problem.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Free form amino acid	As directed on label.	Helps to strengthen bladder muscle. Use a product made from a vegetable source.
<i>Important</i>		
Calcium and magnesium	1,500 mg daily. 350 mg daily.	To aid in controlling bladder spasms.
<i>Helpful</i>		
Multivitamin and mineral complex with vitamin B complex	As directed on label.	Aids in relieving stress and supplies all needed nutrients.
Potassium	99 mg daily.	Aids in balancing sodium and potassium in the body.
Vitamin A and vitamin E	As directed on label. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily or 400 IU every other day.	To aid in normalizing bladder muscle function. Use d-alpha-tocopherol form.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	For improved bladder function. Also enhances the immune system.

Herbs

Kidney Bladder Formula from Nature's Way and Kidney Blend SP-6 from Solaray are herbal formulas that have a diuretic effect and reduce bladder spasms. Take 2 capsules twice daily.

Recommendations

Stay away from alcohol, caffeine, carbonated beverages, coffee, chocolate, refined or processed foods, and simple sugars. Chemicals in food, drugs, and impure water have an adverse effect on the bladder.

If you are overweight, adopt a healthy weight-loss diet and exercise program to help you lose the excess pounds. Obesity is a common factor in incontinence. (See OBESITY in Part Two.)

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Do not delay emptying the bladder. Making sure that you urinate every two to three waking hours—"voiding by the clock"—can help.

Do not use "feminine hygiene sprays," packaged douches, bubble baths, or tampons, sanitary pads, or toilet paper containing fragrance. The chemicals these products contain are potentially irritating.

Do pelvic exercises such as Kegel exercises. (See under PROLAPSE OF THE UTERUS in Part Two.) These are useful be-

cause weak pelvic muscles are often involved in bladder control problems. Daily exercises can strengthen pelvic muscles and improve bladder control. Exercising your muscles for just five minutes three times a day can make a big difference. The National Kidney and Urologic Diseases Information Clearinghouse (*see* Health and Medical Organizations in the Appendix) can supply very useful information on all types of pelvic exercises.

### Considerations

- Anyone who is experiencing bladder control problems should consult a physician to check for possible underlying causes and investigate the possibilities for treatment. The appropriate type of treatment depends on the type of bladder control problem.
- Cantharis* is a homeopathic remedy for pain during urination and for frequent urination.
- Tolterodine (Detrol), an antispasmodic drug, may be prescribed for some types of incontinence. Muscle relaxers and calcium channel blockers may be tried as well.
- Local injections of Botulinum toxin (BoTox) are sometimes recommended for men who have bladder control difficulties related to prostate problems.
- For names and addresses of organizations that can provide additional information on incontinence and its treatments, *see* Health and Medical Organizations in the Appendix.

### INDIGESTION (DYSPEPSIA)

Indigestion may be a symptom of a disorder in the stomach or the intestines, or it may be a disorder in itself. Symptoms can include abdominal pain, allergic symptoms, belching, a bloated feeling, a burning sensation after eating, chronic bowel irritation, chronic fatigue, constipation, diarrhea, gas, insomnia, joint and muscle pain, nausea, rumbling noises, skin disorders, sugar cravings, and vomiting. Heartburn often accompanies indigestion.

Swallowing air—by chewing with the mouth open, talking while chewing, or gulping down food—can cause indigestion. Drinking liquids with meals contributes to indigestion because it dilutes the enzymes needed for digestion (a lack of digestive enzymes can cause intestinal problems). Certain foods and beverages can cause indigestion because they are irritating to the digestive tract. These include alcohol; caffeine; greasy, spicy, or refined foods; and vinegar. Other factors that can cause or contribute to indigestion include intestinal obstruction, lack of friendly bacteria, malabsorption, peptic ulcers, and disorders of the gallbladder, liver, or pancreas. Food allergies and intolerances (such as lactose intolerance) also can cause indigestion.

If food is not digested properly, it ferments in the stomach and upper intestines, producing hydrogen, carbon di-

oxide, and organic acids. These acids do not help digestion, but are factors in gas and bloating. Foods high in complex carbohydrates, such as grains and legumes, are the primary foods responsible for gas because they are difficult to digest, and therefore are more likely to yield undigested particles on which the intestinal bacteria act. Some have postulated that the undigested food and bacteria present in the gut can produce toxins that can damage the mucosal lining, causing “leaky gut syndrome.” This condition occurs when tiny particles of undigested food normally eliminated in the feces pass through tiny rips in the intestinal lining and get absorbed into the system, causing severe digestive distress. This is more likely to occur in inflammatory bowel syndrome. Contributing factors include abnormal intestinal flora (candida), food allergies, regular alcohol consumption, and parasites, chemicals, or drugs that irritate the small intestine. Psychological factors such as anxiety, stress, worry, or disappointment can disturb the nervous mechanism that controls the contractions of stomach and intestinal muscles.

### Stomach Acid Self-Test

Hydrochloric acid (HCl), which is produced by glands in the stomach, is necessary for the breakdown and digestion of many foods. Insufficient amounts of HCl can lead to indigestion. HCl levels often decline with age.

You can determine if you need more hydrochloric acid with this simple test. Take a tablespoon of apple cider vinegar or lemon juice. If this makes your indigestion go away, then you need more stomach acid. If it makes your symptoms worse, then you have too much acid, and you should take care not to take any supplements that contain HCl.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Glucmannan or ABC Aerobic Bulk Cleanse from Aerobic Life Industries	1 tbsp in a full glass of liquid upon arising. Take separately from other supplements and medications.	Colon cleansers that aid in normal stool formation.
Proteolytic enzymes or Inf-zyme Forte from American Biologics or pancreatin	As directed on label, with each meal. Take ½ the recommended dose with snacks.	To aid in the breakdown of protein for proper absorption. Important for combating gas and bloating. <i>Caution:</i> Do not give these supplements to a child.

**Important**

Acidophilus (Kyo-Dophilus from Wakunaga or Probiotic All-Flora from New Chapter)	As directed on label, ½ hour before each meal.	Necessary for normal digestion. Use a nondairy formula.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Aids in digestion and destroys unwanted bacteria in the bowel.
Omega-3 fatty acids	As directed on label.	Maintains proper digestive function.
Vitamin B complex  plus extra vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. 150 mg twice daily. 1,000 mcg twice daily.	Essential for normal digestion.  Enhances production of hydrochloric acid. Digesting protein increases need for this vitamin, which is required for HCl production. Important for proper digestion. Use a lozenge or sublingual form.

**Helpful**

AbsorbAid from Nature's Sources	As directed on label.	To prevent acid reflux.
Activated charcoal	As directed on label.	To absorb intestinal gas.
Alfalfa		See under Herbs, below.
Copper	2–3 mg daily.	Required for protein metabolism.
Hydrochloric acid (HCl)	As directed on label.	Required for protein digestion.
L-carnitine	As directed on label.	Carries fat into the cells for breakdown into energy.
Lecithin granules or capsules or phosphatidyl choline	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals. As directed on label.	Fat emulsifiers that aid in the breakdown of fats.  Restores gastrointestinal mucosa by strengthening the mucosal lining.
L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A potent liver detoxifier. (See AMINO ACIDS in Part One.)
Manganese	3–10 mg daily.	Required for fat and carbohydrate metabolism.
Multienzyme complex	As directed on label. Take with meals.	To improve digestion. <i>Caution:</i> Do not use a formula containing HCl.
N-Acetylcysteine (NAC)	500–1,000 mg daily, on an empty stomach with a small amount of vitamin B <sub>6</sub> and vitamin C.	Essential for repair of the large, and especially the small, intestines. Also detoxifies harmful substances.
Selenium	100–300 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Required for proper pancreatic function.
Zinc	20–50 mg daily.	Required for proper digestion and protein metabolism.

**Herbs**

- Acid-Ease from Prevail Corporation is an herbal formula that aids in the breakdown and assimilation of foods, and also contains natural plant enzymes to ease heartburn. It can be taken between meals if needed.
- Alfalfa supplies needed vitamin K and trace minerals. It can be taken in liquid or tablet form.
- Aloe vera is good for heartburn and other gastrointestinal symptoms. Take ¼ cup of aloe vera juice on an empty stomach in the morning and again at bedtime.
- Anise seeds can help relieve a sour stomach. Chew the whole seeds or grind them and sprinkle on food.
- Catnip, chamomile, fennel, fenugreek, goldenseal, papaya, and peppermint are all good for indigestion.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Ginger is a time-honored remedy for nausea.
- A few sprigs of fresh parsley, or ¼ teaspoon of dried, taken with a glass of warm water, can help relieve indigestion.

**Recommendations**

- If you are prone to indigestion, consume well-balanced meals with plenty of fiber-rich foods such as fresh fruits, vegetables, and whole grains. Eat slowly and chew food well. Don't eat in a stressful environment or when you feel under stress.
- Include in your diet fresh papaya (which contains papain) and fresh pineapple (which contains bromelain). These are good sources of beneficial digestive enzymes.
- Add acidophilus to your diet. Acidophilus can be useful for indigestion because a shortage of the "friendly" bacteria is often the cause. Open 10 capsules or use 1 tablespoon of powdered formula. Kyo-Dophilus from Wakunaga is a nondairy product that can be used if you have a reaction to dairy products. Acidophilus used as an enema hardly ever results in a problem. You may experience some rumbling and slight disturbance for an hour or so, but it will subside. (See ENEMAS in Part Three.)
- For disorders such as gas, bloating, and heartburn, try brown rice and/or barley broth. Use 5 parts water to 1 part grain, and boil the mixture, uncovered, for ten minutes. Then put the lid on and simmer for fifty-five minutes more. Strain and cool the liquid. Sip this throughout the day.

- Limit your intake of lentils, peanuts, and soybeans. They contain an enzyme inhibitor.
- Avoid bakery products, beans, caffeine, carbonated beverages, citrus juices, fried and fatty foods, pasta, peppers, potato chips and other snack foods, red meat, refined carbohydrates (sugar), tomatoes, and salty or spicy foods.
- Do not eat dairy products, junk foods, or processed foods. These cause excess mucus formation, which results in inadequate digestion of protein.
- For upper gastrointestinal gas, take pancreatin; for lower gastrointestinal gas, take supplemental trace minerals. If you have gas, use the juice of one fresh lemon in a quart of lukewarm water as an enema to balance the body's pH. If gas is constant for days, use a *B. bifidus* enema. This should relieve the problem within hours. (See ENEMAS in Part Three.)
- For relief of occasional digestive difficulties, use charcoal tablets, available in health food stores. These are good for absorbing gas and toxins. Because they can interfere with the absorption of other medications and nutrients, they should be taken separately, and they should not be taken for long periods of time. Occasional use is not harmful and has no side effects.
- If stools are foul-smelling and are accompanied by a burning sensation in the anus, follow a fasting program. This is often a sign that the colon contains toxic material. (See ENEMAS and FASTING in Part Three.)
- If you have had abdominal surgery (such as a bowel shortened), take pancreatin to help digest foods. If you have hypoglycemia (low blood sugar), you also need pancreatin. After meals, if you have a stuffed feeling and a rumbling or gurgling with bloating and gas, use pancreatin.
- If the results of the stomach acid self-test showed that you need more hydrochloric acid, sip 1 tablespoon of pure apple cider vinegar in a glass of water with each meal to aid digestion.
- Chew your food thoroughly. Digestion starts in the mouth, and chewing signals the rest of the digestive system to prepare to break down the food for absorption.
- Do not eat when you are upset or overtired.
- Do not drink liquids while eating. This dilutes the stomach juices and prevents proper digestion.
- Find out which foods your body has trouble digesting, and stay away from foods that cause a reaction. (See ALLERGIES in Part Two.)
- If you are experiencing an excess of acid backup with heartburn symptoms, see your doctor to rule out gastroesophageal reflux disease (GERD) or heartburn.
- If you develop heartburn and the symptoms persist, consult your health care provider. If the pain begins to travel down your left arm, or if the sensation is accompanied by a feeling of weakness, dizziness, or shortness of breath, seek emergency medical help. The early symptoms

of a heart attack can be very much like those of indigestion, particularly heartburn, and as a result, many people mistakenly dismiss them. (See HEART ATTACK in Part Two.)

### Considerations

- Fructooligosaccharides (FOS) and galactooligosaccharides (GOS) have been clinically proven to promote the growth of friendly intestinal bacteria.
- Drinking the juice of a lemon in a cup of water first thing in the morning is good for healing and for purifying the blood.
- Exercise, such as brisk walking or stretching, aids the digestive process.
 

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.
- Food combinations are important. Proteins and starches are a poor combination, as are vegetables and fruits. Milk should not be consumed with meals. Foods containing sugar, such as fruit, should not be consumed with proteins or starches.
- Older people often lack sufficient hydrochloric acid and pancreatin to digest foods properly.
- Many people take antacids to relieve the discomfort of indigestion and heartburn, but these medications may actually make matters worse. Antacids neutralize the acid in the stomach, preventing proper digestion and interfering with the absorption of nutrients. This only leads to continued indigestion. Antacids may not help with gas and bloating.
- Most antacids sold in the United States contain aluminum compounds, calcium carbonate, magnesium compounds, or sodium bicarbonate. Aluminum-based antacids can cause constipation. Calcium carbonate can cause a rebound effect in which the stomach produces more acid than before once the antacid's effects wear off. Although you may produce more acid for a short time, over the long term, continued use has been shown to be effective in treating ulcers, and the rebound effect will not make your ulcer worse. Magnesium compounds can cause diarrhea. Sodium bicarbonate can cause gas and bloating. However, these also are quite effective in treating ulcers, which can outweigh the uncomfortable side effects they may produce.
- Beano, available at most supermarkets and drugstores, is good for preventing gas. This product must be taken with the first bite of food to be effective.
- The *Johns Hopkins Medical Letter* reported that decreased sexual ability or breast enlargement may result from prolonged, excessive (more than 3 grams a day) use of the heartburn medication cimetidine (Tagamet).
- See also ENZYMES in Part One.
- See also ALLERGIES in Part Two and take the self-test.

☐ See also DIVERTICULITIS; FOODBORNE/WATERBORNE DISEASE; GALLBLADDER DISORDERS; HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE (GERD); IRRITABLE BOWEL SYNDROME; LACTOSE INTOLERANCE; MOTION SICKNESS; PANCREATITIS; PEPTIC ULCER; and/or ULCERATIVE COLITIS, all in Part Two.

**INFERTILITY**

Infertility is usually defined as the failure to conceive after a year or more of regular sexual activity during the time of ovulation. It may also refer to the inability to carry a pregnancy to term. Some 7.3 million American women between the ages of fifteen and forty-four are impaired in their ability to have children; 2.1 million of these women are infertile. Pinpointing the exact cause of the problem can be difficult. Ovulation, fertilization, and the journey of the fertilized ovum through the fallopian tube and finally into the uterus are highly intricate processes. Many events must work together perfectly for pregnancy to occur. In general, however, about one-third of the cases of infertility can be traced to the woman, another third to the man, and the remaining third can be attributed to both partners or no cause is found.

In about half of infertile couples, problems affecting the male partner are either partially or wholly the cause of infertility. For men, infertility is most often the result of a low sperm count or an anatomical abnormality. A variety of factors can result in a low sperm count, including alcohol consumption; endocrine disorders; exposure to toxins, radiation, or excessive heat; recent acute illness or prolonged fever; testicular injury; and, very rarely, mumps-induced wasting of the testicles. Obesity also reduces sperm count because estrogen levels increase in males who have excess body fat. Varicoceles, abnormal enlargements of veins that drain the testicles, can cause infertility in men because the veins of the testes no longer moderate the temperature of the testicles correctly, and this can negatively affect sperm.

For women, the most common causes of infertility include ovulatory failure or defect, blocked fallopian tubes, endometriosis, prior abdominal surgery, and uterine fibroids. Some women develop antibodies to their partners' sperm, in effect becoming allergic to them. Chlamydia is a sexually transmitted disease that causes many cases of infertility. Psychological issues, such as stress or fear of parenthood, may contribute to infertility as well, although stress is usually the result of infertility, not the cause of it. Some infertility cases are due to sperm abnormalities. The following are the most common reasons couples are unable to conceive:

- The woman has endometriosis.
- The man has abnormal sperm, a low sperm count, or erectile dysfunction.
- The woman's fallopian tubes are blocked.
- Ovulation takes place rarely or irregularly.

- The couple is unable to have complete sexual intercourse.
- The cervical mucous attacks and kills the sperm.
- The woman does not manufacture enough progesterone to carry a baby to term.
- The woman is over thirty-four (fertility declines rapidly after that age).
- One or both members of the couple eats a poor diet and experiences too much stress.

Often, more than one cause for infertility is found, and in approximately 20 percent of cases, nothing that would seem to inhibit conception can be found.

**Ovulation Timing Self-Test**

If you wish to become pregnant, there are a number of tests available over the counter that can help you determine the best time to attempt to conceive. These tests predict the time of ovulation by detecting the release of luteinizing hormone (LH), which in turn triggers the release of the egg.

A chemically treated dipstick detects the LH in urine samples. If the hormone has been released, the stick changes color. After a positive result, ovulation takes place within twelve to thirty-six hours. Remember, however, that no test is 100 percent accurate.

Unless otherwise specified, the following nutrients in this section are recommended for either or both partners.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Selenium	200–400 mcg daily. If you become pregnant, cut back to no more than 40 mcg daily.	Deficiency leads to reduced sperm count and has been linked to sterility in men and infertility in women.
Vitamin C with bioflavonoids	2,000–6,000 mg daily, in divided doses.	Important in sperm production. Keeps the sperm from clumping and makes them more motile.
Vitamin E	200 IU daily or 400 IU every other day.	Needed for balanced hormone production. Has been known as the "sex vitamin" that carries oxygen to the sex organs and increases sperm count. Use d-alpha-tocopherol form.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important for the functioning of the reproductive organs. Zinc is found in high concentrations in semen.
<i>Important</i>		
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Increases oxygen supply in the blood to all tissues. Use a sublingual form.

Octacosanol	As directed on label.	The heart of wheat germ. Aids in hormone production.
Phosphatidyl choline	1,000 mg daily.	Improves the transmission of messages from the brain to the genitals, thus increasing sex drive.
<b>Helpful</b>		
Essential fatty acids (Kyolic-EPA from Wakunaga)	As directed on label.	Essential for normal glandular function and activity, especially for the reproductive system.
L-arginine plus	As directed on label.	Increases sperm count and plays a role in sperm motility. Sulfur-containing amino acids that are effective free radical destroyers and chelating agents that protect glandular and hormonal function.
L-cysteine and L-methionine	As directed on label.	
plus L-tyrosine	As directed on label. 500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Alleviates stress and aids in stabilizing moods. (See AMINO ACIDS in Part One.) Caution: Do not take tyrosine if you are taking an MAO inhibitor drug.
plus acetylcholine	As directed on label.	
Manganese	As directed on label. Take separately from calcium.	Maintains sex hormone production.
Proteolytic enzymes	As directed on label. Take between meals.	Aids in the breakdown of foods. Facilitates absorption of nutrients.
Pycnogenol or grape seed extract	As directed on label.	Powerful antioxidant bioflavonoids that may increase sperm count.
Raw orchic glandular	As directed on label.	
Raw ovarian glandular	As directed on label.	For women. Supports ovarian function. (See GLANDULAR THERAPY in Part Three.)
7-Keto DHEA	As directed on label.	Improves libido.
Vitamin A plus carotenoid complex (Betatene)	15,000 IU daily. As directed on label.	Important in reproductive gland function. Antioxidants and vitamin A precursors.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) and para-aminobenzoic acid (PABA) and folic acid and vitamin B <sub>12</sub>	50 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). As directed on label. 50 mg 3 times daily. 50 mg daily. 400 mcg daily. 2,000 mcg daily.	Important in reproductive gland function. Maintains sex hormone production. Helpful for stress. Needed for the synthesis of RNA and DNA. Plays a role in restoring fertility in some women. Protects the egg, sperm, and genetic material. Maintains fertility. Use a sublingual form.

## Herbs

Astragalus extract has been reported to stimulate sperm motility. Damiana, ginseng, sarsaparilla, saw palmetto, and yohimbe enhance sexual function in men. Damiana, dong quai, false unicorn root, ginseng, gotu kola, licorice root, and wild yam root enhance sexual function in women.

**Cautions:** Do not use astragalus in the presence of a fever. Do not use ginseng if you have high blood pressure or are pregnant or nursing. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Yohimbe should not be used by women who are pregnant or nursing. Do not use yohimbe if you have high blood pressure, heart disease, stomach ulcers, depression, or other psychiatric conditions. There have been cases of people dying from taking too much yohimbe.

Green oat (*Avena sativa*) extract is an excellent aid if the reason for infertility is the man's inability to maintain an erection.

Yin-yang-huo (*Aceranthus sagittatum*), a Chinese herb also known as horny goatweed, is a male aphrodisiac, and may increase sperm count and semen density.

Heavy use of echinacea, ginkgo biloba, and St. John's wort may cause infertility in men, and should be avoided.

**Cautions:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

## Recommendations

Avoid all alcohol; it reduces sperm count in men and can prevent implantation of the fertilized egg in women.

Lose weight if you are overweight. Infertility is more prevalent in obese men and women.

Avoid douching, as this appears to reduce fertility.

Do not take any drugs except those prescribed by your physician. Inform your physician if you are attempting to have a baby. He or she will be able to advise you if your medications may inhibit conception or may be dangerous for the fetus.

Do not smoke, and avoid being around cigarette smoke.

A balanced diet is important. Do not consume animal fats, fried foods, sugar, or junk foods. Do eat pumpkin seeds, bee pollen, or royal jelly.

**Caution:** Bee pollen may cause an allergic reaction in some people. Start with a small amount at first, and discontinue use if a rash, wheezing, discomfort, or other symptom occurs.

- Some artificial lubricants can prevent the sperm from reaching the cervix. Saliva may also have a detrimental effect on spermatozoa.
- Investigate the possibility of heavy metal intoxication, which may affect ovulation. A hair analysis can reveal heavy metal poisoning. (See HAIR ANALYSIS in Part Three.)
- Infertility is stressful, but do all you can to reduce the stresses in your life. Learn stress management techniques to help you deal with stresses that cannot be avoided. (See STRESS in Part Two.)

### Considerations

- Because there are so many causes of infertility, in most cases the opinion of a qualified health care professional is needed.
- Sperm factors account for approximately 40 percent of all cases of infertility. Some causes of sperm inadequacy (recent illness, endocrine disorders) may be temporary or reversible, but others are not. Except for artificial insemination, orthodox drug therapy is ineffective in such cases.
- Varicoceles are sometimes treatable with surgery, and fertility can sometimes be restored.
- The ulcer medications cimetidine (Tagamet) and ranitidine (Zantac) may decrease the sperm count and even produce decreased sexual ability.
- Strict adherence to a gluten-free diet has enabled some previously sterile men to become fathers. A gluten-free diet has also enabled women who were previously unable to conceive to become pregnant. See CELIAC DISEASE in Part Two for more information about a gluten-free diet.
- In one study, 83 percent of infertile women with abnormal menses who lost weight on a 1,200- to 1,300-calorie diet, and exercised for one hour, three times a week, resumed normal menses and improved their estrone/estradiol ratio. Another study found that in men with poor semen quality, diet also had an effect. Compared to men with normal sperm counts, men with poor semen ate more processed meats, potatoes, and dairy. The men with normal sperm counts ate more fruits (apricots and peaches), vegetables (lettuce and tomatoes), shellfish, and skim milk.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Marijuana and cocaine lower sperm count.
- The transdermal use of natural progesterone cream may benefit infertile women.
- Scientists are looking at gene abnormalities that may lead to new male infertility treatments and male contraception.
- If a woman has developed antibodies to her partner's sperm, it may help to have him use a condom for at least thirty days. The sperm antibodies should then decrease,

and intercourse without the use of a condom during the time of ovulation may lead to conception.

- Conception is more likely if the woman is on the bottom during intercourse.
- Sperm count reaches its highest level after two or three days of abstinence from any sexual activity, but sperm that remains in a man's body for longer than a month is less effective at fertilizing an egg.
- A woman who suffers from such premenstrual symptoms as bloating and breast tenderness is probably ovulating, so if she is having difficulty becoming pregnant, the cause probably lies elsewhere.
- Increasingly, women are waiting to bear children until their later reproductive years. However, a woman's fertility begins to decrease when she reaches her thirties.
- Para-aminobenzoic acid (PABA) stimulates the pituitary gland and sometimes restores fertility to some women who cannot conceive.
- In one study, infertile men benefited from 225 micrograms of selenium and 400 IU of vitamin E. The men had better sperm motility and less oxidative damage to the sperm. In contrast, large doses (4.5 grams) of a B-vitamin complex had no effect.
- Caffeine consumption may prevent some women from becoming pregnant.
- Procedures known as transcervical balloon tuboplasty (TBT) and selective fallopian tube canalization have roughly 90-percent success rates in removing obstructions of the fallopian tubes. TBT is similar to the artery-clearing technique called angioplasty. A tiny balloon is inserted into the tube by means of a catheter; when the catheter reaches the blockage, the balloon is inflated to stretch and clear the blocked section of the tube. The procedure may be performed in about fifteen minutes under either local or general anesthesia. Because this procedure is relatively noninvasive (no incision is required), the risks involved are few. However, there is a chance that a tube may become blocked again. Fallopian tube canalization produces similar results to those of TBT.
- Assisted reproductive techniques (ART) may be tried if all other methods have been attempted. These techniques include the following:
  - *Gamete intrafallopian tube transfer* (GIFT). In this technique, eggs and sperm are mixed and put into the fallopian tube immediately, without waiting to see if fertilization has taken place.
  - *Intracytoplasmic sperm injection* (ICSI). In this procedure, which may be used if the man has a low sperm count or too many abnormal sperm, the woman is injected with healthy sperm extracted from the testes.
  - *In vitro fertilization* (IVF). Here a woman's eggs are fertilized outside the womb and inserted into the uterus. This is usually done if the fallopian tubes are blocked.

## Fertility Tests

There are a number of tests—some for men, some for women—that may be performed if conception does not occur within a twelve-month period. It is both easier and more cost-effective to test the male partner first before going on to

the more invasive techniques needed to test the female partner. The following table lists some of the most frequently performed fertility tests.

TEST	DESCRIPTION
<b>Tests Performed on Men*</b>	
Anti-sperm antibody tests	These tests are used to check for immune cells (antibodies) that attack sperm and can affect their ability to function.
Genetic tests	These tests are used if your doctor suspects your fertility problems could be caused by an inherited sex chromosome abnormality. A blood test can reveal whether there are subtle changes in the Y chromosome.
Hormone test	A blood test is done to determine the level of testosterone and other male hormones that affect fertility.
Scrotal ultrasound	Uses high-frequency sound waves to produce images of structures within the body.
Semen analysis	This is the most important test for the male partner. A laboratory analyzes the physical characteristics of the semen and the number of sperm present, and looks for any abnormalities in the shape and structure (morphology) and movement (motility) of the sperm. The lab will also check semen for signs of problems, such as infections or blood. Often sperm counts fluctuate from one specimen to the next, so the doctor may want to evaluate a few different samples.
Specialized sperm function tests	A number of different tests can be used to evaluate how well the sperm survive ejaculation, how well they can penetrate the egg membrane, and whether there is any problem attaching to the egg.
Testicular biopsy	This test involves removing samples from the testicle with a needle. It may be used if the semen analysis shows no sperm at all. The results of the testicular biopsy will tell if sperm production is normal. If it is, the problem is likely caused by blockage or another problem with sperm transport.
Vasography	In some cases, contrast dye is injected into each vas deferens to see whether they are blocked.
<b>Tests Performed on Women*</b>	
Endometrial biopsy	A tiny sample of the endometrium (the lining of the uterus) is taken in the later part of the menstrual cycle and tested to see if there is enough progesterone in the lining as it matures. If not, the condition is called luteal phase defect. It can be treated with hormone therapy.
FSH test	A blood sample is taken on day three of the menstrual cycle and tested for FSH. FSH levels increase as a woman reaches menopause. If there is a high FSH level, pregnancy is unlikely.
Genetic testing	Genetic testing may be done to determine whether there is a genetic defect causing infertility.
Hysterosalpingogram (HSG)	Dye is inserted through the cervix into the fallopian tubes and uterus, and an X-ray is taken to determine whether the tubes are open and if the uterus is a normal shape.
Laparoscopy	A surgical procedure in which a physician examines the reproductive organs by means of a tiny scope. If scar tissue or endometrial buildup is found, it can be removed by means of the scope as well.
Postcoital test (PCT, Sims-Huhner test)	The partners have intercourse 2–8 hours before this test. A sample of cervical mucus and tissue is removed and examined to determine whether the mucus or the cervix is prohibiting fertilization. Undergoing a PCT is much the same as having a Pap smear.
Transvaginal ultrasound	A probe is inserted into the vagina to look for fibroid tumors or ovarian cysts. This can also be done to track early pregnancies.

\*Source: mayoclinic.com

- *Zygote intrafallopian tube transfer (ZIFT)*. Eggs and sperm are combined, and if an egg is fertilized, it is inserted into the fallopian tube.

❑ A University of Michigan study indicated that intense exercise may result in a drop in the production of hormones involved in potency, fertility, and sex drive.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

❑ The use of donor eggs to impregnate women who cannot conceive on their own is controversial and is extremely expensive.

❑ Your health care provider must get your consent before performing diagnostic tests to determine the cause of infertility. There may be risks involved any time you penetrate the body using a tube, needle, or viewing instrument, or expose the body to the radiation, drugs, anesthetics, and dye materials used in certain imaging techniques. The risks of any given procedure vary depending on your age and health status, and the skill of the practitioner.

**INFLAMMATION**

Inflammation is a natural reaction to injury or infection. The affected tissues swell, redden, become warm and tender, and may be painful. Proteins called cytokines attack the threatening germ and repair damaged tissues. Too much inflammation can do the body harm, however, leading to immobility, weight loss, and eroding of muscle tissue and the power to fight disease. Disorders that involve specific types and/or locations of inflammation include bursitis, carpal tunnel syndrome, fibromyalgia, osteoarthritis, and tendinitis, just to name a few. Cardiovascular disease also may be at least partially a result of inflammation in the linings of the arteries. Things that can trigger inflammation include a diet rich in omega-6 fatty acids, drug overuse, exposure to environmental toxins, free radical damage, infections, injury, trauma, and bacterial, fungal, or viral infection.

Any organ or tissue of the body, internal or external, can become inflamed. Internal inflammation is often caused by bacterial infection, but can also be caused by disorders such as allergies, anemia, arthritis, asthma, autoimmune diseases, Crohn's disease, osteoarthritis, peptic ulcer disease, or ulcerative colitis. External inflammation is most often the result of injury, but can also result from (or be aggravated by) allergies, infection, and other factors. Unfortunately, it is often difficult to identify the source or sources of inflammation.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Omega-3 fatty acids	As directed on label.	Flax oil and other plant omega-3s are not as potent as those from fish oil.
Vitamin B complex  plus extra vitamin B <sub>12</sub>	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).  2,000 mcg daily.	Needed for tissue repair.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Essential to the healing process and in reducing inflammation. Use a buffered form.
<i>Very Important</i>		
Carotenoid complex	As directed on label.	Strengthens the immune response.
Essential fatty acids (evening primrose oil, flaxseed oil)	As directed on label.	Reduces inflammation.
Grape seed extract	As directed on label.	Powerful antioxidant.
Proteolytic enzymes  or Inf-zyme Forte from American Biologics	As directed on label, between meals and at bedtime, for 1 month.  2 tablets twice daily, between meals.	Aids in controlling inflammation.
Superoxide dismutase (SOD)	As directed on label.	A high-potency free radical scavenger that reduces infection and inflammation.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Helps to control inflammation and promotes healing. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Important</i>		
Bromelain	As directed on label. Take on an empty stomach with 100–500 mg magnesium and 500 mg L-cysteine to enhance results. Take separately from copper and iron.	Has anti-inflammatory activity and increases the breakdown of fibrin, which forms around the inflamed area, blocking the blood and lymphatic vessels.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Has natural anti-inflammatory properties.
Micellized Vitamin A and E from American Biologics	As directed on label.	Supplies vitamins A and E in easily assimilated emulsion form to destroy free radicals, boost the immune system, and help the body to use oxygen efficiently.
Multimineral complex	As directed on label.	Supplies important minerals. Needed to reduce stress. Use a formula high in calcium.
Silica	As directed on label, twice daily.	Supplies silicon, which aids in absorption of calcium and repair of connective tissues.
<i>Helpful</i>		
Beta-1,3-D-glucan	As directed on label.	Boosts immune function and fights inflammation.

Kelp or alfalfa	1,000–1,500 mg daily.	Contains a balance of essential minerals plus chlorophyll, which cleanses the blood. See under Herbs, below.
Raw thymus glandular	As directed on label.	Improves thymus function, which is important for immune function.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A powerful antioxidant and aid in inflammation reduction.
Vitamin E	200 IU daily or 400 IU every other day.	Effective antioxidant and reducer of inflammation. Use d-alpha-tocopherol form.

## Herbs

- Alfalfa is a good source of minerals and chlorophyll.
- Aloe vera juice is helpful for inflammation.
- Bilberry contains flavonoids that reduce inflammation.
- Boswellia and turmeric (curcumin) help to reduce inflammation.
- Cat's claw is good for inflammation and healing.

*Caution:* Do not use cat's claw during pregnancy.

- Cayenne, curcumin, devil's claw, echinacea, ginger, goldenseal, pau d'arco, red clover, stinging nettle, white willow bark, and yucca are all good for inflammation.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- A poultice that combines fenugreek and flaxseed can be applied directly to the affected area to subdue inflammation. As an alternative, a goldenseal or mustard poultice can be used. See USING A POULTICE in Part Three.
- Olive leaf extract eases inflammation and is good for any bacterial infection.

## Recommendations

- Eat a diet composed of 75 percent raw foods, and drink plenty of herbal teas and juices.
- Eat foods high in flavonoids, which are powerful antioxidants and useful for inflammation reduction. Spinach and blueberries are excellent sources of flavonoids. Strawberries contain smaller amounts. Quercetin, found in onions, is good for inflammation as well.
- Consume half of a fresh pineapple or fresh papaya daily. Pineapple contains bromelain and papaya contains

papain, both enzymes that reduce swelling and inflammation. It should reduce the pain and swelling in two to six days. Only fresh pineapple or papaya (not canned) is effective. Bromelain is also available in pill form.

- Eat cold-water fish such as herring, mackerel, salmon, and sardines at least twice a week, as they are rich sources of essential fatty acids. Take fish oil capsules as well.
- Limit saturated fats and polyunsaturated fats that are rich in omega-6s like corn oil, cottonseed oil, and sunflower oil. For heart health, use other polyunsaturated fats such as canola, safflower, and soybean oil. Avoid packaged goods, because many contain omega-6-rich fats.
- Limit your intake of salt.
- Avoid cola, sugar, white flour products, and junk foods.
- For quick results, see FASTING in Part Three and follow the program.

## Considerations

- Heart disease used to be associated only with an increase in cholesterol levels. Now it is thought to be related to inflammation, as evidenced by increases in homocysteine and C-reactive protein levels in many patients; these are markers of inflammation. Also, obesity causes an increase in blood cytokine levels, indicating that it too is causing increased inflammation in the body. Obese children as young as two and three years old have elevated cytokine levels.
- Bacterial arthritis, which causes painful inflammation of the joints, is usually associated with an infection elsewhere in the body, such as in the lungs, kidneys, or gallbladder.
- The complex sugar beta-1,3-D-glucan (found in the cell walls of baker's yeast, and a variety of fungi, such as maitake and reishi mushrooms) has proven to be a powerful immune booster. When beta-1,3-D-glucan attaches to the receptor site on macrophage cells, these immune cells are activated to attack and destroy invading organisms and reduce infection and inflammation.
- The traditional methods for relieving inflammation are positioning the affected part properly (including splinting, if necessary), applying heat and/or ice (heat and cold therapies), taking painkillers along with nutritional supplements, and getting plenty of rest. Nonsteroidal anti-inflammatory drugs (NSAIDs) are prescribed to 33 million people a year for chronic inflammation. However, NSAIDs increase the risk of stomach pain, intestinal bleeding, heart problems, and kidney failure.
- Goat's milk mineral whey is used to promote bone density as well as relieve aching, painful joints.
- See ABSCESS; ARTHRITIS; and SPRAINS, STRAINS, AND OTHER INJURIES OF THE MUSCLES AND JOINTS, all in Part Two.
- See also PAIN CONTROL in Part Three.

INFLUENZA

Influenza, better known as “the flu,” is a highly contagious viral infection of the upper respiratory tract. There are two types of influenza viruses, designated type A and type B, that cause this acute infection of the throat, nose, bronchial tubes, lungs, and middle ear. The virus enters the body’s airways through mucous membranes in the nose, eyes, or mouth. Because this illness can be spread easily by coughing and sneezing, influenza epidemics are very common, especially in winter. Every year in the United States, on average 5 to 20 percent of the population gets the flu. Up to 36,000 Americans die each year of influenza, with approximately 200,000 hospitalized. The flu is unpredictable and can strike anyone, at any age. More than two hundred different individual strains of virus can cause colds and flu, and strains of these viruses are constantly changing, so vaccinations against influenza have been only partly successful in preventing outbreaks of the disease.

Vaccines become available each year to try to reduce the likelihood of getting the flu. Most are safe and effective, if the strain targeted is actually the one that hits during the winter months. The vaccine decision is based on a best guess at the time the vaccine is manufactured. In April 2009, a new virus appeared and was called swine flu, because many genes in the virus were thought to be similar to flu viruses that normally occur in pigs in North America. Later it was learned that the genes really harbor two genes from flu viruses that are found in pigs in Europe and Asia, avian genes, and human genes. This is referred to as a quadruple reassortant virus, and the CDC renamed it H1N1. The H1N1 was declared a pandemic by the World Health Organization in June 2009. It was the first pandemic in forty-one years.

The symptoms of influenza begin much like those of the common cold—body aches, cough, fatigue, headache, and hot and cold sweats. In many cases, a fever develops, and you may feel unbearably hot one moment and chilled and shaking the next. Most influenza sufferers have a dry throat and cough. Nausea and vomiting may occur as well. Often, a person with the flu is so weak and so uncomfortable that he or she does not feel like eating or doing anything else. Colds last for about one week to ten days, on average, but the flu lasts longer—up to twelve days or more, followed by a week or more of residual coughing and fatigue.

Influenza is rarely dangerous in healthy adults sixty years of age or younger, but it does make a person more susceptible to pneumonia, ear infections, and sinus trouble. Among people sixty-five or older, serious respiratory infections such as influenza and pneumonia are the fifth leading cause of death, so the flu is clearly a serious infection for older people. High-risk flu groups also include those of any age with weakened immune systems or with chronic conditions such as heart or lung disease. The H1N1 virus of 2009 was particularly dangerous for young children and pregnant women.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
ACES + Zn from Carlson Labs	As directed on label.	Contains vitamins A, C, and E, plus selenium and zinc. Take this supplement in addition to zinc lozenges as directed below.
Vitamin A	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	A powerful antioxidant and immunity booster.
plus natural beta-carotene or carotenoid complex (Betatene)	15,000 IU daily. As directed on label.	Antioxidants and precursors of vitamin A.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Strengthens the immune system by increasing the number and quality of white blood cells. For a child, use buffered vitamin C or calcium ascorbate.
Zinc lozenges	Adults and children over 6 years: 1 15-mg lozenge every 2 hours for 2 days, starting at the first signs of the flu. Then reduce dosage to a total of 80 mg or less daily.	A potent immunostimulant that nourishes the cells. Keep these on hand and use them as soon as symptoms develop.
<i>Important</i>		
Free form amino acid	As directed on label.	Helps to repair tissue and control fever. Free-form amino acids are rapidly absorbed into the body.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Has antiviral and antibacterial properties.
L-lysine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aids in combating viral infection and preventing outbreaks of cold sores in and around the mouth, common when the body is under stress from illness. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take lysine longer than six months at a time.
N-acetylcysteine (NAC)	As directed on label.	Thins mucus and aids in preventing respiratory disease.
<i>Helpful</i>		
Dioxychlor	10–20 drops sublingually, 1–2 times daily. Also, add 20 drops to 1 oz water and instill a dropperful in each nostril daily.	An important antibacterial, antifungal, and antiviral agent. Especially good for older adults.
Maitake extract or shiitake extract or reishi extract	As directed on label. As directed on label. As directed on label.	Helps to boost immunity and fight viral infection.

Multivitamin and mineral complex with vitamin B complex and selenium	As directed on label.  100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	All vitamins are needed for healing. Necessary in all cellular and enzyme functions. Reduces stress caused by viral infection.  Boosts the immune response, enhancing the body's ability to fight infection.
--	---	---

## Herbs

Astragalus, black cherry, echinacea, ginger, goldenseal, pau d'arco, and yarrow tea are good for influenza. Combining peppermint tea with any of these herbal teas is effective for helping to open up the nasal passages. Echinacea is also good for children.

*Cautions:* Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

The herb boneset works as an expectorant and eliminates mucus from the lungs.

*Caution:* Do not use boneset on a daily basis for more than one week, as long-term use can lead to toxicity.

If it is necessary to lower fever, take catnip tea enemas and ¼ to ½ teaspoon lobelia tincture every three to four hours until fever drops. This is good for children also.

*Caution:* Do not use this mixture if you are pregnant or breast-feeding, and do not give it to a child under one year old. Do not take lobelia internally on an ongoing basis.

Cat's claw may cut the duration of the flu. Cold-X10 from Olympian Labs is a complex that contains cat's claw and many nutrients effective against flu and colds.

Cayenne (capsicum) helps to keep mucus flowing, aiding in preventing congestion and headaches. Simply add a bit of cayenne powder to soups and other foods.

ClearLungs from RidgeCrest Herbals is a Chinese herbal formula designed to provide nutrients to the lungs.

The Chinese mushroom cordyceps is available in a tonic formula to support the lungs.

At the first sign of a cough, place one dropperful of alcohol-free echinacea and goldenseal extract in your mouth and hold it there for five to ten minutes. Repeat this every hour for three to four hours. This stops the virus from multiplying.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis

for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Alcohol-free echinacea and goldenseal combination extract is recommended for children. Give a child 4 to 6 drops of combination extract in water or juice every four hours for three days. Echinacea is very effective at enhancing the body's own natural defenses. Goldenseal is a natural antibiotic and helps to relieve congestion.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Elderberry has antiviral properties and reduces flu symptoms.

Elderflower tea promotes sweating and cleanses the body of toxins.

Eucalyptus oil is beneficial for relieving congestion. Put 5 drops in a hot bath or 6 drops in a cup of boiling water, put a towel over your head, and inhale the vapors.

Fenugreek breaks up phlegm and mucus, and slippery elm helps remove them from the body.

Linden-flower tea suppresses cough and reduces fever.

Lung Tonic Extract by Herbs Etc. is a mixture of herbs designed to protect the lungs.

Maitake, shiitake, and reishi mushrooms possess beta-1,3-D-glucan, a type of polysaccharide that stimulates the immune cells. Their immune-boosting power makes them essential for fighting the flu.

Olive leaf extract enhances immune function and fights all types of infection, including the flu virus.

Wild pansy tea can treat colds accompanied by fever and respiratory congestion.

## Recommendations

Follow these basic tips for keeping flu away:

- Cover your nose and mouth with a tissue when you cough or sneeze.
- Wash your hands frequently, especially after coughing or sneezing, after using the bathroom, and before eating.
- Stay away from others who are sick.
- Maintain the best overall health possible to ward off germs by getting enough sleep, eating nutritiously, and exercising.

- Do not share glasses, cups, or utensils.
- Teach children not to touch their eyes or noses, or to put things into their mouths.
- Scrub your desk at work with a disinfecting wipe once a week.
- Spray your keyboard with disinfecting spray.
- Spray your telephone with disinfecting spray.

If you do come down with the flu, consume plenty of fluids, especially fresh juices, herbal teas, soups, and filtered water, to prevent dehydration and help flush out the body. To shorten the length of the flu, go on a liquid diet emphasizing hot herbal teas and hot broth for one or two days.

Eat plenty of hot chicken or turkey soup. This is grandmother's old remedy and it is still good today. Add a bit of cayenne pepper to help prevent and break up congestion. Avoid dairy products, mucus-forming foods, and sugar.

Sleep and rest as much as possible.

In treating a sore throat, *avoid* using aspirin chewing gum and aspirin gargles. Aspirin applied directly to mucous membranes does not reduce pain and can act as an irritant.

Do not take zinc at the same time you eat or drink citrus fruits or juices. It will diminish the effectiveness of the zinc. Do consume a lot of other types of fruit.

Do not take iron supplements while a fever exists.

Do not give aspirin to a child who has the flu. The combination of aspirin and a viral illness has been linked to the development of Reye's syndrome, a potentially dangerous complication. (See REYE'S SYNDROME in Part Two.)

Fever is one of the body's major defense mechanisms against the flu. Flu viruses do not survive well in a warmer environment. If you have a fever, do not try to suppress it, unless it is over 103°F.

If you consume alcoholic beverages even occasionally, or if you have liver or kidney disease, be cautious about using the painkiller acetaminophen (Tylenol, Datril Extra Strength, and others). The combination of alcohol and acetaminophen has been associated with serious liver problems.

If you are over sixty-five, see your health care provider. Influenza can cause serious complications for people in this age group.

Since flu viruses are often transmitted by way of the hands, wash your hands frequently with an antibacterial soap. Rinse and dry your hands thoroughly and keep them away from your eyes, nose, and mouth. If you sneeze, use a disposable tissue.

Buy a new toothbrush—toothbrushes can harbor viruses and prolong the illness.

Try one or more of the following homeopathic remedies to ease flu symptoms:

- *Anas barbariae* (Oscillococcinum), a homeopathic treatment, works very well if taken at the first signs of the flu.
- *Aconitum napellus*, *Belladonna*, and *Eupatorium perfoliatum* help to ease flu symptoms.

*Caution:* You should not use this formula if you are pregnant.

### Considerations

Antibiotics are useless against viral illnesses like influenza. The best way to get rid of the flu or any other infectious illness is to attack it head-on by strengthening the immune system. The thymus and the adrenal glands are the power seat of the immune system. When the body is getting sick, or is already sick, it is under stress, and stress taxes the immune system. Researchers have linked vulnerability to colds and flu to psychological stress.

Zanamivir (Relenza), an inhaled antiviral drug, battles flu symptoms and shortens the duration of the illness. It has also been shown to be effective in preventing the flu in both strains of influenza. Another medication, oseltamivir (Tamiflu) has shown comparable results. Both of these medications may be beneficial for people with immune system problems. The U.S. Centers for Disease Control and Prevention (CDC) recommends these two drugs specifically for the treatment and prevention of the H1N1 virus.

Children who have the flu frequently should be checked for thyroid malfunctions. (See HYPOTHYROIDISM in Part Two.) Warning signs that need urgent medical attention in children include: fast breathing, bluish/gray skin color, not drinking fluids, severe vomiting, and not being able to be woken up when asleep.

The term "stomach flu" is commonly used to refer to another condition, gastroenteritis. This is not influenza, but an acute inflammation of the lining of the stomach. Gastroenteritis is characterized by diarrhea, vomiting, and abdominal cramps that vary in severity, and may be accompanied by fever, chills, head and body aches, chest pain and cough, and extreme fatigue. It may be caused by a number of different factors, including food poisoning, viral infection, alcohol intoxication, sensitivity to drugs, and certain allergies. This type of illness usually runs its course in one or two days.

See also COMMON COLD and PNEUMONIA, both in Part Two.

### INSECT ALLERGY

There are only a few stinging insects in the United States that can cause an allergic reaction: honeybees, hornets, yellowjackets, bumblebees, wasps, and ants. Insects of the group known as *hymenoptera*, which includes bees, wasps, hornets, and ants, cause an allergic reaction in 10 to 20 percent of the population. This reaction is known as an insect venom allergy, and it can be dangerous, even life-threatening.

ing. The yellow jacket and honeybee are the cause of most allergic reactions to insects.

Allergic reactions to stings can cause wheezing, tightness in the throat, nausea, diarrhea, hives, itching, pain and swelling in the joints, respiratory distress, and vascular swelling. In a person with a mild allergy to venom, the reaction can occur within a few minutes, but when a person experiences a severe allergic reaction, the symptoms can take longer to appear (ten to twenty minutes). If the reaction to the venom is delayed, symptoms such as fever, hives, inflamed lymph glands, and joint pain can occur. In some circumstances, a person who is highly allergic to insect venom can go into shock (circulatory collapse) and die within minutes. Signs that a dangerous reaction is developing include confusion, difficulty swallowing, extreme drop in blood pressure, hoarseness, labored breathing, severe anxiety, severe swelling, weakness, and a feeling of impending disaster. A more severe reaction can also result in closing of the airway, producing unconsciousness.

Some biting insects, such as mosquitoes, can cause allergic skin reactions that appear as scaly and itchy eczema.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Quercetin (Activated Quercetin from Source Naturals)	As directed on label.	A unique bioflavonoid that reduces allergic reactions.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Acts as an anti-inflammatory and helps fight the toxicity of insect venom. For a child, use buffered vitamin C or calcium ascorbate.
<i>Helpful</i>		
Aller Bee-Gone from CC Pollen	As directed on label.	A combination of herbs, enzymes, and nutrients designed to fight acute allergic symptoms.
Inf-zyme Forte from American Biologics	As directed on label.	A potent enzyme and powerful inflammatory inhibitor.

### Herbs

Calendula is an excellent topical cream to apply to skin irritations.

Herbal flea-repellent pet collars contain oils of cedar, citronella, eucalyptus, pennyroyal, rosemary, and rue. These herbs may be effective insect repellents for humans as well.

*Caution:* Do not use pennyroyal or rue during pregnancy. Avoid excessive and/or prolonged use.

Lavender may help relieve itching.

Tea tree oil can be rubbed on exposed areas of skin to ward off insects. It can also be applied to bites. If pure tea tree oil is too strong, dilute it with canola oil or another low-fragrance vegetable oil until a tolerable strength is achieved.

### Recommendations

If you have ever had an allergic reaction to an insect sting, you should have access to an epinephrine (adrenaline) kit at all times. Have your physician prescribe an emergency treatment kit and instruct you in its proper use. Epinephrine raises the blood pressure and speeds the heart rate, counteracting the allergic response. It is best administered via a preloaded syringe found in injection kits. Your emergency kit should also include antihistamine tablets and an identification card listing your medical information.

To avoid insect stings, wear plain, light-colored clothing when spending time outdoors—avoid wearing anything that is flowered or dark. Do not wear shiny jewelry, and do not use hair spray, perfume, scented soaps, or suntan lotion. Avoid wearing sandals or loose-fitting clothes.

Avoid areas where bees are concentrated, such as orchards and flower gardens.

If you are bothered by a yellow jacket, do not squash it; doing so releases a chemical that attracts other yellowjackets and wasps. It is best to leave these insects alone, or to find and destroy the nest after dark, when they are less active.

Immediately after getting stung, *carefully* remove any stinger left in the skin. It is best not to pull the stinger out. Instead, gently and carefully scrape or tease it out with a sterilized knife. If no knife is readily available, you can use a fingernail or even the edge of a credit card instead. After a sting, be alert for signs that a reaction is developing. Reactions can occur in minutes or hours, and they can progress very quickly. If you have any doubts about your condition, seek treatment at once.

Once the stinger has been removed and the area cleansed, try one or more of the following home remedies to ease pain and swelling:

- Make a paste by adding a bit of cool water to baking soda, a crushed aspirin, or a crushed papaya enzyme tablet, and apply the mixture to the sting.
- Use charcoal tablets, available in health food stores, to make a poultice. Crush 2 tablets, then add 6 drops of liquid alcohol-free goldenseal extract to make a paste. Smooth the mixture on a sterile gauze pad and place it on the sting area. This will absorb the poisons and prevent infection. Use only charcoal recommended for internal use.

- Apply an ice compress to the sting area a few minutes every two hours for the first day after you've been stung. Not only will you reduce the swelling and pain from the sting, but you will be stopping the spread of venom.
- Apply lavender oil to the sting area to reduce inflammation and pain.
- Crush plantain leaves and squeeze out the juice. Apply this extract directly to the sting. Within thirty minutes, the pain and swelling should be greatly reduced.

Other remedies to consider include the following: rubbing toothpaste on the sting (its cooling effect can make the sting area feel better); applying calamine lotion to the area; or rubbing a meat tenderizer containing papain (an enzyme) on the sting can also ease the pain.

*Apis mellifica*, a homeopathic remedy, is good for wasp or bee stings. When taken promptly after a bite, it helps to prevent severe swelling and anaphylactic shock. It works quickly and can be used while waiting for medical attention. Another homeopathic remedy, *Silica*, is useful if a stinger is embedded deep in the skin; it forces the object out of the body in a few hours.

**Considerations**

Sometimes brewer's yeast or garlic rubbed on the skin deters insects. Eating garlic may help also.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Antihistamines given by injection or by mouth following a sting can reduce later-appearing symptoms.

When a person has had a severe allergic reaction, the treatment usually involves an injection of adrenaline (epinephrine) and/or cardiopulmonary resuscitation. Corticosteroids may be prescribed to diminish swelling and reduce the hives.

If you are diagnosed with an insect allergy, your physician may suggest immunotherapy, which involves building up tolerance to the venom. Small doses of the venom are introduced into the body over a period of time until your system can tolerate the toxin.

See also BEE STING; INSECT BITE; and/or SPIDER BITES AND SCORPION STINGS in Part Two.

**INSECT BITE**

Many different insects bite, including mosquitoes, fire ants, fleas, gnats, no-see-ums, and ticks. Most insect bites are merely a nuisance. They cause localized itching and redness, but are relatively harmless. Others can be serious. Tick bites can spread diseases such as babesiosis, Lyme disease, or Rocky Mountain spotted fever. In some places

(principally in developing countries), mosquito bites may transmit malaria and yellow fever, as well as viruses that cause encephalitis, an inflammation of the brain. Spiders, while not technically insects, can cause similar bites. The black widow and brown recluse are two of the most poisonous spiders, inflicting painful and serious bites. (See SPIDER BITES AND SCORPION STINGS in Part Two.) Bees, hornets, and yellow jackets may sting in self-defense or to subdue their prey. (See BEE STING in Part Two.) There are also stings that can be obtained from aquatic life such as jellyfish, sea anemones, and some types of coral.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Bromelain plus curcumin	400–500 mg 3 times daily. As directed on label.	Reduces inflammation, swelling, and pain. Has anti-inflammatory properties.
Grape seed extract	75 mg daily.	An effective anti-inflammatory and powerful antioxidant.
Quercetin (Activated Quercetin from Source Naturals)	300–400 mg every 4 hours.	A unique bioflavonoid that reduces allergic reactions.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	An anti-inflammatory that is helpful for relieving the toxicity of bites. For a child, use buffered vitamin C or calcium ascorbate.

**Herbs**

Calendula ointment is an excellent insect repellent and counterirritant. You can also try cedar, eucalyptus, and/or tea tree oils. These are available in oil, spray, and lotion forms.

Citronella candles are good for repelling mosquitoes.

Goldenseal and tea tree oil are natural insect repellants and are beneficial when applied to affected areas.

Poultices made with lobelia and charcoal tablets (found in health food stores) are helpful for insect bites. (See USING A POULTICE in Part Three.)

Pennyroyal oil helps to repel insects.

*Caution:* Do not use this herb during pregnancy. Avoid excessive and/or prolonged use.

Apple cider vinegar diluted with water in a one-to-one ratio reduces skin irritations resulting from insect bites.

## Recommendations

For ant, mosquito, or chigger (mite) bites, wash the area thoroughly with soap and water. For chigger bites, use a brush and scrub. Then apply a paste made of baking soda and water. Use cloth-wrapped ice packs if swelling occurs and, if bitten on an arm or leg, elevate the affected limb to decrease swelling.

For tick bites, remove the tick as quickly as you can. The sooner the tick is removed, the less chance there is of contracting any disease the tick may be carrying. Using tweezers, grasp the head of the tick firmly, as close to the skin as possible, and pull straight back with the tweezers. Try not to leave the head or any other part of the tick embedded in the skin. Do not touch the tick with your hands. Once it has been removed, scrub the bite with soap and water. *Do not* try to burn the tick out, or use home remedies like kerosene, turpentine, or petroleum jelly.

Make a paste using a charcoal capsule and a few drops of goldenseal extract and place it on a piece of gauze. Apply the gauze to the bite and cover it with a bandage. This will draw out the poisons and aid in fast relief. Do this immediately after being bitten, if possible.

Apply calamine lotion to help relieve itching.

Rub a cut onion on an insect bite to provide a powerful antioxidant treatment.

Take a dose of homeopathic *Apis mellifica* promptly after a bite. It works quickly to help prevent severe swelling.

Dab a paste consisting of meat tenderizer and water directly on a bite or sting. Leave for thirty minutes, then rinse off. Enzymes in the tenderizer draw the poison out.

If you have been bitten by a spider you suspect may be a black widow or a brown recluse, seek medical attention immediately. If possible, take the spider with you for identification. (See SPIDER BITES AND SCORPION STINGS in Part Two.)

To avoid mosquito bites, eat fish, brown rice, brewer's yeast, blackstrap molasses, or wheat germ before spending time outside. These foods are rich in vitamin B<sub>1</sub> (thiamine). Mosquitoes appear to be repelled by the B vitamins, which are excreted through the skin, and especially by thiamine, so as an alternative, take thiamine supplements. Carbon dioxide, estrogens, moisture, sweat, and warmth attract mosquitoes.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

To avoid many insect bites, try a very diluted chlorine bleach bath before going out. Add 1 cup of bleach per tub of water. Insects dislike the smell. Swimming in a pool treated with chlorine also works. Rubbing brewer's yeast or garlic on the skin may deter insects as well.

*Caution:* Brewer's yeast can cause an allergic reaction in

some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Avoid walking barefoot outside.

Avoid all refined sugar, which causes the skin to give off a sweet smell that attracts mosquitoes.

Avoid alcoholic drinks. Alcohol causes the skin to flush and the blood vessels to dilate, which attracts mosquitoes and horseflies.

Avoid using perfume, hair spray, and other cosmetics. These attract insects.

Avoid wearing bright colors—wear white clothing. Also, wear clothing that covers your arms and legs (although mosquitoes can bite through cotton clothing).

Apply citrus juice to exposed areas to repel mosquitoes.

## Considerations

Diethyl-meta-toluamide (DEET) works to repel chiggers, ticks, and mosquitoes. It is probably the most effective insect repellent known, but it is also potentially quite toxic and it can destroy substances such as plastics and synthetic fabrics, so it must be used with care and only in accordance with package directions. Never apply a product that has more than 35 percent DEET to the skin. Children are especially at risk for problems due to this potentially hazardous chemical, so their skin exposure to it should be strictly limited. To be safe, apply DEET to clothing and use it sparingly, if at all, on the skin.

*Caution:* DEET is extremely toxic and can be deadly if ingested. However, when used according to the product directions, it does not pose a health concern because its use is expected to be brief. Be extremely careful when using it around small children. Do not use under clothing.

If you are in the wilderness, or anywhere without access to the above remedies, the traditional remedy of immediately applying mud to a sting can help to neutralize the pain and swelling.

We do not recommend using electric insect-repelling devices ("bug zappers"). They kill biting bugs, but not black flies and mosquitoes. Many of the insects they kill are an important part of the daily diet of birds. If you feel you must use one of these devices, do not place it near children's play areas, barbecue grills, or picnic tables. When insects like houseflies get zapped, the parts can spray as far as seven feet, spreading bacteria and viruses.

Information on poisonings from insect bites can be obtained from the U.S. Centers for Disease Control and Prevention (CDC) in Atlanta (see Health and Medical Organizations in the Appendix).

See also BEE STING; INSECT ALLERGY; LYME DISEASE; and/or SPIDER BITES AND SCORPION STINGS, all in Part Two.

## INSOMNIA

Habitual sleeplessness is classified as insomnia. Failure to get an entire night's sleep on most nights over a one-month period can be considered chronic insomnia. Insomnia can take the form of being unable to fall asleep when you first go to bed or waking during the night and being unable to go back to sleep. It affects one out of ten Americans. Over half of those over the age of sixty-five experience disturbed sleep. Those over sixty-five make up about 13 percent of the U.S. population, but consume over 30 percent of prescription drugs and 40 percent of sleeping pills.

While insomnia can be very frustrating, it is usually only a temporary annoyance. In some cases, however, sleep-related problems can last for months or even years.

Chronic insomnia is often a symptom of a serious underlying medical disorder. At least 80 percent of depressed people experience insomnia. Insomnia cases can be attributed to other psychological disorders, such as anxiety, stress, or grief. Insomnia can also result from a wide variety of physical causes, including arthritis, asthma, breathing problems, hypoglycemia, hyperthyroidism, indigestion, kidney or heart disease, muscle aches, Parkinson's disease, or physical pain. Caffeine consumption, jet lag, and the use of certain drugs, including the antiseizure medication phenytoin (Dilantin), most appetite suppressants, the decongestant pseudoephedrine (found in many cold and allergy remedies), and thyroid hormone replacement drugs can also lead to insomnia.

A lack of the nutrients calcium and magnesium can cause you to wake up after a few hours and not be able to return to sleep. Systemic disorders involving the brain, digestive system, endocrine system, heart, kidneys, liver, lungs, and pancreas all may affect sleep, as can poor nutritional habits and eating too close to bedtime. A sedentary lifestyle can be a major contributor to sleep disorders.

While one or two sleepless nights can cause irritability and daytime sleepiness, with decreased ability to perform creative or repetitive tasks, most people can adapt to short-term periods of sleep deprivation. After more than three days, however, sleep deprivation begins to cause a more serious deterioration in overall performance and can even result in mild personality changes. If chronic, inadequate sleep compromises productivity, creates problems in relationships, and can contribute to other health problems.

Normal sleep consists of two main states, designated *rapid-eye-movement* (REM) and *non-rapid-eye-movement* (non-REM) sleep. It is REM sleep that is most often associated with dreaming. The stages of sleep are further broken down as follows:

- *Stage 1: Light sleep.* We drift in and out and can be awakened easily. Our eyes move slowly and muscle activity slows.
- *Stage 2: Light sleep.* Our eye movement stops and our brain waves become slower, with occasional bursts of rapid waves called *sleep spindles*.

- *Stage 3: Deep sleep.* Extremely slow brain waves called delta waves appear, interspersed with smaller, faster waves.
- *Stage 4: Deep sleep.* The brain produces mostly delta waves. There are no eye movements and no muscle activity.
- *Stage 5: REM sleep.* Breathing becomes more rapid, irregular, and shallow. The eyes jerk rapidly while limb muscles become temporarily paralyzed. Dreams almost always happen in this stage, but may occur in other sleep stages.

It takes about two hours to go through all five stages of sleep, after which they are normally repeated. REM sleep usually occurs about ninety minutes after we fall asleep. Adults spend half their sleep time in Stage 2 sleep, 20 percent in REM sleep, and 30 percent in the other stages. Infants start out spending about half their sleep time in REM sleep.

There are four stages to non-REM sleep, and the deepest two (stages three and four) are referred to as *delta sleep*. Older people spend less time in delta sleep, and some may not experience it at all.

There are no hard-and-fast rules about how much sleep is enough, because every individual's requirements are different. Some people can function on as little as five hours of sleep a night, while others seem to perform better with nine, ten, or even more hours of sleep. Most adults need about eight hours of sleep nightly in order to feel refreshed and function at peak efficiency during the day.

Children, especially very young children and adolescents, generally require more sleep than adults to be at their best. It is not uncommon for people to sleep less as they get older, especially after the age of sixty. The cardinal sign of a sleep problem requiring a doctor's attention is inappropriate sleepiness, such as dozing off at the dinner table, during conversation, or while driving. Even dozing off in front of the television can be a warning sign that something is amiss with the body's internal clock.

Millions of people have trouble getting to sleep due to a condition commonly known as restless leg syndrome (RLS). For reasons unknown, when these people are in bed, their legs jerk, twitch, and kick involuntarily. Restless leg syndrome has also been linked to the painful nighttime leg muscle cramps that afflict so many people. A deficiency of magnesium may be involved in RLS, and some research strongly suggests that anemia may play a major role in this annoying disorder.

Sleep apnea affects an estimated 12 million American adults. Of those who have sleep apnea, half are overweight. This condition is often found in overweight and obese patients because their diaphragm cannot fully exert itself to take a full breath, as it is hindered by excess abdominal body fat. This problem is commonly associated with snoring and extremely irregular breathing throughout the night. In sleep apnea, breathing actually stops for as long as two minutes at a time while the individual is asleep. When breathing stops, the level of oxygen in the blood drops, resulting in oxygen deprivation. The individual then awak-

ens, startled and gasping. A person with sleep apnea may awaken as many as two hundred times throughout the night. The affected individual may not remember these awakenings, but anyone else who is awake at the time can naturally become alarmed when a person with sleep apnea stops breathing. In the less common form, central sleep apnea, breathing is stopped, not because the airway is closed, but because the diaphragm and chest muscles stop working.

Aside from disrupting normal sleep and causing extreme sleepiness during the day, sleep apnea is associated with other, more serious, health problems. People who have sleep apnea tend to have higher than normal blood pressure and are more likely to have strokes than the general population, and they also face an increased risk of heart disease, although the reason or reasons for these links are not known. People with sleep apnea also seem to have a higher-than-normal incidence of emotional and psychotic disorders. Experts attribute this to what they call a “dream deficit”—a lack of adequate rapid-eye-movement (REM) sleep, the stage of sleep in which dreaming occurs. A person with sleep apnea often cannot settle into REM sleep for even the eight to twelve seconds it takes to have a normal, healthy dream. While there is much about the phenomenon of dreaming that is not understood, it is known that prolonged periods of REM sleep deprivation can induce various psychoses and other serious emotional disorders.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Calcium	1,500–2,000 mg daily, in divided doses, after meals and at bedtime.	Has a calming effect. Use calcium lactate or calcium chelate form (do not use lactate form if you are allergic to dairy products).
and magnesium	1,000 mg daily.	Needed to balance with calcium and relax the muscles.
Melatonin	Start with 1.5 mg daily, 30 minutes to 1 hour before bedtime. If this is not effective, gradually increase the dosage until an effective level is reached (up to 5 mg daily).	A natural hormone that promotes sound sleep. Use it only occasionally and do not give it to children.
<i>Helpful</i>		
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid)	As directed on label.	Helps to promote a restful state. Good for relieving stress.
and inositol and	100 mg daily, at bedtime.	Enhances REM sleep.

niacinamide	100 mg daily.	Promotes serotonin production.
Vitamin C with bioflavonoids	500 mg daily.	Very important for reducing stress.
Zinc	15 mg daily.	Aids in the recovery of body tissues while sleeping.

### Herbs

California poppy, hops, kava kava, lemon balm, passionflower, skullcap, and valerian root, taken in capsule or extract form, are all good for helping to overcome insomnia. Valerian root has become the favorite among many experts. It is best not to rely on one herb on a regular basis, but to rotate among several. Take these herbs before bedtime.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken with other substances that act on the central nervous system, such as alcohol, barbiturates, anti-depressants, and antipsychotic drugs.

The combination of California poppy, passionflower, and valerian promote sound sleep and beneficial REM sleep. California poppy and chamomile will strengthen the nervous system to calm you before bedtime.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Catnip and chamomile have mild sedative properties. These herbs are safe even for children if taken in tea form. For adults, drinking chamomile tea several times throughout the day helps to calm and tone the nervous system, promoting restful sleep.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Kava kava is a good relaxant. If stress or anxiety is the reason for your insomnia, this herb can help you develop better sleep patterns.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken with other substances that act on the central nervous system, such as alcohol, barbiturates, anti-depressants, and antipsychotic drugs.

### Recommendations

In the evening, eat bananas, dates, figs, milk, nut butters, tuna, turkey, whole grain crackers, or yogurt. These foods are high in tryptophan, which promotes sleep. Eating a grapefruit half at bedtime also helps.

Do not eat large meals within two hours of bedtime.

Avoid caffeine, alcohol, and nicotine in the four to six hours before bedtime. A small amount can help induce sleep initially, but it invariably disrupts deeper sleep cycles later. While smoking may seem to have a calming effect, nicotine is actually a neurostimulant and can cause sleep problems.

Avoid bacon, cheese, chocolate, eggplant, ham, potatoes, sauerkraut, sugar, sausage, spinach, tomatoes, and wine close to bedtime. These foods contain tyramine, which increases the release of norepinephrine, a brain stimulant.

Avoid taking nasal decongestants and other cold medications late in the day. While many ingredients in these preparations are known to cause drowsiness, they can have the opposite effect on some people and act as a stimulant.

Establish a set of habits and follow them consistently to establish a healthy sleep cycle. Among them:

- Go to bed only when you are sleepy.
- Do not stay in bed if you are not sleepy. Get up and move to another room and read, watch television, or do something quietly until you are really sleepy.
- Use the bedroom only for sleep and sex—not for reading, working, eating, or watching television.
- Keep a regular sleep-wake cycle. Try to go to bed and wake up at the same time every day.
- Set an alarm clock and get out of bed at the same time every morning, no matter how you slept the night before. Once normal sleep patterns are reestablished, most people find that they have no need for an alarm clock.
- Sleep in a dark, quiet room with a comfortable temperature.
- Do not nap during the day if this isn't a normal thing for you to do. Especially avoid napping later than 3:00 P.M.
- Exercise regularly in the late afternoon or early evening—but not within two hours of bedtime. Physical exertion is an excellent way to make your body tired so that sleep comes about more easily. Exercising five or six hours before bedtime may help you sleep more soundly.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

• Take a hot bath (not a shower) an hour or two before bedtime. For further relaxation, put several drops of a soothing essential oil such as chamomile (if you are not allergic to ragweed) in the bathwater. (See AROMATHERAPY AND ESSENTIAL OILS in Part Three.)

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

• Keep the bedroom comfortable and quiet. If *too much* quiet is the problem, try running a fan or playing a radio softly in the background. There are also devices available that generate “white noise” sounds like the ocean surf or a steady rain that help people who are “quiet-sensitive” to sleep.

• Learn to put worries out of your mind. If you have occasional trouble getting to sleep, concentrate on pleasant memories and thoughts. Re-create a pleasurable time or event in your life and relive it in your mind. Learning a relaxation technique such as meditation or the use of guided imagery is extremely helpful in getting sleep patterns back to normal for many people.

For occasional sleeplessness, try using melatonin, Calcium Night from Source Naturals, or one of the herbs recommended above. These are effective and safe sleep promoters.

One of the best remedies for insomnia is taking 5 milligrams of melatonin one hour before bedtime. If you feel groggy in the morning, reduce the dosage the next time you use it. Certain drugs frequently prescribed for older adults, including beta-blockers (for high blood pressure) and even aspirin, can lower melatonin levels.

*Caution:* Do not overuse melatonin. According to some recent reports, more than occasional use of melatonin can permanently stop the body's own production of this vital hormone.

If you snore, try sleeping on your side. Sleep on a couch for a few nights to become accustomed to sleeping on your side.

## Considerations

During sleep, the body's systems are still controlling basic functions. Nutrients are essential for the body and are used during the sleep cycle.

Sleep is needed to restore appetite hormones to their normal levels. Many obese people do not get at least eight hours of sleep a night. In one study, inadequate sleep was shown to increase calorie intake from snacks by 20 percent.

A lack of sleep can encourage serious illness and cause premature aging. Experts recommend at least eight hours of sleep per night.

Two of the most common sleep problems are not being able to fall asleep and waking in the middle of the night. It should take less than thirty minutes to get to sleep, but for many people it takes much longer. Others fall asleep, but wake up and can't get back to sleep. If you have either of these disturbances and feel tired in the morning, speak to your health care provider. You are not alone.

An estimated 12 million Americans suffer from restless leg syndrome (RLS), a disorder marked by uncomfortable urges to move the legs, especially just before falling asleep.

Various treatments have been attempted for restless leg syndrome, but nothing seems to work consistently for everyone. The drug pramipexole (Mirapex) has shown positive benefits for some people with this condition. If you have restless leg syndrome, see your doctor to rule out anemia. We believe that taking the proper vitamin and mineral supplements is the best approach to this problem. The supplements that help this condition more than anything are calcium, potassium, magnesium, and zinc. The following nutrients may prevent restless leg syndrome and leg cramps: 400 milligrams of B complex, 1,000 milligrams of magnesium, and 200 international units of vitamin E (d-alpha-tocopherol) per day.

❑ Type 2 diabetes and sleep apnea are commonly seen together. In one study, patients who used a device called CPAP (continuous positive airway pressure) while sleeping experienced lower blood sugar levels and less fluctuations in blood sugar.

❑ Regardless of how many hours of sleep you get each night, if you wake up easily in the morning, and especially if you rarely (or ever) need the services of your alarm clock, and if you can make it through the entire day without seeming to run out of steam or feeling drowsy after sitting quietly or reading for a while, you are probably getting enough sleep.

❑ The hormonal shifts that occur during premenstrual syndrome and menopause may trigger insomnia. Estrogen affects the production and balance of the brain chemicals responsible for wakefulness.

❑ 5-hydroxy L-tryptophan (5-HTP) and the amino acid tryptophan are helpful for insomnia and depression. For more information, *see under* AMINO ACIDS and NATURAL FOOD SUPPLEMENTS in Part One.

❑ Dehydroepiandrosterone (DHEA) is a naturally occurring hormone that improves the quality of sleep. (*See* DHEA THERAPY in Part Three.)

❑ Anyone who snores excessively should be evaluated for sleep apnea. Many cases of sleep apnea respond to such measures as allergy treatment, weight reduction, or a simple laser surgery procedure to remove obstructions in the nasal passages.

❑ Mild cases of obstructive sleep apnea can sometimes be treated with lifestyle and diet changes. Oral devices are available for mild cases to prevent obstruction of the airway by holding the tongue or jaw forward.

❑ An effective treatment for snoring is the use of radio waves to reduce the soft palate tissue that obstructs the air passage in the mouth. In this technique, a health care practitioner inserts a probe into the back of the mouth and the radio waves are directed at the palate.

❑ Millions of Americans consciously choose to skimp on their sleep in the mistaken belief that sleeping fewer hours allows them to be more productive. Many people even look on the fact that they can “get by” on so few hours of

sleep as a badge of honor. In fact, however, they are likely doing themselves a great deal of harm in the long run. Moreover, the night owls who sleep less to accomplish more are actually less creative and less productive than those who get adequate amounts of sleep. Dr. Richard Bootzin, professor of psychology and director of the insomnia clinic at the University of Arizona Sleep Disorders Center, conducted long-term research into normal sleep habits and patterns. He discovered that people who get seven to eight hours of sleep each night live longer, happier, healthier lives than those who skimp on their sleep.

❑ Sleep therapists and other experts are greatly divided about the virtues of napping. While some maintain that napping is not necessary for people who are well rested, others say it is a natural human tendency and should not be discouraged. There have been studies that seem to demonstrate that productivity is higher and the incidence of accidents lower in countries where napping is common.

❑ Consistency is probably the most important factor for healthy sleep. While it is usually most advisable to consolidate all sleeping into one time period, if you regularly take an afternoon nap and you do not suffer from any sleeping disorders, then giving up naps might actually cause a disruption in your sleeping habits. If you nap, keep your naps short—less than an hour—and make sure that they are a *regular* part of the daily routine, not a now-and-then proposition.

❑ Sleep experts advise that people with insomnia avoid caffeine, but many people who are accustomed to drinking coffee late in the day and in the evening hours have been known to have their sleep cycles disrupted if they give up drinking coffee. This seems to bear out the idea that maintaining a steady routine is the most important factor in establishing a healthy sleep pattern. Of course, this applies only to those who are not experiencing any difficulties with their sleeping habits. Anyone who develops a bout of insomnia should consider eliminating all caffeine from his or her diet.

❑ Many people who suffer from insomnia resort to taking sleeping pills, whether over-the-counter or prescription medications. Sleeping pills do not cure insomnia, and they can interfere with REM sleep. The continued use of pharmacological sleeping aids can eventually lead to disruption of all the deeper stages of sleep. Researchers have found that many people who take sleeping pills on a regular basis actually find that their insomnia becomes worse. The persistent use of sleeping pills also leads to dependency, either psychological or physical. The use of sleep medication should therefore be reserved for those whose insomnia has a physical basis, and then only as a temporary solution.

❑ Tranquilizers like the benzodiazepines and similar medications are being prescribed for insomnia because they pose a lower risk of overdose than sedatives. However, they become less effective after thirty days of use. The most prescribed include quazepam (Doral), estazolam

(ProSom), flurazepam (Dalmane), temazepam (Restoril), and triazolam (Halcion). Triazolam can cause mental confusion and even amnesia. There have also been reports that drugs such as temazepam, flurazepam, and diazepam (Valium) may lead to confusion, sluggishness, restlessness, and heightened anxiety, as well as prolonged sedation and drug dependency. Elderly people need a smaller dose than younger people. All of these products are dangerous if mixed with alcohol.

Zolpidem (Ambien) and Eszopiclone (Lunesta) are a different type of prescription sleep-aid drug. Their manufacturers claim that they do not inhibit or disrupt the deep-sleep cycles, like REM.

People over sixty-five years of age who use sleeping pills have four times the risk of suicide.

Over-the-counter sleep aids can cause a wide range of side effects, including agitation, confusion, depression, dry mouth, and worsening of symptoms of enlarged prostate. Check with your doctor before using over-the-counter sleep medicines for short-term insomnia. These drugs use sedating antihistamines to make you drowsy. Examples include diphenhydramine (in Nytol and other products) and doxylamine (Unisom and others). People with breathing problems, glaucoma, or chronic bronchitis; women who are pregnant or nursing; and men who have difficulty urinating due to an enlarged prostate should not use these medicines. People with sleep apnea should not take sleep-promoting medicine because it could suppress their respiratory drive, making it harder to wake up when they experience episodes of interrupted breathing.

See also under PREGNANCY-RELATED PROBLEMS.

## IRRITABLE BOWEL SYNDROME

Irritable bowel syndrome (IBS) is the most common digestive disorder seen by physicians. It is estimated that approximately 10 to 15 percent of the U.S. population have symptoms of IBS, although fewer than half of them seek a physician's help for it. More than twice as many women suffer from the condition as men. IBS is also sometimes called *intestinal neurosis*, *mucous colitis*, *spastic colitis*, or *spastic colon*, but these are outdated terms. Irritable bowel syndrome is one of a range of conditions known as functional gastrointestinal disorders. In IBS, this disorder of functioning is with the way nerves and muscles are working. In the doctor's office nothing abnormal is seen on tests. The bowels look fine. Yet there is pain, discomfort, and other symptoms that won't go away or keep coming back.

In IBS, the normally rhythmic muscular contractions of the digestive tract become irregular and uncoordinated. This interferes with the normal movement of food and waste material, and leads to the accumulation of mucus and toxins in the intestine. This accumulated material sets up a partial obstruction of the digestive tract, trapping gas

and stools, which in turn causes bloating, distention, and constipation. IBS may affect the entire gastrointestinal tract, from the mouth through the colon. There are no physical signs of disease in bowel tissue with this disorder, and its cause is unknown, but one theory is that irregularities in the intestinal hormones responsible for bowel motility, cholecystokinin (CCK), motilin, and vasoactive intestinal peptide (VIP), are behind this disorder. According to this theory, people with IBS have abnormal contractions of the smooth muscle of the digestive tract. Some scientists believe a virus or bacterium may play a role. Lifestyle factors such as stress and diet are probably common causes, as are food allergies. The overuse of antibiotics, antacids, or laxatives, which disturb the bacterial microflora of the bowel, may also be a factor.

Symptoms of IBS may include abdominal pain, anorexia, bloating, constipation and/or diarrhea (often alternating), flatulence, intolerances to certain foods, mucus in the stools, and nausea. Pain is often triggered by eating and may be relieved by a bowel movement. Because of the pain, diarrhea, nausea, and sometimes severe headaches and even vomiting, a person with IBS may dread eating. Whether or not an individual with IBS eats normally, malnutrition may result because nutrients often are not absorbed properly. As a result, people with IBS require as much as 30 percent more protein than normal, as well as an increased intake of minerals and trace elements, which can quickly be depleted by diarrhea.

Many other diseases can be related to IBS, including candidiasis, colon cancer, diabetes mellitus, gallbladder disease, malabsorption disorders, pancreatic insufficiency, ulcers, and the parasitic infections amebiasis and giardiasis. More than a hundred different disorders may be linked to the systemic effects of IBS. One disorder that is linked in about 25 percent of adults with IBS is arthritis, usually peripheral arthritis, which affects the ankles, knees, and wrists. Less frequently, the spine is affected. IBS can also be related to skin disorders, but this is unusual. Some people with IBS have abnormalities in the levels of liver enzymes in their blood.

Diagnosis of irritable bowel syndrome requires ruling out disorders that can cause similar symptoms, such as celiac disease, colon cancer or benign tumors, Crohn's disease, depression, diverticulitis, endometriosis, fecal impaction, food poisoning, infectious diarrhea, ischemic or ulcerative colitis, and lactose intolerance. A physician may recommend one or more of a variety of procedures to do this, including barium enema, colonoscopy, rectal biopsy, sigmoidoscopy, and stool examination to check for the presence of bacteria, blood, and/or parasites.

Irritable bowel syndrome is painful, but not serious, and most people who have it can lead active, productive lives if they change their diets, get regular exercise, and replace needed nutrients.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recom-

mended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Acidophilus (Bio-Bifidus from American Biologics)	As directed on label.	To replenish the "friendly" bacteria. Needed for digestion and for the manufacture of the B vitamins. Use a nondairy formula.
Essential fatty acids (flaxseed oil or primrose oil)	As directed on label.	Needed to protect the intestinal lining.
L-glutamine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A major metabolic fuel for the intestinal cells; maintains the villi, the absorption surfaces of the gut. (See AMINO ACIDS in Part One.)
Vitamin B complex	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Needed for proper muscle tone in the gastrointestinal tract.
plus extra vitamin B <sub>12</sub>	1,000–2,000 mcg daily.	Needed for proper absorption of foods, protein synthesis, and metabolism of carbohydrates and fats, and to prevent anemia. Use a lozenge or sublingual form.
<b>Important</b>		
Colostrum (Colostrum Plus from Symbiotics or Colostrum Prime Life from Jarrow Formulas)	As directed on label.	Heals intestinal lining and aids in nutrient absorption.
Fiber (oat bran, flaxseeds, psyllium seeds, or ABC Aerobic Bulk Cleanse from Aerobic Life Industries)	As directed on label. Take separately from other supplements and medications.	Has both a healing and cleansing effect. Avoid wheat bran, as it may be too irritating.
Free form amino acid	As directed on label.	Necessary for repair of mucous membranes of the intestines.
Garlic (Kyolic from Wakunaga)	As directed on label.	Aids in digestion and destruction of toxins in the colon. Liquid form is best.
Multivitamin and mineral complex	As directed on label.	Supplies those nutrients lost or not absorbed. Use a hypoallergenic formula.
N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	A major constituent of the intestinal lining and of the barrier layer that protects the intestinal lining from digestive enzymes and other potentially damaging intestinal contents.
Proteolytic enzymes with pancreatin	As directed on label.	To aid in protein digestion and prevention of "leaky gut syndrome." Also aids in

reducing inflammation. Use a formula that is low in HCl and high in pancreatin.

Quercetin	As directed on label.	Helps control the allergic response to foods.
Ultra Clear Sustain from Metagenics	As directed on label.	A complex that provides nutritional support for gastrointestinal mucosa. Available only through health care professionals.
<b>Helpful</b>		
Calcium and magnesium	2,000 mg daily. 1,000 mg daily.	Help the "nervous stomach" and the central nervous system. Aid in preventing colon cancer. Use chelate forms.
Dioxychlor	As directed on label.	Destroys foreign bacteria in the digestive tract and carries oxygen to the tissues.

### Herbs

If you have IBS, it is wise to treat your liver as well as your digestive tract, preferably with silymarin (milk thistle extract). Licorice can also be used. Other beneficial herbs are burdock root and red clover, which are good for cleansing the bloodstream, and thereby the liver.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Alfalfa contains vitamin K, needed to build intestinal flora for proper digestion, and chlorophyll for healing and cleansing of the bloodstream. It can be taken in liquid or tablet form.

Aloe vera is healing to the digestive tract. Used in combination with ABC Aerobic Bulk Cleanse from Aerobic Life Industries, it helps to keep the colon walls clean of excess mucus and slow down food reactions. Take ½ cup of aloe vera juice three times daily, on an empty stomach.

Peppermint aids in healing and digestion, and also relieves upset stomach and gas or that "too-full" feeling. It must be taken in enteric-coated capsule form to prevent the oil from being released before it reaches the colon. Do not take any other form, or heartburn may result.

Skullcap and valerian root are helpful for the nerves that regulate intestinal muscle function. These are good taken at bedtime or when an upset occurs.

Other herbs that can be beneficial for irritable bowel syndrome include balm, chamomile, fenugreek, ginger, goldenseal, lobelia, marshmallow, pau d'arco, and rose hips.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding,

and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

The Indian herb myrobalan (*Terminalia chebula*) alleviates diarrhea, dysentery, and many other digestive complaints.

## Recommendations

Eat a high-fiber diet including plenty of vegetables, whole grains (especially brown rice), and legumes. However, be careful of fruit; fructose and fructans may cause worsening of symptoms—limit intake of all fruit and juices to two servings per day. Eating less fruit may result in fewer symptoms with less severity.

Use supplemental fiber. Psyllium powder regulates bowel movements and should be used daily. Also use oat bran and ground flaxseeds daily, on an alternating basis.

Avoid animal fats, butter, all carbonated beverages, coffee and all other substances containing caffeine, candy, chocolate, all dairy products, fried foods, ice cream, all junk foods, the additives mannitol and sorbitol, margarine, nuts, orange and grapefruit juices, pastries, all processed foods, seeds, spicy foods, sugar, sugar-free chewing gum, and wheat bran and wheat products. These foods encourage the secretion of mucus by the membranes and prevent the uptake of nutrients.

Limit your consumption of gas-producing foods such as beans, broccoli, and cabbage if they cause any problems.

Avoid alcohol and tobacco; these irritate the linings of the stomach and colon.

When an intestinal upset occurs, switch to a bland diet. Put vegetables and nonacidic fruits through a food processor or blender. Organic baby food is good. If you are on a soft diet, take some type of fiber and a protein supplement.

To relieve occasional gas and bloating, use charcoal tablets (available in health food stores). Take 5 tablets as soon as this problem arises. Do not use charcoal daily, however, because it also absorbs needed nutrients, and do not take it at the same time as other supplements or medications.

For excessive gas and bloating that lingers, read the section on ENEMAS in Part Three and follow the instructions for the retention enema. This will replace the "friendly" bacteria very quickly and resolve the problem. Exercise, such as stretching exercises, swimming, or walking, is also important.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Check to see if you have food allergies; they are important factors in this disorder. Eliminating allergenic foods from the diet relieves symptoms in many cases. (See ALLERGIES in Part Two.)

Chew your food well. Do not overeat or eat in a hurry.

Practice deep-breathing exercises. Shallow breathing reduces the oxygen available for proper bowel function.

Wear loose-fitting clothing. Do not wear anything that is tight around the waist.

Do not eat right before going to bed. Wait one or two hours after eating before lying down.

See ACID/ALKALI IMBALANCE in Part Two and take the self-test. Significant acidosis may occur with IBS.

## Considerations

Eating the correct diet, using supplemental fiber, and drinking plenty of quality water are very important in controlling IBS. Early recognition of the disease, good nutrition, and a positive outlook help minimize complications.

It takes between twelve and fifteen hours for food to be completely processed. Food such as meat can take longer, whereas fresh foods, raw foods, or lightly steamed foods are processed much more quickly.

Certain foods irritate the wall of the intestinal tract. Lactose (milk sugar) is a common culprit, as are all dairy products. Avoid grains, nuts, and seeds until symptoms subside. Always chew these types of foods until they are almost liquefied in the mouth.

As with other chronic conditions, alternative therapies are popular for treating IBS symptoms. In one study, the most commonly tried alternative treatments included lifestyle modifications such as dietary changes, yoga, acupuncture, and using suppositories.

IBS should not be confused with the more serious bowel disorders, such as Crohn's disease and ulcerative colitis. These are also inflammatory bowel diseases but, unlike IBS, they result in demonstrable lesions in the digestive tract. Crohn's disease affects the entire length and thickness of the wall of the large and/or small intestine; ulcerative colitis affects the lining of the large intestine, the last five to seven feet of the digestive tract. (See CROHN'S DISEASE and/or ULCERATIVE COLITIS, both in Part Two.)

People with irritable bowel syndrome are also likely to have associated conditions such as dysphagia (difficulty swallowing), gastroesophageal reflux disease (GERD), globus sensation (a feeling of having a ball in the throat), gynecological problems, heartburn, noncardiac chest pain, and urologic dysfunction.

An imbalance of gut flora is common for those with irritable bowel syndrome. Usually, the pathogenic flora outnumber the friendly bacteria. This can be corrected somewhat with probiotics (live microorganisms) and prebiotics (fiber).

- People with IBS should receive regular physical examinations. This disorder has been linked to a higher than normal incidence of colon cancer and diverticulitis.
- If IBS causes chronic diarrhea, electrolyte and trace mineral deficiencies are likely. (See DIARRHEA in Part Two for suggested mineral supplementation. See also MALABSORPTION SYNDROME in Part Two.)
- Certain drugs can aggravate the malabsorption problems often present with IBS. These include antibiotics, corticosteroids, cholestyramine (Questran), and sulfasalazine (Azulfidine), among others. These drugs increase the need for nutritional supplements.
- Antispasmodic drugs (Di-Spaz, Lomotil) and antidiarrheal drugs (Imodium) slow the function of the gastrointestinal tract and are regularly prescribed for irritable bowel syndrome. However, they have serious side effects and can induce dependency. Some health practitioners have also prescribed highly addictive tranquilizers and antidepressants. Consult a pediatrician before using any of these or any drugs for children.
- Many people with irritable bowel syndrome have experienced improvements in symptoms after using Chinese herbal medicine (CHM).
- In one study, children eight to eighteen years of age with IBS benefited from gut-directed hypnotherapy. After one year, the children in this study experienced less pain and less frequent attacks. The authors concluded that this was a highly effective therapy for children. This practice has also been shown to be effective for adults.
- Research and testing have found not only that breathing exercises can control IBS, but that people who practice stress management have fewer and less severe attacks. Stress management also relieves symptoms. (See STRESS in Part Two. Also see BREATHING EXERCISES under PAIN CONTROL in Part Three.)
- The symptoms of IBS are similar to those of many other disorders, including cancer. If dietary modification and natural remedies yield no relief, it is wise to consult a physician to rule out some other underlying problem. We recommend this only after natural remedies have been tried, however.
- See also DIVERTICULITIS; HEARTBURN; and/or INDIGESTION in Part Two.

## JAUNDICE

Jaundice is a yellowing of the skin and eyes that is caused by a buildup of bilirubin in the blood. Bilirubin is a yellow-brown substance that results from the breakdown of old red blood cells. If this waste product is not removed from the bloodstream by the liver, as it should be, a backup of bilirubin in the blood occurs, producing a yellowing of the skin and the whites of the eyes. The urine may be darker

than normal, while the stools may appear lighter. Jaundice may be accompanied by edema (fluid retention) in the trunk of the body, fatigue, generalized itching, nausea, rashes on the skin, and vomiting. If you suspect you have jaundice, seek medical attention.

Jaundice is not a disease in itself, but a sign of any one of several blood or liver disorders. Among the conditions that can cause jaundice are cirrhosis of the liver, pernicious anemia, hepatitis, and hemolysis (abnormal destruction of red blood cells). Jaundice can also be a sign of an obstruction in the path of the bile flow, from the liver through the bile ducts to the gallbladder, and then to the intestinal tract. If any part of the biliary tract is obstructed for some reason, the bile (which contains bilirubin) passes back into the bloodstream instead of into the digestive system, producing jaundice. Occasionally, jaundice is caused by some form of parasitic infestation such as tapeworm or hookworm, or a bite from a flea or mosquito that carries a viral, bacterial, or parasitic infection. It can also be caused by a tumor, a gallstone, or inflammation.

Some degree of jaundice is common in newborn babies, especially premature babies, and is not considered serious. It occurs because a new baby's liver is limited in its ability to process bilirubin, and in most cases soon resolves itself. Some babies are placed under a heating lamp to speed up the removal of the excess bilirubin.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Coenzyme Q <sub>10</sub> plus	As directed on label.	Promotes tissue oxygenation and removes toxic substances from the body.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Colostrum (Colostrum Plus from Symbiotics)	As directed on label.	Improves immune function and protects the liver.
Grape seed extract	As directed on label.	A powerful antioxidant that aids the liver in removing toxic substances from the body.
Kyo-Dophilus from Wakunaga	As directed on label.	Protects the liver and the intestinal tract.
Kyolic from Wakunaga	As directed on label.	Potent immune enhancer.
L-glutathione and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg	Substances that work together to protect the liver. (See AMINO ACIDS in Part One.)

	vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	An excellent liver detoxifier.
Raw liver extract	As directed on label.	Aids in building the liver. ( <i>See GLANDULAR THERAPY in Part Three.</i> ) Use liver from organically raised beef.
S-Adenosylmethionine(SAMe)	As directed on label.	Aids in relief of stress and depression, eases pain, and produces antioxidant effects that can improve the health of the liver. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex	50 mg of each major B vitamin three times daily (amounts of individual vitamins in a complex will vary).	The B vitamins are necessary for proper digestion, absorption of nutrients, and formation of red blood cells. They help to maintain the health of the eyes, liver, and skin. Use a high-potency formula.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Vitamin C combines with toxic substances, renders them harmless, and removes them from the body.

## Herbs

- Burdock root and red clover aid in cleansing the blood.
- Celandine, and dandelion aid in cleansing the liver.
- Oregano is good for relieving jaundice.
- Silymarin, an active flavonoid extracted from the herb milk thistle, is known to repair damaged tissues in the liver. Liv-R-Actin from Nature's Plus is a good source of silymarin.

## Recommendations

- Eat only raw vegetables and fruits for one week. Then eat a diet consisting of 75 percent raw food for a month. Take fresh lemon enemas daily during this period. This is for adults only. (*See ENEMAS in Part Three.*)
- Use the spices coriander and turmeric in your cooking. These are good liver cleansers.
- Drink the following juices: lemon juice and water, beet and beet greens, and dandelion or black radish extract. All are good for rebuilding and cleansing the liver.
- Never consume raw or undercooked fish, meat, or poultry. All raw fish pose a risk of infection from bacteria, parasites, and viruses.
- Do not consume *any* alcohol. Alcohol places a great strain on the liver, which can aggravate the condition even further.

## Considerations

- If jaundice is a result of a tumor or gallstone, surgery may be necessary to correct the problem.
- To diagnose the problem that is causing jaundice, your physician may perform a blood test, liver biopsy, or ultrasound scan of the liver.
- See CIRRHOSIS OF THE LIVER and HEPATITIS, both in Part Two, for additional nutritional and dietary suggestions.*

## JOB SYNDROME

*See HYPERIMMUNOGLOBULIN E [HYPER-IGE] SYNDROME under RARE DISORDERS.*

## JOCK ITCH

*See under FUNGAL INFECTION.*

## KAPOSI'S SARCOMA

*See under SKIN CANCER.*

## KIDNEY DISEASE (RENAL FAILURE)

Kidneys remove waste products from the body, keep body chemicals in balance, and help maintain the body's water balance. There are a number of different renal (kidney) problems that may occur. The kidneys may be damaged by exposure to certain drugs or toxins, including heavy metals, solvents, chemotherapy agents, snake or insect venom, poisonous mushrooms, and pesticides. Renal failure can also accompany or result from many other disorders, such as congestive heart failure, diabetes, chronic hypertension, liver disease, lupus, and sickle-cell anemia. If you think your kidneys are not working properly, consult your health care provider.

Bright's disease is a kidney disease marked by the presence of blood protein in the urine, along with hypertension and edema (retention of water in the tissues). Glomerulonephritis is an inflammation of tiny blood vessels within the kidneys that filter out wastes from the blood. This may occur as a result of an immunological response to infection, such as a *Streptococcus* throat infection. Pyelonephritis is a kidney infection that may be caused by a birth defect. Both glomerulonephritis and pyelonephritis can be chronic or acute, and can be serious. Hydronephrosis is a condition in which the kidneys and the renal pelvis (the structure into which urine is discharged from the kidneys) become filled with urine due to an obstruction of urinary flow. Polycystic kidney disease (PKD) is an inherited disease in which cysts grow on the kidneys, rendering them incapable of functioning. Kidney stones are mineral accumulations (primarily calcium) in the kidneys. In renal tubular acidosis, the

kidneys fail to reabsorb bicarbonate normally, causing impaired ammonia production and acid excretion. Severe acidosis, potassium depletion, and bone disorders may result. Nephrotic syndrome is not a disease in itself, but can be a sign of kidney disease. It is marked by edema and excess protein in the urine. It can be caused by lesions of glomeruli (small structures in the kidneys made of capillaries) that become inflamed, or by chronic diseases such as diabetes or lupus.

One important symptom of kidney problems is edema. Edema results when the kidneys produce less urine because they are unable to properly excrete salt and other wastes, and fluid builds up in the body. Ankles and hands may swell, and the person becomes short of breath. Toxic wastes may accumulate in the bloodstream due to kidney malfunction, a condition known as uremia. Symptoms of kidney problems include abdominal pain, appetite loss, back pain, chills, fever, fluid retention (bloating), nausea, urinary urgency, and vomiting. The urine may be cloudy or bloody. Back pain may be sudden and intense, occurring just above the waist and running down the groin.

The following supplements aid in controlling urinary tract infection, and help maintain proper kidney function. Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label, 3 times daily. Take on an empty stomach.	Especially important if you are taking antibiotics.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Acts as an antioxidant and removes harmful substances from the body.
Vitamin B <sub>6</sub> (pyridoxine)	50 mg 3 times daily.	To reduce fluid retention.
plus choline and inositol hexaphosphate (IP <sub>6</sub> )	50 mg daily. 100 mg daily.	
Vitamin C with bioflavonoids	2,000–4,000 mg daily.	Acidifies the urine, boosts immune function, and aids healing.
<i>Helpful</i>		
Calcium	1,500 mg daily.	For proper mineral balance; calcium and magnesium should be in a 2-to-1 ratio in the body. Do not use bone meal, oyster shells, or dolomite as a source. Important in water absorption.
and magnesium	750 mg daily.	

L-arginine and L-methionine	500 mg 4 times daily. As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	For kidney disease. For improved kidney circulation. (See AMINO ACIDS in Part One.)
Lecithin granules or capsules	1 tsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Needed for nephritis.
Multienzyme complex plus hydrochloric acid (HCl)	As directed on label. As directed on label.	Necessary for digestion. <i>Caution:</i> Do not give this supplement to a child under sixteen years except as directed by physician. Particularly important for older adults, who tend to be deficient. <i>Caution:</i> Do not take HCl if you have a history of ulcers.
Multimineral complex	As directed on label.	Corrects mineral depletion, common with kidney disease. Use a high-potency formula.
Vitamin A with mixed carotenoids	100,000 IU daily for 3 days, then 50,000 IU daily for 5 days, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Important in healing of urinary tract lining and in immune function. Use emulsion form for easier assimilation and greater safety at high doses. Do not take this amount in pill form.
Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin)	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 25 mg 3 times daily.	B vitamins work best when taken together. Use a high-potency formula. Needed for nephritis.
Vitamin E emulsion	200 IU daily or 400 IU every other day.	Promotes immune function. An important free radical destroyer. Use d-alpha-tocopherol form.
Zinc plus copper	50–80 mg daily. Do not exceed 100 mg daily from all supplements. 3 mg daily.	An immunostimulant necessary for healing and an important inhibitor of crystallization and crystal growth. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.

**Herbs**

- Buchu tea is good. Do not boil it, however.
- Celery and parsley seeds are natural diuretics. Taken in combination, they are especially helpful if high uric acid levels are present in the blood. Eating large amounts of animal proteins makes one susceptible to high levels of uric acid. These two herbs help keep them in check.
- Cranberries contain substances that acidify the urine, destroy bacterial buildup, and promote healing of the bladder. Drink at least 8 ounces of cranberry juice three times daily. Use only pure, unsweetened juice (available at health food stores). Do not substitute a commercial cranberry juice cocktail product; these contain large amounts of sugar. If natural cranberry juice is not available, cranberry capsules can be used as a substitute. Cranberry supplements are also available, and work just as well.

- Dandelion root extract aids in excretion of the kidney's waste products and is very beneficial for nephritis.
- The herbs hydrangea and uva ursi are excellent natural diuretics. One of the best first steps in cleaning out the urinary tract and keeping it healthy is to help it flush itself. Voiding the urinary tract keeps harmful deposits of calcium or other mineral salts from forming obstructions. Uva ursi is also slightly germicidal, so if there are any bacteria present, they will likely be destroyed by it.
- Marshmallow tea helps to cleanse the kidneys. Drink 1 quart daily.
- Kidney Blend SP-6 from Solaray helps reduce water retention. Kidney Bladder Formula from Nature's Way is also a good herbal diuretic.
- Other herbs that are beneficial for kidney problems include goldenrod tea, juniper berries, marshmallow root, nettle, parsley, red clover, and watermelon seed tea.

### Recommendations

- Consume a diet composed of 75 percent raw foods. Eat asparagus, bananas, celery, cucumbers, garlic, papaya, parsley, potatoes, and watercress. Watermelon and pumpkin seeds are also beneficial. Watermelon should be eaten by itself so that it passes through the system quickly; if it stays in the body too long, toxins begin to form. Also eat sprouts and most green vegetables. Raw foods tend to be high in potassium. Potassium may be difficult for the kidneys to clear from the blood in people with kidney disease. Check with your physician before following this recommendation.
- Include in the diet legumes, seeds, and soybeans. These foods contain the amino acid arginine, which is beneficial for the kidneys.
- Reduce your intake of potassium and phosphates if your levels of these are elevated. Do not use any salt or potassium chloride, a salt substitute. Also avoid beet greens, chocolate, cocoa, eggs, fish, meat, rhubarb, spinach, Swiss chard, and tea.
- If you have symptoms of kidney problems, especially blood in the urine or severe back pain, consult your health care provider promptly. You may need medical treatment.
- Drink 8 to 10 ounces of steam-distilled water every waking hour. Quality water is essential for urinary tract function.
- Reduce your intake of animal protein, or eliminate it altogether. A diet high in animal protein puts stress on the kidneys. Excess accumulation of protein can result in uremia. Protein is easiest to utilize if it has been broken down into free form amino acids. Other good protein sources include beans, lentils, millet, peas, soybeans, and whole grains.
- Avoid all dairy products except for those that are soured, such as low-fat yogurt, buttermilk, and cottage cheese.

- Try a raw goat's milk diet for two weeks, consuming nothing but 4 quarts of raw goat's milk, warmed to body temperature, each day. Add 1 tablespoon of crude blackstrap molasses to each quart. During this period, take 1,000 international units of vitamin E and 75,000 international units of vitamin A in emulsion form.

*Caution:* If you are pregnant, this diet is not recommended.

- Try a three-day cleansing and juice fast, and coffee or catnip tea enemas. (See ENEMAS and FASTING in Part Three.)
- If you are taking antibiotics for a kidney problem, do not take iron supplements as long as the problem exists.

### Considerations

- To test for kidney failure, a doctor can test your urine for levels of albumin protein, creatinine (waste from muscle cells), hemoglobin (if the kidneys are not working properly, hemoglobin levels may fall), phosphorus, potassium, and urea (waste from protein you have eaten). The most common tests are BUN (blood urea nitrogen) and serum creatinine.
- Lead and other metallic poisons are very harmful to the kidneys. Anyone who works with lead, or who is exposed to lead regularly, should take precautions to protect his or her kidneys from damage. (See LEAD POISONING in Part Two.)
- If you have diabetes, high blood sugar, high blood pressure, or a family history of kidney disease, you may be at higher risk for kidney disease.
- A study reported in the *Journal of Nutritional and Environmental Medicine* found that treatment with coenzyme Q<sub>10</sub> decreased the progression of kidney disease and also reversed renal dysfunction in a majority of patients with end-stage disease.
- Infectious diseases, such as measles, scarlet fever, and tonsillitis, can damage the kidneys if not treated properly and completely.
- A study at the pharmaceutical department of Chiba University in Japan found that spirulina reduced kidney poisoning caused by mercury and drugs. Researchers discovered that adverse effects of certain drugs on the kidneys also may be decreased by the use of spirulina.
- Human growth hormone treatment can improve kidney function. (See GROWTH HORMONE THERAPY in Part Three.)
- Recurrent urinary tract infections indicate the possibility of a serious underlying problem. See your health care provider.
- High doses of the painkiller ibuprofen (Advil, Nuprin, and others) can lead to kidney dysfunction.
- A home dialysis system is available for those requiring dialysis treatments.
- See also BLADDER INFECTION and KIDNEY STONES in Part Two.

## KIDNEY STONES

Kidney stones, medically termed *renal calculi*, are accumulations of mineral salts that can lodge anywhere along the course of the urinary tract, and they can be one of the most painful of all health ailments. Human urine is often saturated to the limit with uric acid, phosphates, and calcium oxalate. Normally, due to the secretion of various protective compounds and natural mechanisms that control the pH of urine, these substances remain suspended in solution.

However, if the protective compounds are overwhelmed or immunity becomes depressed, the substances may crystallize and the crystals may begin to clump together, eventually forming stones large enough to restrict urinary flow. These stones can be jagged or smooth. Symptoms of kidney stones include pain radiating from the upper back to the lower abdomen and groin, profuse sweating, frequent urination, pus and blood in the urine, odorous or cloudy urine, absence of urine formation, nausea and vomiting, and, sometimes, chills and fever. In milder cases, the symptoms may mimic a bad case of stomach flu or other gastrointestinal ailment.

An estimated 1.5 percent of Americans develop kidney stones at some point in their lives. They are most common in white men between the ages of thirty and fifty, although if you are prone to kidney stones, they can occur as early as your twenties. Kidney stones are rare in children and in African-Americans. They are more prevalent in the southeastern United States (known to doctors as the “Stone Belt”) than in other parts of the country. The reason for this is not known, but it is theorized that the hot climate, which promotes dehydration, and/or regional dietary habits may be to blame. Men are much more likely than women to suffer from this ailment (four out of five cases are in men). Adults have a 50 percent rate of recurrence.

Stones can range in size from microscopic specks to the size of a fingertip. There are four kinds of kidney stones: calcium stones (composed of calcium oxalate); uric acid stones; struvite stones (composed of magnesium ammonium phosphate); and cystine stones.

About 80 percent of all stones are calcium oxalate stones. High blood calcium levels lead to hypercalciuria—excessive absorption of calcium from the intestine—which increases the level of calcium in the urine. This excess calcium eventually forms a stone. High blood calcium levels can also result from malfunctioning parathyroid glands (tiny glands in the neck that regulate blood calcium levels), vitamin D intoxication, and multiple myeloma. The consumption of refined carbohydrates, especially sugar, can help precipitate kidney stones as well, because the sugar stimulates the pancreas to release insulin, which in turn causes extra calcium to be excreted in the urine. Mild chronic or recurrent dehydration can also be a factor in kidney stones; it concentrates the urine, increasing the likelihood of stone formation.

Uric acid stones form when the volume of urine excreted

is too low and/or blood levels of uric acid are abnormally high. The latter condition is commonly associated with symptoms of gout. Unlike other types of kidney stones, struvite stones are unrelated to metabolism; these stones are caused by infection. Women often get them with recurrent urinary tract infections. Cystine stones are caused by a condition called cystinuria, a rare congenital defect that can cause stones composed of the amino acid cystine to form in the kidney or bladder.

Calcium stones often run in families because the tendency to absorb too much calcium is hereditary. Also, in people with a family history of kidney stones, there seems to be a stronger than normal correlation between the intake of either vitamin C or oxalic acid and the urinary excretion of oxalate. Apparently, such individuals either absorb more oxalate from their diets or metabolize greater amounts of oxalate precursors. People who have Crohn’s disease or irritable bowel syndrome, or who eat diets high in oxalic acid, may have an increased risk of kidney stones as well, as these factors can cause the excretion of oxalate in the urine to increase. Other risk factors for kidney stones include low urine volume, low bodily pH, heredity, living in a tropical climate, and reduced production of natural urinary inhibitors of crystal formation.

Kidney stones are ten times as common now as they were at the start of the twentieth century. While the consumption of foods high in oxalic acid (mostly eggs, fish, and certain vegetables) has declined markedly in this country in that time, the amount of animal fats and protein in the average American’s diet has increased significantly. The ratio of plant to animal protein in the typical diet at the beginning of the twentieth century was roughly 1 to 1. This ratio has since changed to 1 to 2. The consumption of animal protein is strongly associated with oxalate absorption.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Inositol hexaphosphate (IP <sub>6</sub> ) with inositol	As directed on label.	Has been shown in many studies to help prevent and treat kidney stones.
L-methionine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Reduces the incidence of kidney stones by destroying free radicals associated with stone formation. (See AMINO ACIDS in Part One.)

Magnesium citrate	500 mg daily.	Reduces calcium absorption and can lower urinary oxalate, a mineral salt common in kidney stones.
Vitamin B complex  plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg twice daily.	B vitamins work best when all are taken together.  Taken with magnesium, reduces oxalate.
Zinc	50–80 mg daily. Do not exceed 100 mg daily from all supplements.	An important inhibitor of crystallization, which can lead to stone formation. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Helpful

L-arginine	500 mg daily. If you are prone to herpes outbreaks, take with L-lysine.	Aids kidney disorders.
Multivitamin complex	As directed on label.	To maintain a balance of all nutrients.
Potassium	99 mg daily.	Inhibits crystallization, which can lead to stone formation. Use potassium citrate form.
Proteolytic enzymes	As directed on label. Take between meals.	Aids normal digestion.
Raw kidney glandular	500 mg daily.	Strengthens the kidneys. (See GLANDULAR THERAPY in Part Three.)
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Promotes healing of the urinary tract lining, which is often damaged by stones. If you are pregnant, use a natural carotenoid complex such as Betatene in place of vitamin A.
Vitamin E	200 IU daily or 400 IU every other day.	A powerful antioxidant. Use d-alpha-tocopherol form.

### Herbs

- Aloe vera juice, taken at levels that do not produce a laxative effect, can be useful in preventing stone formation and in reducing the size of a stone during an acute attack.
- Ginkgo biloba and goldenseal, taken in extract form, aid circulation to the kidneys and have anti-inflammatory properties. They are also powerful antioxidants.

*Cautions:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- A combination of lobelia tincture (3 to 4 drops) and wild yam tincture (15 drops) in a glass of warm water helps to relax the ureters, relieve pain, and hasten the passing of stones. Sip this mixture throughout the day.

- Marshmallow root tea daily helps to cleanse the kidneys and to expel kidney stones. Drink 1 quart daily.
- Uva ursi helps to relieve pain and bloating.
- Other herbs that may aid in alleviating kidney stones include cleavers, gravel root, juniper berries, and pipsisewa (also called Prince's Pine).

### Recommendations

- For pain relief, drink the juice of half a fresh lemon in 8 ounces of water every half-hour until the pain subsides. You can alternate between lemon juice and fresh apple juice.
- To maintain good kidney function, drink plenty of quality water—at least ten 8-ounce glasses daily. By far the single most important measure one can take to prevent kidney stones from forming is to increase water consumption. Water dilutes urine and helps prevent concentrations of the minerals and salts that can form stones. (Chronic dehydration is a major risk factor in kidney stone disease.) Also drink unsweetened cranberry juice to help acidify the urine (unless you are prone to uric acid stones). Drinking the juice of a fresh lemon in a glass of warm water first thing each morning can help prevent stones from forming. Lemon juice contains nearly five times the concentration of citric acid—a natural citrate source—in orange juice. One study showed people who consumed lemonade on a daily basis actually reduced stone recurrence.
- Increase your consumption of foods rich in vitamin A. Vitamin A is beneficial to the urinary tract and helps to discourage the formation of stones. Good sources of vitamin A include alfalfa, apricots, cantaloupes, carrots, pumpkin, sweet potatoes, and squash.
- Use only distilled water for drinking and cooking. Add trace mineral drops to your drinking water.
- Minimize your consumption of animal protein, or eliminate it from your diet altogether. A diet high in animal protein causes the body to excrete calcium, producing excessive amounts of calcium, phosphorus, and uric acid in the kidneys and often resulting in painful kidney stones.
- Reduce your intake of potassium and phosphates. Do not use any salt or potassium chloride, a salt substitute, and avoid carbonated soft drinks. Cola drinks are thought to be a risk factor for stone formation, while some other drinks containing citric acid may lessen stone activity. In one study, water was compared to caffeine-free Diet Coke and Fresca (citrate containing). The last two were chosen to prevent the known increase in calcium excretion promoted by caffeine and carbohydrates. With respect to stone formation, none of these three beverages differed. Thus, it seems that all sodas do not need to be removed from the diet in order to maintain healthy kidney function.
- Do not omit calcium from your diet—it is important in lowering your risk of developing osteoporosis, which is a

much more common problem than kidney stones, especially for women. Getting extra magnesium can reduce the risk of kidney stones by increasing the solubility of calcium oxalate. Seafood, brown rice, tofu, and soybeans are naturally high in magnesium.

☐ Try drinking a large amount of liquid (preferably pure water), allow twenty minutes for digestion, and then run up and down stairs vigorously. This has been known to allow small, stubborn kidney stones to pass naturally.

☐ If you do not pass the lodged stone, see your physician. He or she may order a urine test and an X-ray for formal diagnosis and proper treatment.

☐ If you have a family history of kidney stones, take calcium supplements *with meals*. When you consume calcium-rich foods with oxalates, they bind together and are expelled in the stool, lessening your risk of kidney stones. Calcium supplements should be avoided only by those with a personal history of kidney stones.

☐ Avoid foods that contain or lead to the production of oxalic acid, including asparagus, beet greens, beets, blueberries, celery, eggs, fish, grapes, parsley, rhubarb, sorrel, spinach, Swiss chard, and vegetables of the cabbage family. Also avoid alcohol, black tea (green tea is a good substitute), chocolate, cocoa, dried figs, nuts, pepper, and poppy seeds.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

☐ Avoid all refined sugar and products that contain it. Sugar stimulates the pancreas to release insulin, which in turn causes extra calcium to be excreted in the urine.

☐ Stay active. People who are sedentary tend to accumulate high levels of calcium in the bloodstream. Exercise helps pull calcium from the blood into the bones, where it belongs.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

☐ If you have a history of cystine stones, avoid the amino acid L-cystine. If you must take a supplement containing L-cystine, take at least three times as much vitamin C at the same time. Otherwise, cystine can crystallize in the kidneys and form large stones that fill the interior of the kidney.

## Considerations

☐ A Harvard University study found that consuming dairy products may actually lower the risk of developing kidney stones, instead of increasing the risk, as was previously thought. They also found that calcium supplements raise the risk slightly unless they are taken with meals.

☐ Drinking coffee, tea, and wine may lower the risk of kidney stones, while grapefruit juice may increase it.

☐ Vitamin C at high doses poses a risk of stone formation. In one study, 40 percent of people with a history of calcium oxalate stones who took 2,000 milligrams of vitamin C a day had increased urinary oxalate levels and a higher risk of developing more stones, according to the Tiselius Risk Index (TRI). Get vitamin C from fruits and vegetables instead of supplements.

☐ In one study, people with idiopathic calcium stone formation who adhered to a low animal protein diet (less than 10 percent of total calories) had fewer kidney stones. Another group of patients in this study was assigned to a high-fiber group (greater than 25 grams per day), and this had no effect on stone formation.

☐ Some people avoid milk because they fear it may cause kidney stones. One study showed that substituting apple juice for one and a half cups of milk did not lower the risk of calcium oxalate stone formation in people with a history of kidney stones. The diet consumed in this study had moderate oxalate from whole grains, legumes, fruits, and vegetables. A healthy diet with some milk seems to not be harmful.

☐ In Japan, the incidence of kidney stones has been rising steadily since the middle of the last century, when dietary changes typical of an industrialized nation began to occur. People in Japan who develop kidney stones consume far more proteins, refined carbohydrates, fats, and oils than did their forebears.

☐ Most kidney stones eventually pass by themselves. Depending on the type and size of stone, your physician may recommend the use of electroshock wave lithotripsy (ESWL) to break up the stones, ureterscope calculus removal, or percutaneous nephrolithotomy (in which the surgeon creates a small tunnel through the skin and inserts an instrument to remove the stone), or the use of a laser or other tiny device that is threaded up the urinary tract to break up stones.

☐ Once kidney stones have formed and have been treated, the risk of recurrence increases; once a person has formed a stone, there is a 20 to 50 percent chance that he or she will form another in the next ten years. Once a second incidence has occurred, the risk increases markedly.

☐ Prescription medications containing sodium cellulose phosphate are effective on calcium-based stones. Potassium citrate (Urocit-K) is effective on stones not of calcium origin. Allopurinol (Lopurin, Zyloprim) is another medication that may help to prevent the occurrence of stones.

☐ Taking up to 100 milligrams of zinc daily can help inhibit the formation of crystals that later accumulate into stones.

*Caution:* While the recommended amount of zinc helps to enhance immune function, anything over 100 milligrams per day tends to depress immunity.

☐ To control calcium stones, the pH of the body should be raised, while to control uric acid stones, bodily pH should be lowered. (See ACID/ALKALI IMBALANCE in Part Two.)

☐ Diet alone cannot remove kidney stones, but it can be very effective at preventing them. Kidney stones are primarily an affliction of well-fed societies in which people consume large quantities of animal protein. A vegetarian diet can be of great benefit to anyone prone to kidney stones. A strict vegan diet that contains no animal proteins whatsoever, is almost entirely devoid of processed foods, and is low in sodium and high in fiber and water is generally considered conducive to kidney stone prevention.

☐ In one study, for children with intractable epilepsy who developed kidney stones, following a ketogenic diet and taking oral potassium citrate seemed to reduce the incidence of kidney stones.

☐ Measures used to treat kidney stones and to prevent recurrences depend on the nature of the stone, so it is important to take any stone you pass to your health care provider for analysis.

## LACTOSE INTOLERANCE (LACTASE DEFICIENCY)

Lactose intolerance is the inability to digest lactose (milk sugar). It is caused by a lack or deficiency of lactase, an enzyme manufactured in the small intestine that splits lactose into glucose and galactose. When a person with lactose intolerance consumes milk or other dairy products, some or all of the lactose they contain remains undigested, retains fluid, and ferments in the colon, resulting in abdominal cramps, bloating, diarrhea, and gas. Symptoms usually begin between thirty minutes and two hours after consumption of dairy foods.

The degree of lactose intolerance varies from individual to individual. For most of the world's adults, lactose intolerance is actually a normal condition. Only Caucasians of northern European origin generally retain the ability to digest lactose after childhood. In the United States, an estimated 30 to 50 million people are lactose intolerant. Lactase deficiency can also occur as a result of a gastrointestinal disorder that damages the digestive tract, such as celiac disease, irritable bowel syndrome, regional enteritis, or ulcerative colitis. It can also develop on its own. There is no known way to prevent it.

Although far less common, lactose intolerance can occur in children as well as adults. In infants, lactose intolerance can occur after a severe bout of gastroenteritis, which damages the intestinal lining. Symptoms of lactose intolerance in an infant can include foamy diarrhea with diaper rash, slow weight gain and development, and vomiting.

Lactose intolerance can cause discomfort and digestive disruption, but it is not a serious threat to health and it can easily be managed through dietary modification. Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seven-

teen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose and for a child under six years old, use one-quarter of the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilis from Wakunaga)	1 tsp in distilled water twice daily, on an empty stomach.	Replaces lost "friendly" bacteria and promotes healthy digestion. Use a nondairy formula only.
Charcoal tablets	For an acute attack, take 4 tablets every hour with water until symptoms subside. Take separately from other medications and supplements.	Absorbs toxins and relieves diarrhea.
<i>Helpful</i>		
Bone Defense from KAL	As directed on label.	To supply necessary calcium and nutrients needed for calcium absorption.
LactAid from Lactaid, Inc.	As directed on label.	To supply the enzyme lactase, needed for digesting milk sugar.
Magnesium	1,000 mg daily.	Needed for calcium uptake. Promotes pH balance.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed for optimal health.
Ultra Clear Sustain from Metagenics	As directed on label.	Promotes favorable bacteria in the digestive tract and provides additional nutritional support for the digestive system. Available only through health care professionals.
Vitamin D	400 IU daily.	Needed for calcium uptake.
Vitamin E	200 IU daily or 400 IU every other day.	Protects the cell membranes that line the colon wall. Use d-alpha-tocopherol form.
Zinc plus copper	30 mg 3 times daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	To maintain immune system and proper mineral balance. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.

## Recommendations

☐ Avoid milk and all dairy products except yogurt. This is the most important dietary measure for anyone who is intolerant to lactose. Use soymilk in place of milk, and soy cheese instead of dairy cheese. Rice milk has no lactose, but is not a suitable substitute as it is often low in protein.

☐ Include yogurt in your diet. Yogurt is the one dairy product that can be good for a person with lactose intolerance. The cultures present in yogurt digest the lactose it contains, so it is no longer a problem. They also aid in overall digestion. Be sure to eat only yogurt that contains active live yogurt cultures. Homemade yogurt is best.

☐ Be sure to eat plenty of foods that are high in calcium. Good choices include apricots, blackstrap molasses, broc-

coli, collard greens, dried figs, kale, calcium-fortified orange juice, rhubarb, salmon, sardines, spinach, tofu, and yogurt. Calcium supplements may be beneficial.

❑ Check with your pharmacist before taking any medications. Many pills are formulated using lactose as filler. Some birth control pills and stomach medications contain lactose.

❑ During an acute attack, do not eat any solid food, but do drink plenty of quality water and replace lost minerals. *See* DIARRHEA in Part Two for dietary suggestions.

❑ Read food product labels carefully, and avoid any that contain lactose or “milk solids.” Lactose is added to many different types of processed food, including breads, canned and powdered soups, cookies, pancake mixes, powdered drink mixes such as flavored coffees, processed breakfast cereals, processed meats, and salad dressings.

❑ If you are pregnant and have a family history of lactose intolerance, give serious consideration to breast-feeding your baby. If that is not possible, first see if the baby can tolerate regular formula. Then discuss with your pediatrician choosing a nondairy baby formula, such as a soy-based product.

### Considerations

❑ There are several tests used to measure the absorption of lactose into the digestive system. The first test is known as the lactose tolerance test, in which the person drinks a liquid containing lactose after fasting overnight. Approximately one-half hour later, the amount of glucose (blood sugar) in the blood is measured and the presence of symptoms assessed. If the blood glucose does not rise by at least 20 points, and especially if there are symptoms such as bloating or discomfort, a diagnosis of lactose intolerance is confirmed. The hydrogen breath test measures the amount of hydrogen in the breath. Again, the person is given a drink containing a high level of lactose. When lactose is improperly digested in the colon, gases form and are carried through the bloodstream to the lungs and are exhaled. A higher level of hydrogen in the breath indicates faulty digestion of lactose. This test is given to adults and children, but is not recommended for infants and very young children. Young children and infants are tested by the stool acidity test, which measures the amount of acid in the stool. This test also assesses the levels of glucose and lactic acid present in the stool.

❑ Lactose intolerance is not the same as milk allergy. Lactose intolerance specifically refers to a syndrome caused by the failure to digest milk sugar; a person with a milk allergy may be able to digest milk normally, but his or her immune system then has an allergic response to one or more of the milk’s components. (*See* ALLERGIES in Part Two.)

❑ Hard, aged cheeses, such as Parmesan cheese, are relatively low in lactose, and may be easier to tolerate than other dairy products.

❑ Many people can’t tolerate much lactose at one sitting. Consuming small amounts of dairy products with meals may help improve the lactose tolerance level. The large intestine becomes more accustomed to digesting the lactose when it is introduced in small quantities on a regular basis. Ten grams of lactose a day is considered a low-lactose diet. Much less is found in a tablespoon of milk for coffee (about 2 grams), an ounce of cheese (about 2 grams), or ½ cup of ice cream (about 6 grams). If you want to see how much lactose you can tolerate, try one of these foods each day. Be careful with ice cream; not only is ice cream made from milk, but many brands add extra lactose to achieve the desired texture, and the cold temperature can be shocking to the digestive system as well. Also, a half-cup serving is smaller than you are likely to eat; be sure to try only 4 ounces to begin with and see how you do. More expensive ice creams may be easier to tolerate because they are higher in fat from cream and have less milk.

❑ The symptoms of lactose intolerance are similar to those of celiac disease, and the two disorders may occur together. (*See* CELIAC DISEASE in Part Two.)

❑ Lactose-free and lactose-reduced products are available in most supermarkets.

### LEAD POISONING

Lead is one of the most toxic metal contaminants known. It is a cumulative poison that is retained in the body. Even at low levels, lead that is not excreted through the digestive system accumulates in the body and is absorbed directly from the blood into other tissues. When lead leaves the bloodstream, it is stored, along with other minerals, in the bones, where it continues to build up over a lifetime. Lead from the bones may then reenter the bloodstream at any time as a result of severe biologic stress, such as renal failure, pregnancy, menopause, or prolonged immobilization or illness.

Unlike some metallic elements, lead has no known functions or health benefits for humans. It is considered a metabolic poison, which means that it inhibits some basic enzyme functions. Lead reacts with selenium and sulfur-containing antioxidant enzymes in the cells, seriously diminishing the ability of these substances to protect against free radical damage. When present in toxic amounts, it can damage the heart, kidneys, liver, and nervous system.

The body cannot distinguish between calcium and lead. Once lead enters the body, it is assimilated in the same manner as calcium. Because young children and pregnant women absorb calcium more readily to meet their extra needs, they also absorb more lead than other people. Children absorb 25 to 40 percent more lead per pound of body weight than adults do. People with deficiencies of calcium are more susceptible to lead toxicity as well.

Symptoms of lead poisoning typically come on over the course of several weeks in adults and several days in chil-

dren. Children's symptoms also tend to be more severe. People with lead poisoning commonly have days of severe gastrointestinal colic. Their gums often turn blue, and they may experience muscle weakness. Other possible symptoms include anxiety, arthritis, confusion, chronic fatigue, diarrhea, gout, insomnia, learning disabilities, loss of appetite, a metallic taste in the mouth, seizures, tremors, and vertigo. Lead poisoning can eventually lead to blindness, loss of memory, mental disturbances, mental retardation, paralysis of the extremities, and even coma and death. Chronic lead poisoning can also cause erectile dysfunction, infertility and other reproductive disorders, and liver failure.

Lead is one of the most widely used metals in the United States today, and it is estimated that a large number of people have high levels of lead in their bodies. Sources of lead exposure include lead-based paints, ceramic glazes, lead crystal dishes and glassware, leaded gasoline, lead-acid batteries used in automobiles, tobacco, liver, water, some domestic and imported wines, canned fruit (the lead from lead-soldered cans leaches out and is absorbed by fruits), garden vegetables (if grown in lead-contaminated soil), bone meal, and insecticides. Even such innocuous-seeming items as vinyl mini-blinds and porcelain-glazed sinks and bathtubs have been implicated in lead exposure.

Another potential source of lead poisoning is water supplied through lead piping. Lead piping was used in most homes built before 1930. Newer homes use copper pipes; however, even if you have copper pipes in your home, the chances are very good that they were assembled with lead solder, which is 50 percent lead. Solder can leach a significant amount of lead into the water supply, especially in the first few years after installation. Due to mounting concern over the amount of lead leaching into the water, the use of lead solder was banned in 1986.

Lead poisoning first gained widespread public attention when large numbers of children, especially children in inner cities, were found to have been poisoned by chips of lead-based paint that had peeled off the walls. Lead-based paints were banned for use in housing in 1978. All houses built before 1978 are likely to contain some lead-based paint. However, it is the deterioration of this paint that causes a problem. Approximately 24 million housing units have deteriorated leaded paint and elevated levels of lead-contaminated house dust. More than 4 million of these dwellings are homes to one or more young children. Newer buildings are required to use non-lead-based paints. Some children acquired high lead levels from playing in lead-contaminated dirt, which would get on their hands and then into their mouths.

Since then, it has been learned that pregnant women who have high levels of lead in their bodies can give birth to babies with high lead levels. Lead stored in the mother's body is free to cross the placenta to the fetus. Children born to women who have toxic amounts of lead in their bodies

generally suffer from growth retardation and nervous system disorders. Even low-level lead exposure in young children may be associated with impaired intellectual development and behavioral problems.

In 2007, the U.S. Consumer Protection Commission began issuing recalls of many toys manufactured in China because unacceptably high levels of lead were found in the toys' paint. Still, average blood lead levels in the United States have declined dramatically in recent decades, but, according to the U.S. Centers for Disease Control and Prevention, about 250,000 American children under the age of five still have blood lead levels that exceed the acceptable norm.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Alpha-lipoic acid (ALA)	As directed on label.	Helps to detoxify the body of metal pollutants and works as a powerful antioxidant.
Apple pectin	As directed on label.	Binds toxins and metals, removing them from the body.
Calcium	2,000 mg daily.	Prevents lead from being deposited in the body tissues. Use calcium chelate form. Do not obtain calcium from dolomite, bone meal, or cow's milk, which can contain lead.
and magnesium	1,000 mg daily.	Needed to balance with calcium. Use magnesium chelate form.
Garlic (Kyolic from Wakunaga)	2 tablets 3 times daily, with meals.	Protects the body's immune system. Helps to bind with and excrete lead.
Kelp	As directed on label.	Contains essential minerals, especially calcium and magnesium. Also removes unwanted metal deposits. See under Herbs, below.
and/or alfalfa		
L-lysine plus	500 mg daily, on an empty stomach.	Assists calcium absorption.
L-cysteine and L-cystine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Sulfur-containing amino acids that act as detoxifiers and remove heavy metals. (See AMINO ACIDS in Part One.)
Methylsulfonylmethane (MSM)	As directed on label.	Helps the body detoxify toxic metals.
S-adenosylmethionine (SAME)	As directed on label.	Has antioxidant effects and helps chelate heavy metals and remove them from the body.

*Caution:* Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.

Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Helps to neutralize the effects of lead.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Can displace lead and lower the body burden. Low levels of zinc have been found in people with high lead levels.

#### Very Important

Glutathione plus L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Powerful antioxidants that protect the liver, kidneys, heart, and central nervous system. (See AMINO ACIDS in Part One.)
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Protects cell membranes.

Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A potent antioxidant.
----------	---	-----------------------

#### Important

Vitamin B complex plus extra vitamin B <sub>1</sub> (thiamine)	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 100 mg daily.	B vitamins work best when taken together.
and vitamin B <sub>6</sub> (pyridoxine)	50 mg daily.	These B vitamins are vital in cellular enzyme function and important in brain metabolism; they help to remove lead from the brain.

#### Helpful

Vitamin A with mixed carotenoids plus vitamin E or Micellized Vitamin A and E from American Biologics	5,000 IU daily for 2 months. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily or 400 IU every other day. As directed on label.	Potent antioxidants that destroy free radicals and protect the cells from damage due to lead poisoning. Use d-alpha-tocopherol form. A form of vitamins A and E that enters the system rapidly.
---	--	---

## Herbs

- Alfalfa is rich in vitamins, minerals, and other valuable nutrients, and has a detoxifying effect on the body.
- Try using aloe vera juice. Take ½ cup in the morning and ½ cup before bedtime. This softens bowel movements and aids in removing metals from the digestive tract.
- Chlorella and cilantro are helpful for absorbing toxic metals.

## Recommendations

- Make sure that your diet is high in fiber and that you supplement it with pectin (found in apples).

*Note:* Always take supplemental fiber separately from other supplements and medications.

- Eat beans, broccoli, Brussels sprouts, cauliflower, eggs, garlic, kale, legumes, onions, and spinach. These help to rid the body of lead.
- Make sure your diet is low in fat and contains adequate amounts of iron and calcium. The body absorbs lead more easily if it is lacking in calcium or iron, or if it has been exposed to a high-fat diet.
- Drink steam-distilled water only.
- Do not smoke, and avoid secondhand smoke.
- If you suspect lead poisoning, have a hair analysis done to determine long-term accumulation of lead. Blood tests reveal only the most recent exposure. (See HAIR ANALYSIS in Part Three.)

Always check the labels when purchasing foreign-made products such as eye makeup (kajal, surma, or kohl dyes from the Middle East) and over-the-counter remedies (Alarcon, Azarcon, Coral, Greta, Liga, Maria Luisa, or Rueda). Some of these products may contain as much as 99 percent lead oxide.

## Considerations

- Succimer (Chemet) is a drug that may be prescribed to treat lead poisoning.
- Chelation with EDTA can help prevent accumulation of lead. Chelating agents work by binding to lead in the bloodstream and expediting its elimination from the body in urine. (See CHELATION THERAPY in Part Three.)
- In 1991, the Centers for Disease Control and Prevention (CDC) set a federal standard of 10 micrograms of lead per deciliter of blood. So the 8 percent of U.S. kids five and younger who have lead levels between 5 and 10 micrograms are considered safe. But recent Cornell University research in the journal *Environmental Health Perspectives* supports a stricter standard. The research team had previously followed kids from birth through age five. The current study looked again at the children at age six. The kids were divided into two groups: one with blood lead levels between 0 and 5, and the other with levels between 5 to 10—again, currently considered okay. It turned out that those in the 5 to 10 group had IQ scores about five points lower than those with the lowest lead levels.
- The CDC recommends routine blood testing for lead in all children at one and two years of age. When small children have blood lead levels above 10 micrograms per deciliter (mg/dL)—the highest level the CDC considers acceptable—

## Tips for a Lead-Free Environment

Once lead accumulates in the body, it remains there. Prevention is therefore much better than treatment when it comes to lead poisoning. The following are simple measures you can take to avoid exposure to lead:

- Do not buy foods in cans sealed with lead solder, which leaches into foods. Lead-soldered cans often have remnants of solder and indentations along the seam. If you buy canned foods, look for lead-free cans that have no side seams. Be wary of imported canned foods. Other countries may have no regulations governing the use of lead solder.
- Make sure children's hands are clean before they eat.
- Keep painted surfaces in good repair, so that older layers of paint are not exposed, chipping, or peeling. Although lead-based paints have been banned for use in residences, numerous older homes and public housing units still contain these paints. Do not allow children to eat paint chips. Hire a professional to remove lead-based paint from any surface; people can poison themselves by burning or scraping off layers of paint.
- Have your water tested to ensure a safe level of lead and other minerals. National Testing Laboratories sells a kit for testing impurities in your water. (See Resource Organizations in the Appendix.) Your state health department may also conduct tests for water contaminants at a reasonable price. Culligan International provides a WaterWatch Hot Line that can put you in contact with a local Culligan dealer, who will provide a free water-testing service. (See Manufacturer and Distributor Information in the Appendix.) You can also request a free booklet entitled *Water Quality Answers* by writing to the Water Quality Association. (See Resource Organizations.)
- Never use the first water drawn from your tap in the morning. Let it run for at least three minutes before you use it. Better yet, use only steam-distilled, filtered, deionized water for drinking and cooking. If safe drinking water is not available, treat water with grapefruit seed extract (available in health food stores) before using it. Add 10 drops of extract per gallon of water and shake or stir vigorously.
- Never boil water longer than necessary. Five minutes is enough. Boiling concentrates contaminants in water, including lead.
- Be careful about buying imported ceramic products. The amount of lead allowable in ceramicware manufactured in the United States is strictly regulated, but there are often no rules governing the glazing techniques of foreign producers. Standards for acceptable lead levels are relatively strict in countries where many of our dishes are manufactured—Great Britain and Japan, for example—but they are often more lax in other countries, such as Mexico and China. The FDA is unable to check a significant number to ensure safety.
- Antiques and other collectibles may look attractive, but this type of dinnerware is more likely to leach lead than dishes made more recently. If you buy such items, use them for decorative purposes only.
- Do not store alcoholic beverages, or acidic foods or beverages such as vinegar, fruit juices, or foods made with tomatoes, in lead crystal glassware for any length of time. The lead that gives fine crystal its sparkle and brilliance leaches into foods and beverages served or stored in it. Babies and children should not be fed from crystal dishes or glassware at all.
- If you are pregnant, avoid drinking hot coffee or other hot acidic beverages, such as tomato soup, from lead-glazed ceramic cups or mugs.
- Do not turn bread bags inside out and use them to store other foods. The ink used to print labels on many bread bags contains considerable amounts of lead. While the lead on the labels doesn't get through the plastic to the bread inside, it can contaminate food if you turn the bags inside out and use them to store other foods.
- If you drink wine, always wipe the mouth of the bottle well (inside and out) with a damp cloth before pouring the wine. The foil wrappers around the corks of wine bottles can deposit lead around the mouth of a bottle and contaminate the beverage.

their intelligence suffers. Numerous studies show an average decrease of one-quarter point in intelligence quotient (IQ) for each 1-mg/dL increase in blood lead level.

A portable, battery-operated testing system that can analyze lead levels in the blood within three minutes is available. The testing unit, called LeadCare II, was developed by ESA Biosciences Inc. ([www.esainc.com](http://www.esainc.com)) and Andcare Inc. of Durham, North Carolina (which has merged with ESA).

Hair analysis is another method that can be used to detect heavy metal toxicity. However, results may not be ac-

curate if the sample is contaminated, for example, by hair dye or other possible sources of lead. (See HAIR ANALYSIS in Part Three.)

One way to get an indication if your child may be at risk of developing lead poisoning is to have a veterinarian check the lead level in your family dog. Long before children show symptoms of lead poisoning, dogs can get colic, then diarrhea or vomiting, and even seizures. Dogs ingest lead the way small children do—licking toys covered with lead-filled dust, chewing old paint on walls or furniture, or putting things covered with old lead paint flakes in their mouths.

☐ Children with above-average levels of lead in their blood are half an inch shorter, on average, than other children. According to one researcher, lead levels are significantly higher in infants who die of sudden infant death syndrome (SIDS) than in infants who die of other causes.

☐ A study reported in *The New England Journal of Medicine* suggested that even low levels of lead in children may lead to lifelong problems, such as severe reading difficulties, learning disabilities, poor eye-hand coordination, retarded growth, and slowed reflexes. High levels of lead in the body have also been implicated in autism, behavioral problems, hyperactivity, and juvenile delinquency.

☐ Even though leaded gasoline has been almost completely replaced with unleaded fuel, there is still an estimated 4 to 5 million metric tons of lead in American soil that accumulated as a result of leaded gasoline use in the past. Anyone who grows crops or garden produce near busy roads or highways or near a house painted with lead paint should check the lead level in the soil.

☐ Any building fifty years old or older should be inspected by a professional, and if there is lead-based paint on the walls, it should be removed by someone with the proper expertise and equipment. Simply painting over old lead-based paint can release tiny particles containing lead into the air, posing a possible lead hazard.

☐ A previously underreported source of lead poisoning may be lead-based hair colorings used by men. According to the Cosmetic, Toiletry, and Fragrance Association, 80 percent of the hair-coloring products designed for men use so-called progressive coloring agents, which are made of lead acetate. It is known that some lead is absorbed through the scalp, raising questions about the risk of lead poisoning.

☐ The U.S. Food and Drug Administration (FDA) considers children and pregnant women at highest risk for lead poisoning.

☐ An easy way to test dishes for lead is to use LeadCheck Swabs from Hybrivet Systems. The same company also makes a kit for testing for lead in water.

☐ More information about lead poisoning is available from the U.S. Environmental Protection Agency's National Lead Information Center. (See Health and Medical Organizations in the Appendix.)

## LEG CRAMPS

See MUSCLE CRAMPS. See also under PREGNANCY-RELATED PROBLEMS.

## LEG ULCERS

Ulcers are open sores that develop on deteriorated patches of skin. When poor circulation in the legs restricts blood flow, the skin tissue begins to erode; it is thus more suscep-

tible to the development of an open sore. The broken skin can be very slow to heal. Leg ulcers are more likely to develop in people with poor circulation, thrombophlebitis, and/or varicose veins. *Venous ulcers* are leg ulcers related to a condition known as venous stasis, in which leg veins cease to function as they should. Blood pools in the veins, resulting in inflammation of the overlying skin that leads to the development of ulcers. Venous ulcers are usually situated on the lower third of the leg. *Arterial ulcers* occur when an artery or arteries serving the leg fail to deliver an adequate blood supply, which in turn may be caused by atherosclerotic plaque or by an embolism blocking the proper flow of blood. These ulcers usually occur on bony areas around the feet and ankles. *Diabetic ulcers* can be a result of peripheral neuropathy or insufficient blood supply to the surface of the skin. (See DIABETES in Part Two.) They normally occur around the feet.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Coenzyme Q <sub>10</sub>	60 mg daily.	Increases resistance to leg ulcers by increasing tissue oxygenation.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Enhances utilization of oxygen to improve blood flow to the legs.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Improves circulation and aids the healing process.
Grape seed extract	As directed on label.	A powerful antioxidant that prohibits free radical damage.
Shark cartilage	As directed on label.	To improve blood vessel integrity.
Ultra Connexin from American Biologics	As directed on label.	Supports wound healing and blood vessel wall health.
Vitamin C with bioflavonoids	5,000–10,000 mg daily, in divided doses.	Improves circulation and aids in the healing process. Also keeps infection in check.
Vitamin E emulsion	200 IU daily or 400 IU every other day.	Helps the body use oxygen efficiently and speeds healing. Use d-alpha-tocopherol form. Emulsion is preferable to capsules; it provides for easier assimilation and greater safety at higher doses.

Helpful		
Colloidal silver	Apply topically to the affected area as directed on label.	A broad-spectrum antiseptic that promotes rapid healing and subdues inflammation.
Flaxseed oil or Ultimate Oil from Nature's Secret	2 tsp daily. As directed on label.	To minimize clot formation and help keep veins soft and pliable.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label. Take on an empty stomach.	Promotes healing and tissue repair.
Iron  or Floradix Iron + Herbs from Salus Haus	As directed by physician. Take with 100 mg vitamin C for better absorption. As directed on label.	Important for cell growth and healing. <i>Caution:</i> Do not take iron unless anemia is diagnosed. A natural and nontoxic source of iron.
Multivitamin and mineral complex	As directed on label, with meals.	Necessary for proper healing and to remedy and/or prevent nutritional deficiencies.
Vitamin A emulsion with mixed carotenoids	25,000 IU daily for 1 month. If you are pregnant, do not exceed 10,000 IU daily.	Necessary for healing and protection of tissues. Use emulsion form for more rapid and complete assimilation.
Vitamin B complex  plus extra vitamin B <sub>12</sub>  and folic acid	As directed on label.  1,000–2,000 mcg daily.  400 mcg 3 times daily, plus injections (under a doctor's supervision) twice weekly or as prescribed by physician.	B vitamins work best when taken together. Use a high-potency formula. Allows proper tissue enzyme function for healing. Helps to prevent anemia. Use a lozenge or sublingual form. Vital for proper utilization of protein during the healing process.
Vitamin K	As directed on label.	Needed for blood clotting and healing.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Aids in the healing of ulcers and boosts immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

- Alfalfa, taken in capsule or tablet form, is a good source of vitamin K. Red clover tea or capsules are also beneficial.
- Make comfrey tea and use it as a compress; soak a clean cloth in it and apply the cloth to aching, inflamed leg ulcers.

*Caution:* Comfrey is recommended for external use only.

- Echinacea improves immune function and aids healing.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- Goldenseal is a natural antibiotic and promotes healing.

It can be taken in tea or capsule form. It can also be used as a poultice. Moisten a piece of sterile gauze with alcohol-free goldenseal extract and use this to cover the ulcer.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

## Recommendations

- Go on a diet of raw foods with lightly steamed vegetables for one month to help the healing process.
- Eat dark green leafy vegetables to obtain vitamin K.
- Include plenty of fresh garlic and onions in your diet. These promote circulation and healing, and also contain the trace element germanium, which boosts the immune system and improves tissue oxygenation.
- See FASTING in Part Three and follow the program.
- To speed healing, apply vitamin E oil to the sore and bandage it lightly with a sterile gauze pad. Change the bandage daily until the sore is healed.
- Keep the ulcer clean and germ-free to prevent infection.
- See your physician if you have this medical problem. Sometimes antibiotics are necessary for the sores to heal.
- If you must take antibiotics, be sure to take acidophilus liquid or tablets. You can also obtain acidophilus from yogurt and soured milk products.

## Considerations

- Dimethylsulfoxide (DMSO) can be applied topically to the sores. It helps to relieve pain and promote healing. In one study, DMSO powder produced significantly higher healing rates in venous leg ulcers than a placebo.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

- Laser therapy has not proved beneficial for venous leg ulcers. There may be some benefit in combining laser and infrared light therapy, but more research is needed to prove this conclusively.
- CircAid Medical Products makes adjustable bands specifically for venous stasis and venous ulcer conditions. (See Manufacturer and Distributor Information in the Appendix.)
- Leg ulcers often do not cause much pain, so if you have

diabetes or circulatory problems, it is advisable to examine your lower legs and feet often.

See also CIRCULATORY PROBLEMS and VARICOSE VEINS in Part Two.

## LEGIONNAIRES' DISEASE

This is a serious lung and bronchial tube infection caused by bacteria of the genus *Legionella*, especially *Legionella pneumophila*. It was first identified following an outbreak that affected 182 people attending an American Legion convention in 1976—hence the name. The bacteria live primarily in water and are transmitted through airborne vapor droplets, although they are sometimes found in excavation sites and newly plowed soil. The incubation period is from two to ten days after exposure to the bacteria. The disease does not spread from one person to another.

The first signs of illness may resemble those of the flu—achiness, fatigue, headache, and moderate fever. The disease then progresses to include high fever (up to 105°F), chills, coughing, diarrhea, disorientation, nausea and vomiting, severe chest pain, shortness of breath, and, as a result of inadequate oxygen, a bluish tinge to the lips, nails, or skin. The coughing begins without sputum but eventually produces sputum that is gray or blood-streaked. Laboratory blood studies and cultures of sputum aid in diagnosis.

The risk of contracting Legionnaires' disease increases with chronic illness such as diabetes, emphysema, or kidney failure, and with immune-suppressing lifestyle habits such as smoking and alcohol consumption. Young adults usually recover fully from the disease, whereas elderly people, especially those in poor health, are at greater risk of developing respiratory failure.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Garlic (Kyojolic from Wakunaga)	2 capsules 3 times daily, with meals.	Aids in destroying bacteria.
Natural beta-carotene or carotenoid complex (Betatene)	25,000 IU daily. As directed on label.	A precursor of vitamin A that protects the lungs.
Vitamin C plus bioflavonoids	3,000 mg 3 times daily. 100 mg twice daily.	Powerful antioxidants that help to kill bacteria. Intravenous treatment (under a doctor's supervision) may be beneficial.

### Very Important

Coenzyme Q <sub>10</sub>	60 mg daily.	Increases and regulates immunity. Carries oxygen to the cells. Supports and boosts the body's immune system. Works well with coenzyme Q <sub>10</sub> .
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	
<i>Lactobacillus bulgaricus</i>	As directed on label.	Aids digestion and destroys harmful bacteria.
L-carnitine plus L-cysteine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Important in immune function. Protect lung tissues. (See AMINO ACIDS in Part One.)
Vitamin B complex	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	A complex of vital coenzymes needed for cellular function and protection.

### Important

Inf-zyme from Biotics Research	2 tablets 3 times daily, on an empty stomach.	Stimulates the immune system and reduces inflammation in the body.
Raw thymus glandular and raw lung glandular	As directed on label.	Glandulars that potentiate thymus and lung function and enhance immune function.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Boosts the immune system and protects and repairs lung tissue. Use emulsion form for easier assimilation and greater safety at high doses.
Vitamin E emulsion or capsules	200 IU twice daily. 200 IU daily or 400 IU every other day.	An important antioxidant that protects lung tissue. Use d-alpha-tocopherol form. Emulsion form is easier to assimilate.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important for immune response. Zinc gluconate in lozenge form is best.

### Helpful

Aerobic 07 from Aerobic Life Industries or Dioxychlor	As directed on label.	To destroy infectious bacteria but not "good" bacteria.
	As directed on label.	A potent antibacterial, antifungal, and antiviral agent.

### Herbs

- Catnip tea is good for reducing fever.
  - Clear Lungs from RidgeCrest Herbals is a Chinese herbal formula that protects the lungs. Take 2 capsules three times daily.
  - Echinacea is a powerful immune stimulant.
- Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.
- Eucalyptus helps to open up air passages.

- Goldenseal is a natural antibiotic.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Olive leaf extract helps protect against bacterial and viral infections. It has proven effective against pneumonia and sore throat.

### Recommendations

- Eat a diet consisting of 75 percent raw foods and very lightly steamed vegetables.
- Consume no alcohol, dairy products, fried foods, sugar, or tobacco.
- Use a cool mist humidifier to increase the amount of moisture in the air and to thin lung secretions.
- Keep warm—do not get chilled, as this will worsen the disease.
- Practice deep-breathing exercises. (See BREATHING EXERCISES *under* PAIN CONTROL in Part Three.)
- Use a heating pad or a hot water bottle on the chest to relieve pain.
- Be aware that recovery from Legionnaires' disease takes time. Allow yourself two to four weeks for recovery, and be sure to get adequate rest. Do not push yourself to resume normal activities prematurely.

### Considerations

- Legionnaires' disease progresses rapidly and can be very dangerous. Hospitalization and aggressive treatment with intravenous antibiotics and oxygen may be necessary.
- Legionella* bacteria may inhabit heating and cooling systems. It is wise to have the heating and cooling systems in both your home and workplace cleaned and inspected regularly, and to change the filters often.

### LEUKODYSTROPHIES

See *under* RARE DISORDERS.

### LEUKORRHEA

See VAGINITIS in Part Two.

### LIVER DISEASE

See CIRRHOSIS OF THE LIVER *and* HEPATITIS in Part Two.

### LUMBAGO

See *under* BACKACHE.

### LUPUS

Lupus is a chronic inflammatory disease that can affect many of the body's organs. It is an autoimmune disease—that is, it occurs when the immune mechanism forms antibodies that attack the body's own tissues. Many experts believe that it is due to an as-yet-unidentified virus. According to this theory, the immune system develops antibodies in response to the virus that then attack the body's own organs and tissues. This produces inflammation of the skin, blood vessels, joints, and other tissues. Heredity and sex hormones are two other possible factors in the development of this illness.

This disease was named *lupus*, which means "wolf," because many people who got it developed a butterfly-shaped rash over the cheeks and nose that was considered to give them something of a wolflike appearance. In fact, rashes may appear elsewhere on the body as well, such as the chest, ears, hands, shoulders, and upper arms. At least 90 percent of lupus patients between the ages of fifteen and forty-five are women. However, after the age of fifty (approximately the age of the onset of menopause), the percentage of women with lupus falls to 75 percent and the percentage of men with the disease rises to 25 percent. African American women are two to three times more likely to get it than Caucasian women. Women of Asian, Hispanic, and Native American background also appear to be at greater risk of developing lupus than Caucasian women.

There are two main types of lupus: systemic lupus erythematosus (SLE) and discoid lupus erythematosus (DLE). Two others that are far less common are drug-induced lupus, which is caused by medications, and neonatal lupus, which is a rare disease that can occur in newborn babies of women with SLE, Sjögren's syndrome, or no disease at all. SLE is the form of the disease that most people are referring to when they say lupus. As the name implies, SLE is a systemic disease that affects many different parts of the body. The severity can range from mild to life-threatening. The first symptoms of many cases of SLE resemble those of arthritis, with swelling and pain in the fingers and other joints. The disease may also appear suddenly, with acute fever. The characteristic red rash may appear across the cheeks; there may also be red, scaling lesions elsewhere on the body. Sores may form in the mouth. Other symptoms can include abdominal and chest pains, blood in the urine, fatigue, hair loss, loss of appetite, low-grade fever, nausea, poor circulation in the fingers and toes, shortness of breath, ulcers, vomiting, and weight loss. The lungs and kidneys are often involved. Approximately one-third of those with lupus will develop the kind that needs treatment. In serious cases, the brain, lungs, spleen, and/or heart may be affected. SLE can cause anemia and inflammation of the

surface membranes of the heart and lungs. It can also cause excessive bleeding and increased susceptibility to infection. If the central nervous system is involved, amnesia, deep depression, headaches, mania, paralysis, paranoia, psychosis, seizures, and stroke may be present. Patients with lupus are at greater risk of heart attacks, strokes, infections (sepsis), and kidney failure.

The discoid type of lupus is a less serious disease that primarily affects the skin. The characteristic butterfly rash forms over the nose and cheeks. There may also be lesions elsewhere, commonly on the scalp and ears, and these lesions may recur or persist for years. The lesions are small, soft yellowish lumps. When they disappear, they often leave scars. If these scars form on the scalp, permanent bald patches may result. While DLE is not necessarily dangerous to overall health, it is a chronic and disfiguring skin disease. Some experts have related it to a reaction to infection with the tubercle bacillus.

Both types of lupus follow a pattern of periodic flare-ups alternating with periods of remission. Exposure to the sun's ultraviolet rays can result in a flare-up of DLE and may even induce the first attack. Fatigue, pregnancy, childbirth, infection, some drugs, stress, unidentified viral infections, and chemicals may also trigger a flare-up. Drug-induced cases usually clear up when the drug is discontinued.

According to the American Rheumatism Association, four of the following eight symptoms must occur, either serially or at the same time, before a diagnosis can be made:

1. Abnormal cells in the urine.
2. Arthritis.
3. Butterfly rash on the cheeks.
4. Low white blood cell count, low platelet count, or hemolytic anemia.
5. Mouth sores.
6. Seizures or psychosis.
7. Sun sensitivity.
8. The presence in the blood of a specific antibody that is found in 50 percent of people with lupus.

A kidney biopsy may be needed to diagnose lupus-related nephritis.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium	1,500–3,000 mg daily. 750 mg twice daily.	Necessary for pH balance and for protection against bone loss due to arthritis.
Essential fatty acids (fish or flax oil)	As directed on label.	Aids in arthritis prevention.
L-cysteine and L-methionine plus L-lysine	500–1,000 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Assist in cellular protection and preservation; important in skin formation and in white blood cell activity. Aids in preventing mouth sores and offers protection against viruses. (See AMINO ACIDS in Part One.)
Proteolytic enzymes	As directed on label. Take with meals.	Powerful anti-inflammatory and antiviral agents.
<i>Important</i>		
Garlic (Kyoic from Wakunaga)	2 capsules 3 times daily, with meals.	An immune system enhancer that protects enzyme systems.
Glucosamine sulfate or N-acetylglucosamine (N-A-G from Source Naturals)	As directed on label. As directed on label.	Important for healthy skin, bones, and connective tissue. May help to prevent lupus erythematosus.
Raw thymus glandular and raw spleen glandular	As directed on label. As directed on label.	Glandulars that enhance thymus and spleen immune function. (See GLANDULAR THERAPY in Part Three.)
Zinc plus copper	50–100 mg daily. Do not exceed this amount from all supplements. 3 mg daily.	Aids in normalizing immune function; protects the skin and organs and promotes healing. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.
<i>Helpful</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	Protects against intestinal bacterial imbalances. Use a nondairy formula.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains a balance of antioxidants, amino acids, and herbs that promote skin health.
Kelp	1,000–1,500 mg daily.	Supplies commonly deficient minerals.
Multivitamin and mineral complex with vitamin B complex	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	To supply commonly deficient nutrients. Use a high-quality, hypoallergenic formula. Heals mouth sores, protects against anemia, and protects the skin tissues. Important for brain function and digestion.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Powerful antioxidants and free radical scavengers that protect the cells.
Vitamin A with mixed carotenoids plus natural beta-carotene or carotenoid complex (Betatene)	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily. As directed on label.	Potent antioxidant and free radical scavenger needed for tissue healing. Use emulsion form for easier assimilation. An antioxidant and vitamin A precursor.

## Herbs

Alcohol-free goldenseal extract is good for mouth sores or inflammation. Place a few drops on a small piece of gauze or cotton before bedtime and leave it on overnight for fast healing.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Other herbs beneficial in treating lupus include burdock root, feverfew, pau d'arco, and red clover.

*Caution:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

Try using licorice root as a tea or dilute it to alleviate lupus symptoms. If you are taking immunosuppressive agents such as steroids, you may find licorice root to provide comparable results without being as harmful to your system.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Milk thistle cleanses and protects the liver.

Yucca is good for arthritis-type symptoms.

Many herbal remedies are being studied for use in patients with lupus. Herbs can both suppress and enhance various aspects of the immune system. For example, Cordyceps sinensis, reishi, and nettles have all been studied in lupus for immunosuppression and pain relief. The most studied herbs were thunder god vine and lei gong teng.

## Recommendations

Eat a diet low in fat, salt, and animal protein—this kind of diet keeps the immune system from being overly reactive and is easy on the kidneys. Use only canola or olive oil.

Consume sardines often; they are a good source of omega-3 essential fatty acids. Other good sources are flax oil and any seafood. Include seafood twice a week in your diet and use fish oil supplements.

Eat eggs, garlic, and onions. These foods contain sulfur, which is needed for the repair and rebuilding of bone, cartilage, and connective tissue, and aids in the absorption of calcium.

Include in the diet brown rice, fish, green leafy vegetables, nonacidic fresh fruits, oatmeal, and whole grains.

Eat fresh (not canned) pineapple frequently. Bromelain, an enzyme present in fresh pineapple, is excellent for reducing inflammation.

Use some form of fiber daily.

Do not consume milk, dairy products, or red meat. Also avoid caffeine, citrus fruits, paprika, salt, tobacco, and everything that contains sugar.

Avoid the nightshade vegetables (eggplant, peppers, tomatoes, white potatoes). These foods contain a substance called solanine, which can contribute to inflammation and pain.

Get your iron from food sources, not supplements, unless your doctor tells you that you need it. Taking iron in supplement form may contribute to pain, swelling, and joint destruction.

Avoid eating alfalfa sprouts. They contain canavain, a toxic substance that is incorporated into protein in place of arginine.

Get plenty of rest and regular moderate exercise that promotes muscle tone and fitness.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Avoid strong sunlight and use protection from the sun. Protect your skin by applying a sunscreen product with an SPF of 15 or higher. Wear a wide-brimmed hat and clothing that will adequately cover exposed skin. Go out in the sun only when absolutely necessary.

Use hypoallergenic soaps and cosmetics. Some deodorant soaps and other toiletry items may contain ingredients that will increase your sensitivity to light.

Try to avoid fluorescent lighting in both the home and the workplace. Exposure to fluorescent lighting can aggravate lupus symptoms. If possible, remove all fluorescent and halogen lighting and replace them with incandescent bulbs.

Avoid large groups of people and those with colds or other viral infections. Autoimmune diseases such as lupus render an individual more susceptible to viral infections.

Avoid using birth control pills. They may cause lupus to flare up.

## Considerations

Some researchers believe that faulty genes are the ultimate culprit behind this disorder, but that outside factors can trigger it. Substances that are common contributing factors include chemicals, environmental pollutants, food additives, and some foods.

A test for food allergies is helpful and often very revealing in cases of lupus. (See ALLERGIES in Part Two.)

In one study, blood cholesterol was improved with fish oil and a healthy diet. This combination helps reduce the risk of heart attack. In another study, flax oil was shown to help maintain kidney function. Patients who followed their daily flax oil regimen over two years had a lowering of creatinine, a marker of worsening kidney function. Patients took 30 grams of ground flaxseeds each day, but many found

it caused gastrointestinal distress and some thought it was inconvenient to prepare. Taking both fish oils and ground flaxseeds may lead to improved heart and kidneys.

❑ Ronenn Roubenoff, MD, a Senior Director of Immunology Medical Research at Biogen Idec, Inc. in Cambridge, Massachusetts, advises that lupus patients take a multivitamin as well as calcium and iron. However, he cautions that there is no proof that megavitamin therapy is effective.

❑ Up to 10 percent of lupus cases could be caused by drug reactions, according to an article that was published in *The New England Journal of Medicine*. Certain drugs, such as hydralazine (Apresoline), a blood pressure medication, procainamide (Pronestyl), used for irregular heartbeat, and quinidine (Quinaglute), seem to be able to initiate lupus in susceptible individuals. Drug-related lupus usually does not affect the kidneys or nervous system. It is likely to be milder, and the condition usually subsides when the drug is stopped.

❑ Many people with lupus also have Raynaud's disease. (See RAYNAUD'S DISEASE/RAYNAUD'S PHENOMENON in Part Two.) The condition can lead to false-positive blood test results for syphilis.

❑ Many different treatments are used for lupus. Anti-inflammatory drugs are usually used first. Antimalarial drugs such as hydroxychloroquine (Plaquenil) may alleviate the skin problems and joint problems that afflict those who have lupus. Corticosteroids, such as prednisone (Deltasone and others), are adrenal hormones that are considered important in the treatment of lupus. In severe cases, physicians may have to use cortisone and immunosuppressive agents to induce remission. Anticonvulsants, drugs used to control seizures, and warfarin (Coumadin), an anticoagulant used to prevent blood clotting and reduce the possibility of stroke or heart attack, may also be prescribed. All of these drugs, especially the corticosteroids, have potentially serious side effects.

❑ Dehydroepiandrosterone (DHEA) therapy has been found to help in treating lupus. (See DHEA THERAPY in Part Three.)

❑ Some research into experimental procedures and new drugs is under way. These include stem cell transplant, where your own adult stem cells are used to rebuild the immune system, and the drug rituximab (Rituxan), which decreases the number of B cells, a type of white blood cell involved in modulating immune function. Rituximab may help those patients who haven't responded to other therapies. However, it has been linked to fatal brain infections in two people with lupus.

❑ Mild cases of lupus respond well to supplements that build up the immune system. (See WEAKENED IMMUNE SYSTEM in Part Two.)

❑ Further information on lupus can be obtained from the Lupus Foundation of America. (See Health and Medical Organizations in the Appendix).

❑ See also ARTHRITIS in Part Two.

## LYME DISEASE

This disease takes its name from the town of Old Lyme, Connecticut, where it was first identified in 1975. Since that time, the locations and the number of cases of Lyme disease have continued to increase. In 1983, the year after national surveillance began, 48 cases were reported to the national Centers for Disease Control and Prevention in Atlanta. More than 27,000 cases of Lyme disease were reported in the United States in 2007, according to the CDC, although they say the disease is greatly underreported. Most known cases in the United States have occurred in the northeastern, mid-Atlantic, and north-central states, and it is most common among persons five to fourteen and forty-five to fifty-four years of age. It also occurs in Europe, Russia, China, Japan, and Australia.

Lyme disease is the most common tick-borne illness in the United States. The bacteria that cause it, spirochetes called *Borrelia burgdorferi*, are transmitted by the deer tick (carried by deer and mice) in most places. In several counties along the northern Pacific coast of California, however, they are transmitted by the closely related black-legged tick, which is also carried by wood rats. Both deer ticks and black-legged ticks are very tiny; an adult tick is less than one-tenth of an inch long, and the nymph is the size of a pinhead. They are hard to spot because they are so much smaller than the common dog tick. Because they are so tiny, they often go undetected. The nymphs and larvae feed primarily on white-footed mice, and the adults on white-tailed deer, although they may feed on many other animals as well, including birds, chipmunks, cows, horses, cats, dogs, lizards, and jackrabbits. The ticks fall off one host animal into grasses in marshes or fields, or into brush in wooded areas, from which they can be picked up by an unsuspecting passerby, whether human or animal, who becomes the next host. Not surprisingly, those most likely to be affected are people who spend time outdoors in or near wooded areas, where the ticks are prevalent, and the majority of cases occur in the summer and fall. Household pets like dogs and cats can pick up ticks and carry them into the home, where they can be transmitted to humans.

After a tick bites, it waits several hours before it begins to feed on the host's blood, and once it does, it feasts for three or four days. As it feeds, it may deposit its infectious cargo in the host's bloodstream. The longer the tick remains attached, the greater the risk of disease.

The symptoms of Lyme disease are extremely variable, as is the incubation period, which may take anywhere from two to thirty-two days. The first sign may be the appearance of a red, circular lesion or rash on the skin, which is known as *erythema migrans* (EM). This is caused by the migration of the infecting organism outward through the skin, and it may appear anywhere from a few days to a few weeks after the bite. The lesion gradually expands in a circular pattern, while the center appears to clear up. For this reason, it is often referred to as a bull's-eye rash. In addition to the

rash (or, in some cases, instead of the rash), achiness, backache, difficulty sleeping, fatigue, flulike symptoms, headache, muscle weakness, stiff neck, and, occasionally, nausea and vomiting may occur. The disease then usually progresses through the following three stages, although not everyone experiences all three:

1. Three days to three weeks after a tick bite, small raised bumps on the skin and/or a rash appears and may cover the entire torso, for as little as a day or two or as much as several weeks, and then fade. (If a rash appears immediately at the site of the tick bite, it may be a reaction to the bite itself and not to the bacteria that causes Lyme disease.) Chills, fever, nausea, sore throat, and vomiting may also occur.
2. Facial paralysis that mimics Bell's palsy may occur weeks to months later. An abnormal heart rhythm, enlargement of the heart muscle, enlargement of the spleen and lymph glands, and severe headaches may also occur about this time.
3. Over the long term, persistent backache, stiff neck, joint pains that attack the knees, swelling and pain in other joints, and even degenerative muscle disease may be caused by Lyme disease.

Because these tick bites are usually painless, the incubation period is so long, and the symptoms of Lyme disease are so varied, the disorder may go unrecognized for weeks or even months. A physician may fail to diagnose the disease before it is in its advanced stages. Be sure to go to the doctor right away if you have a red bull's-eye mark (darker red in the center). Don't guess; most doctors are familiar with what Lyme disease marks look like, so it is better to have it checked by a professional than to analyze it yourself. Lyme disease produces symptoms that resemble those of chronic fatigue syndrome, gout, lupus, and multiple sclerosis, and misdiagnosis is not uncommon. Once arthritis appears, the joint pain and stiffness can come and go, recurring even years later. An estimated 10 percent of those with Lyme disease arthritis are left with permanent stiffness in their joints.

Lyme disease is treatable and almost always curable if found in its early stages. If the disease is not treated in the early stages, however, arthritis, enlargement of the spleen and lymph nodes, eye inflammation, hepatitis, irregular heart rhythm, and damage to the cardiovascular and central nervous systems can occur. Some people find that their symptoms slowly subside over two to three years; others develop chronic problems. Often, symptoms leave and recur without another tick bite.

A simple test has been developed to identify Lyme disease. A blood sample is used to measure the levels of certain antibodies that usually increase in number from three days to three weeks after infection.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve

and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Essential fatty acids (Kyolic-EPA from Wakunaga)	As directed on label.	Reduces inflammation and joint stiffness.
Pancreatin and bromelain or Inf-zyme Forte from American Biologics	As directed on label. 2-3 times daily, between meals and at bedtime.	To aid protein digestion and reduce inflammation.
Primrose oil	1,000 mg 2-3 times daily.	Helps to combat pain and inflammation by promoting the production of anti-inflammatory prostaglandins.
<i>Helpful</i>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A powerful immune system stimulator; acts as an antibiotic.
Kelp	1,000-1,500 mg daily.	Contains essential vitamins and minerals and aids in detoxifying the body.
Multivitamin and mineral complex	As directed on label.	For necessary vitamins. Use a high-potency formula.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A free radical scavenger.
Taurine Plus from American Biologics	As directed on label.	An important antioxidant and immune system regulator necessary for white blood cell activation and neurological function. Use the sublingual form.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	An important antioxidant.
Vitamin C with bioflavonoids	6,000-10,000 mg daily, in divided doses.	Needed for adequate immune function.
Vitamin E	200 IU daily or 400 IU every other day.	An important antioxidant. Use d-alpha-tocopherol form.
Zinc lozenges plus copper	1 15-mg lozenge every 3 waking hours for 4 days. Do not repeat this regimen for at least 30 days. 3 mg daily.	Necessary for immune function. Needed to balance with zinc.

**Herbs**

- Alfalfa supplies needed minerals.
- Dandelion root, ginseng, hawthorn, and marshmallow root are all good for helping to rebuild the blood and damaged tissues.

**Caution:** Do not use ginseng if you have high blood pressure or are pregnant or nursing.

Echinacea is an immune enhancer.

**Caution:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Goldenseal is a natural antibiotic. Take ½ dropperful of alcohol-free goldenseal extract three times a day for one week. It can be taken under the tongue for fast results, or added to tea.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Milk thistle extract protects the liver.

Red clover cleanses the bloodstream.

## Recommendations

Include plenty of garlic in your diet or take garlic supplements. It is a natural antibiotic and immune-booster.

Use barley grass, bee pollen, and/or royal jelly to supply nutrients needed to repair tissue and rebuild the blood.

**Caution:** Bee pollen may cause an allergic reaction in some people. Start with a small amount at first, and discontinue use if a rash, wheezing, discomfort, or other symptom occurs.

Use "green drinks" to provide chlorophyll, which aids in detoxification, and other valuable nutrients and enzymes. Kyo-Green from Wakunaga is an excellent choice.

If you develop a bull's-eye-type rash anywhere on your body, see your health care provider as soon as possible, even if you have no memory of being bitten by a tick. Early treatment is essential.

If antibiotics are prescribed, be sure to take some form of acidophilus supplement daily.

Take hot baths or whirlpool treatments. Heat relieves joint pain.

Take precautionary measures to help prevent tick bites:

- When spending time in or near wooded areas, wear long pants and tuck them into your socks. Wear a long-sleeved shirt with a high neck or a scarf, plus a hat and gloves. Wear light-colored clothing so that any ticks will be more visible.
- Use an insect repellent containing diethyl-meta-toluamide (DEET) on your clothing, your neck, and any other exposed area except your face. Deet lasts longer and is safer when applied to certain clothing (see Caution be-

low) than on exposed skin, so cover as much of the body with clothing as you can. Do not use excessive amounts of DEET. Follow product label directions carefully, and wash the repellent off as soon as you go indoors.

**Caution:** DEET is extremely toxic and can be deadly if ingested. However, when used according to the product directions, it does not pose a health concern because its use is expected to be brief. Be extremely careful when using it around small children. Do not use under clothing.

- After spending time outdoors, check yourself carefully for any small raised bumps and for pinpoint-sized specks on clothing. Do this right away; the longer a tick is attached, the greater the risk of Lyme disease.
- Check children before they go to bed during the summer if they spend a lot of time outdoors. Look closely at their hair, ears, underarms, trunks, groins, and the backs of their knees. Have them shower when they come in from outdoors, and wash their clothes immediately.
- Dry your laundry in an electric clothes dryer for half an hour to kill any ticks that may be present. Washing clothes, even in hot water and bleach, will not necessarily kill ticks.
- Inspect pets before letting them indoors. They may carry ticks into the house that can fall off and bite family members.
- In a wooded or overgrown area, try to stay near the centers of trails and out of wooded areas, especially in May, June, and July.
- Keep your lawn mowed and remove leaf litter and brush. Move woodpiles away from the house during the summer.

If you find a tick on your body, do the following:

1. Remove the tick with a pair of tweezers. Grasp the tick with the tweezers as close to the skin as possible and pull the tick straight out. Do not twist the tweezers as you pull, and do not squeeze the tick's body, or bacteria may be injected into the skin. If possible, save the tick in a small bottle or jar. *Do not* use a match to try to burn the tick out, or resort to other home remedies like kerosene or petroleum jelly.
2. Once the tick is removed, thoroughly wash your hands and the bite area, and apply rubbing alcohol or another topical antiseptic to the bite. If you suspect the tick may be a deer tick, see your health care provider promptly. Take the tick with you for identification.
3. For the three weeks following a tick bite, be alert for any of the symptoms described in this section. If you have any doubts about your condition, consult your health care provider.

If you are being treated for Lyme disease but are not getting better, consider having yourself tested again. False positive results are possible, and you may actually have a different problem.

### Considerations

Pregnant women need to be especially careful to avoid ticks in Lyme disease areas. The infection can be transferred to the developing fetus and, in rare circumstances, can cause complications such as miscarriage or the birth of a stillborn baby.

Prompt treatment with antibiotics can halt the course of Lyme disease. Many physicians do not like to prescribe antibiotics unless a person develops the characteristic symptoms of Lyme disease—a small red bump at the site of the tick bite, and a bull's-eye rash surrounding it, with flulike symptoms such as fatigue, chills, and joint pain. If treatment is deferred until the onset of more advanced symptoms, such as involvement of the brain, heart, or joints, antibiotic therapy is not as effective. One study found that with antibiotic treatment, patients felt better and were better able to care for themselves while recovering from Lyme disease compared to a group given a placebo. An intravenous drug also is available to treat Lyme disease. Speak to your health care provider about the latest treatment methods and best practices.

The vaccine against Lyme disease was removed from the market in 2002 due to low demand. Because antibiotics are so effective at treating Lyme disease, the vaccine was considered no longer necessary.

One study showed that of 788 people diagnosed with Lyme disease, over half had other health problems, not Lyme disease. Physicians blame current laboratory tests for the false-positive results.

Pets can get Lyme disease, too. Call your veterinarian if your pet exhibits any of the following:

- Fever of 103°F to 106°F.
- One or more swollen, hot joints.
- A tendency to sit or lie in one place for longer periods of time than usual.
- Lameness that seems to come and go.
- Reluctance to move.
- Poor appetite.
- A hot, dry nose.

The CDC provides information on Lyme disease to health professionals and the public. (See Health and Medical Organizations in the Appendix.) The CDC also works with state health departments to track cases of Lyme disease. Your state or local health department can tell you if Lyme disease has been reported in your area.

## MACHADO-JOSEPH DISEASE (MJD)

See under ATAXIA in RARE DISORDERS.

## MACULAR DEGENERATION

See under EYE PROBLEMS.

## MALABSORPTION SYNDROME

Malabsorption is the failure of the body to properly absorb vitamins, minerals, and other nutrients from food. Even though his or her diet is adequate, an individual with malabsorption develops various nutritional deficiencies. This problem can result from impaired digestion, impaired absorption of nutrients into the bloodstream from the digestive tract (especially the small intestine), or both.

Common symptoms of malabsorption syndrome include constipation or diarrhea, dry skin, fatigue, gas, mental difficulties such as depression or an inability to concentrate, muscle cramps and/or weakness, premenstrual syndrome (PMS), steatorrhea (pale, bulky, fatty stools), a tendency to bruise easily, failure to grow normally, thinning hair, unexplained weight loss, and visual difficulties, especially problems with night vision. Abdominal discomfort may be present as well. A combination of anemia, diarrhea, and weight loss is typical. In addition, in an attempt to get the nutrients it needs but is not absorbing, the body may begin to crave more and more food, often leading to the consumption of many empty and/or fat calories.

Digestive disorders are among the most common health problems in America today. Impaired digestion leads to malabsorption because if food is not broken down properly, the nutrients it contains cannot be absorbed through the lining of the intestines. The intestinal tract, pancreas, liver, and gallbladder all have parts to play in the uptake of nutrients. Consequently, anything that interferes with the proper functioning of any of these can lead to impaired digestion. Some factors that can contribute to impaired digestion are a lack of adequate levels of digestive enzymes; food allergies; a diet deficient in nutrients, such as the B vitamins, that are needed to produce digestive enzymes; and diseases of the pancreas, gallbladder, liver, and bile ducts that result in a lack of bile and essential enzymes. Although any type of nutrient may be affected by poor digestion, lipids (fats) are affected most often. In addition to causing nutritional deficiencies, the failure to digest food properly causes gastrointestinal problems. Undigested food ferments in the intestinal tract, causing gas, bloating, and abdominal pain and discomfort.

Even if food is properly digested, there may be a problem that prevents nutrients from being taken up by the bloodstream and used to nourish the body tissues. Damage to the intestinal walls, through which nutrients are absorbed, is one such problem. Disorders such as celiac disease, colitis, Crohn's disease, diverticulitis, irritable bowel syn-

drome, lactose intolerance, parasitic infestation, and excessive consumption of alcohol, antacids, or laxatives can all cause intestinal damage. Chronic constipation and/or diarrhea can have the same result. Another problem is too-rapid intestinal transit time, which results in nutrients being passed out of the body as waste before they can be absorbed. Radiation therapy, digitalis treatment, and surgery that shortens the intestinal tract all reduce the absorptive area, and therefore the absorptive capacity, of the small bowel.

Other factors that can contribute to a malfunction of the absorption mechanism include a poor diet; excess mucus covering the intestinal lining (most commonly a result of the overconsumption of mucus-forming and processed foods); an imbalance in intestinal bacterial flora, such as in candidiasis; the use of certain medications, such as neomycin (an antibiotic), colchicine (an antigout drug), and cholestyramine (a cholesterol-lowering drug); food allergies; and illnesses such as cancer. Obstructions in the lymphatic system may also interfere with nutrient absorption.

Regardless of how good your diet is or how many supplements you take, if you suffer from malabsorption syndrome, you will have nutritional deficiencies. These in turn lead to other problems. The impaired absorption of protein can induce edema (swelling of the tissues due to fluid retention). A lack of potassium can result in muscle weakness and cardiovascular problems. Anemia results from a lack of needed iron and folic acid. Calcium and vitamin D deficiency result in bone loss and tetany, a condition characterized by painful muscular spasms and tremors. Bruising easily results from a lack of vitamin K, night blindness from a deficiency of vitamin A. Malabsorption is also self-perpetuating; the failure to absorb B vitamins and to transfer amino acids across the intestinal lining interferes with the production of needed digestive enzymes and causes further malabsorption, since these nutrients are essential in the absorption process itself. A vicious cycle results.

Besides being a serious condition in itself, malabsorption is a factor in other medical and physical problems. The body needs all nutrients in balance because they work in concert. If there is a deficiency in even a single nutrient, the body can no longer function as it should, and all kinds of things can go awry. The result is disease. Malabsorption is a common contributing factor to a wide range of disorders, including cancer, heart disease, osteoporosis, and—because immune function is damaged by a lack of necessary nutrients—all types of infection.

Malabsorption is also a significant factor in the overall aging process, and it may account for the fact that some people seem to age more rapidly than others. As we age, the intestinal tract gets “out of shape” and the lining becomes covered with hard fecal matter and mucus, which makes absorption of nutrients more difficult. This is one reason older people need to consume greater amounts of nutrients. It is also why it is so important to keep the colon clean. Fecal deposits can irritate the nerve endings in the colon, leading to spastic colon or inflamed colon. Both of these

conditions interfere with bowel function and with the proper absorption of nutrients. In addition, the impacted deposits decay after a time, releasing toxins that can seep into the bloodstream, poisoning the organs and tissues.

People with malabsorption syndrome must take in more nutrients than the average person to compensate, and to treat and correct the problem. In supplying these nutrients, it is best to bypass the intestinal tract as much as possible. When choosing supplements, sustained-release and large, hard tablets should be avoided. Many people with malabsorption problems are unable to break down supplements taken in hard pill form; some even discharge pills whole in the stool. Injections, powders, liquids, and lozenges provide nutrients in forms that are more easily assimilated and therefore are preferred.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	1 tsp 3 times daily, on an empty stomach.	Needed for uptake and manufacture of many nutrients. Use a nondairy formula.
Vitamin B complex injections plus extra vitamin B <sub>12</sub> injections	2 cc twice weekly, or as prescribed by physician. 1 cc twice weekly, or as prescribed by physician.	To correct deficiencies. B vitamins must be replenished daily. Injections (under a doctor's supervision) are best. Needed for normal digestion and to prevent anemia.
and liver extract injections or vitamin B complex plus extra vitamin B <sub>12</sub>	1 cc twice weekly, or as prescribed by physician. As directed on label.	A good source of B vitamins and other valuable nutrients. If injections are not available, use a lozenge, sublingual, or spray form such as No Shot B-6/B-12/Folic from Superior Source.
and vitamin B <sub>6</sub> (pyridoxine) and folic acid	1,000 mcg 3 times daily, on an empty stomach. 50 mg 3 times daily. 400 mcg 3 times daily.	
<i>Important</i>		
Bioperine (Bioperine from Sabinsa or Bioperine 10 from Nature's Plus)	As directed on label.	Increases the absorption of nutrients and improves digestion.
Calcium	As directed on label.	Necessary for maintaining healthy bones. Use calcium citrate chelate form.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label 3 times daily, on an empty stomach.	Needed because protein is not broken down properly into amino acids, which are needed for virtually all life functions.
Garlic (Kyolic from Wakunaga)	As directed on label. Take with meals.	Aids digestion and promotes healing of the digestive tract. Use the liquid form.

Inf-zyme Forte from American Biologics	2 tablets with each meal.	A balanced, potent enzyme and cofactor as a powerful inflammatory inhibitor.
Magnesium	As directed on label.	Important for energy production. Assists in calcium and potassium absorption. Use chelate form.
Vitamin C with bioflavonoids	2,000–8,000 mg daily, in divided doses. Take with juice.	Needed to stimulate immune system function and to aid uptake of nutrients. Use a buffered powder form.
Vitamin E	200 IU daily or 400 IU every other day.	An essential antioxidant, it improves circulation and is necessary for tissue repair. Use d-alpha-tocopherol form.

### Helpful

Essential Fatty Acid Complex	As directed on label.	To repair the cells along the intestinal walls and to assist in proper utilization of fats.
Multivitamin and mineral complex plus carotenoid complex	As directed on label.	To replace lost nutrients. Minerals are the key to protein and vitamin utilization. Use a powdered form that is yeast- and allergen-free.
Proteolytic enzymes or multienzyme complex with pancreatic enzymes	As directed on label 3–6 times daily. Take with meals and between meals. As directed on label, 3 times daily, with meals.	Needed for protein digestion and breakdown of carbohydrates and fats.
Zinc lozenges plus copper	1 15-mg lozenge 3 times daily for 1 month. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Aids in the manufacture of digestive enzymes and in protein uptake. Needed to balance with zinc.

### Herbs

- Alfalfa, dandelion root, fennel seed, ginger, and nettle are rich in minerals and can aid the body in absorbing nutrients.
  - Aloe vera and peppermint aid digestion.
  - Black pepper contains piperine, which aids in the digestion and absorption of some nutrients.
  - Buchu decreases inflammation of the colon and mucous membranes.
  - Goldenseal promotes the functioning capacity of the colon, liver, and pancreas.
- Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.
- Irish moss and rhubarb are good for colon disorders.
  - Yellow dock improves colon and liver function.

### Recommendations

- Follow the dietary recommendations in this section for at least thirty days to give the colon a chance to heal and to cleanse its walls of hard matter and mucus. After thirty days, you may gradually reintroduce the foods that you have eliminated back into your diet; however, do not add them back too quickly or all at once. Instead, add small amounts of these foods, one at a time, back into your diet.
- Eat a diet that is high in complex carbohydrates and low in fats. Include in the diet well-cooked brown rice, millet, oatmeal, and steamed vegetables.
- Eat plenty of fruits (except for citrus fruits).
- Consume fresh papaya and pineapple often. Chew four to six papaya seeds after meals.
- Eat broiled, steamed, or baked whitefish three times a week.
- Do not eat large meals, as this places too much stress on the digestive system. Instead, eat smaller portions of food throughout the day.
- Drink six to eight glasses of liquids daily, including juices, quality water, and herbal teas (*see Herbs*, above, for suggestions). Use barley malt, a small amount of honey, or nut or soymilk for sweeteners, if necessary.
- Do not consume wheat products until healing is complete.
- Avoid products containing caffeine, which interferes with iron absorption. These include teas, coffee, colas, chocolate, many processed foods, and some over-the-counter medications (read labels).
- Keep fats and oils to an absolute minimum. Do not consume any animal products (including butter), fried or fatty foods, or margarine. The fats these foods contain exacerbate malabsorption problems by coating the stomach and small intestine, blocking the passage of nutrients. For the same reason, avoid all dairy products and processed food products, which encourage the secretion of mucus. Make sure to take supplemental calcium and vitamin D, if you avoid all dairy products.
- Eliminate citrus fruits, shellfish, and white rice from the diet.
- Strictly avoid all junk foods, such as potato chips and candy, as well as other products containing sugar, salt, monosodium glutamate (MSG), and preservatives.
- See COLON CLEANSING* in Part Three and follow the program.
- Follow the fasting program once monthly. (*See FASTING* in Part Three.)
- Avoid using mineral oil or other laxatives. Especially avoid using them for extended periods, as dependence and damage to the colon may result.
- If diarrhea or other symptoms of digestive disturbance occur for longer than three days, call your health care pro-

vider. Also consult a professional if you notice black and tarry or bright red stools, or if digestive problems are accompanied by severe abdominal pain or a fever of over 101°F.

❑ If a change of diet and the correct supplements do not improve your health status in a few months, consult your physician. You may have a malabsorption problem that requires medical attention.

### Considerations

❑ Chronic pancreatic insufficiency is a condition in which the pancreas does not secrete enough enzymes for proper digestion. Serious pancreatic disease can lead to malabsorption severe enough to damage the nervous system. Gallbladder and/or liver problems can lead to trouble in the digestion and absorption of essential fatty acids, which are necessary for good health. Impaired absorption of fats in turn can lead to deficiencies of fat-soluble nutrients, such as beta-carotene and vitamins A, D, E, and K. A simple stool test can measure which nutrients you are excreting.

❑ Aging is associated with low levels of vitamins B<sub>12</sub> and D. Levels are easily measured by a blood test. If you are over sixty years of age, you should have these measured at your yearly physical exam.

❑ Treatment of malabsorption requires recognition and, if possible, correction of the underlying cause of the problem, plus a healthful dietary regimen and supplementation. Appropriate medical consultation is needed in cases related to the use of cancer drugs, pancreatic insufficiency, and special problems associated with gastric or intestinal surgery. In some cases of severe malnutrition, intravenous nutrition may be needed.

❑ Certain drugs interfere with the absorption of nutrients. Examples include corticosteroids, cholestyramine (Questran), sulfasalazine (Azulfidine), and especially antibiotics. Corticosteroids depress protein synthesis, inhibit normal calcium absorption, and increase the amount of vitamin C lost through excretion. Cholestyramine interferes with the absorption of the fat-soluble vitamins A, D, E, and K. Sulfasalazine inhibits the transport of folate and iron, potentially causing anemia. Antibiotics disrupt the essential bacterial flora of the intestine. All of these drugs may increase the need for nutritional supplements.

### MALNUTRITION

### MANIC-DEPRESSIVE DISORDER

See BIPOLAR MOOD DISORDER.

### MASTITIS

See under BREAST-FEEDING-RELATED PROBLEMS.

### MEASLES

Measles, known to doctors as *rubeola*, is a viral infection that attacks the respiratory tract, eyes, and skin. Although it is typically a childhood disease, adults are also susceptible. This is not the same disease as rubella, or German measles, and is caused by a different virus.

Measles is very contagious and is easily spread through the nose, mouth, or throat; secretions on articles or surfaces; or by coughing and sneezing.

Illness usually sets in between seven and fourteen days after exposure to the virus. The first symptoms include fever (temperature of 103°F or higher), cough, sneezing, runny nose, and red eyes that may be sensitive to light. Several days later, Koplik's spots (tiny red spots with white centers) appear in the mouth and throat, the throat becomes sore, and a raised red rash erupts on the forehead and ears. Over a period of five to seven days, the rash spreads to all parts of the body.

In previously healthy children, measles usually runs its course in about ten days. However, measles is almost nonexistent in the United States because a vaccine is given to most children early in life. The measles vaccine (contained in MMR, MR, and measles vaccines) can prevent this disease. The MMR vaccine is a live, weakened combination vaccine that protects against the measles, mumps, and rubella viruses. It was first licensed in the combined form in 1971. It is made by taking the measles virus from the throat of an infected person and adapting it to grow in chick embryo cells in a laboratory. As the virus becomes better able to grow in the chick embryo cells, it becomes less able to grow in a child's skin or lungs. When this vaccine virus is given to a child, it replicates only a little before it is eliminated from the body. This replication causes the body to develop an immunity that, in 95 percent of children, lasts for a lifetime. A second dose of the vaccine is recommended to protect those 5 percent who did not develop immunity in the first dose and to give a booster effect to those who did develop an immune response.

If measles does develop, it can be followed by a number of complications, some of them potentially serious. These include middle ear infection (especially in children with a history of repeated ear infections), bronchitis, croup, pneumonia, strep throat, and even, in rare cases, encephalitis or meningitis. Adults who develop measles tend to suffer more serious cases of the disease than children do.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Bio-Strath from Nature's Answer	As directed on label.	Acts as a tonic. Contains the vitamin B complex. Use the liquid form.
Calcium and magnesium	As directed on label.	Needed for tissue repair.
Micellized Vitamin A and E from American Biologics or vitamin A	As directed on label. If you are pregnant, do not exceed 10,000 IU daily. 10,000 IU twice daily for 1 week, then reduce to 10,000 IU once daily. Do not exceed this dosage.	For adults. Needed to reduce infection and to repair tissues.
or cod liver oil	As directed on label.	For children.
Proteolytic enzymes	As directed on label 2-3 times daily, between meals.	Reduces infection and aids digestion.
Raw thymus glandular	500 mg twice daily.	Stimulates the immune system.
Vitamin B complex	100 mg of each major B vitamin 3 times daily or as directed on label (amounts of individual vitamins in a complex will vary).	Important in all bodily functions, including immune response and proper healing. For a child under eight, use a formula designed specifically for children.
Vitamin C with bioflavonoids	Adults: 3,000-10,000 mg daily, in divided doses. Children: 1,000-3,000 mg daily, in divided doses.	Very important for immune function. Fights fever and infection. Has antiviral properties. Use an ascorbate or esterified form.
Vitamin E	200 IU daily or 400 IU every other day. Children's dosage should not exceed 200 IU daily.	Neutralizes harmful free radicals, which can destroy cell membranes. Use d-alpha-tocopherol form.
Zinc lozenges	1 15-mg lozenge 3 times daily for 4 days. Then reduce to 1 lozenge daily.	For immune response and tissue repair. Reduces symptoms and speeds healing. Also relieves itchy throat and coughing.

## Herbs

Catnip tea or garlic enemas can be used to help to lower fever if necessary. (See ENEMAS in Part Three.)

Lobelia extract helps to relieve pain. Take ½ teaspoon of lobelia extract every four to five hours.

*Caution:* Lobelia is to be taken only under supervision of a health care professional, as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Spirulina is helpful for bolstering the immune system and can help slow replication of the virus.

## Recommendations

If you suspect that you or a member of your family has measles, see your health care provider. This is important for a correct diagnosis and to prevent serious complications.

Drink plenty of fluids such as water, juices, herbal teas, and vegetable broths.

Avoid processed foods.

To help relieve coughing, mix 1 tablespoon lemon juice and 2 tablespoons honey with ¼ cup water. Take as needed.

*Caution:* Never give honey to an infant under one year of age.

To alleviate itching, place ½ cup of baking soda in a bathtub filled with lukewarm water and soak in the bath until the itching decreases. Gently applying witch hazel to the affected area also will help to ease the discomfort and itching associated with the rash.

Try homeopathic remedies to ease symptoms. *Aconitum napellus* (monkshood), a homeopathic version of vitamin C, is helpful in the initial stage of measles. *Ferrum phosphoricum* (homeopathic phosphate of iron) is beneficial for mild infections. These remedies may not have been tested on children. If considering giving these to a child, consult a homeopathic practitioner first.

Rest until the rash and fever have disappeared.

Keep the lights dim. Do not read or watch television while your eyes are sensitive to light.

Do not send a child who has had measles to school until seven to nine days after the fever and rash have disappeared.

## Considerations

Doctors generally recommend that children receive two measles vaccinations, one at about fifteen months and one before entering school or at about age twelve. A second vaccination is considered necessary because measles outbreaks have occurred among college students who received a single immunization in childhood. Certain individuals should *not* be immunized against measles, including pregnant women and anyone who has cancer or a weakened immune system, is on cortisone or anticancer drugs, is undergoing radiation therapy, or has any type of illness with fever. People allergic to eggs should tell their physicians before having the vaccine. A person who has had and recovered from measles does not require immunization; a single attack of measles gives lifelong immunity.

Short-term, high doses of vitamin A have been used to lessen the severity and complications of measles. Since high doses can be toxic, they should be taken only briefly (two weeks or less) and monitored very carefully. Ask the pediatrician before using vitamin A in excessive amounts.

☐ Antibiotics are useless against viruses, so they are not called for unless complications occur.

## MELANOMA

See under SKIN CANCER.

## MEMORY PROBLEMS

Memory is as natural to us as breathing. It is an ability we all have, yet rarely ever think of—unless we perceive that we are losing that ability. Memory lapses are an annoyance in themselves, but worse is the anxiety that often comes along with them. We begin asking ourselves if they are a symptom of some other problem, such as midlife depression or arteriosclerosis. Probably the greatest fear provoked by lapses in memory is that of Alzheimer's disease, a progressive and debilitating disease that usually starts in midlife with minor defects in memory and behavior. Although this is a fairly common disorder among older people, it is important to realize that most memory lapses have nothing to do with Alzheimer's disease.

It is generally believed that advancing age brings an increasing likelihood of developing memory loss. The mildest form of this malady is called mild cognitive impairment (MCI), and is characterized by one's perception of one's own memory loss. An estimated 1 percent of normal Americans over the age of sixty-five experiences MCI. Scientists have been interested in memory impairment in part because a significant percentage of people over the age of sixty-five with MCI eventually develops Alzheimer's disease—in some studies, approximately 12 to 15 percent per year (or about 40 percent after three years). As such, MCI is a risk factor for developing Alzheimer's disease. However, not all memory loss is attributable to aging. Occasional memory lapses, such as misplacing the car keys or forgetting something at the grocery store, are a natural, normal part of life at virtually any age, and are not likely to precede serious memory loss. In fact, with proper diet, nutrition, and memory use, the memory can remain sharp and active well into one's nineties or beyond.

One reason many people suffer from memory loss is an insufficient supply of necessary nutrients (especially the B vitamins and amino acids) to the brain. The life of the body is in the blood. It literally feeds and nourishes every cell within our bodies. The brain is surrounded by a protective envelope known as the blood-brain barrier, which allows only certain substances to pass from the bloodstream into the brain. If the blood is "thick" with cholesterol and triglycerides, the amount of nutrient-rich blood that can pass through the blood-brain barrier decreases. Over time, this can result in the brain becoming malnourished.

In addition, the functioning of the brain depends upon substances called neurotransmitters. Neurotransmitters are brain chemicals that act as electrical switches in the brain and, through the functioning of the nervous system, are ul-

timately responsible for all the functions of the body. If the brain does not have an adequate supply of neurotransmitters, or the nutrients from which to make them, it begins to develop the biochemical equivalent of a power failure or a short circuit. If your mind goes blank when you are trying to recall a specific fact or piece of information, or it begins to plug into some other, irrelevant memory instead, it is likely that such a "short circuit" has occurred.

There are numerous other factors involved in the deterioration of memory. One of the most important is probably exposure to free radicals, which can wreak enormous damage to the memory if unchecked. Alcoholics and drug addicts often suffer a great deal from memory loss. Alcoholics are notorious for "blackouts"—huge memory gaps that occur even though they are conscious. Allergies, candidiasis, stress, thyroid disorders, and poor circulation to the brain may also be contributing factors. Hypoglycemia (low blood sugar) can play a role in memory loss as well, because to function properly, the brain requires that the level of glucose in the blood fall within a very specific narrow range. Wide swings in blood sugar levels affect brain function and memory.

The dosages given below are for adults.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Ginkgo biloba	As directed on label.	Has been shown to enhance memory. <i>Caution:</i> Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.
Vitamin B complex	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	Needed for improved memory. Injections (under a doctor's supervision) may be necessary.
plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	50 mg 3 times daily.	Helps in transformation of the amino acid choline to the neurotransmitter acetylcholine. Needed for proper brain function.
Vitamin B <sub>3</sub> (niacin)	50 mg 3 times daily.	Needed for proper brain function.
	As directed on label.	To promote proper circulation to the brain and aid in brain function. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
<i>Very Important</i>		
Acetylcholine	As directed on label.	Most important of the neurotransmitters. Maximizes mental ability and prevents memory loss in adults.
Boron	3–6 mg daily. Do not exceed this amount.	Improves brain and memory function.
Dimethylaminoethanol (DMAE)	As directed on label.	Aids in learning and memory. <i>Note:</i> This supplement is not intended for everyday use. It is

		best reserved for days when you need to be more focused and alert.
Garlic (Kyolic from Wakunaga)	As directed on label.	May be useful for treating physiological aging and age-related memory deficits. Potent brain cell protector.
Huperzine A or vinpocetine	As directed on label. As directed on label.	Aid the effectiveness of acetylcholine in preventing memory loss.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Needed for improved memory. Contains choline.
Manganese	As directed on label. Take separately from calcium.	Helps nourish the brain and nerves. Aids in the utilization of choline.
Multivitamin and mineral complex with potassium	As directed on label. 99 mg daily.	All nutrients are necessary in balance. Use a high-potency formula. Needed for proper electrolyte balance.
Omega-3 fatty acid complex	As directed on label.	Low levels have been associated with impaired brain function.
Phosphatidylcholine	As directed on label.	Improves memory.
Superoxide dismutase (SOD)	As directed on label.	Known for its ability to eliminate free radicals.
Vitamin A plus carotenoid complex with beta-carotene	15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily.	Deficiencies of antioxidants expose the brain to oxidative damage.
Vitamin C with bioflavonoids	3,000–10,000 mg daily.	A powerful antioxidant that also improves circulation.
Vitamin E	200 IU daily or 400 IU every other day.	Causes dilation of blood vessels, improving blood flow to the brain. Use d-alpha-tocopherol form.
Zinc plus copper	50–80 mg daily. Do not exceed 100 mg daily from all supplements. 3 mg daily.	Important in binding toxic substances and removing them from the brain. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.

**Important**

Acetyl-L-carnitine	500 mg twice daily.	May enhance brain metabolism. Slows deterioration of memory and reduces the production of free radicals.
L-glutamine and L-phenylalanine plus L-aspartic acid	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Amino acids necessary for normal brain function; serve as fuel for the brain and prevent excess ammonia from damaging the brain. <i>Caution:</i> Do not take phenylalanine if you are pregnant or nursing, or if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
L-tyrosine	Up to 100 mg per kg of body weight daily. Take on an empty stomach with	Helps sharpen learning, memory, and awareness; elevates mood and motivation;

1,000 mg vitamin C and 50 mg vitamin B<sub>6</sub> for better absorption. aids in preventing depression. *Caution:* Do not take this supplement if you are also taking an MAO inhibitor drug.

**Helpful**

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Improves brain oxygenation. Improves the effectiveness of coenzyme Q <sub>10</sub> .
Dehydroepiandrosterone (DHEA from Natrol) or 7-Keto DHEA	As directed on label. Take with vitamins C and E and selenium to prevent oxidative damage to the liver. As directed on label.	May help to improve memory. (See DHEA THERAPY in Part Three.) A metabolite of DHEA that has been found to be superior to DHEA in enhancing memory. Unlike DHEA, it is not converted into estrogen or testosterone in the body.
Diamond Mind from Diamond-Herpanacine Associates or Bacopin & Ginkgo Complex from America's Finest	As directed on label. As directed on label.	Combination supplements that can aid with memory-related functions.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Improves brain oxygenation.
Melatonin	2–3 mg daily, taken 2 hours or less before bedtime.	A powerful antioxidant that may prevent memory loss.
Nicotinamide adenine dinucleotide (NADH)	As directed on label.	A coenzyme form of niacin that is essential for the production of certain neurotransmitters and energy. Natural levels decline with age. Supplemental NADH can improve energy production in the brain and nervous system.
Pregnenolone from TriMedica	As directed on label.	May improve brain function and enhance memory.
RNA and DNA	As directed on label.	Increases energy production for memory transfer in the brain. <i>Caution:</i> Do not take this supplement if you have gout.

**Herbs**

- Brahmi, an Ayurvedic herb related to gotu kola, increases circulation in the brain and has been found to improve both short- and long-term memory.
- Garlic has been found to possess memory-enhancing properties.
- Ginkgo biloba has been attracting attention from researchers because of its ability to increase blood flow to the brain and central nervous system, thereby enhancing memory and brain function. Ginkgo is available in capsule or extract form at most health food stores. For memory enhancement, take capsules as directed on the product label,

or place 6 drops of an alcohol-free extract under your tongue, hold them there for a few minutes, then swallow. Do this twice daily.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

❑ Other herbs that are helpful for memory include anise, ginseng, gotu kola, and rosemary.

*Caution:* Do not use ginseng if you have high blood pressure or are pregnant or nursing.

### Recommendations

❑ Eat a diet high in raw foods. Consume the following often: brewer's yeast, brown rice, farm eggs, fish, legumes, millet, nuts, soybeans, tofu, wheat germ, and whole grains.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

❑ Combine complex carbohydrates with foods containing 10 percent protein and 10 percent essential fats.

❑ Avoid dairy and wheat products (except for wheat germ) for one month. If there is no memory improvement, slowly add these foods back to your diet.

❑ Eat more blueberries and spinach. Some researchers believe that flavonoids found in these foods may aid in memory retention.

❑ Make certain that you are getting the correct amounts of amino acids, antioxidants, B vitamins, choline, coenzyme Q<sub>10</sub>, iron, and pregnenolone, either from the diet or through supplementation.

❑ Avoid refined sugars—these “turn off” the brain.

❑ Practice holding your breath for thirty seconds every hour for thirty days. This improves mental alertness.

❑ Consider having a hair analysis done to rule out intoxication by metals such as aluminum and lead. Either of these conditions can lead to impaired mental functioning. (See HAIR ANALYSIS in Part Three.)

❑ Use the following tips to help minimize age-related memory loss:

- Reduce stress.
- Keep active mentally.
- Eat a healthy brain diet.
- Get regular physical exercise.
- Get plenty of sleep.
- Limit sugar intake.
- Avoid tobacco.
- Avoid excessive use of alcohol.

❑ Make sure to focus on things that you may wish to remember, and be sure to give them meaning. Often, we blame our inability to recall something on a failing memory when

the problem is that we did not really pay attention in the first place.

❑ Keep yourself active mentally by using your brain on a daily basis. Pursue activities such as reading, doing crossword puzzles, surfing the Internet, or playing a mentally challenging game. Research has shown that the more you put your memory to use, the more vital it will be.

❑ Keep yourself physically active. This increases blood flow to the brain. One study of older women indicated that those who engaged in moderate exercise, such as walking at least six hours per week, had a 20 percent decrease in risk of cognitive impairment as compared with those who were inactive. They also demonstrated cognitive functioning of someone three years younger, on average, than their actual age.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

❑ Be sure to get the proper amount of rest to avoid fatigue, which can have a direct effect on the ability to focus.

### Considerations

❑ In Europe, ginkgo is the principal therapeutic treatment of cerebral dysfunction or cerebral insufficiency. An extract standardized to 22 to 27 percent flavonoid glycosides and 5 to 7 percent terpene lactones has been tested in normal individuals and shown to enhance memory and working memory in postmenopausal women. Similarly, in one study, elderly individuals improved their speed in processing information, working memory, and executive processing. When you buy your ginkgo, be sure that the brand you are buying has the right mixture of flavonoids (22 to 27 percent) and terpenes (5 to 7 percent). These results were based on taking 120 milligrams per day.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

❑ Human growth hormone (HGH) has been shown to improve brain function. But this therapy is not the first line of treatment. (See GROWTH HORMONE THERAPY in Part Three.)

❑ Some medications may have an adverse effect on memory, including beta-blockers, benzodiazepines (prescribed for anxiety), some painkillers and antihistamines, and anticholinergics (prescribed for incontinence or depression).

❑ Occasional memory loss or forgetfulness is common. However, if you begin to notice certain memory-related problems happening, such as forgetting things much more often than you did before, forgetting how to do something that was commonplace to you before, getting lost in familiar surroundings, or repeating the same conversation over and over again to the same person, there may be cause for concern. Seek medical help. Early treatment with Alzheimer's medications can slow the progression of the disease.

❑ Absent a disease such as Alzheimer's, the keys to having a good memory often are in attitude and approach. As we age, our attitudes change. Our ability to remember isn't

affected as much as we think. It is the change in our motivation to remember things that is probably the larger factor.

☐ According to a study conducted at the University of Toronto, Canada, potatoes, pasta, and bread boost memory. The natural sugars found in these foods apparently enhance the brain's ability to store memories.

☐ Studies from the 1990s showed that phosphatidyl serine improved memory. This supplement was once made from cow brains. However, after the mad cow (in humans it is called Creutzfeldt-Jakob disease) scare, dietary supplement companies began making it from soybean oil, and there are no studies to show whether it still works.

☐ See also AGING; ALZHEIMER'S DISEASE; ARTERIOSCLEROSIS; HYPOGLYCEMIA; and/or SENILITY, all in Part Two.

### MÉNIÈRE'S DISEASE

Ringing in the ears, variable loss of hearing, loss of balance, vertigo or dizziness, tinnitus (buzzing or ringing in the ears), and a sensation of fullness or pressure are symptoms of the inner ear disturbance known as Ménière's disease. The condition may affect one or both ears.

Ménière's disease is rare and the exact cause or causes are unknown, but many experts believe it results from a condition known to researchers as *endolymphatic hydrops*, an excessive swelling of the small, fluid-filled chambers of the inner ear. Eventually, the pressure and severe disruptions within the inner ear cause periodic attacks of vertigo. The attacks can last from ten minutes to several hours. During a severe attack, symptoms can include nausea, sweating, vomiting, and loss of balance. Unsteadiness may last for several days after the attack. Impaired blood flow to the brain from clogged arteries and poor circulation may also be involved. Allergies, consumption of alcohol or caffeine, stress, barometric changes, pregnancy, visual stimuli, experiencing orgasm, sugar, exposure to loud noises, and excessive salt intake may trigger this disorder. Other factors, such as obesity and high blood cholesterol, may contribute to this syndrome. Allergies, spasms of the blood vessels that supply the inner ear, and, for women, fluid retention during the premenstrual period may also be related to Ménière's disease. Drug use, smoking, trauma, and temporomandibular joint (TMJ) syndrome may be involved as well.

Ménière's disease usually affects adults (men more often than women) between the ages of thirty and sixty. For many individuals, Ménière's disease is an unpredictable disorder and the attacks only occur occasionally; for others it is severe and can cause complete deafness and repeated, debilitating vertigo.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children

under the age of six, use one-quarter of the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Manganese	5 mg daily. Take separately from calcium.	Deficiency may be the cause of Ménière's disease.
<i>Very Important</i>		
Bio-Strath from Nature's Answer	As directed on label.	A natural source of the B vitamins. Acts as a tonic and enhances brain function.
Chromium picolinate	200 mcg daily.	Aids in controlling blood sugar levels, which are often high in people with this disorder.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Improves circulation. Supports and boosts the immune system.
Vitamin B <sub>3</sub> (niacin)	100 mg twice daily. Do not exceed this amount.	Improves circulation. If you are uncomfortable with the flush caused by niacin, use part niacinamide. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
<i>Important</i>		
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	As directed on label. 100 mg twice daily.	Important for the nervous system. Use a high-stress formula. Reduces fluid retention.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Boosts immune function. Use an esterified or buffered form.
<i>Helpful</i>		
Calcium and magnesium	1,500 mg daily. 1,000 mg daily.	Needed for stability of the nervous system and for muscle contraction. Chelated forms are the most effective.
Essential fatty acids (primrose oil, salmon oil, or Kyolic-EPA from Wakunaga)	As directed on label 3 times daily, with meals.	To correct metabolic disturbances.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	For cellular protection and brain function.
Vitamin E	200 IU daily or 400 IU every other day.	Promotes efficient oxygen use. Use d-alpha-tocopherol form.

### Herbs

- ☐ Butcher's broom combats fluid retention and improves circulation.
- ☐ Ginger is helpful for nausea.
- ☐ Ginkgo biloba, taken in extract or tablet form, increases circulation to the brain.

**Caution:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

St. John's wort can relieve anxiety and depression.

**Caution:** St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anti-coagulants.

### Recommendations

Limit your intake of salt. Under normal conditions, the body needs about 2 grams of salt a day; most Americans eat 10 grams. Over time, restricting the amount of salt you eat should help to decrease the fluid in the inner ear and reduce any pressure on nerve endings that may be affecting your balance and hearing.

Try a hypoglycemic diet for two weeks. If you experience an improvement, remain on the diet. (See HYPOGLYCEMIA in Part Two.)

Do not consume any fats, fried foods, added salt, monosodium glutamate (MSG), alcohol, sugar (in any form), or anything containing caffeine. Caffeine excessively stimulates nerve endings.

Stop smoking. Smoking constricts and reduces blood flow to the tiny blood vessels that nourish the inner ear nerve endings.

Check for food allergies. (See ALLERGIES in Part Two.)

To help with vertigo attacks, restrict your head movement and keep your eyes fixed on a stationary object at a good distance from you. Also, you can lie down with your unaffected ear against the floor, and look in the direction of the affected ear.

As much as possible, reduce the anxiety in your life. Stress is a major trigger in Ménière's disease.

Reasonable exercise such as a daily brisk walk will stimulate circulation and help blood flow.

### Considerations

Some doctors recommend a high-protein, low-refined-carbohydrate diet because they have found that people with this disorder have high blood insulin levels. High insulin levels impair circulation. (See ARTERIOSCLEROSIS and CIRCULATORY PROBLEMS, both in Part Two.)

Doctors prescribe a variety of medications to combat the symptoms of vertigo and nausea. Promethazine (Phenergan) is usually prescribed to treat the nausea, vomiting, and vertigo symptoms. To reduce fluids in the system, diuretics may be prescribed. A low-salt diet may accompany this plan. Diazepam (Valium) is frequently prescribed to lessen anxiety and to sedate the vestibular system. For some people, physicians prescribe antihistamines, and in some cases, steroids.

If symptoms are severe and interfere drastically with daily life, surgery may be recommended. Surgical procedure options for Ménière's disease include the insertion of a small tube into the eardrum (a tympanostomy tube), enlarging the endolymphatic sac by drilling the bone surrounding it or draining the fluid to reduce pressure (endolymphatic sac decompression), placing a small tube into the endolymphatic sac to drain excess fluid (endolymphatic sac shunt), removal of the labyrinth or a portion of the labyrinth (surgical labyrinthectomy), cutting the vestibular nerve to destroy the balance function of the ear (vestibular nerve section surgery), placing ototoxic drugs (toxic antibiotics like gentamicin) in the ear to destroy the balance portion of the ear (chemical labyrinthectomy), or inserting drugs into the eardrum with a syringe by laser.

A Meniett device has been shown to help treat and control acute attacks of vertigo in patients with unilateral cochleo-vestibular disease who had tympanostomy tubes inserted. These patients also followed a low-salt diet, and 67 percent had reduced symptoms—80 percent of these had reduced symptoms for as long as a year after treatment.

See also HEARING LOSS in Part Two.

For the name and address of an organization that can provide more information about Ménière's disease, see American Academy of Otolaryngology *under* Health and Medical Organizations in the Appendix.

### MENINGITIS

Meningitis is an infection of the three membranes, called the meninges, that lie between the brain and the skull. The thin membranes that cover the spinal cord may also be involved. This disorder is more common in children than in adults.

The most common type of meningitis is viral meningitis. This disease causes comparatively mild symptoms, such as headache and malaise, and usually improves on its own in a week or two. Also called *aseptic meningitis*, viral meningitis usually occurs in conjunction with other diseases. Almost 50 percent of cases of viral meningitis infections are caused by intestinal viruses. This condition may also accompany mumps or a herpes outbreak, and it can be carried by mosquitoes as well. The early symptoms of viral meningitis include sore throat, fever, headache, stiff neck, fatigue, and, possibly, a rash and vomiting.

Bacterial meningitis is the more serious infection, and it requires prompt, aggressive medical treatment. The bacteria responsible for most outbreaks of bacterial meningitis are *Neisseria meningitidis* (meningococcus), *Streptococcus pneumoniae* (pneumococcus), *Haemophilus influenzae* type B, and group B *Streptococcus*. *Neisseria* and *Streptococcus* are the leading causes of infection since, after 1990, routine immunization curbed the outbreaks of *H. influenzae* type B (Hib). In the case of *N. meningitidis*, at any one time, some 5 to 20 percent of the population carry this bacteria in their saliva without feeling any ill effects—but it can be trans-

mitted through the saliva to other people. The *Streptococcus pneumoniae* bacteria is commonly found in the throat and is not contagious. The symptoms of bacterial meningitis include stiff neck, headache, irritability, high fever, chills, nausea, vomiting, delirium, and sensitivity to light. A blotchy, red skin rash may appear. In infants, the signs include fever, vomiting, poor muscle tone, difficulty feeding, irritability, a high-pitched cry, and a bulging fontanel (soft spot). Changes in temperament and extreme sleepiness signal dangerous changes in the cerebrospinal fluid (the fluid that surrounds and cushions the brain). Meningococcal meningitis kills 10 to 12 percent of those affected; among the survivors, 10 to 15 percent suffer hearing loss, diminished intellect, kidney disease, or need to have limbs amputated because of blood poisoning (septicemia).

Children with cochlear implants to treat hearing loss have a greater risk of developing bacterial meningitis than children in the general population. A study conducted by the U.S. Centers for Disease Control and Prevention, the U.S. Food and Drug Administration, and state and local health departments, and published in *The New England Journal of Medicine*, found that children with a specific type of cochlear implant that had an extra piece called a positioner had 4.5 times the risk of developing meningitis compared with those who had other types of implants. It is possible that individuals who are candidates for implants may have factors that increase their risk of meningitis.

The recommendations in this section are designed to support medical treatment, not replace it. Meningitis can progress very quickly and become life-threatening in a matter of twenty-four hours for adults, much less for children. If untreated, this disease can cause permanent brain damage and paralysis, even coma and death.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	Needed to replenish the friendly bacteria antibiotics destroy. Use a nondairy formula.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	125 mg twice daily.	Carries oxygen to the cells, relieving many symptoms. Use a sublingual form.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	Needed for tissue repair and protection of membranes.

Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	An immune system stimulant that also acts as a natural antibiotic.
Geoxy-132 from American Biologics	As directed on label.	An antioxidant and immune system stimulator.
Maitake extract or reishi extract or shiitake extract	As directed on label.	To help to build immunity and fight viral infection.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed for tissue protection and healing. Use a high-potency formula.
Raw thymus glandular	500 mg twice daily.	Enhances immune response.
Taurine Plus from American Biologics	As directed on label.	An antioxidant and immune system regulator necessary for white blood cell activation and neurological function. Use the liquid form.
Vitamin A emulsion or capsules	50,000 IU daily. 25,000 IU daily for 7 days, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	A powerful antioxidant and immune system booster. Needed for protection and healing of all membranes. Emulsion form is recommended for easier absorption and greater safety at higher doses.
Vitamin C with bioflavonoids	3,000–10,000 mg daily.	Reduces infection and aids in cleansing the bloodstream.
Zinc lozenges	1 15-mg lozenge 3 times daily. Do not exceed a total of 100 mg daily from all supplements.	An immune system booster.

**Herbs**

For fever, use catnip tea enemas. (See ENEMAS in Part Three.) Catnip tea is also good for sipping.

Echinacea boosts the immune system.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Goldenseal is a natural antibiotic.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Olive leaf extract helps fight viral infections.

St. John's wort is good for viral infections.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anti-coagulants.

## Recommendations

- If you develop symptoms characteristic of meningitis, see a physician or go to the emergency room of the nearest hospital immediately.
- Avoid drinking out of the same glass or container as someone else, and avoid sharing cigarettes, food, lipstick, and eating utensils.
- Avoid heavy use of alcohol.
- Avoid passive smoking (secondhand smoke).
- Avoid aspirin, which increases bleeding tendencies.
- Once the acute phase of the illness has passed and recovery has begun, eat a well-balanced diet including fresh fruits and vegetables (50 percent of them raw), grains, nuts, seeds, and yogurt and other soured products.
- Consume fresh pineapple and papaya frequently. Pineapple reduces inflammation; papaya is good for digestion. Only the fresh forms are effective.
- Avoid the following foods, which encourage the formation of mucus: animal protein and its by-products, caffeine, dairy products (except for yogurt), processed foods, salt, sugar, and white flour products.
- Rest in bed in a dimly lit room. Drink plenty of high-quality liquids.
- Take cool sponge baths.

## Considerations

- Diagnosis of meningitis requires microscopic analysis and culture of the cerebrospinal fluid.
- If there are no complications, recovery from viral meningitis generally takes three weeks under a physician's care.
- Antibiotics do not fight viruses, so they are not appropriate treatment for viral meningitis. Only strains of *bacterial* meningitis can be treated with antibiotics.
- For bacterial meningitis, aggressive treatment with antibiotics is necessary. For viral meningitis, antibiotics are ineffective and therefore inappropriate. If meningitis is caused by a fungal infection, treatment with an antifungal drug is used.
- Pain medication may be needed such as nonsteroidal anti-inflammatory drugs (Advil, Aleve) and acetaminophen (Tylenol).
- It is wise to seek prompt treatment for a bacterial infection anywhere in the body, such as strep throat or an ear infection.
- Antibiotics may be prescribed as a preventive for those who have been in close contact with a person who has bacterial meningitis.
- Adults tend to be immune to *H. influenzae* type B, and the Hib vaccine protects most young children. However, if you have been in close contact with someone who has this infec-

tion, you may need to see your physician to inquire about antibiotic treatment. The vaccine is sometimes given to those over five years of age with sickle cell disease or HIV/AIDS, as well as those who have had their spleens removed, had bone marrow transplants, or are taking cancer-treatment drugs.

- If you are a parent contemplating the placement of a cochlear implant in your child, discuss with your physician all of the potential risks and benefits, and whether or not the child has certain medical conditions that might make meningitis more likely. If you do opt for the implant, make sure your child is up to date on vaccines at least two weeks before the procedure. If the implant has already been done, check with the child's doctor to ensure that vaccines are updated. (Current vaccines protect against the most common strains of meningitis-causing bacteria, but not all.) Watch for possible signs and symptoms of meningitis: high fever, headache, stiff neck, nausea or vomiting, discomfort looking into bright lights, sleepiness, or confusion. A young child or infant may be sleepy or cranky or eat less. Contact a doctor promptly if these symptoms are present. Also watch for signs and symptoms of an ear infection, which can include ear pain, fever, and decreased appetite. Seek prompt medical attention for these symptoms.

## MENOPAUSAL AND PERIMENOPAUSAL PROBLEMS

Menopause is the point at which a woman stops ovulating and menstruation ceases, indicating the end of fertility. It is important to remember that menopause is *not* a disease. It is as natural a progression in life as puberty.

Many years before a woman stops ovulating, her ovaries slow their production of the hormones estrogen, progesterone, and testosterone. Estrogen and progesterone are commonly thought of as sex or reproductive hormones. While estrogen is indeed essential for reproduction, it also acts on many nonreproductive organs and systems in the body. Cells in the vagina, bladder, breasts, skin, bones, arteries, heart, liver, and brain all contain estrogen receptors, and require this hormone to stimulate these receptors for normal cell function. Estrogen is needed to keep the skin smooth and moist, and the body's internal thermostat operating properly. It is also necessary for proper bone formation. Although estrogen levels drop sharply after menopause, the hormone does not disappear entirely. Other organs take over from the ovaries and continue to produce a less potent form of estrogen. The organs known as endocrine glands secrete some hormones from fatty tissue to maintain bodily functions.

Progesterone works as a counterpart to estrogen. During the second half of the menstrual cycle, it stimulates changes in the lining of the uterus to complete its preparation to act as a "home" for a fertilized egg. If no egg is fertilized, the uterine lining is broken down and expelled. The cycle then begins again. Progesterone too has effects beyond the reproductive system. It has a calming effect on

the brain and appears to affect other aspects of nervous system function as well.

Testosterone is the hormone that is most important for sex drive. Women produce much less of this hormone than men do—about 80 percent less—but it is the driving force for maintaining a healthy libido (sexual appetite).

Perimenopause is the period when a woman's body is preparing for menopause. For most women, hormone production begins to slow down when they reach their thirties, and continues to diminish as they age. Many women experience few if any symptoms during this time, but others may suffer from some, or all, of the following: anxiety, dry skin, fatigue, feelings of bloating, headaches, heart palpitations, hot flashes, insomnia, irritability, decreased interest in sex, loss of concentration, mood swings, night sweats, reduced stamina, urinary incontinence, vaginal dryness and itching, weight gain, cold hands and feet, joint pain, hair loss, and skin changes. Some women experience none of these symptoms; others may have some of these symptoms, but find that they are not related to hormonal changes.

Menopause is the time when a woman stops menstruating altogether. By this stage, most of the acute problems a woman may have experienced are actually over and a new balance between all hormones should be established. However, this is the time women become increasingly vulnerable to other, potentially serious health problems. Over the long term, the diminished supply of estrogen increases the likelihood of cardiovascular disease, osteoporosis, and vaginal atrophy. Osteoporosis in particular is a major problem for women after menopause. An estimated 45 to 50 percent of the 1.5 million hip fractures that occur in the United States every year are due to osteoporosis in women over fifty years of age.

With a proper diet, nutritional supplements, and exercise, most of the unpleasant side effects of menopause can be minimized, if not eliminated.

The dosages given below are for adults.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Beta-1,3-D-glucan	As directed on label.	Boosts bone marrow production and acts as a powerful stimulant for the immune system.
Cerasomal-cis-9-cetylmyristoleate	As directed on label.	Acts like a lubricant for joints and reduces inflammation. <i>Caution:</i> Do not take this supplement if you have liver problems.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	To support the immune system's detoxification of many dangerous substances, streamline metabolism, ease depression and fatigue, increase energy, support adrenal glands, process fats, boost the immune system, and

Dehydroepiandrosterone (DHEA)	As directed on label.	improve overall physical and mental processes.
or 7-keto DHEA	As directed on label.	Increases memory function, reduces stress, and enhances sex drive. <i>Note:</i> DHEA is converted into testosterone and estrogens in the body. Use with caution if you are taking HRT. A metabolite of DHEA that is not converted into sex hormones. Some studies have shown benefit for short-term use, but data for long-term use is not available.
Essential fatty acids (primrose oil, black currant seed oil, or Kyolic-EPA from Wakunaga)	As directed on label.	Act as sedatives and diuretics. Good for hot flashes. Important for production of estrogen.
<i>Lactobacillus rhamnosus</i> and <i>L. reuteri</i>	2.5 million cells of each daily.	Restores normal vaginal flora.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Important as an emulsifier for vitamin E, which reduces hot flashes and related symptoms.
Multienzyme complex with hydrochloric acid (HCl)	As directed on label. Take with meals.	To aid digestion. HCl production declines with age. <i>Caution:</i> Do not use HCl if you have a history of ulcers.
Soy protein	30 grams daily.	Soybeans contain a form of estrogen. Helps relieve hot flashes and protect against heart disease and osteoporosis.
Ultra Osteo Synergy from American Biologics	As directed on label.	Nutritional support for bone renewal.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) and folic acid	As directed on label. 100 mg 3 times daily. 50 mg 3 times daily As directed on label.	For improved circulation and cellular function. Use a sublingual form for best absorption. Or consider injections (under a doctor's supervision). A powerful antistress vitamin needed for adrenal function. Minimizes water retention and eases symptoms. Helps to protect against heart disease.
Vitamin E	200 IU daily or 400 IU every other day.	Reduces hot flashes and many other symptoms. Use emulsion form for easier assimilation. Use d-alpha-tocopherol form.
<i>Important</i>		
Boron	3 mg daily. Do not exceed this amount.	Enhances calcium absorption.
Calcium and magnesium	1,000–2,000 mg daily. 1,000 mg daily.	To relieve nervousness and irritability, and to protect against bone loss. Use chelate forms.
Quercetin Plus from Nature's Plus or Nutrition Now	2 mg daily.	An antioxidant flavonoid that may help with hot flashes.

Silica	As directed on label.	Supplies silicon, needed for connective tissue and for calcium uptake.
Vitamin D	400–600 IU daily.	Regulates calcium within the body. Calcium (1,000 mg) and vitamin D (400 IU) may reduce mortality in postmenopausal women.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Aids in protecting against bone loss and reducing symptoms. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.
plus copper	3 mg daily.	
<b>Helpful</b>		
L-arginine and L-lysine	500 mg twice daily.	Detoxifies the liver. Aids liver function. (See AMINO ACIDS in Part One.)
	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	
Multiglandular complex	As directed on label.	For hormonal stability. (See GLANDULAR THERAPY in Part Three.)
Multivitamin and mineral complex with potassium	As directed on label. Take with meals.	All nutrients are needed for normal hormone production and function.
	99 mg daily.	To replace potassium lost through perspiration during hot flashes. Potassium protects the nervous system and encourages a regular heart rhythm.
and selenium	200 mcg daily.	An important trace mineral linked to normal hormonal balance.
Vitamin C plus mixed bioflavonoids	3,000–10,000 mg daily.	For hot flashes. Also for heart health.
	1,000 mg daily.	

## Herbs

A paste made from aloe vera gel, mixed to the consistency of toothpaste and inserted into the vagina at night, can relieve vaginal dryness.

Amaranth, chickweed, dandelion greens, nettle, seaweed, and watercress are rich in calcium and can help prevent osteoporosis.

Anise, black cohosh, fennel, licorice, raspberry, sage, unicorn root, and wild yam root are natural estrogen promoters, as are soybean products. Black cohosh has received the most attention, and the results of the studies are mixed. The biggest study, paid for by the National Institutes of Health (NIH), did not find black cohosh to be of benefit in relieving hot flashes or night sweats. Studies on soy and hot flashes have had both positive and negative results.

*Cautions:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Licorice root should not be used during pregnancy or nursing. It should not be used

by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Damiana enhances sexual desire and pleasure.

Hops and valerian root help to calm the body and promote restful sleep. Ginseng has been shown to help improve mood and sleep during menopause. Kava kava decreases anxiety but has no effect on hot flashes.

*Cautions:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing. Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and anti-psychotic drugs.

Gotu kola, black cohosh, red clover, and dong quai relieve hot flashes, vaginal dryness, and depression.

*Cautions:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Dong quai enhances the action of the blood thinner warfarin, so the two should not be used together.

Seaweed and soy foods are commonly consumed in Japan, where 10 to 20 percent of women experience hot flashes compared to 70 to 80 percent in Western countries. In one study, soy protein containing 60 milligrams of isoflavones reduced hot flashes by 57 percent and night sweats by 43 percent.

St. John's wort is valuable if you suffer from anxiety or depression.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

Siberian ginseng aids in relieving depression and in the production of estrogen.

*Caution:* Do not use this herb if you have hypoglycemia, high blood pressure, or a heart disorder.

## Recommendations

Eat a diet consisting of 50 percent raw foods and take a protein supplement to help stabilize blood sugar. Add blackstrap molasses, soybean products, broccoli, dandelion greens, kelp, salmon with bones, sardines, and whitefish to your diet.

Eat foods high in phytoestrogens, such as soybeans, flaxseeds, nuts, whole grains, apples, fennel, celery, parsley, and alfalfa. Soy and soy isoflavones may help to alleviate hot flashes associated with menopause. A high intake of phytoestrogens is thought to explain why hot flashes and other menopausal symptoms rarely occur among women in Asian cultures. If you have breast, uterine, or

## Hormones, Hormone Therapy, and Menopause

Menopause is something all women experience, and as it approaches, they are faced with the decision as to whether or not to opt for some sort of hormone therapy, whether it is hormone replacement therapy (HRT) with estrogen and progesterone, or estrogen replacement therapy (ERT) only. In order to make an informed decision, it is necessary first to understand something about different types of hormones.

Broadly speaking, there are two types of hormone products available: natural and synthetic. Natural hormones are hormones whose molecular structures most closely resemble those of the hormones made by the body. Some doctors argue that natural hormone replacement therapy is not regulated sufficiently. Because the hormones are considered natural, some say, they have not been exposed to the rigorous tests that the synthetic variety has had to undergo. Yet other physicians argue that synthetic hormones carry an additional risk to the health of some, if not all, women. There are no simple answers at present. However, if hormones are recommended, the lowest dose should be used for the least amount of time. Much more research into this controversial topic is needed.

### ESTROGEN

Three estrogens are naturally made by the body: estradiol, estrone, and estriol. Estradiol is the dominant estrogen produced by the ovaries. Levels of estriol are highest during pregnancy, and this form of estrogen has been shown to have a protective effect against breast cancer. Estrone is formed from estradiol, and appears to be the estrogen responsible for estrogen-dependent breast cancer. Estradiol is available for replacement therapy. Climara, Estrace, Estraderm, Estring, Menostar, and Vagifem are some of the brand names under which replacement estradiol is sold. Some are taken orally or as vaginal creams, and others are absorbed from skin patches. Both estriol and estrone are also available for replacement therapy.

There are also synthetic versions of estrogen that may be prescribed. These are compounds that have estrogen-like effects in the body, but they are less similar, on a molecular level, to the body's own estrogens. Conjugated or esterified estrogen is manufactured from the purified urine of pregnant mares. Premarin is the synthetic estrogen most prescribed for HRT.

### PROGESTERONE

Estrogen dominance is an important concept to understand if you are perimenopausal and/or thinking of hormone replacement. This is a situation that can occur if the correct balance between estrogen and progesterone is not maintained. Symptoms of estrogen dominance can include flagging energy, fluid retention and bloating, and weight gain. Estrogen dominance can also increase certain types of cancer, notably endometrial cancer. This is why, unless you have undergone hysterectomy, HRT regimens usually include

both estrogen and progesterone. There are many natural progesterone creams that may be prescribed by your doctor. Despite wild yam being touted as a source of estrogen, sometimes synthetic progesterone (medroxyprogesterone acetate) is added to wild yams. The resulting product is no longer natural. Furthermore, when the two are combined, the product is not effective for treating menopausal symptoms, and it can cause side effects including headache, breast tenderness, and upset stomach.

### TESTOSTERONE

Testosterone is the essential hormone for continuing sexual desire in both sexes. It also supports the skin, muscles, and bones. If sexual desire diminishes, women may want to add this hormone to their replacement therapy. Natural testosterone or methyltestosterone is available for use as part of hormone therapy. It is sold as a combination (estrogen and testosterone) called Estratest.

### TYPES OF REPLACEMENT THERAPY

There are two basic approaches to hormone replacement therapy: single hormone therapy and combination hormone therapy. Single hormone therapy usually involves estrogen only. Thus, it has been referred to as estrogen replacement therapy (ERT). ERT was and still is the most frequently prescribed treatment for women who have had a hysterectomy, or women without an intact uterus. ERT treatment should *not* be used by a woman who has an intact uterus, as it may increase her risk of developing cancer of the uterus or the endometrium (the uterine lining) by as much as six to eight times. Estrogen is available in tablets, patches, vaginal creams, vaginal rings, and intervaginal gels. The vaginal creams, rings, and gels are used for vaginal dryness or itchiness only, or for urinary problems. In addition to coming in various forms, estrogen products come in various doses. You must discuss the appropriate dose with your doctor.

Combination hormone therapy, or HRT, uses both estrogen and progesterone (usually in the form of progestin, a synthetic form of this hormone). HRT is normally prescribed for women who have a uterus and ovaries and who are approaching, or have reached, menopause. Progestin is believed to protect against the increased risk of uterine cancer posed by taking estrogen alone. There are many different doses and different methods of taking these hormones. You and your doctor need to decide what is right for you.

In addition to ERT and HRT, there is combination estrogen and testosterone therapy (see above). If tests indicate that levels of estrogen and testosterone are low, these hormones are available in combination formulas.

### RISKS AND BENEFITS

A study conducted by the Women's Health Initiative (WHI) and sponsored by the National Institutes of Health (NIH), be-

ginning in 1993 and involving 16,600 women aged fifty to seventy-nine, examined the benefits and risks associated with HRT. Two distinct groups were studied, those using ERT and those using HRT.

In July 2002, the study involving women prescribed HRT was halted due to the increased risks of breast cancer, heart attack, stroke, and blood clots that were observed during the study. In March 2004, women with intact uteruses stopped taking ERT due to increased risk of stroke. However, data was inconclusive as to whether ERT increased risk of blood clots. The data also suggested that the risk of developing ovarian cancer increased with the length of time ERT was used. Hormone replacement is now recommended for two groups of women:

1. Women who are going through menopause and women who have already gone through it (called postmenopausal) and are experiencing symptoms such as hot flashes, night sweats, vaginal dryness, and sleep disorders.
2. Women with certain health conditions such as premature ovarian failure, where their bodies don't produce normal amounts of the hormone estrogen.

Overall, as with any type of treatment, hormone therapy promises certain benefits but also poses risks. Some of the risks and benefits that have been most studied concern the following:

- *Aging.* Most research shows that HRT keeps the skin more supple and the sex organs better lubricated, with less atrophy (thinning of tissues).
- *Alzheimer's disease.* A study editorialized in the *Journal of the American Medical Association* indicates that HRT, once thought to prevent dementia and Alzheimer's disease, now seems to cause thinking and memory impairment.
- *Blood clots.* According to the WHI study released in July of 2002, women taking combined hormone therapy, HRT, had twice the risk of developing blood clots as compared with those who did not take HRT.
- *Breast cancer.* According to the WHI study, data demonstrated a compelling link between combined hormone replacement, HRT, and invasive (infiltrating) lobular breast cancer and ductal breast cancer. In fact, the study showed a 26 percent increase in breast cancer cases.
- *Colorectal cancer.* Studies suggest that women taking HRT are better protected against colorectal cancer than those who are not taking HRT. All women over forty should have regular colorectal examinations to test for cancer.
- *Heart disease.* According to the WHI study, taking combined hormone therapy, HRT, was associated with a 29 percent increase in the risk of heart disease. Heart disease kills more women than all types of cancer put together, so it is important to take measures to protect yourself against heart disease whether you opt for hormone therapy or not. (See HEART ATTACK in Part Two.)
- *Hot flashes and mood swings.* Hormone therapy, whether ERT or HRT, should eliminate hot flashes. It may

also alleviate mood swings—although that depends on exactly what causes them.

- *Osteoporosis.* Estrogen replacement does appear to protect women from severe bone loss and osteoporosis. For osteoporosis prevention, experts recommend taking estrogen with about 1,000 milligrams of calcium a day. (See OSTEOPOROSIS in Part Two.)
- *Stroke.* The WHI study concluded that women who took combined hormone therapy, HRT, had a 41 percent increase in their risk for stroke.
- Summarized by the type of hormone therapy, certain known risks can be described as follows.
  - *ERT (estrogen only).* This is associated with an *increased* risk of osteoporosis and, possibly, an increase in the risk of dementia or memory loss; and a *decreased* risk of hip fracture. It has not been found to have any effect on the risk of breast cancer or heart disease.
  - *HRT (estrogen plus progestin).* This is associated with an *increased* risk of breast cancer, blood clots, stroke, and dementia (including Alzheimer's disease); and a *decreased* risk of hip fracture, colorectal cancer, and endometrial cancer as compared with women who did not take hormones.

## MAKING THE DECISION

This decision to take—or not to take—hormone therapy is not an easy one for many women, and there are no easy answers. Researchers are only beginning to really understand the biological effects of estrogen replacement. A woman's age when she begins taking HRT, the duration of treatment, and the method—whether patch or pill—could all have an effect on her risk.

Everyone must weigh her own particular risk factors and decide whether the potential benefits outweigh those risks. You also need to decide whether to use synthetic or natural hormones, or approach any discomfort you may have with a more holistic approach that makes use of the nutrients and other remedies outlined elsewhere in this section.

There are also the questions of when to begin hormone therapy and how long to continue. Some doctors think that women should be introduced to HRT during perimenopause, but there are many others who think that this is unnecessary and, with the correct diet, stress management, and exercise, women do not need to opt for replacement therapy at this early stage unless there are profound reasons for doing so. Discuss this issue with your doctor. Also discuss how long you should continue taking HRT. The uncomfortable symptoms of menopause and perimenopause often last for only a short time, so you may not need to remain on the therapy for a prolonged period. In fact, many women are opting for low-dose HRT for a short period of time when menopausal symptoms are interfering with their quality of life. On the other hand, if you are taking hormone therapy because of long-term concerns such as osteoporosis prevention, a different duration may be necessary. Consult your physician.

## Male Menopause

The term “male menopause” is often used in a joking way, sometimes as a dismissive substitute for “midlife crisis.” But while men do not face the end of fertility in midlife as women do, they too undergo important physical and hormonal changes at that time. Men should not take male menopause—sometimes called andropause—lightly.

During male menopause, sex drive may weaken, anxiety may increase, and depression and moodiness may accompany a sense of failure. These symptoms can occur because of falling levels of testosterone. Men’s testosterone levels begin to decline by the age of forty—earlier in some cases—and this may cause a loss of sexual desire,

mood swings, and irritability, and may even increase the risk of heart disease. If low testosterone levels are a problem, testosterone replacement therapy may be prescribed. Before a man makes a decision about testosterone replacement, he should undergo a prostate specific antigen (PSA) test to look for signs of prostate cancer, and he should have a frank discussion with his physician about potential side effects. It is advisable also to check DHEA and estrogen levels (estrogen is a male as well as a female hormone) so that if therapy is needed, it can be tailored to the individual’s particular needs.

ovarian cancer, or have had or are at risk for any of these, you may want to speak to your health care professional about the risks of increasing your dietary soy intake.

- Do not consume any animal products except for those recommended in this section. Avoid dairy products—limit your consumption to small amounts of low-fat yogurt or buttermilk. Dairy products and meat promote hot flashes.
- Make sure you take calcium and vitamin D as supplements to reduce your risk of osteoporosis.
- Avoid alcohol, caffeine, sugar, spicy foods, and hot soups and drinks; they can trigger hot flashes, aggravate urinary incontinence, and make mood swings worse. They also make the blood more acidic, which prompts the bones to release calcium to act as a buffering agent. This is an important factor in bone loss.
- Get regular moderate exercise.
- Avoid stress as much as possible.
- Substitute garlic or onion powder for salt when cooking. Consuming salt increases urinary excretion of calcium.
- Drink 2 quarts of quality water each day to help prevent drying of the skin and mucous membranes.
- For itching in the vaginal area, use vitamin E cream (with no fragrance added) or open a vitamin E capsule and apply the oil.
- If sexual intercourse is painful, try using vitamin E oil or aloe vera gel to lubricate the vagina.

### Considerations

- Gamma-oryzanol, a nutrient derived from rice bran, has been shown to be effective in treating symptoms of menopause. A daily dose of 20 milligrams reduced symptoms by 50 percent in 67 percent of the women studied.
- In one study, taking soy isoflavones (40 to 80 milligrams per day) seemed to be effective at reducing the number of

hot flashes in women who experience hot flashes frequently—ten or more a day. Most of the women had a 22 percent reduction in hot flashes. In another study, 60 milligrams of isoflavones from soy each day reduced hot flashes by 57 percent and night sweats by 43 percent. Check with your doctor before taking soy isoflavones as a supplement.

- Red clover has been the subject of five controlled studies, with mixed results as to their effectiveness in reducing hot flashes. Red clover contains phytoestrogens. Women should speak to their doctors before using red clover.
- Smoking is associated with early menopause.
- Frequent sexual intercourse can help relieve vaginal dryness.
- Some physicians recommend hormone replacement therapy (HRT) to control severe symptoms caused by estrogen deficiency in menopausal and postmenopausal women. Although hormone therapy appears to be effective, it does have possible serious risks, which should be carefully considered. Investigators in the Women’s Health Initiative announced that estrogen increases the risk of stroke and might even raise the likelihood of developing dementia, although the hormone had no effect on breast cancer or heart disease. Be aware that research is ongoing in all aspects of replacement hormones—there is probably more conflicting information on this medical topic than there is about any other condition. It is essential to work with a good physician who can advise you about which of the vast array of products available may help you overcome any discomforts you may be experiencing. (See *Hormones, Hormone Therapy, and Menopause* on page 580.)

Conventional treatment for a problematic perimenopause is to prescribe a low-dose contraceptive. However, natural progesterone is a precursor to make estrogen in the body, and may be the answer during this period, rather than supplemental estrogen, because symptoms are often a result of estrogen dominance. (See the discussion of estro-

gen dominance in Hormones, Hormone Therapy, and Menopause on page 580.)

❑ After menopause, a reduction in the amount of the sex hormone estrogen can cause shrinkage of urethral and vaginal membranes, promoting incontinence. There may be a continuous dribbling of urine. Urethral dilation helps stretch a contracted urethra.

❑ It may be more important to replace progesterone than estrogen. Natural progesterone cream is a good way to do this.

❑ Some of the bioidentical hormones on the market are custom-mixed formulas containing various hormones that are chemically identical to those made naturally by the body. Saliva testing is often used to determine your particular need. They may offer some benefit, according to the North American Menopause Society, but they are not regulated for purity, potency, safety, or efficacy by the FDA. Other bioidentical hormones are made by drug companies and are sold in standard doses, and are approved by the FDA. FDA-approved bioidentical hormone therapies are:

- Estradiol (Estrace, Climara Patch, Vivelle-Dot Patch)

❑ Hypothyroidism is common in menopausal women. Many symptoms ascribed to menopause may be due to improper thyroid function. (See HYPOTHYROIDISM in Part Two.)

❑ Symptoms of perimenopause are often mistaken for those of premenstrual syndrome (PMS). Both PMS and perimenopausal symptoms are a result of an imbalance between estrogen and progesterone—specifically, rising estrogen and diminishing progesterone. If your menstrual cycles have changed—for example, if your periods are lasting for a longer or shorter time than they used to, or if they are irregular when they were not irregular before—it is more likely that you are perimenopausal rather than premenstrual. A blood test to determine your level of a hormone called follicle-stimulating hormone (FSH) is also helpful in determining whether you are experiencing perimenopause. FSH levels increase as estrogen diminishes.

❑ It is important for menopausal and postmenopausal women to take measures to protect themselves against heart disease. (See HEART ATTACK in Part Two.) Many women have been led to believe that taking estrogen protects against this disease, but there is very reasonable doubt about the protective benefits of synthetic estrogen against heart attacks. (See Hormones, Hormone Therapy, and Menopause on page 580.)

❑ See also HYPOGLYCEMIA and HYSTERECTOMY-RELATED PROBLEMS in Part Two.

## MENSTRUAL CRAMPS

See under PREMENSTRUAL SYNDROME.

## MERALGIA PARESTHETICA

See under RARE DISORDERS.

## MERCURY TOXICITY

Mercury is one of the most toxic metals—even more so than lead. This poison is found in our soil, water, and food supply, as well as in sewage sludge, fungicides, and pesticides. Some grains and seeds are treated with methyl mercury chlorine bleaches, which seep into the food supply. Because methyl mercury contaminates our waters, large amounts are found in fish, particularly larger ones that are farther up in the food chain. An estimated one-third (or possibly more) of America's lakes and one-fourth of its rivers now contain fish that may be contaminated with mercury. Mercury is also present in a wide variety of everyday products, including cosmetics, dental fillings, fabric softeners, batteries, industrial instruments, inks used by printers and tattooists, latex, some medications, some paints, plastics, polishes, solvents, and wood preservatives.

Mercury is a cumulative poison. There is no barrier that prohibits mercury from reaching the brain cells, and it is retained in the pain center of the brain and in the central nervous system. Its presence there can prevent both the normal entry of nutrients into the cells and the removal of wastes from the cells. It can bind to immune cells, distorting them and interfering with normal immune responses. This may be one factor behind autoimmune disorders. Mercury can cause permanent kidney, cardiac, and respiratory problems. Significant amounts of mercury in the body can produce arthritis, depression, dermatitis, dizziness, fatigue, gum disease, nausea, vomiting, hair loss, insomnia, headaches, joint pain, slurred speech, memory loss, diarrhea, muscle weakness, and excessive salivation. High levels can also interfere with enzyme activity, resulting in blindness and paralysis. The symptoms of mercury poisoning can mimic those of multiple sclerosis and amyotrophic lateral sclerosis (ALS, also known as Lou Gehrig's disease). Many food and environmental allergies may be directly attributable to mercury poisoning. The U.S. Environmental Protection Agency has linked exposure to mercury vapor to menstrual disorders and spontaneous abortion (miscarriage) as well. Mercury exposure in pregnant women can cause neurological damage, such as lowered intelligence and delayed development in infants. In addition, the mortality rate for infants is significantly increased when mothers are exposed to mercury. Children who have severe mercury poisoning can experience acrodynia, a syndrome characterized by peeling and pinkness of the skin on the hands, nose, and feet; blindness; increased heart rate; agitation; and pain in the arms and legs.

Signs that indicate the presence of toxic mercury levels include behavioral changes, depression, confusion, irritability, and hyperactivity. People with this toxicity may also experience allergic reactions or asthma. They may com-

plain about a metallic taste in the mouth, and their teeth may loosen. These symptoms can occur within a few minutes, or they can take as long as thirty minutes to appear.

People get most of their mercury from eating fish. Microorganisms in the environment can convert inorganic mercury to the organic form methylmercury. This form can build up in the environment and accumulate in certain freshwater and saltwater fish and marine mammals. Methylmercury is the form of mercury that is most likely to cause adverse health effects in the general population. It is particularly damaging to developing embryos, which are five to ten times more sensitive than adults.

Although concerns have been raised over the years about the safety of mercury in dental amalgams, researchers have shown these concerns to be unfounded. Previous estimates of how much mercury is absorbed from fillings were too high. The measured levels in the brain, blood, and urine from an amalgam are about 1 to 3 micrograms per day. Toxic amounts are considered to be 30 micrograms per gram of creatinine (a protein in the urine) a day. You would need to have 450 to 530 fillings to achieve this level. According to the American Dental Association, fewer than 100 cases of allergic reactions to mercury in the amalgams have been reported. Furthermore, in two major studies in children, no effect was seen on kidney function, behavior, or IQ from mercury in fillings.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Glutathione plus L-methionine and L-cysteine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed for sulfur. Also helps to detoxify harmful metals and toxins. (See AMINO ACIDS in Part One.)
Selenium	200 mcg daily, in divided doses. If you are pregnant, do not exceed 40 mcg daily.	Neutralizes the effects of mercury.
Vitamin E	200 IU daily or 400 IU every other day.	Works with selenium to neutralize mercury. Use d-alpha-tocopherol form.
<i>Very Important</i>		
Apple pectin	As directed on label.	Aids in removing toxic metals from the body.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Acts as a detoxifier.
Kelp or alfalfa	1,000–1,500 mg daily.	Aids the body in removing toxins. See under Herbs, below.

Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	A powerful antioxidant; destroys free radicals.
plus carotenoid complex with beta-carotene	15,000 IU daily.	Powerful free radical scavengers.
Vitamin C with bioflavonoids	4,000–10,000 mg daily.	Helps remove metals and strengthens the immune system.
<i>Important</i>		
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Important for the functioning and protection of the brain.
<i>Helpful</i>		
Brewer's yeast	As directed on label.	A good source of B vitamins.
Hydrochloric acid (HCl)	As directed on label.	To aid digestion. Take this supplement if you are over forty and deficient in HCl (see INDIGESTION in Part Two).
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Protects brain cells from mercury poisoning.

**Herbs**

Alfalfa contains valuable nutrients and helps the body to eliminate toxins.

**Recommendations**

Eat organically grown foods, especially beans, onions, and garlic, for added sulfur, which helps protect the body against toxic substances.

Drink water only if it is steam-distilled. Drink plenty of pure fresh fruit and vegetable juices.

Supplement your diet with plenty of fiber (oat bran is a good source) and pectin (found in apples).

*Note:* Always take supplemental fiber separately from other supplements and medications.

Eat fish in moderation (two 6-ounce servings a week), and always broil it; do not baste it in its juices. While some fish may contain mercury, fish also contains compounds called alkylglycerols, which help to remove mercury from the body. If there is mercury in the fish, it is primarily stored in the fat. By broiling the fish and draining the juices, you will get rid of much of the fat and retain the beneficial alkylglycerols. Rarely eat high-mercury fish such as tilefish, swordfish, king mackerel, shark, and albacore tuna. Good seafood choices include canned light tuna, salmon, shrimp, catfish, and pollock.

If you suspect mercury toxicity, have a hair analysis performed. This can detect toxic levels of mercury. A urine mercury test also can give you this information. (See HAIR ANALYSIS in Part Three.)

## Considerations

❑ Maintain regular dental check-ups for yourself and your children to avoid having fillings in the first place. Regular brushing and flossing helps as well. Have decayed teeth treated.

❑ In a study published in *The New England Journal of Medicine*, high mercury levels in the body predicted heart attack risk. The investigators measured toenail mercury levels and found those with the highest amounts were at greater risk. In addition, these same people had the highest levels of DHA, an omega-3 fatty acid from fish. High mercury intake from fish may diminish the cardioprotective effect of fish. Another article in the same issue of the journal found that toenail mercury did not predict heart attack risk. Given the conflicting data, it seems prudent to avoid high-mercury seafood and choose mostly low-mercury fish. However, because low-mercury fish tend to have lower amounts of omega-3 fats, take high-quality omega-3 supplements to increase your omega-3 intake without the mercury.

❑ Chelation therapy removes toxic metals from the body. (See CHELATION THERAPY in Part Three.)

❑ High mercury levels have been linked to candidiasis. (See CANDIDIASIS in Part Two.)

❑ The U.S. Consumer Product Safety Commission (CPSC) has issued a warning to consumers to inform them of the dangers of inhaling mercury vapors. Certain ethnic and religious customs involve using a product called *azogue*, which in reality is metallic mercury. This product is sold in herb shops, or *botanicas*. Azogue is sprinkled throughout the home for religious purposes. The CPSC suggests *immediate* removal of the mercury if it has been sprinkled in the home, but removal must be done in the proper way to avoid making the danger worse. Call your local health department for information on the correct procedure for mercury removal.

❑ See also CHEMICAL ALLERGIES and ENVIRONMENTAL TOXICITY in Part Two.

## MIGRAINE

Migraines are severe, throbbing headaches that may or may not be accompanied by nausea, visual disturbances, and other symptoms. The incidence of migraine headaches has increased by 50 percent within the last twenty years. An estimated 28 million people in the United States—17 percent of women and 6 percent of men—suffer from them. Migraines are one of the most severe types of headache.

Traditional research has described migraines as vascular headaches involving excessive dilation or contraction of the brain's blood vessels. More current research gives other clues. Single photon emission computerized tomography (SPECT) scanning indicates that the inflammation involved in migraines is most noticeable in the meninges. These are three membranes—the dura, the arachnoid, and

the very inner layer of membrane, called the pia, which is separated from the other two by cerebrospinal fluid. These membranes surround the brain and the spinal cord.

However, it is not the inflammation of the meninges that leads to the pain of migraine, but rather abnormal nerve activity. Stimulation of the trigeminal nerve, which goes from the brain to the head and face, appears to trigger the release of substances known as calcitonin gene-related peptides (CGRP), which both induce inflammation and send messages to pain receptors in the meninges. Some researchers liken migraines in many ways to meningitis, another condition affecting the meninges, noting that with meningitis, the symptoms are very similar—headache, nausea, and sensitivity to light. Meningitis, however, is caused by viral or bacterial infection.

Migraines may occur anywhere from once a week to once or twice a year, and they often run in families. One factor behind the higher incidence of migraines in women may be fluctuations in the level of the hormone estrogen; women typically get migraines around the time of menstruation, when estrogen levels are low. Migraines occur most often in people between the ages of twenty and thirty-five, and tend to decline with age. However, children too can suffer from migraines. In children, migraine pain tends to be more diffuse, rather than localized. Migraines can first show up in childhood not as headaches, but as colic, periodic abdominal pains, vomiting, dizziness, and severe motion sickness. There are usually five phases in a migraine:

1. A day or so before the onset of a headache, there may be detectable changes in mood, problems with memory, an alteration in one or all of the five senses, or speech problems.
2. Just before the headache begins, some people see flashes or patterns of light and/or experience numbness of the hands or mouth. This is called an *aura*, much like the auras that affect many people with epilepsy before a seizure. A migraine preceded by an aura is called a *classic migraine*. Migraines without auras are called *common migraines*.
3. The headache starts, with severe, throbbing pain. It may occur on one side or on both sides of the head. The pain can also move from side to side. Nausea may set in, along with tenderness in the neck and scalp. The eyes may be very sensitive to light, and the person may be almost immobilized by the pain.
4. The headache dissipates. Nausea may linger, however.
5. The person may feel tired and lethargic and may simply want to sleep.

Any number of things can trigger a migraine in a susceptible individual, including allergies, constipation, stress, liver malfunction, too much or too little sleep, emotional changes, hormonal changes, sun glare, flashing lights, lack of exercise, and changes in barometric pressure. Dental problems may also be a factor. Low blood sugar is frequently associated with migraine; studies have shown that blood sugar

## Distinguishing Migraine Headaches

Just because a headache is very painful, that does not mean it is a migraine. Migraines have certain distinct characteristics that set them apart from other types of headaches.

The following table will help you to determine whether you have a true migraine or one of the two types most commonly confused with migraine—a tension or cluster headache.

Characteristic	Migraine	Tension Headache	Cluster Headache
Site of pain	One or both sides of the head	Both sides of the head	One side of the head
Duration of pain	4–72 hours	2 hours–days	30–90 minutes per episode, but episodes can recur multiple times daily
Severity of pain	Usually severe, but may be moderate	Mild or moderate	Very severe
Accompanied by nausea, sensitivity to light, sound, or smells	Common	No	No
Accompanied by fatigue and dizziness	Sometimes	No	No

levels are low during a migraine attack, and the lower the blood sugar level, the more severe the headache. Underlying causes of migraines that render an individual susceptible to various immediate triggers can include genetic factors, chemical imbalances in the brain, poor nutrition, and the overuse of painkillers.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. If a child under twelve experiences severe headache pain, especially if it is accompanied by nausea or visual disturbances, contact a physician promptly. (See MENINGITIS in Part Two.)

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium	2,000 mg daily.	Minerals that help to regulate muscular tone and to transmit nerve impulses throughout the body and to the brain. Use chelate forms.
	1,000 mg daily.	
Coenzyme Q <sub>10</sub>	60 mg daily.	Increases blood flow to the brain and improves circulation. Works with coenzyme Q <sub>10</sub> .
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont) and trimethylglycine (TMG)	125 mg twice daily.	Improve brain oxygenation.
	As directed on label.	

DL-phenylalanine (DLPA)	As directed on label.	Taken with care, and after consulting a physician, DLPA can relieve pain and elevate mood.
Essential fatty acid complex or primrose oil	As directed on label.	Needed for brain cells and for fat metabolism.
	As directed on label.	An anti-inflammatory agent to keep the blood vessels from constricting.
5-hydroxytryptophan (5-HTP)	As directed on label.	Increases the body's production of serotonin, a neurotransmitter involved in blood vessel regulation.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.
Rutin	200 mg daily.	Removes toxic metals, which may cause migraines.
Vitamin B complex	As directed on label.	Needed for a healthy nervous system. Use a hypoallergenic form. Injections (under a doctor's supervision) may be necessary.
plus extra vitamin B <sub>2</sub> (riboflavin)	400 mg daily.	Necessary for cell respiration and growth.
and vitamin B <sub>3</sub> (niacin) and niacinamide	200 mg 3 times daily. Do not exceed this amount. 800 mg daily.	Increases blood flow to the brain. <b>Caution:</b> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
and vitamin B <sub>5</sub> (pantothenic acid) or royal jelly	100 mg twice daily.	Needed by the adrenal glands when the body is under stress. Royal jelly is high in pantothenic acid. Use royal jelly from a natural source.
and vitamin B <sub>6</sub> (pyridoxine)	As directed on label.	Required for normal brain function. Use a hypoallergenic form.

**Helpful**

Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	A potent detoxifier.
Quercetin and bromelain or Activated Quercetin from Source Naturals	500 mg daily, before meals. As directed on label.	Helps control food allergies. Needed for a variety of enzyme functions. Contains quercetin plus bromelain and vitamin C to aid absorption.
Taurine Plus from American Biologics	10–20 drops daily.	An important antioxidant and immune system regulator, needed for white blood cell activation and neurological function. Use the sublingual form.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Aids in producing antistress adrenal hormones and enhances immunity. A buffered or esterified form is best.

**Herbs**

- Cordyceps is a Chinese herb that may, through its ability to reduce anxiety and stress and promote sound sleep, help people who suffer from migraines.
- Feverfew helps to alleviate pain.

**Caution:** Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

- Ginkgo biloba extract enhances cerebral circulation.

**Caution:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Other herbs effective for the treatment of migraines include cayenne (capsicum), chamomile, fumitory, ginger, peppermint, rosemary, valerian, willow bark, and wormwood.

**Cautions:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Consult with your physician before using fumitory. Do not use wormwood in high doses or for extended periods because it contains the chemical compound thujone that can be poisonous. Do not use wormwood if you suffer from any type of seizure disorder or are pregnant.

**Recommendations**

- Adopt a diet that is low in simple carbohydrates and high in protein. See HYPOGLYCEMIA in Part Two and follow the dietary guidelines.
- Include almonds, almond milk, watercress, parsley, fennel, garlic, cherries, and fresh pineapple in the diet.
- Omit from the diet foods that contain the amino acid tyramine, including aged meats, avocados, bananas, beer, cabbage, canned fish, dairy products, eggplant, hard cheeses,

potatoes, raspberries, red plums, tomatoes, wine, and yeast. Also avoid alcoholic beverages, aspirin, chocolate, monosodium glutamate (MSG), and nitrites (preservatives found in hot dogs and luncheon meats). Through the process of elimination, try to see if you have a particular allergy to some, or all, of these foods.

- Get regular moderate exercise.
  - Massage your neck and the back of your head daily.
  - Avoid salt and acid-forming foods such as meat, cereal, bread, and grains. Also avoid fried foods and fatty and greasy foods.
  - Eat small meals, and eat small, nutritious snacks between meals if needed, to help stabilize wide swings in blood sugar that may precipitate a migraine. Especially avoid missing meals.
  - Take only hypoallergenic supplements.
  - See your dentist for treatment of any tooth problems, such as gum disease, tooth decay, bacterial infection, temporomandibular joint (TMJ) syndrome, or tooth-grinding, that may be contributing to the problem.
  - Do not smoke, and avoid secondhand smoke.
  - Avoid loud noises, strong odors, and high altitudes.
  - Call a doctor if you have a headache that is triggered by, accompanied by, or linked to, any of the following:
    - Exertion (including sexual exertion), bending, or coughing.
    - Stiff neck and fever.
    - Head injury.
    - Vomiting.
    - Slurred speech, distorted vision, or numbness or tingling in part of the body.
- These can be signs of more serious disorders.

**Considerations**

- Some researchers believe many migraine attacks are caused by chemical imbalances in the brain. Serotonin levels in the brain drop during a headache. This triggers an impulse along the trigeminal nerve to blood vessels in the meninges, the brain's outer covering. In the meninges, the blood vessels become inflamed and swollen. The result is a headache.
- Among the natural remedies that can provide safe relief of migraine include omega-3 fatty acids, magnesium, vitamin B<sub>6</sub> (pyridoxine), probiotics like *Acidophilus* and *Bifidus* bacteria, feverfew, ginkgo, black cohosh, proper diet, and regular exercise.

**Cautions:** Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding. Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

❑ Migraine headaches in women may result from hormonal changes during the menstrual cycle. After menopause, the headaches usually decrease.

❑ Women who suffer from migraines may benefit from the use of natural progesterone cream.

❑ There is a relationship between food ingestion and migraines that is in part based on allergic mechanisms. Testing for IgE-specific food allergies appears helpful in selecting which people would likely benefit from diet therapy involving eliminating trigger foods. In one study, people with migraines who eliminated some foods had a 66 percent reduction in headaches.

❑ A study reported in the British medical journal *The Lancet* found that when allergenic foods were eliminated from the diets of migraine sufferers, as many as 93 percent of them found relief. (See ALLERGIES in Part Two.)

❑ In one study, subjects were tested to see whether red wine was a cause of headaches. In nine out of eleven subjects the wine provoked a headache, even though the wine did not contain tyramine (a natural substance formed from the breakdown of protein as food ages). Moreover, this group did not experience a headache following a drink of vodka.

❑ Researchers in France have identified a gene linked to a rare, severe type of migraine called *familial hemiplegic migraine*.

❑ Music has a calming effect and can help to relieve migraines. (See MUSIC AND SOUND THERAPY in Part Three.)

❑ Some find migraine relief by taking lecithin (a soybean derivative). In one study, those who took between three and six 1,200-milligram capsules when they felt a headache coming on had fewer, milder migraine attacks.

❑ Acupuncture and acupressure have helped many people control the pain of migraines.

❑ A study on the herb feverfew conducted at the University of Nottingham in England found that participants who took the herb got an average of 24 percent fewer migraines than those who did not, and they also found that vomiting was reduced, with no side effects.

**Caution:** Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

❑ The FDA has approved three over-the-counter medications to treat migraines: Excedrin Migraine (a combination aspirin, acetaminophen, and caffeine); Advil Migraine; and Motrin Migraine Pain. (The last two are ibuprofen-based.)

❑ Prescription medications for treating the pain of a migraine include: Dihydroergotamine (DHE) injection and as a nasal spray (Migranal); a combination product containing DHE plus isometheptene (Midrin) is not very effective. Triptans (5-hydroxytryptamine [5-HT], serotonin, agonists) are a class of medications used to treat migraines that are categorized as acute. They include: Sumatriptan (Imitrex), an injection, nasal spray, and rapid-dissolving tablet; almotriptan

(Axert); naratriptan (Amerge); rizatriptan (Maxalt); zolmitriptan (Zomig); frovatriptan (Frova); and eletriptan (Relpax). These migraine-specific therapies are most effective when taken early in an attack. The goal is to relieve the pain and associated symptoms. Triptans should not be used by those who have a past history of, or risk factors for, heart disease, high blood pressure, high cholesterol, angina, peripheral vascular disease, impaired liver function, stroke, or diabetes.

❑ The FDA has approved four drugs for migraine prevention: propranolol (Inderal); timolol (Blocadren); topiramate (Topamax); and divalproex sodium (Depakote). Amitriptyline (Elavil) is also sometimes used. If patients have frequent migraine attacks, attacks that do not respond consistently to the treatments above, or if the migraine-specific medications are ineffective or contraindicated because of other medical problems, then these preventive medications should be given to reduce the migraine frequency and improve the response to the acute migraine medicines.

❑ Antidepressants are sometimes prescribed for people who get migraines. Most effective are tricyclic antidepressants such as nortriptyline (Pamelor) and protriptyline (Vivactil). Other classes of drugs such as selective serotonin reuptake inhibitors (SSRIs) and serotonin and norepinephrine reuptake inhibitors (SNRIs) haven't proved effective, with the exception of venlafaxine (Effexor), which may be helpful in preventing migraines.

❑ Some women who experience migraines also have eating disorders such as bulimia nervosa.

❑ For names and addresses of organizations that offer information about how to deal with headaches, see Health and Medical Organizations in the Appendix.

❑ See also HEADACHE in Part Two and PAIN CONTROL in Part Three.

## MISCARRIAGE

See under PREGNANCY-RELATED PROBLEMS.

## MONONUCLEOSIS

Mononucleosis ("mono") is an infectious viral disease. The vast majority of cases (85 percent) are caused by the Epstein-Barr virus (EBV). More rarely, it may be caused by cytomegalovirus (CMV). Both of these viruses are members of the herpes family. Once the virus enters the body, it multiplies in lymphocytes (white blood cells). Mono affects the respiratory system, the lymphatic tissues, and glands in the neck, groin, armpits, bronchial tubes, spleen, and liver.

Symptoms include depression, extreme fatigue, fever, generalized aching, headache, jaundice, loss of appetite, sore throat, pain on the upper left side of the abdomen, puffy eyelids, swollen glands, and, sometimes, a bumpy red rash. The spleen may become enlarged, and liver function may be affected. Meningitis, encephalitis (inflamma-

tion of the brain), or rupturing of the spleen are very rare complications that can develop from mono.

The viruses that cause mono are contagious and can be transmitted from person to person by close contact such as kissing (mono is often referred to as the “kissing disease”) or by sharing food or utensils, although they can also spread during sexual contact or through respiratory droplets. The incubation period is about ten days in children and thirty to fifty days in adults. Many of the cases occur in the military and in colleges, where living conditions are crowded and sleeping patterns are inadequate. High school students also have a high incidence of this disease. Mono is most common among children and adolescents. As many as 95 percent of people over age thirty-five have mono antibodies in their blood, indicating that they had the disease at some point in their lives—although many do not even know they had it.

Because the symptoms are often so similar to those of influenza, mononucleosis is often mistaken for it. However, with mono, the symptoms tend to be more persistent. The acute symptoms usually last from two to four weeks, and fatigue can persist for three to eight weeks after the other symptoms disappear. In some individuals, the disease lingers for a year or more, producing recurring, but successively milder, attacks. If the immune system is weakened due to an organ transplant or other viruses, the mononucleosis symptoms can be serious and chronic.

A diagnosis of mono is made through a blood test called a mononucleosis spot test. This reveals the presence of specific viral antibodies and confirms the presence of mono. A liver function test may aid in diagnosis. If you have been exposed to the virus or feel unusually fatigued, get tested.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga or Bio-Dophilus from American Biologics)	As directed on label.	“Friendly” bacteria are important. Use a nondairy formula.
Proteolytic enzymes	As directed on label 3–4 times daily on an empty stomach, between meals and at bedtime.	Reduces inflammation and aids in absorption of nutrients.
Vitamin A with mixed carotenoids and vitamin E	25,000 IU daily for 2 weeks, then slowly reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily or 400 IU every other day.	Essential for the immune system. Use emulsion forms for easier assimilation and greater safety at high doses. Use d-alpha-tocopherol form.

Vitamin C with bioflavonoids	5,000–10,000 mg daily, in divided doses.	Destroys the virus and boosts the immune system. A buffered esterified form is best.
------------------------------	--	--

*Important*

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	125 mg twice daily.	An immune stimulant that enhances oxygenation.
Free form amino acid	¼ tsp 2–3 times daily, on an empty stomach.	To provide protein, necessary for healing and to rebuild tissues. Use a powdered form.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	A powerful immune booster. Acts as a natural antibiotic.
Vitamin B complex plus extra vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).  2,000 mcg twice daily.	B vitamins increase energy and are needed for every bodily function, including proper digestion and brain function. Use a high-stress, hypoallergenic formula. A sublingual form is recommended. Injections (under a doctor’s supervision) may be necessary. Required for proper digestion and to prevent anemia. Use a lozenge or sublingual form.
Zinc lozenges	As directed on label.	A powerful antioxidant that helps fight free radicals.

*Helpful*

Maitake extract or reishi extract or shiitake extract	As directed on label.	Mushroom extracts with immune-boosting and antiviral properties.
Multivitamin and mineral complex with calcium and magnesium and potassium	As directed on label.  1,000 mg daily.  75–1,000 mg daily.  99 mg daily.	All nutrients are necessary for normal cellular function and repair. Use a high-potency formula.
Raw thymus glandular plus multiglandular complex (Multi-Glandular from American Biologics)	500 mg 3 times daily.  As directed on label.	To enhance immune response. (See GLANDULAR THERAPY in Part Three.)

**Herbs**

- Astragalus and echinacea boost the immune system.
  - Cautions:* Do not take astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.
- Cat’s claw has immune-enhancing properties and acts against viral infection.
  - Caution:* Do not use cat’s claw during pregnancy.
- Dandelion and milk thistle protect the liver.

Goldenseal fights infection. If a sore throat is present, place a dropperful of alcohol-free goldenseal extract in the mouth and hold it there for a few seconds, then swallow. Do this every four hours for three to five days.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Olive leaf extract appears to help inhibit the growth of viruses that cause diseases such as mononucleosis.

Pau d'arco balances the bacteria in the colon.

Spirulina contains phytonutrients that appear to boost the immune system.

### Recommendations

Eat a diet composed of at least 50 percent raw foods. Consume as much of your food raw as possible. Also emphasize wholesome soups, root vegetables, and whole grains, including brown rice.

Each day, drink ten 8-ounce glasses of distilled water, plus fresh juice.

Do not consume any coffee, fried foods, processed foods, soft drinks, stimulants, sugar, tea, or white flour products. These depress immune function. Any omega-6-rich fat—found in most vegetable oils—is immunosuppressive and should be avoided or limited.

Eat four to six small meals daily. Avoid overeating at any one meal.

Get plenty of rest. Round-the-clock bed rest is a good idea during the acute phase of the disorder.

Gargle with a glass of warm salt water to relieve sore throat. Add ½ teaspoon of salt to a glass of warm water and gargle several times a day.

Use a protein supplement from a vegetable source. Spiru-tein from Nature's Plus is a good protein drink for between meals.

Use chlorophyll in tablet form, or in a liquid form such as "green drinks" made from leafy green vegetables or wheatgrass. Kyo-Green from Wakunaga is a highly concentrated natural barley and wheatgrass source of amino acids, vitamins, minerals, carotene, chlorophyll, and enzymes. It is also available in powder form containing chlorella, kelp, and brown rice.

Do not strain when having a bowel movement, as this may injure an enlarged spleen.

Do not give aspirin to a child or adolescent with mononucleosis, as it may lead to complications such as Reye's syndrome. (See REYE'S SYNDROME in Part Two.)

Avoid close physical contact with others as much as possible. Flush all tissues after use, and do not share food, eating utensils, or towels. Wash your hands frequently.

Avoid strenuous exercise and competitive sports until you are completely recovered.

If you have a fever over 102°F, or if you develop severe pain in the upper left abdomen that lasts for five minutes or more, or if breathing and/or swallowing becomes difficult as a result of throat inflammation, consult your health care provider promptly. These can be signs that a more serious condition is developing.

### Considerations

Once contracted, both EBV and CMV remain in the body for life, but the acute illness eventually runs its course in nearly all cases. Because there is no cure for mononucleosis, a proper diet and supplements, plus adequate rest, are especially important for this disorder.

Antibiotics are of no use unless there is a secondary infection such as ear infection or strep throat.

Adequate rest, exercise, and nutrition are essential for the maintenance of general health and the prevention of mononucleosis.

Protein is needed to stimulate the formation of antibodies that protect against complications such as hepatitis and jaundice.

See also CHRONIC FATIGUE SYNDROME in Part Two.

### MORNING SICKNESS

See under PREGNANCY-RELATED PROBLEMS.

### MOTION SICKNESS

Motion sickness occurs when motion causes the eyes, the sensory nerves, and the vestibular apparatus of the ear to send conflicting signals to the brain, causing a loss of equilibrium or a sense of vertigo. It usually is experienced in a car, airplane, train, boat, elevator, or swing. Anxiety, genetics, overeating, poor ventilation, and traveling immediately after eating are common contributing factors. A susceptibility to things such as offensive odors, sights, or sounds can often precede an attack of motion sickness. Women are affected by this condition more frequently than men are. Elderly people and children under the age of two usually are not affected.

People suffering from motion sickness experience symptoms that range from severe headache to queasiness to nausea and vomiting while flying, sailing, or traveling in automobiles or trains. Other symptoms of motion sickness include cold sweats, dizziness, excessive salivation and/or yawning, fatigue, loss of appetite, pallor, severe distress, sleepiness, weakness, and, occasionally, breathing difficul-

ties that can make you feel as though you are suffocating. If severe, an attack can make you completely uncoordinated, and sometimes injury can occur from loss of balance. Once the stimulus is removed, the motion sickness usually goes away; however, it can persist for hours or days. If you suffer from motion sickness for a prolonged amount of time, you may experience depression, dehydration, or low blood pressure. It can also worsen any other illness you may already have.

Natural remedies have been used with great success for motion sickness. Prevention is the key; motion sickness is far easier to prevent than it is to cure. Once excessive salivation and nausea set in, it is often too late to do anything but wait for the trip to be over so recovery can begin.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Charcoal tablets	5 tablets 1 hour before travel. Take separately from other medications and supplements.	A detoxifier.
Magnesium	500 mg 1 hour before trip.	Acts as a nerve tonic.
Vitamin B <sub>6</sub> (pyridoxine)	100 mg 1 hour before trip, then 100 mg 2 hours later.	Helps to relieve nausea.

### Herbs

- Black horehound can reduce nausea.
- Butcher's broom, kudzu, and motherwort help to relieve vertigo.
- Ginger suppresses nausea and therefore is an excellent treatment and preventive for nausea and upset stomach. Studies have shown that it may be more effective than dimenhydrinate (Dramamine) without the side effects. Take 2 ginger capsules (approximately 1,000 milligrams) every three hours, starting one hour before the beginning of the trip.
- Peppermint tea soothes and calms the stomach. A drop of peppermint oil on the tongue provides excellent relief from nausea and motion sickness. Peppermint can also be taken in lozenge form.

### Recommendations

- When traveling, take whole-grain crackers with you on trips. Olives can help ward off nausea because they have the effect of decreasing salivation.
- Try sipping green or ginger tea during long trips. Sucking on a fresh lemon may also calm the stomach.

Pay special attention to your diet. If a certain dish disagrees with you at home, it will most certainly disagree with you on the road.

Do not eat spicy, salty, sugary, heavy, or fatty foods, especially fried foods, before or during travel. Also avoid dairy products and processed and junk foods. These can contribute to nausea or cause digestive imbalances.

Also avoid large meals when traveling. Instead, eat smaller, more frequent meals so that your stomach is never empty.

Avoid alcohol. Alcohol disrupts the delicate operations that occur in the inner ear. If you are prone to motion sickness, alcohol consumption will only aggravate the problem by further disrupting communication between the eyes, the inner ears, and the brain.

Avoid odors and aromas that can bring about nausea. Aside from obvious things such as smoke and engine exhaust, certain food odors can make you ill, as can paint fumes, nail polish, or animal waste. Even otherwise pleasant smells, such as those from perfume or aftershave, can cause a problem if you are prone to motion sickness.

Sit still and breathe deeply. Your brain is already thoroughly confused without extra motion on your part. Especially try to keep your head still. Rest in a reclined position in an area where there is the least amount of motion (in the center of a ship or in the wing area of an airplane). Focus your eyes on a distant object and try not to allow your eyes to drift to either side. Or close your eyes and take deep breaths. If possible, lie down in a dark place with a cool, damp cloth over your eyes.

Stay cool, if possible. Fresh air can assist in battling motion sickness. If in a car, roll down a window. If on a ship, standing on deck and taking in the sea breezes may help. In an airplane, open the overhead vent.

When you begin to feel sick, rub or press on your wrist, about three fingers' width down from the line that separates the hand from the arm. Massaging this acupressure point often stops motion sickness.

Do not read while traveling in a car.

Limit or eliminate visual input. This will cut down on the conflicting information assaulting the brain. Traveling at night helps many people, simply because visual acuity is diminished, so that they do not perceive motion to the same degree as during the day.

### Considerations

- Symptoms of nausea may indicate that the liver needs attention.
- A homeopathic liver remedy may help reduce nausea.
- Chewable papaya tablets can be helpful.
- There are numerous over-the-counter products available that may help to prevent motion sickness, including

cyclizine (Marezine), dimenhydrinate (Dramamine), and meclizine (Antivert, Bonine). These drugs are not always effective, however, and can cause side effects, especially drowsiness. Motion sickness medication should not be taken with alcohol, sleep aids, or any type of tranquilizers. It is important to use extreme caution and carefully follow the dosage instructions for children.

❑ If motion sickness is debilitating, and herbal, homeopathic, and over-the-counter medications do not bring relief, a physician can prescribe scopolamine (which is a component of the herb belladonna) to be applied in a patch (Transderm Scop) that delivers the drug through the skin for up to three days. Possible side effects of scopolamine include dry mouth, drowsiness, blurred vision, and a dilated pupil on the side on which the patch is worn. This drug should not be used by anyone with glaucoma, as it raises pressure within the eye. If you are pregnant or nursing, talk to your doctor before using scopolamine. It is not recommended for use by children.

❑ To a certain extent, motion sickness is psychological. In many cases, it can be prevented if you consciously tell yourself that you *will not* get sick. If you travel frequently and are prone to motion sickness, you may benefit from psychotherapy or counseling.

## MOUTH AND GUM DISEASE

See HALITOSIS; PERIODONTAL DISEASE. See also BLEEDING GUMS under PREGNANCY-RELATED PROBLEMS.

## MULTIPLE SCLEROSIS

Multiple sclerosis (MS) is a progressive, degenerative disorder of the central nervous system, including the brain, the optic nerve, and the spinal cord. It is characterized by many areas of inflammation and scarring of the myelin sheaths in the brain and spinal cord. These are wrappings, composed of a fatty substance, that insulate the nerve fibers throughout the body. *Sclerosis* means hardening of tissue; *multiple* simply indicates many regions of tissue hardening. It seems that the body's immune system malfunctions and produces antibodies that attack the myelin sheaths. Consequently, the sheaths are damaged, and the damaged areas develop scarring that leads to either distorted communication or lack of communication between the nerve endings. This may produce a multiplicity of symptoms, from slurred speech to vision problems to loss of mobility.

At least 400,000 people in the United States have multiple sclerosis. Symptoms vary from individual to individual, depending on which portion or portions of the nervous system are most affected. In the earlier stages, the primary symptoms may include episodes of dizziness; extreme fatigue; eye problems such as blurred or double vision; a feeling of tingling and/or numbness, especially in the hands and feet; loss of balance and/or coordination; mus-

cular stiffness; slurred speech; tremors; or bowel and bladder dysfunction. Secondary symptoms, which are problems that arise because of the primary symptoms rather than because of the underlying illness itself, may include bone loss, muscle wasting, paralysis, sexual dysfunction, urinary tract infections, and weak respiration. Many of these secondary conditions occur as a result of decreased mobility if the disease progresses.

The disease typically follows a pattern of periodic flare-ups, called *exacerbations*, followed by periods in which symptoms diminish or even disappear called *remissions*. MS is variable in its rate of progression. It can be relatively benign, with only a few minor attacks spread over decades, or it can be rapidly and completely disabling. Most commonly, it progresses slowly, disappearing for periods of time but returning intermittently, often in progressively more severe attacks.

The underlying cause of MS is not known, but it is widely believed to be an autoimmune disease in which white blood cells attack the myelin sheaths as if they were a foreign substance. Stress and malnutrition, whether from poor absorption or poor diet, often precede the onset of the disease. Some experts suspect that an as-yet-unidentified virus may be involved. Heredity may also be a factor. Another theory is that this condition may be caused by food intolerances or allergies, especially allergies to dairy products and gluten.

Chemical poisoning of the nervous system by pesticides, industrial chemicals, and heavy metals may also play a part in the development of MS. Environmental toxins can cause disturbances in the body's normal metabolic pathways that result in damage to the nerves' protective myelin sheaths. Even substances that are not necessarily toxic to everyone can be a problem for susceptible individuals. Toxins such as those produced by bacteria and fungi in the body have been known to produce symptoms like those of MS.

Finally, diet may play a key role in the development of MS. This is suggested by the fact that MS is fairly common in the United States and Europe and almost unheard-of in some other countries, such as Japan, Korea, and China. The consumption of saturated fats, cholesterol, and alcohol, so common in Western countries, promotes the inflammatory response and worsens symptoms of multiple sclerosis. People in Asian countries typically consume much less fat than people in North America and northern Europe do. Their diets are also rich in marine foods, seeds, and fruit oils, which are high in essential fatty acids, including the omega-3 essential fatty acids, which have an inhibitory effect on the inflammatory response. Our American diet in contrast is rich in oils from grains that promote inflammation.

MS is usually diagnosed between the ages of twenty and fifty. Women are affected two to three times more than men; the rate is higher in younger women compared to men (3.2 to 1). MS is rarely diagnosed in children and in people over sixty years of age. In the United States, MS occurs much more often in states north of the thirty-seventh

parallel (an imaginary line stretching approximately from Newport News, Virginia, to Santa Cruz, California) than in other parts of the country. It also appears in clusters in places including El Paso, Texas; De Pue, Illinois; and Galion, Ohio.

Diagnosing MS is not a simple task, so the illness often goes undiagnosed for some time. Tests that can be used to detect the disease include magnetic resonance imaging (MRI), to look for signs of plaques or lesions; lumbar puncture (spinal tap), to detect abnormalities in the levels of white blood cells and/or immune system proteins in the cerebrospinal fluid; a visual evoked potential (VEP) test, done to assess the connection between the retina and the visual area of the brain; an audio evoked potential (AEP) test, which may help to detect lesions in the brain; and electrodiagnostic tests that measure the rate at which nerve impulses travel (this may be slower than normal in people with MS).

There is no known cure for this disease, but the supplement and dietary programs outlined in this section have been shown to be helpful. Long-term sufferers of MS may not benefit as much, but younger people who are just starting to exhibit symptoms may find that the correct supplements slow or even stop the progression of the disease.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium	2,000–3,000 mg daily.	Deficiency may create a predisposition to developing MS. Use chelate form for best assimilation.
and magnesium	1,000–1,500 mg daily.	Needed for calcium absorption and for proper muscular coordination.
Coenzyme Q <sub>10</sub>	90 mg daily.	Needed for improved circulation and tissue oxygenation. Strengthens the immune system.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Supports the immune system's detoxification of many dangerous substances. Can ease depression and fatigue, increase energy, process fats, remove toxins from the body, and boost the immune system.
Gamma-linolenic acid (GLA)	As directed on label 3 times daily, with meals.	An essential fatty acid needed to control symptoms. Deficiency is common in people with MS.
or flaxseed oil or	As directed on label 3 times daily, with meals.	If GLA is not available, use one of these supplements

primrose oil or omega-3 essential fatty acid complex	As directed on label 3 times daily, with meals. As directed on label 3 times daily, with meals.	for essential fatty acids.
Garlic (Kyojic from Wakunaga)	2 capsules 3 times daily.	An excellent source of sulfur.
Methylsulfonylmethane (MSM)	As directed on label.	Helps to keep cell walls permeable, allowing water and nutrients to freely flow into cells and allowing wastes and toxins to properly flow out. With vitamin C, is used by the body to build healthy new cells.
Oxy-5000 Forte from American Biologics	As directed on label.	A potent nutritional antioxidant formula.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	Aids immune system function and maintains healthy nerves. Use hypoallergenic formulas for all the B vitamins. Promotes red blood cell production; aids the nervous system and immune function. Deficiency may cause MS in susceptible persons.
and vitamin B <sub>12</sub>	1,000 mcg twice daily.	Aids in cellular longevity and helps to prevent nerve damage by maintaining the protective myelin sheaths. Use a lozenge or sublingual form.
and choline and inositol	As directed on label.	To stimulate the central nervous system and aid in protecting the myelin sheaths from damage.
Vitamin D	800 IU daily.	Aids in calcium absorption.
<i>Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	1 tsp twice daily, on an empty stomach.	Helps to detoxify harmful substances, enhances absorption of nutrients, and aids digestion. Use a powdered nondairy form.
Amino-VIL from Carlson Labs	¼ tsp twice daily, on an empty stomach.	A combination of the branched-chain amino acids, which aid in use of nutrients by the muscles. (See AMINO ACIDS in Part One.)
plus L-glycine	500 mg twice daily, on an empty stomach.	Aids in supporting the myelin sheaths.
Creatine	As directed on label. Do not take with fruit juice, as this combination produces creatinine, which is difficult for the kidneys to process. Do not exceed the recommended dose.	May help counteract muscle depletion. Should be used in combination with a balanced diet.
Free form amino acid	As directed on label 3 times daily, between meals.	Helps to maintain good absorption of nutrients needed for proper brain function.
Grape seed extract	As directed on label.	A powerful antioxidant and anti-inflammatory.

Multienzyme complex or Inf-zyme Forte from American Biologics	As directed on label. Take with meals. As directed on label.	For proper breakdown of foods. To reduce inflammation and aid digestion.
Multiglandular complex	As directed on label.	Needed for the endocrine, hormonal, and enzyme systems. (See GLANDULAR THERAPY in Part Three.)
Nicotinamide adenine dinucleotide (NADH)	As directed on label.	Important in the creation and transfer of chemical energy, especially during breathing.
Parasitin from Växa International	As directed on label.	To detoxify the body of parasites.
Potassium	300–1,000 mg daily.	Needed for normal muscle function. Check with your health care provider before taking these amounts.
Raw thymus glandular	500 mg twice daily.	Enhances immune function.
Selenium	150–300 mcg daily.	An antioxidant and immune system stimulant.
7-Keto DHEA	As directed on label.	Slows overall body deterioration. Enhances fat loss and lean muscle mass development. Preferable to ordinary DHEA because it is not converted into sex hormones in the body.
Ultra Osteo Synergy from American Biologics	As directed on label.	To provide nutritional support for bone renewal.
Vitamin A plus carotenoid complex (Betatene)	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Important antioxidants. Use emulsion forms for easier assimilation.
Vitamin C with bioflavonoids	3,000–5,000 mg daily.	Promotes production of the antiviral protein interferon in the body. Also an antioxidant and immune system stimulant. Use buffered ascorbic acid or an esterified form.
Vitamin E	200 IU daily or 400 IU every other day.	Important for circulation, destroys free radicals, and protects the nervous system. Use d-alpha-tocopherol form. Emulsion form is recommended for easier assimilation and greater safety at high doses.
Vitamin K or alfalfa	200 mcg 3 times daily, with meals.	Helps to prevent nausea and vomiting. See under Herbs, below.

**Helpful**

Brewer's yeast	Start with ¼ tsp daily and slowly increase to 2 tsp daily.	Improves blood sugar metabolism when taken with chromium. Aids in lowering cholesterol and improving HDL/LDL ratio.
----------------	--	---

Kyo-Green from Wakunaga	1 tsp in liquid 3 times daily.	A good source of organic chlorophyll, live enzymes, vitamins, and minerals plus amino acids.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3–4 times daily, before meals.	Protects the cells. Needed for normal brain function.
Manganese	5–10 mg daily. Take separately from calcium.	An important mineral often deficient in people with MS.
Multimineral complex	As directed on label.	Needed for all enzyme systems in the body and to supply needed nutrients. Use a high-potency formula.
Phosphorus	900 mg daily.	Needed for transfer of energy within cells.

**Herbs**

- Alfalfa is a good source of vitamin K. It can be taken in liquid or tablet form.
- Burdock, dandelion, echinacea, goldenseal, pau d'arco, red clover, St. John's wort, sarsaparilla, and yarrow are effective detoxifiers.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

- Cordyceps is a Chinese herb that improves memory, helps you assimilate nutrients more efficiently, and increases energy.
- Lobelia, skullcap, and valerian root relax the nervous system. Taken at bedtime, they aid in preventing insomnia. Lobelia is good for daytime use also.

*Caution:* Lobelia is to be taken only under supervision of a health care professional, as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

**Recommendations**

- Eat only organically grown foods with no chemical treatments or additives, including eggs, fruits, gluten-free grains, raw nuts and seeds, vegetables, and cold-pressed vegetable oils. The best diet for people with this disorder is

totally vegetarian. Make sure that you study up on what following a well-balanced vegetarian diet entails. Missing out on essential nutrients will only worsen your condition.

- Eat plenty of raw sprouts and alfalfa, plus foods that contain lactic acid, such as sauerkraut and dill pickles. Also good are “green drinks” that contain plenty of chlorophyll.
- Eat plenty of dark leafy greens. These are good sources of vitamin K.
- Drink at least ten 8-ounce glasses of quality water each day to prevent toxic buildup in the muscles.
- Do not consume any alcohol, barley, chocolate, coffee, dairy products, fried foods, highly seasoned foods, meat, oats, refined foods, rye, salt, spices, sugar, tobacco, wheat, or processed, canned, or frozen foods.
- Take a fiber supplement. Fiber is important for avoiding constipation. Periodically take warm cleansing enemas with the juice of a fresh lemon. A clean colon is important for keeping toxic waste from interfering with muscle function. (See COLON CLEANSING and ENEMAS in Part Three.)
- Never consume saturated fats, processed oils, oils that have been subjected to heat (either in processing or in cooking), or oils that have been stored without refrigeration.
- Have yourself tested for possible food allergies. (See ALLERGIES in Part Two.) We believe that food allergies are a major factor in the development and progression of multiple sclerosis. Unfortunately, all too often the allergies are not discovered until irreversible nerve damage has occurred. Early detection is therefore vital. Eliminating offending foods from your diet may slow down the progression of the disease and help you avoid further damage.
- Avoid stress and anxiety. Attacks of MS are often precipitated by a trauma or a period of emotional distress.
- Avoid exposure to heat, such as hot baths, showers, sunbathing, and overly warm surroundings, and avoid becoming overheated when working or exercising. Avoid exhaustion and viral infections. All of these may trigger an attack or worsen symptoms.
- Get periodic massages and regular exercise, and keep mentally active. These are extremely valuable in maintaining muscle function and bringing about remission of symptoms. However, exercises that may increase body temperature can decrease the function of the nerves involved and make symptoms worse. Swimming is the best activity. Doing other exercises in cool water is good as well because body temperature is kept lower and the body’s weight is supported by the water. Stretching exercises help to prevent muscle contractures. Physical therapy is often needed.
- When an exacerbation begins, take at least two days of complete bed rest. This can often stop a mild attack.
- Educate yourself and your family about the disease, and seek out sources of emotional support. For names and

addresses of organizations that can help, see Health and Medical Organizations in the Appendix.

## Considerations

- A strong immune system may help to prevent multiple sclerosis by helping the body avoid infection, which often precedes the onset of this disease.
- While the effects of MS on pregnancy seem to be minimal, slightly more flare-ups occur during the six months following childbirth. During the reproductive years, there is a preponderance of autoimmune disorders in women, including MS.
- Gluten intolerance may make a person more susceptible to MS.
- Recent studies point to a possible link between MS and candida infection. A significant proportion of people with MS show evidence of imbalanced bowel flora, which is characteristic of candidiasis. Further, chronic fatigue is a symptom of candidiasis, and it is also one of the most common complaints of people with multiple sclerosis. Treatments to reduce candida activity have been found to reduce the fatigue experienced by many people with MS. (See CANDIDIASIS in Part Two.)
- The symptoms of Lyme disease may mimic those of multiple sclerosis. (See LYME DISEASE in Part Two.)
- Chlamydia pneumoniae*, a very common type of bacteria, has been cited as a possible cause of MS. In an article in the July 1999 issue of *Annals of Neurology*, researchers reported that *C. pneumoniae* were found in all MS patients in their study group. (It may be that this was a result of MS, not a cause.)
- One recent study concentrated on the ability of hypericin, a chemical found naturally in St. John’s wort, to destroy viruses and cancer cells when exposed to light. Hypericin has shown promise as a disease-fighting agent, and research is continuing.
 

*Caution:* St. John’s wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.
- Researchers in Scandinavia have long studied the use of essential fatty acid supplementation to treat MS and to reduce the frequency of new events. A low-fat, high-fish-oil diet has been shown to be moderately effective in patients with relapsing-remitting MS.
- Some people with MS have experienced relief of symptoms by using honeybee venom. Bee venom apparently acts as an anti-inflammatory and immune system stimulant.
- Although its use is considered controversial by many physicians in the United States, hyperbaric oxygen therapy has been used with success for people with multiple sclerosis in some other countries. (See HYPERBARIC OXYGEN THERAPY in Part Three.)

Drugs that are commonly used for multiple sclerosis include:

- Corticosteroids. The most common treatment for multiple sclerosis, corticosteroids reduce the inflammation that spikes during a relapse. Examples include oral prednisone and intravenous methylprednisolone. Side effects may include mood swings and weight gain.
- Interferons. These types of drugs—Betaseron, Avonex, and Rebif—appear to slow the rate at which multiple sclerosis symptoms worsen over time. But interferons can cause serious liver damage.
- Glatiramer (Copaxone). Doctors believe that glatiramer works by blocking the immune system's attack on myelin. This drug must be injected subcutaneously once daily. Side effects may include flushing and shortness of breath after injection.
- Mitoxantrone (Novantrone). This immunosuppressant drug can be harmful to the heart, so it's usually used only in people who have advanced multiple sclerosis.
- Natalizumab (Tysabri). This drug is designed to work by interfering with the movement of potentially damaging immune cells from the bloodstream to the brain and spinal cord. Tysabri is generally reserved for people who see no results from or can't tolerate other types of treatments. This is because Tysabri increases the risk of progressive multifocal leukoencephalopathy—a brain infection that is usually fatal.

Always ask your physician about all available medications, and especially about possible side effects, so that you can make informed decisions about which (if any) to take.

In one study, men with relapsing-remitting MS who were given 100 milligrams of testosterone showed improved cognition and slowed brain atrophy. They also had increased lean body mass, and there were no side effects.

Epidemiological data suggests that there is a link between vitamin D deficiency and increased prevalence rates of MS. In one study, the use of oral calcitriol (1,25-dihydroxy vitamin D<sub>3</sub>), in combination with a diet that provided 800 milligrams of calcium, reduced the symptoms in about one-third of the patients with MS. In another study, high doses of vitamin D—beyond the Upper Limits of Safety—and calcium reduced the number of lesions in patients with MS. This sort of treatment requires regular blood monitoring and close physician supervision, but these early results seem promising in terms of slowing the progression of the disease.

According to the New Jersey College of Medicine, X-ray irradiation to the lymph glands and the spleen may halt the progress of MS in some cases. However, radiation exposure depresses the immune system.

Because there are so many conditions that can occur over time with MS—including bowel and bladder problems, chronic fatigue, depression, headaches, impotence, pain, problems with vision and hearing loss, seizures, uri-

nary tract infections, and vertigo—it is advisable to read the sections that cover these individual conditions in this section of this book. Consult the Table of Contents to look for sections that may be relevant for you.

## MUMPS

Before the routine vaccination program was introduced in the United States, mumps was a common viral illness, mostly of childhood, caused by a type of virus known as a paramyxovirus that infects the parotid glands—the salivary glands located at the jaw angles below the ears. Mumps vaccine (usually MMR) is the best way to prevent mumps. Children should be given the first dose of MMR vaccine at twelve to fifteen months of age. The second dose is recommended before the start of kindergarten. One dose of mumps vaccine prevents approximately 80 percent of mumps and two doses about 90 percent of cases. Although mumps are rare in the United States, small outbreaks do occur; the first recent cases of mumps-like illness were reported from Iowa in December 2005. More cases have been occurring since then in Iowa, and in several other states. There are on average 265 mumps cases reported each year in the United States.

Of those people who do get mumps, up to half have very mild or no symptoms, and therefore do not know they were infected with mumps. The most common symptoms include swelling of one or both glands plus headache, fever, chills, decreased appetite, sore throat, and pain when swallowing or chewing, especially when swallowing acidic substances such as citrus juices. Often, one of the parotid glands swells before the other, and as swelling in one gland subsides, the other begins to swell.

Symptoms typically appear sixteen to eighteen days after infection, but this period can range from twelve to twenty-five days after infection. Mumps is transmitted from person to person by means of infected droplets of saliva or direct contact with contaminated materials. It can be contracted through sneezing, coughing, kissing, talking, breathing, drinking out of the same glass as an infected person, and sharing utensils. A person with mumps is contagious any time from forty-eight hours before the onset of symptoms to six days after the symptoms have started. This illness is not as contagious as measles or chickenpox, and one attack usually affords lifetime immunity. Mumps is most common in children between the ages of three and ten, although it can occur through teenage years and, in rare cases, in adulthood. If it does occur after puberty, the ovaries or testes may become involved and sterility may result. If the testicles are affected, they become swollen and painful; if the ovaries or pancreas is affected, abdominal pain results. Other organs that can be affected in rare, severe cases include the brain, and kidneys—possibly with serious complications.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve

and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
<i>Bifidobacterium bifidus</i>	As directed on label.	"Friendly" bacteria contain antibiotic substances that inhibit pathogenic organisms.
Vitamin C with bioflavonoids	500 mg every 2 hours until improvement is noted, up to 3,000–10,000 mg daily.	Destroys the virus and eliminates toxins. For children, use sodium ascorbate form to lessen diarrhea.
Zinc lozenges (ImmunActinZinc lozenges from Nature's Plus)	1 15-mg lozenge every 4 to 6 hours. Do not exceed a total of 100 mg daily from all supplements.	Aids healing. Lozenges are fast acting. Do not chew them, but allow them to dissolve slowly in the mouth.
<b>Important</b>		
Acidophilus (Kyo-Dophilus from Wakunaga or Bio-Dophilus from American Biologics)	As directed on label.	For adults and children. Contains antibiotic substances that inhibit pathogenic organisms. Use a nondairy formula.
Free form amino acid plus vitamin B complex	As directed on label.	Important for tissue repair and healing.
plus potassium	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 99 mg daily.	Needed for healing.  To restore electrolytes depleted by fever. Potassium levels are depressed by fever over 101°F.
Vitamin A with mixed carotenoids	Children under twelve: 14,000 IU daily. Adults and children over twelve: 50,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Vitamins A and E potentiate immune function. Use emulsion forms for easier assimilation.
and vitamin E	200 IU daily or 400 IU every other day for adults and children	Use d-alpha-tocopherol form.
<b>Helpful</b>		
Kelp	1,000–1,500 mg daily.	Contains essential minerals, iodine, and vitamins.

### Herbs

Catnip and chamomile teas are good calming agents and help to induce sleep. Catnip tea enemas help reduce fever. (See ENEMAS in Part Three.)

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Taken as a tea, dandelion cleanses and supports the liver. Ground into a powder and combined with a little aloe vera gel in a poultice, it helps to reduce swelling.

Echinacea helps to reduce swelling and cleanses the blood and lymphatic system. Take it in tea form, mixed with a little juice, four times a day or more.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Elderflower tea helps to reduce fever.

Lobelia extract is good for pain. Take ½ teaspoon every three to four hours.

*Caution:* Lobelia is to be taken only under supervision of a health care professional, as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Mullein poultices are good for relieving pain and swelling of the salivary glands. (See USING A POULTICE in Part Three.)

Peppermint tea soothes an upset stomach and helps to flush infection from the body.

Adding powdered slippery elm bark to barley water makes a drink that is nourishing and soothing to the throat and digestive tract. (See THERAPEUTIC LIQUIDS in Part Three.)

Yarrow reduces fever and inflammation and is a good lymphatic cleanser.

### Recommendations

As long as the glands are swollen, eat mostly raw fruits and vegetables that are juiced or softened. Sticking to a diet of soft foods helps to minimize the pain of chewing.

Drink plenty of pure water and fresh juices to keep the body well hydrated and to flush the system clean.

Do not consume coffee, dairy products, tobacco, or white flour or sugar. Avoid acidic foods, such as pickles and citrus fruits or juices, as they are likely to cause discomfort.

Follow a fasting program to detoxify the body. (See FASTING in Part Three.)

Stay warm and dry, and get plenty of rest.

Intermittently apply warmth or cold, whichever feels best, to the swollen glands and around the neck. Use hot towels, hot water bottles, and ice packs with caution.

If testicular swelling and pain occur, support the scrotum by means of an adhesive tape "bridge" between the thighs and use cool compresses to help relieve pain.

### Considerations

Complete recovery from mumps usually can be expected in about ten days if no complications occur. If any of the following symptoms develop, you should see your doctor as soon as possible: tenderness or swelling of the testicles, severe vomiting (this may indicate infection that

has spread to the pancreas), a fever over 104°F, lethargy, or a stiff neck accompanied by a severe headache (this may be a sign of developing meningitis).

❑ Because complications are more common when this disease is contracted in adulthood, immunization should be considered for any adult who has not had mumps or who has not already been vaccinated against it.

❑ The mumps virus may be contagious even during incubation. Anyone who has come in contact with a person who had or who developed mumps should be on the lookout for symptoms for a twelve to twenty-five-day period following exposure, and should minimize his or her contact with persons who may be susceptible during this period.

❑ There is no medication that can cure mumps. Treatment focuses on bed rest and measures to support the body as the virus runs its course. Your doctor may recommend acetaminophen (Tylenol, Datril Extra-Strength, and others) or ibuprofen (Advil, Nuprin, and others) if fever causes significant discomfort.

❑ A doctor may advise the use of corticosteroids to diminish testicular pain and swelling. These are powerful drugs, and should be used with caution.

❑ If nausea and/or pain on swallowing is so severe that a person with mumps becomes unable to eat, intravenous administration of dextrose and fluids may be required.

❑ Swelling of the parotid and/or other salivary glands can also be caused by a number of other factors, including cirrhosis of the liver; bulimia; a bacterial infection such as strep throat; poor oral hygiene; a salivary gland tumor or a calcium-based stone in one of the salivary ducts; and Mikulicz's syndrome, which is characterized by swelling (usually painless) of the parotid glands and, sometimes, the tear glands, and which can occur in people with a number of different diseases, including leukemia, lupus, non-Hodgkin's lymphoma, and tuberculosis. Swollen salivary glands can also be related to the use of certain drugs. Consequently, an isolated case of mumps (a case not associated with a local outbreak of the disease) warrants extra care in diagnosis.

❑ In most U.S. states, immunization against mumps is required before a child can be admitted into public kindergarten. Infections like mumps can cause infertility in males if the virus occurs during puberty. Not vaccinating a baby boy could increase the chances of sterility in adulthood.

**MULTIPLE SYSTEM ATROPHY WITH ORTHOSTATIC HYPOTENSION**

See ORTHOSTATIC HYPOTENSION *under* RARE DISORDERS.

**MUSCLE CRAMPS**

Ordinarily, a muscle contracts when it is used, then stretches out when the motion is completed or another muscle moves it in the opposite direction. If a muscle contracts with great

intensity without stretching out again, you feel the pain of a muscle cramp. Many people experience muscle cramps during the night. This type of cramp generally affects the legs, especially the calf muscles, and the feet. They occur more frequently in older adults than in younger people. Children sometimes experience a type of crampy muscle and leg pain often called "growing pains."

Muscle cramping is often caused by an imbalance in the body's levels of electrolytes—minerals such as potassium, calcium, and magnesium, which in turn can be due to illness or exercise. A deficiency of vitamin E also may be involved. Another common cause is unaccustomed physical overexertion, overuse, or strain. Sitting, standing, or lying for a long time in one position; anemia; the use of tobacco; inactivity; fibromyalgia; hormone imbalances; allergies; arthritis; and even arteriosclerosis can also result in cramping, as can dehydration, heat stroke, hypothyroidism, or varicose veins, or, more rarely, the early stages of amyotrophic lateral sclerosis (ALS, or Lou Gehrig's disease).

Some medications can cause muscle cramping as a side effect. The use of diuretic drugs for high blood pressure or heart disorders may lead to electrolyte imbalances, causing muscle cramps. People using statins to lower blood pressure and those who take anti-osteoporosis medications such as alendronate (Fosamax) may also experience muscle cramps. Poor circulation also contributes to leg cramps.

Unless otherwise specified, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between six and twelve, use one-half of the recommended dose, and for a child under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Calcium and magnesium	1,500 mg daily. 750 mg and up daily.	Deficiencies are most often the cause of cramping in the legs and feet at night. Use chelate or citrate forms.
Vitamin D	400 IU daily.	Needed for calcium uptake.
Vitamin E	200 IU daily or 400 IU every other day.	Improves circulation. Deficiency may cause leg cramps while standing or walking. Especially good if cramping is related to varicose veins. Use d-alpha-tocopherol form.
<i>Very Important</i>		
Malic acid and magnesium	As directed on label.	Malic acid is involved in the production of energy in muscle cells; magnesium is a cofactor in cellular energy production.
Potassium	99 mg daily.	Needed for proper calcium and magnesium metabolism; aids in relieving muscle cramps.

Silica	As directed on label.	Supplies silicon, which aids in calcium absorption.
Ultra Osteo Synergy <sup>†</sup> from American Biologics	As directed on label.	Provides nutritional support for bone renewal.
Vitamin B complex	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	For improved circulation and cellular function.
plus extra vitamin B <sub>1</sub> (thiamine)	50 mg 3 times daily, with meals.	Enhances circulation and may aid in maintaining proper muscle tone. Increases circulation. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
and vitamin B <sub>3</sub> (niacin)	50 mg 3 times daily, with meals.	
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Improves circulation.
<b>Important</b>		
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Improves tissue oxygenation.
<b>Helpful</b>		
Coenzyme Q <sub>10</sub>	100 mg daily.	Improves heart function and circulation. Lowers blood pressure. Improves the effectiveness of coenzyme Q <sub>10</sub> .
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	
Lecithin granules or capsules	1–2 tsp 3 times daily, before meals. 1,200–2,400 mg 3 times daily, before meals.	Reduces cholesterol levels.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary for healthy muscles.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for absorption of calcium and action of B vitamins. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Alfalfa, bayberry, blessed thistle, cayenne, dong quai, echinacea, elderflower, elderberry extract, garlic, ginkgo biloba, and saffron are good for circulation.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Meadowsweet, valerian, and skullcap help to relieve muscle cramps.
- Rubbing lobelia extract on the affected area helps to relieve muscle spasms.
- Taking valerian root at bedtime helps to relax the muscles.

## Recommendations

Getting adequate calcium and vitamin D is important. You can get these from dairy products and/or supplements.

Eat alfalfa, brewer's yeast, plenty of dark green and leafy vegetables, cornmeal, and kelp.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Drink plenty of fluids to stave off dehydration. Take a large glass of quality water (preferably steam-distilled) to flush out toxins stored in the muscles every three hours throughout the day.

Warm up before intense exercise, and cool down and stretch afterward.

Rub pure, unprocessed olive or flaxseed oil into your muscles before and after strenuous exercise. Add 25 drops of oil to a hot bath and soak. Canola oil is also good for this purpose.

Avoid overworking your muscles.

Massage cramping muscles and use heat to relieve pain.

Take a hot bath using mineral salts before bedtime to increase blood flow to the muscles.

Before going to bed, gently stretch the muscles that tend to cramp during the night.

If you are on diuretic medication for high blood pressure or a heart disorder, be sure to take supplemental potassium daily.

*Note:* Do not take supplemental potassium if you are taking a potassium-sparing diuretic (discuss this with your doctor).

If you have cramps during the day, while you are active, consult your health care provider. This can be a sign of impaired circulation or arteriosclerosis. (See CIRCULATORY PROBLEMS in Part Two.)

If cramping occurs after walking and is relieved when you stop, suspect impaired circulation. See ARTERIOSCLEROSIS/ATHEROSCLEROSIS in Part Two and take the artery function self-test. (See also CIRCULATORY PROBLEMS in Part Two.)

## Considerations

Using creatine, actually creatine monohydrate, a popular supplement with athletes and body builders, may increase the likelihood of muscle cramps.

*Caution:* Using creatine along with cimetidine (Tagamet), NSAIDs such as ibuprofen, and/or diuretics also can cause kidney damage.

Hydrotherapy (the therapeutic use of water, steam, and ice) or massage therapy (manipulation of muscles and other soft tissue) may be useful in controlling muscle cramps. (See HYDROTHERAPY and MASSAGE under PAIN CONTROL in Part Three.)

☐ Gabapentin (Neurontin), a drug that is used in the treatment of epilepsy, and may be used for bipolar mood disorder by some doctors, is under study for its ability to relieve muscle cramps. Oddly, however, documented side effects of this drug can include muscle ache or pain (in addition to blurred or double vision; dizziness; drowsiness; swelling of hands, feet, or lower legs; trembling or shaking; and unusual tiredness or weakness). Until the results are known, we recommend steering clear of this drug.

## MUSCLE INJURIES

See SPRAINS, STRAINS, AND OTHER INJURIES OF THE MUSCLES AND JOINTS.

## MYOCARDIAL INFARCTION

See HEART ATTACK.

## NAIL PROBLEMS

The nails protect the nerve-rich fingertips and tips of the toes from injury. Nails are a substructure of the epidermis (the outer layer of the skin) and are composed mainly of keratin, a type of protein. The nail bed is the skin on top of which the nails grow. Nails grow from 0.05 to 1.2 millimeters (approximately 1/500 to 1/20 inch) a week. If a nail is lost, it takes about seven months to grow out fully.

Healthy nail beds are pink, indicating a rich blood supply. Changes or abnormalities in the nails are often the result of nutritional deficiencies or other underlying conditions. The nails can reveal a great deal about the body's internal health. Nail abnormalities on either the fingers or the toes can indicate an underlying disorder.

The following are some of the changes that nutritional deficiencies can produce in the nails:

- A lack of protein, folic acid, and vitamin C causes hangnails. White bands across the nails are also an indication of protein deficiency.
- A lack of vitamin A and calcium causes dryness and brittleness.
- A deficiency of the B vitamins, especially biotin, causes fragility, with horizontal and vertical ridges.
- Insufficient intake of vitamin B<sub>12</sub> leads to excessive dryness, very rounded and curved nail ends, and darkened nails.
- Iron deficiency may result in "spoon" nails (nails that develop a concave shape) and/or vertical ridges.
- Zinc deficiency may cause the development of white spots on the nails.
- A lack of sufficient "friendly" bacteria (lactobacilli) in the body can result in the growth of fungus under and around nails as well as discoloration of the nails.

- A lack of sufficient hydrochloric acid (HCl) contributes to splitting nails.

The Nutrients table, below, lists supplements that promote healthy nail growth.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Taken internally, inhibits the harmful bacteria that cause fungal infection. Use a nondairy formula.
Free form amino acid (Amino Balance from Anabol Naturals) plus extra L-cysteine and L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	The building materials for new nails. Also supplies sulfur, which is necessary for skin and nail growth. (See AMINO ACIDS in Part One.)
Silica or oat straw	As directed on label.	Supplies silicon, needed for hair, bones, and strong nails.  <i>See under Herbs, below.</i>
Vitamin A emulsion or capsules plus carotenoid complex	50,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily. As directed on label.	The body cannot utilize protein without vitamin A. Emulsion form is recommended for easier assimilation and greater safety at higher doses.
<i>Helpful</i>		
Black currant seed oil	500 mg twice daily.	Helpful for weak, brittle nails.
Calcium and magnesium and vitamin D	As directed on label. As directed on label. As directed on label.	Necessary for nail growth. Needed to balance with calcium. Enhances calcium absorption.
Iron (Floradix Iron + Herbs from Salus Haus)	As directed by physician. Take with 100 mg vitamin C for better absorption.	Deficiency produces "spoon" nails and/or vertical ridges. <i>Caution:</i> Do not take iron unless anemia is diagnosed. A natural, nontoxic source of iron.
Ultimate Oil from Nature's Secret	As directed on label.	A combination of essential fatty acids necessary for the health of skin, hair, and nails.
Ultra Nails from Nature's Plus	As directed on label.	Contains calcium, gelatin, amino acids, magnesium, iron, and other nutrients important for healthy nails.

Vitamin B complex plus extra	<input type="checkbox"/> As directed on label.	Deficiencies result in fragile nails.
vitamin B <sub>2</sub> (riboflavin) and vitamin B <sub>12</sub> and biotin and folic acid	50 mg 3 times daily. 1,000 mcg 3 times daily. 300 mg 3 times daily for 9 months. 400 mcg 3 times daily.	Useful for treating brittle nails. Reduces splitting and other nail irregularities.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Hangnails and inflammation of the paronychia (the tissue surrounding the nail) may be linked to vitamin C deficiency.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Affects absorption and action of vitamins and enzymes. Use zinc gluconate lozenges or OptiZinc for best absorption.
plus copper	3 mg daily.	Needed to balance with zinc.

## Herbs

Alfalfa, black cohosh, burdock root, dandelion, gotu kola, and yellow dock are rich in minerals, including silica and zinc, as well as B vitamins—all of which strengthen the nails. Oat straw also is a good source of silica.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Borage seed, flaxseed, lemongrass, parsley, primrose, pumpkin seed, and sage are all good sources of essential fatty acids, which nourish the nails.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Butcher's broom, chamomile, ginkgo biloba, rosemary, saffras, and turmeric are good for circulation, which nourishes the nails.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

## Recommendations

For healthy nails, be sure to get plenty of quality protein, and take a protein supplement. Eat grains, legumes, oatmeal, nuts, and seeds. Eggs also are a good source of protein, as long as your blood cholesterol levels are not too high.

Avoid refined sugars and simple carbohydrates.

Eat a diet composed of 50 percent fresh fruits and raw vegetables to supply necessary vitamins, minerals, and en-

zymes. Eat foods that are rich in sulfur and silicon, such as broccoli, fish, onions, and sea vegetables. Also include in the diet plenty of foods that are high in biotin, such as brewer's yeast, soy flour, and whole grains.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Drink plenty of quality water and other liquids. Cuts and cracks in the nails may indicate a need for more liquids.

Drink fresh carrot juice daily. This is high in calcium and phosphorus and is very good for strengthening the nails.

Consume citrus fruits, salt, and vinegar in moderation, if at all. Excessive intake of these foods can result in a protein/calcium imbalance that may adversely affect the health of the nails.

Supplement your diet with royal jelly, a good source of essential fatty acids, and spirulina or kelp, which are rich in silica, zinc, and B vitamins, and help to strengthen nails. Be sure the B vitamins have biotin in the mix.

For splitting nails and/or hangnails, take 2 tablespoons of brewer's yeast or wheat germ oil daily.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

To restore color and texture to brittle, yellowed nails, make a mixture of equal parts of honey, avocado oil, and egg yolk, and add a pinch of salt. Rub the mixture into your nails and cuticles. Leave it on for half an hour, then rinse it off. Repeat this treatment daily. You should begin to see results after about two weeks.

To strengthen the nails, try soaking them in warm olive oil or apple cider vinegar for ten to twenty minutes daily.

Treat your nails gently. Using them to pry, pick, scrape, or perform tasks such as removing staples can damage them.

Keep your nails relatively short. Nails longer than one-quarter inch beyond the fingertip break and bend easily.

Do *not* cut the cuticles. Uncovering the nails this way is harsh and irritating, and may cause infection. Use baby oil or cream and gently push the cuticles back.

Soak your nails before trimming them. Nails are most likely to split and peel when they are dry. Apply hand cream each morning and evening to prevent nails from drying out.

Do not repeatedly immerse your hands in water that contains detergents or chemicals such as bleach or dish soap; this results in split nails. Wear cotton-lined gloves when doing housework such as dishes and laundry or when using furniture polish. This protects your hands and nails from harsh chemicals. Wearing gloves is especially important for people who work in jobs where their hands are exposed to chemicals. Not only does this damage the nails, but it causes the skin surrounding the nail bed to dry out and crack. This can lead to bleeding and can be quite painful.

## Disorders That Show Up in the Nails

Nail changes may signify a number of disorders elsewhere in the body. These changes may indicate illness before any other symptoms do. Seek medical attention if any of the following symptoms are suspected.

- *Black, splinterlike bits under the nails* can be a sign of infectious endocarditis, a serious heart infection; other heart disease; or a bleeding disorder.
- *Black bands* from the cuticle outward to the end of the nail can be an early sign of melanoma.
- *Brittle, soft, shiny nails without a moon* may indicate an overactive thyroid.
- *Brittle nails* signify possible iron deficiency, thyroid problems, impaired kidney function, and circulation problems.
- *Crumbly, white nails near the cuticle* are sometimes an indication of AIDS.
- *Dark nails and/or thin, flat, spoon-shaped nails* are a sign of vitamin B<sub>12</sub> deficiency or anemia. Nails can also turn gray or dark if the hands are placed in chemicals such as cleaning supplies (most often bleach) or a substance to which one is allergic.
- *Deep blue nail beds* show a pulmonary obstructive disorder such as asthma or emphysema.
- *Downward-curved nail ends* may denote heart, liver, or respiratory problems.
- *Flat nails* can denote Raynaud's disease.
- *Greenish nails*, if not a result of a localized fungal infection, may indicate an internal bacterial infection.
- *A half-white nail with dark spots at the tip* points to possible kidney disease.
- *An isolated dark-blue band in the nail bed*, especially in light-skinned people, can be a sign of skin cancer.
- *Lindsay's nails* (sometimes known as *half-and-half nails*), in which half of the top of the nail is white and the other half is pink, may be a sign of chronic kidney disease.
- *Nail beading* (the development of bumps on the surface of the nail) is a sign of rheumatoid arthritis.
- *Nails raised at the base with small white ends* show a respiratory disorder such as emphysema or chronic bronchitis. This type of nail may also simply be inherited.
- *Nails separated from the nail bed* may signify a thyroid disorder (this condition is known as onycholysis) or a local infection.
- *Nails that broaden toward the tip and curve downward* are a sign of lung damage, such as from emphysema or exposure to asbestos.
- *Nails that chip, peel, crack, or break easily* show a general nutritional deficiency and insufficient hydrochloric acid and protein. Minerals are also needed.
- *Nails that have pitting resembling hammered brass* indicate a tendency toward partial or total hair loss.
- *Pitted red-brown spots and frayed and split ends* indicate psoriasis; vitamin C, folic acid, and protein are needed.
- *Red skin around the cuticles* can be indicative of poor metabolism of essential fatty acids or of a connective tissue disorder such as lupus.
- *Ridges* can appear in the nails either vertically or horizontally. Vertical ridges indicate poor general health, poor nutrient absorption, and/or iron deficiency; they may also indicate a kidney disorder. Horizontal ridges can occur as a result of severe stress, either psychological or physical, such as from infection and/or disease. A horizontal indentation in the nail (Beau's line) can occur as a result of a heart attack, major illness, or surgery. Ridges running up and down the nails also indicate a tendency to develop arthritis.
- *Spooning (upward-curling) or pitting nails* can be caused by disorders such as anemia or problems with iron absorption. This can also be caused by poor lung function due to smoking or exposure to something that damaged the lungs' ability to properly oxygenate the blood such as smoke from a fire.
- *Thick nails* may indicate that the vascular system is weakening and the blood is not circulating properly. This may also be a sign of thyroid disease.
- *Thick toenails* can be a result of fungal infection.
- *Thinning nails* may signal lichen planus, an itchy skin disorder.
- *Two white horizontal bands that do not move as the nail grows* are a sign of hypoalbuminemia, a protein deficiency in the blood.
- *Unusually wide, square nails* can suggest a hormonal disorder.
- *White lines* show possible heart disease, high fever, or arsenic poisoning.
- *White lines across the nail* may indicate a liver disease.
- *If the white moon area of the nail turns red*, it may indicate heart problems.
- *If the white moon area of the nail turns slate blue*, it can indicate either heavy metal poisoning (such as silver poisoning) or lung trouble.
- *White nails* indicate possible liver or kidney disorders and/or anemia.
- *White nails with pink near the tips* can be a sign of cirrhosis.
- *Yellow nails or an elevation of the nail tips* can indicate internal disorders long before other symptoms appear. Some of these are problems with the lymphatic system, respiratory disorders, diabetes, and liver disorders.

- Do not pull at hangnails. Cut them with sharp clippers or scissors. Keep your hands moisturized to help prevent hangnails.
- If you have diabetes, see your health care provider if your cuticles become inflamed, because the infection can spread.
- If you wear nail polish, use a base coat underneath it to prevent yellowing.
- Use nail polish removers as little as possible. They contain solvents that leach lipids from the nails and make them brittle. These solvents are also potentially highly toxic and can be absorbed through the skin. If you need to use a polish remover, use one that contains acetate instead of acetone.
- Never apply polycrylic or other artificial nails over your own. They may look nice for a while, but they destroy the underlying nail. The chemicals and glue used are dangerous to the body, and are readily absorbed through the damaged nail and nail bed. The use of artificial nails also has been known to contribute to the development of fungal infection of the fingernails.
- Many professional manicure businesses have been cited for not meeting health codes. If you have professional manicures, always insist on sterile instruments or bring your own to ensure they are free from bacteria and disease. Use isopropyl alcohol to sterilize your instruments.

### Considerations

- If you expose your hands to too much water and soap, the nail may become loose from the nail bed. Water causes the nails to swell. They then shrink as they dry, resulting in loose and brittle nails.
- Discolored nails can be caused by prolonged illness, stress, nicotine, allergies, or diabetes. If your nails are green, you may have a bacterial infection or a fungal infection between the nail and the nail bed. If you have a fungal or bacterial infection, and especially if you are taking antibiotics, acidophilus is needed.
- Fungal infections can be treated by using a cotton swab to apply a mixture of equal parts of vinegar and water.
- Physicians often prescribe a regimen of 250 milligrams of griseofulvin (Fulvicin), four times daily, for a fungal infection of the nails. The white blood cell count must be monitored during this treatment. Other effective oral drugs include: Itraconazole (Sporanox), Fluconazole (Diflucan), and Terbinafine (Lamisil). Doctors may not recommend these for people with liver disease or congestive heart failure or for those taking certain medications. Another prescription antifungal agent is ketoconazole (Nizoral), which is available as a cream or shampoo, as well as in tablet form. These drugs are highly effective against nail fungus, so if you are worried about the appearance of your nails, seek medical help.

- Anticancer medications can cause bands and streaks of color to appear on the nails. These conditions disappear when the medication is stopped.
- A recent study found that hospital nurses with artificial nails had twice as much bacteria on their hands as those nurses who had natural nails. The area around and underneath the fingernails is one of the easiest places for germs to collect. The best way to prevent this is to thoroughly wash your hands for at least fifteen seconds using antiseptic soap under hot water. Make sure you wash the area underneath the nail and around the cuticle area. Use a clean towel to dry your hands. Use disposable towels if they are available.
- Poor thyroid function may be reflected in the nails. (See HYPOTHYROIDISM in Part Two.)

### NARCOLEPSY

Narcolepsy is a neurological disorder that is estimated to affect as many as 1.5 million Americans. However, fewer than 10 to 25 percent have all of the components of the disease to make a firm diagnosis. There are four classic symptoms that define this syndrome: sleep attacks, cataplexy, sleep paralysis, and hypnagogic (sleep-related) hallucinations. A person with narcolepsy may experience any or all of these classic phenomena.

The best-known symptom of narcolepsy is the sleep attack. A person with narcolepsy can suddenly fall into a sleep state with almost no warning whatsoever. Sleep attacks can occur at any time, even in midconversation, as many as ten times a day (even more, in some cases). These periods of sleep usually last only a matter of minutes, but in some cases sleep can continue for an hour or more. Afterward, the person may feel refreshed, yet he or she may fall asleep again in a few minutes.

While the sleep that results from narcolepsy looks like ordinary sleep, researchers have found at least one key difference. Normal sleep is a cyclical process that alternates between periods of rapid-eye-movement (REM) and non-rapid-eye-movement (NREM) sleep. During the NREM part of the cycle, the entire body slows down—pulse, breathing, blood pressure, and brain wave activity are all lowered. When the REM cycle begins, the body remains asleep, but the brain becomes significantly active; brain waves as recorded by an electroencephalograph (EEG) more closely resemble those of the waking brain. It is during REM sleep that most dreaming occurs.

In healthy individuals, sleep begins with the NREM phase. After sixty minutes or so of NREM sleep, REM sleep begins. A short time later, the entire cycle begins again. In a narcoleptic sleep attack, in contrast, researchers have found that REM sleep begins almost instantly, with no introductory NREM sleep. The precise significance of this is not yet understood, but it does provide a useful diagnostic tool as

well as a clue for researchers to pursue in trying to understand this mysterious disorder.

The second classic symptom of narcolepsy is cataplexy. This is a type of paralysis that usually occurs in response to some type of heightened emotion, such as anger, fear, or excitement. The individual does not lose consciousness, but experiences a sudden and temporary loss of muscle tone. Often, only the legs and/or arms are affected. These episodes normally last less than a minute, and they seem to be most likely to occur if the person is surprised in some way.

Sleep paralysis is the third classic symptom of narcolepsy. Just as you are falling asleep, or as you are beginning to awaken, you try to move or say something but find that you cannot, even though you are fully conscious. This lasts for only a second or two, but it can be frightening, especially the first time it happens. These episodes usually end either on their own or when someone touches or speaks to you. Many doctors feel that sleep paralysis is similar to cataplexy and to the state that accompanies REM sleep, in which motor activity is inhibited even though the brain is active. This phenomenon is not strictly limited to people with narcolepsy; many otherwise healthy people may experience it occasionally.

Like sleep paralysis, sleep-related hallucinations—medically termed *hypnagogic phenomena*—usually occur just prior to sleep, or sometimes upon awakening. The affected individual may hear sounds that aren't there and/or see illusions. These visual and auditory illusions are very vivid. This phenomenon also can occur in individuals who do not suffer from narcolepsy, particularly in children.

Because the symptoms of narcolepsy vary from individual to individual (it is estimated that only 20 to 25 percent of people with narcolepsy experience all four of the classic symptoms), this disorder is frequently misdiagnosed. There is strong evidence that narcolepsy may run in families; 8 to 12 percent of people with narcolepsy have a close relative with the disorder. Further compounding the problem is the fact that other sleep disorders, such as sleep apnea, also can produce spells of marked daytime drowsiness. Narcolepsy is not a particularly dangerous problem, unless one experiences a sleep attack while operating a motor vehicle or other machinery. It can, however, be embarrassing and extremely inconvenient. The cause or causes of this disorder are unknown, but brain infection, head trauma, or brain tumors may be behind some cases. It is known that narcolepsy is almost never the result of insomnia or sleep deprivation. There is currently no cure for this disorder, so the focus must be on treating the symptoms.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Calcium and magnesium	2,000 mg daily, at bedtime. 400 mg twice during the day and again at bedtime.	Needed for energy production and the nervous system.
Choline or lecithin granules or capsules	300 mg daily. 1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Acts as a neurotransmitter and is important for brain function. A good source of choline.
Chromium picolinate	100 mcg daily.	Boosts energy and regulates sugar metabolism.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label. As directed on label.	Promotes circulation to the brain. Works with coenzyme Q <sub>10</sub> .
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	Increases energy levels; needed for proper brain function. Use a formula that contains all the essential amino acids.
L-glutamine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Promotes mental ability. Known as brain fuel because it can pass the blood-brain barrier freely. (See AMINO ACIDS in Part One.)
L-tyrosine	As directed on label. Take at bedtime.	Important in thyroid function. Low levels have been associated with narcolepsy. <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed to balance body functioning.
Nicotinamide adenine dinucleotide (NADH)	As directed on label.	Important in the creation and transfer of chemical energy, especially during breathing.
Octacosanol	100 mg daily.	Increases oxygen utilization and boosts endurance.
Omega-3 essential fatty acids (fish oil or flaxseed oil)	As directed on label.	To protect cell membranes.
Vitamin B complex (Coenzymate B Complex from Source Naturals) plus extra vitamin B <sub>6</sub> (pyridoxine)	150 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 200 mg daily.	B vitamins boost metabolism and are essential for increased energy levels and normal brain function.
Vitamin C with bioflavonoids	2,000–6,000 mg daily, in divided doses.	Increases energy and promotes production of interferon in the body to protect against free radical damage.
Vitamin D	400 IU daily.	Essential for calcium absorption.

Vitamin E	200 IU daily or 400 IU every other day.	Increases circulation and protects heart functioning and brain cells. Use d-alpha-tocopherol form.
-----------	---	--

## Herbs

Gotu kola and St. John's wort boost energy levels and possess antioxidant properties as well.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Ginkgo biloba improves circulation to the brain and is a powerful antioxidant for protecting cells.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

## Recommendations

Eat a low-fat diet high in cleansing foods such as leafy green vegetables and sea vegetables. Also eat foods high in the B vitamins, such as brewer's yeast and brown rice.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Eat foods high in protein (meats, poultry, cheese, nuts, seeds, and soy products) in the middle of the day, and save the complex carbohydrates (fresh fruits and vegetables, legumes, natural whole grains, and pasta) for the evening meal. High-protein foods increase alertness, whereas carbohydrates have a calming effect and can promote sleepiness.

Include in the diet foods rich in the amino acid tyrosine. Good choices include eggs, oats, poultry, and wheat germ.

One MAO inhibitor drug, selegiline, was shown to help with sleep issues in patients with narcolepsy. This drug is usually given to patients with Parkinson's disease, but in patients with narcolepsy who were given 20 to 40 milligrams a day, 43 to 89 percent had fewer narcoleptic symptoms such as longer periods of REM sleep.

*Caution:* If you are taking an MAO inhibitor drug, avoid foods containing tyrosine, as drug and dietary interactions can cause a sudden, dangerous rise in blood pressure. Discuss food and medicine limitations thoroughly with your health care provider or a qualified dietitian.

Avoid alcohol and sugar. They may seem stimulating initially, but will only make you tired later.

Exercise daily to improve circulation and oxygenate tissues.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Napping can rejuvenate you when you have lost sleep. Take up to a forty-five-minute nap in the early afternoon.

Make sure your home and workplace are well lit, either by natural sunlight or overhead lighting. Light suppresses the production of melatonin, which is the hormone that produces drowsiness. Full-spectrum light bulbs are best.

## Considerations

Narcolepsy and sleep apnea are the leading causes of tiredness during the day.

A diagnosis of narcolepsy may involve a *multiple sleep latency test* (MSLT), usually conducted in a sleep disorders clinic.

Irregular sleep patterns are just as likely to cause drowsiness as lack of sleep. Jet lag, shift work, inconsistent bedtimes, and weekend partying can all disturb our natural sleep/wake cycles. America is a nation of sleep-starved yawners fighting a daily battle against the sandman. We live in a world where people drive themselves on relentless schedules that leave insufficient time for quality sleep.

There have been some documented cases in which persons who suffered from narcolepsy were cured by eliminating allergenic foods from the diet. One person, for instance, was found to have an allergy to potatoes. When he removed potatoes from his diet, he no longer experienced the symptoms. (See ALLERGIES in Part Two.)

There is some evidence that the immune systems of people who suffer from narcolepsy may react abnormally to the chemical processes in the brain that cause sleep.

Certain dogs, mainly Doberman pinschers, have been observed to sleep excessively and to collapse when overstimulated. Research has revealed a withering away of axons (the "communication cables" that convey signals between nerve cells) in the brains of these animals, especially in three regions of the brain that have been linked to sleep inhibition, motor control, and the processing of emotions. If similar degeneration can be demonstrated in human brains, this may offer further clues as to the causes of narcolepsy.

Doctors have traditionally prescribed stimulants (amphetamines) and antidepressants for people with narcolepsy. A newer drug, modafinil (Provigil), acts on the hypothalamus, a part of the brain responsible for wakefulness, and may reduce sleep attacks. This drug should not be used by people with heart conditions, liver dysfunction, or a history of mental illness, and it can reduce the effectiveness of certain birth control methods. Doctors also prescribe antidepressant medications, which suppress REM sleep, to alleviate symptoms of cataplexy, hypnagogic hallucinations, and sleep paralysis. These medications include tricyclic antidepressants such as protriptyline (Vivactil) and imipramine (Tofranil) and selective serotonin reuptake inhibitors (SSRIs) such as fluoxetine (Prozac, Sarafem) and sertraline (Zoloft).

See also the discussion of sleep apnea under INSOMNIA in Part Two.

**NAUSEA AND VOMITING**

See under **FOODBORNE/WATERBORNE DISEASE** and **INDIGESTION**.  
See also under **INFLUENZA**.

**NEPHRITIS**

See under **KIDNEY DISEASE**.

See **ANXIETY DISORDER** and **STRESS**.

**NICKEL TOXICITY**

Nickel is a silver-white metal used to produce steel, nickel-cadmium batteries, nickel plating, heating fuel, and ceramics. It has been described as a trace mineral, and is present in many cells within the human body. Small amounts of nickel are useful in certain bodily functions. For example, minute amounts of nickel are important in DNA and RNA stabilization. Nickel may play a role in the metabolism of glucose and hormonal functions. It also helps to activate certain important enzymes, such as trypsin and arginase. A nickel deficiency may affect iron and zinc metabolism.

Too much nickel can be toxic, however. Nickel carbonyl is the most toxic form of this metal. Lethal exposure to nickel through inhalation causes nausea, dizziness, diarrhea, headache, vomiting, chest pain, weakness, and coughing. Contact with the vapor can lead to brain and liver swelling; degeneration of the liver; irritation to the eyes, throat, and nose; and cancer. Although toxic levels of nickel have not been established, it is known that the presence of excess amounts of nickel can cause dermatitis (skin rash and inflammation), also called "nickel itch," and respiratory illness, and can interfere with the Krebs' cycle, a series of enzymatic reactions necessary for cellular energy production. Significant levels of nickel may also contribute to thyroid malfunction or myocardial infarction (heart attack). Environmental exposure to nickel can occur by contact with automobile exhaust, cigarette smoke, manufacturing emissions, and airborne dust. Skin absorption can come from coins, hairpins, jewelry, prosthetic joints and heart valves, and nickel plating.

Many foods naturally contain some amount of nickel. These include bananas, barley, beans, buckwheat, cabbage, hazelnuts, legumes, lentils, oats, pears, soybeans, and walnuts. Nickel can also be present in hydrogenated fats and oils, refined and processed foods, baking powder, cocoa powder, superphosphate fertilizers, and tobacco smoke. Using cooking utensils containing nickel may add unnecessarily to your dietary intake of nickel.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Apple pectin	As directed on label.	Binds toxic metals and removes them from the body.
Garlic (Kyolic from Wakunaga)	As directed on label.	Acts as a detoxifier and aids in removing harmful metals.
Kelp	1,000–1,500 mg daily.	Supplies minerals and iodine to aid in removing toxic metals.
L-cysteine and L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Helps to detoxify the body, including the liver, of harmful metals. (See <b>AMINO ACIDS</b> in Part One.)
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A powerful free radical destroyer.
Vitamin A with mixed carotenoids plus natural beta-carotene	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily.	A powerful antioxidant that destroys free radicals. A free radical scavenger.
Vitamin C with bioflavonoids including rutin	4,000–10,000 mg daily.	Helps to remove metals from the body and strengthens immunity.
Vitamin E	200 IU daily or 400 IU every other day.	A powerful free radical scavenger that also improves circulation. Use d-alpha-tocopherol form.

**Recommendations**

- If you suspect you may have symptoms of metal toxicity, have a hair analysis done to detect toxic levels of nickel and other minerals. (See **HAIR ANALYSIS** in Part Three.)
- Avoid processed food products, as well as any products containing hydrogenated fats and oils.
- Do not smoke, and avoid those who do.
- Beware of metal cookware, especially when preparing acidic foods, such as tomato sauce. Use glass cookware instead. Also avoid using metal cooking utensils. Use utensils made from plastic or wood instead (wood is best).
- Ask your dentist about the metal content of the materials he or she uses. Nickel toxicity can result from nickel alloys used in dental surgery and appliances.

If your job or hobby involves using nickel to plate metals, use a face mask while working. Inhalation of nickel can cause pulmonary edema (accumulation of fluid in the lungs).

### Considerations

Chelation can remove toxic metals from the body. (See CHELATION THERAPY in Part Three.)

In one study, Antabuse, a nickel-chelating agent and drug used in the treatment of alcoholism, was tested in patients with hand eczema and nickel allergy, but it did not have an appreciable effect on scaly skin and flare-ups. However, in another study, a low-nickel diet combined with oral disulfiram (Antabuse) produced much better outcomes. Ninety percent of the patients experienced healing of their hand eczema.

Aside from being potentially toxic, nickel is often allergenic. The nickel in watchbands, zippers, bra closures, pierced earrings, and other everyday items has been associated with many allergic reactions. A high incidence of allergic reactions to nickel in pierced earrings has been reported among children. Many earrings and posts contain nickel. Gold (14-karat or higher) is probably the safest metal for pierced earrings. (See CHEMICAL ALLERGIES in Part Two.)

### NOSEBLEED

Any injury to the tissues inside the nose can cause a nosebleed. Injury can result from a blow to the nose; the intrusion of foreign objects (including fingers); a sudden change in atmospheric pressure; or simply blowing the nose too forcefully. Winter often brings about nosebleeds because heated air tends to be dry. Excessive dryness can cause the nasal membranes to crack, form crusts, and bleed.

In some cases, nosebleeds—medically termed *epistaxis*—can be associated with an underlying illness. Arteriosclerosis, high blood pressure, malaria, scarlet fever, sinusitis, and typhoid fever are all known to cause nosebleeds, some of which can be serious and result in significant blood loss. Conditions that cause increased bleeding tendencies, such as hemophilia, leukemia, thrombocytopenia (a below-normal concentration of platelets in the blood), aplastic anemia, or liver disease, also may be implicated in nosebleeds.

Nosebleeds are much more common in children than in adults. This is no doubt largely due to the fact that children are prone to inserting their fingers and other objects into their nostrils. In addition, children's tissues, including the mucous membranes lining the nose, are thinner than those of adults and therefore more susceptible to damage.

There are two classifications of nosebleeds, depending on where in the nose the blood is coming from. *Posterior nosebleeds* primarily afflict elderly people and those with high blood pressure. In this type of nosebleed, blood comes from the rear of the nose and runs down the back of the mouth into the throat, no matter what position the person

is in. The blood is usually dark red in color, although it can be bright red. If the bleeding is severe, blood can flow from the nostrils as well.

The overwhelming majority of nosebleeds are *anterior nosebleeds*, in which bright-red blood flows from the front part of the nose. Most often they are the result of some type of trauma to the nasal tissues. If the person stands or sits, the flow of blood comes out of one or both nostrils. If the person lies on his or her back, the blood may flow backward, into the throat. This type of nosebleed can be frightening, and it may look as if there is a lot of blood, but in reality it is not usually serious and very little blood is actually lost.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Bioflavonoid complex with rutin	As directed on label.	Deficiencies have been linked to nosebleeds.
Vitamin C with bioflavonoids	3,000 mg when bleeding starts and 1,000 mg every hour thereafter until bleeding has completely stopped.	Promotes healing.

### Herbs

If your nasal membranes become sore from dryness, use aloe vera gel, calendula ointment, or comfrey ointment as needed.

*Caution:* Comfrey is recommended for external use only.

A snuff made from finely ground oak bark is soothing and healing.

To promote healing, rub a small amount of Calendula Cream from Natureworks into each nostril once the bleeding subsides. Repeat as needed.

### Recommendations

To stop an anterior nosebleed, do the following:

1. Sit up in a chair and lean forward (*do not* tilt your head back). Do not put your head between your legs or lie flat on your back.
2. Pinch all the soft parts of the nose together between your thumb and index finger for approximately ten minutes. The pressure should be firm but not painful. Breathe through your mouth.

3. Apply crushed ice or cold washcloths to your nose, neck, and cheeks. This can be done both as you apply pressure (see 2, above) and afterward.
4. Keep your head higher than your heart until the bleeding subsides. Refrain from any energetic physical activity for a few hours and any vigorous exercise for at least two days.
5. If the bleeding does not stop, place a cloth or piece of cotton moistened with water or an over-the-counter decongestant spray into the nasal cavity. Hold your nostrils together tightly for about five minutes.

To help stop a nosebleed, try rolling a piece of cotton or gauze and place it in the top part of your upper lip, under the gum. An artery supplying blood to the nose is located in this region. Applying pressure in this manner may help constrict the blood flow.

If you suspect a posterior nosebleed, consult your doctor. This type of nosebleed requires the care of a physician.

Do not blow your nose for at least twelve hours after a nosebleed stops. Doing so may dislodge the blood clots that stanch bleeding.

Once bleeding is controlled and healing has begun, apply a small amount of vitamin E to the affected tissues—open a capsule and *gently* apply the oil inside the nose. If vitamin E is unavailable, use a little petroleum jelly or A&D Ointment. If you wish, pack the nose with gauze to prevent leakage.

While healing, eat plenty of foods high in vitamin K, which is essential for normal blood clotting. Good sources include alfalfa, kale, and all dark green leafy vegetables.

Avoid foods high in salicylates, which are aspirin-like substances found in tea, coffee, most fruits, and some vegetables. Foods to avoid include almonds, all berries, apples, apricots, bell peppers, cherries, cloves, cucumbers, currants, grapes, mint, oil of wintergreen, peaches, pickles, plums, raisins, tangelos, and tomatoes.

To counteract dryness in the nasal passages, especially during the winter, use nasal irrigation. Spray inside the nostrils with plain warm water or a saline mist spray from time to time.

To prevent nosebleeds, increase the environmental humidity, especially in winter. Use a cool mist humidifier, a vaporizer, or even a pan of water placed near a radiator.

When you sneeze, keep your mouth open.

If you have frequent nosebleeds, see your doctor. The cause of frequent nosebleeds is often an underlying problem such as hypertension, which should be treated.

If you are prone to nosebleeds, an iron supplement may help to rebuild the blood. Iron is an important component in hemoglobin, which is a vital element in red blood cells.

*Caution:* Check with your physician before taking iron supplements.

## Considerations

If packing the nose with gauze or cotton is necessary to stem the flow of blood, some medical authorities recommend moistening the packing material with white vinegar. They contend that the acid in white vinegar gently cauterizes broken blood vessels and aids in stopping the bleeding.

Be careful about inserting any substance that contains zinc into your nose. Zicam, a cold prevention medicine that contains zinc, was removed from sale by the FDA because people lost their sense of smell.

Sometimes the use of drugs that thin the blood, such as the anticoagulants warfarin (Coumadin) or heparin, may cause nosebleeds. Even aspirin can act as an anticoagulant and interfere with blood clotting, which is necessary in stopping nosebleeds.

High estrogen levels increase the flow of blood from the mucous membranes in the nose. This is why nosebleeds are more common during pregnancy. Oral contraceptives also can contribute to nosebleeds.

The risk of serious nosebleeds increases with hemophilia, Hodgkin's disease, rheumatic fever, vitamin C deficiency, or the prolonged use of nose drops or nasal sprays.

Nosebleeds are common among alcoholics. As alcohol dilates blood vessels, including those in the nasal cavities, the vessels bleed more easily. Heavy alcohol use can also create problems with blood clotting because of the toxic effects of alcohol on the liver and bone marrow.

People with hypertension are especially prone to nosebleeds. A low-fat, low-cholesterol diet is recommended for keeping blood pressure under control. (See HIGH BLOOD PRESSURE in Part Two.)

If you have recurring nosebleeds, your doctor may recommend surgical or chemical treatment. In some situations, topical chemical solutions are applied to the blood vessels to constrict the blood flow. If topical applications are unsuccessful, nasal blood vessels can be constricted through cauterization (surgical burning of tissues), using either a chemical solution or an electrical heating tool. If all of the above measures fail, both sides of the nasal cavity may be packed with a spongelike or gauze material. Nasal packing is almost always a standard procedure when an anterior nosebleed will not stop bleeding. Your physician may not remove the packs for two to five days.

See also under PREGNANCY-RELATED PROBLEMS in Part Two.

## OBESITY

Obesity is, quite simply, an excessively high proportion of body fat. Health professionals commonly use a measurement called the *body mass index*, or BMI, to classify an adult's weight as healthy, overweight, obese, and extremely obese. Calculate BMI by dividing weight in pounds by

height in inches squared and multiplying by 703. (Formula:  $(\text{weight (lb)}) / [\text{height (in)}]^2 \times 703$ ). (See Body Mass Index on page 610.) Basically, according to this index, a BMI from 18.5 to 24.9 is considered healthy; from 25 to 29.9, overweight. Obesity class I is a BMI of 30 to 34.9, obesity class II is a BMI of 35 to 39.9, and extreme obesity class III is a BMI of 40 and above. A BMI below 18.5 is considered underweight and unhealthy. Generally, the higher your BMI, the greater your risk of developing other obesity-related problems. However, BMI does not tell the entire story.

In addition to the BMI number, excessive *abdominal* body fat can pose a health risk. Men with a waist size greater than 40 inches, or women with a waist size of 35 inches or more, are more at risk.

Americans are eating less fat, but are getting fatter. More than 66 percent of adults in the United States are either overweight or obese, according to the U.S. Centers for Disease Control and Prevention. Excess weight and inactivity account for more than 300,000 premature deaths each year in the United States. This is second only to deaths related to smoking, according to the CDC. People who are overweight or obese are more likely than those of normal weight to develop heart disease, stroke, high blood pressure, diabetes, gallbladder disease, joint pain (gout), sleep apnea, and osteoarthritis. In addition, carrying excess weight means a higher risk for cancer. At the American Institute for Cancer Research (AICR), researchers have concluded that obesity increases the risk for many of the most common cancers worldwide, and perhaps for cancer generally. Obesity is consistently linked to postmenopausal breast cancer, colon cancer, endometrial (uterine) cancer, prostate cancer, and kidney cancer.

Being overweight is a contributing cause of many preventable illnesses. How much a person weighs is only part of the story, however. Perhaps more important than weight is the percentage of fat in the body. For healthy women, fat can account for as much as 25 percent of body weight; 17 percent is a healthy percentage for men. Women's bodies are designed to carry a higher proportion of fat tissue to ensure that there is plenty of fuel for pregnancy and nursing, even if food is scarce. It is also important to know where the fat is stored—for example, abdominally or on the rear end.

The average human body has 30 to 40 billion fat cells. Most of the extra calories we eat that we do not need for immediate energy are stored as fat. If we were still "hunter/gatherers" like our early ancestors, the fat would provide a needed food store for times when no food is readily available. Today, however, instead of being a valuable survival mechanism, the body's ability to store fat is more likely to have a profoundly negative effect on health. Most people today still have this gene for fat storage, which in part explains why there is an obesity epidemic. Lean people are really genetic mutations and would not have survived tens of thousands of years ago. As fat accumulates, it crowds the space occupied by the internal organs. Obesity—even

moderate overweight—puts an undue stress on the back, legs, and internal organs, and this can eventually exacerbate many physical problems and compromise health. Obesity increases the body's resistance to insulin and susceptibility to infection, and puts one at a higher risk for developing coronary artery disease, diabetes, gallbladder disease, high blood pressure, kidney disease, stroke, and other serious health problems that can result in premature death. Complications of pregnancy and liver damage also are more common in overweight individuals. Obese persons suffer psychologically as well as physically, because our society tends to equate beauty, intelligence, and even success with thinness.

The most common causes of obesity are poor diet and/or eating habits (eating too many calories) and a lack of exercise (burning too few calories). Other factors that can lead to obesity include glandular malfunctions, diabetes, hypoglycemia, or hyperinsulinemia. Obesity has also been linked to food sensitivities and/or allergies.

It has always been traditional wisdom that heredity is a causal factor for obesity. The discovery of the "obesity gene" in 2001 was a major breakthrough in the study of obesity. However, there are many more genes than just this one tied to obesity, and researchers are looking for these as well. What is certain is that carriers of the gene have a *tendency* toward obesity, assuming that other factors, not all now known, fall into place. Also known is that people of certain ethnic backgrounds are more likely to carry this gene than members of other groups (for the curious, North Africans and central Europeans more often have the gene).

Obesity is a serious health problem. Once thought to be a moral failing, it is now classified as a disease. The National Heart, Lung, and Blood Institute calls it a complex chronic disease involving social, behavioral, cultural, physiological, metabolic, and genetic factors. Obesity has reached epidemic proportions in the United States, Australia, and Europe, and in many developing countries in South America and Asia. For the statistics buffs, in the United States there are 76.5 million overweight people, 72 million obese people, and some 18 million with what is categorized as extreme obesity, defined as being 100 pounds or more over the ideal body weight or having a BMI of 40 or greater. Australia is rapidly catching up, and although Australians take no pride in it, they soon may surpass the United States as number one. Meanwhile, dieters are spending billions of dollars to get slim. Some 15 percent of American men and 26 percent of American women are on a diet on any given day. Americans spend over \$100 billion on dieting and diet-related products each year.

Experts have different theories on how and why people become overweight, but they generally agree that the key to losing weight is simple: Eat less and move more. The body has to burn more calories than it takes in. Weight loss involves two distinct phases: active weight loss and weight maintenance. During the active weight loss phase, you

## Body Mass Index

The body mass index (BMI) is a figure that represents the percentage of your body weight that is due to fat. It is determined by looking at your weight in combination with your

height. The following table will give you a rough idea of your BMI.

Height (inches) BMI	19–24 normal	25–29 overweight	30–39 obese	40–54 extreme obesity
58"	91–115	119–138	143–186	191–258
59"	94–119	124–143	148–193	198–267
60"	97–123	128–148	153–199	204–276
61"	100–127	132–153	158–206	211–285
62"	104–131	136–158	164–213	218–295
63"	107–135	141–163	169–220	225–304
64"	110–140	145–169	174–227	232–314
65"	114–144	150–174	180–234	240–324
66"	118–148	155–179	186–241	247–334
67"	121–153	159–185	191–249	255–344
68"	125–158	164–190	197–256	262–354
69"	128–162	169–196	203–263	270–365
70"	132–167	174–202	209–271	278–376
71"	136–172	179–208	215–279	286–386
72"	140–177	184–213	221–287	294–397
73"	144–182	189–219	227–295	302–408
74"	148–186	194–225	233–303	311–420
75"	152–192	200–232	240–311	319–431
76"	156–197	205–238	246–320	328–443

Source: National Heart, Lung and Blood Institute, National Institutes of Health

should lose 10 percent of your body weight in about twelve to sixteen weeks (three to four months). This can be achieved in a variety of ways. Most diets—low-carbohydrate, low-fat, or other—have the same weight-loss potential as long as you are eating fewer calories. During the weight maintenance phase, which should last for the remaining eight to nine months of the year, the goal is to keep weight stable by exercising and eating only the amount of calories necessary so you don't gain weight. Every year the same two-phase program should be followed. This is how you achieve successful weight loss for the long term. The reason most people fail to lose weight on a diet is that they don't like the program they are on, or they try to lose more weight than they should to begin with and then can't adhere to the program because it is too rigid. Try to choose a diet that appeals to you in terms of the kinds of foods you will be eating; this will make it easier to stay with it.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
ABC Aerobic Bulk Cleanse from Aerobic Life Industries  or psyllium husks	As directed on label. Always take supplemental fiber separately from other supplements and medications. 1 tbsp ½ hour before meals with a large glass of liquid. Drink it quickly.	Especially good for high or low blood sugar problems and also provides fiber. Gives a full feeling, cutting down hunger pangs.

## Obesity-Related Health Risks

Obesity is a major health concern in great part because it can dramatically increase your risk of developing other seri-

ous disorders. The following table summarizes the effect of obesity on other conditions.

High Risk Associated with Obesity	Moderate Risk Associated with Obesity	Slightly Increased Risk Associated with Obesity
Diabetes mellitus	Arthritis	Accidents
Insulin resistance	Fibromyalgia	Breast cancer
High blood pressure (hypertension)	Heart disease	Colon cancer
High blood fat levels (including cholesterol)	Lower back pain	Congenital defects in offspring
Gallstones	Medical complications with surgery	Depression
Sleep apnea	Peripheral vascular disease	Hormone (especially sex hormone) disorders
Decreased aerobic fitness potential	Polycystic ovary syndrome	Infertility
Kidney cancer	Stroke	Uterine cancer
		Social isolation

Chromium picolinate	200–600 mcg daily.	Reduces sugar cravings by stabilizing the metabolism of simple carbohydrates (sugars).
Dimethylaminoethanol (DMAE)	As directed on label.	Increases vitality.
Essential fatty acids (flaxseed oil, primrose oil, or salmon oil)	As directed on label.	Use these with a low-fat diet to provide essential fatty acids, needed by every cell in the body and for appetite control.
Kelp	1,000–1,500 mg daily.	Contains balanced minerals and iodine. Aids in weight loss.
Lecithin granules or capsules	1 tsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	A fat emulsifier; breaks down fat so it can be removed from the body.
Spirulina or Spiru-tein from Nature's Plus	As directed on label 3 times daily. Take between meals.	Excellent sources of usable protein. Contains needed nutrients and stabilizes blood sugar. Can replace a meal.
Vitamin C with bioflavonoids	3,000–6,000 mg daily.	Necessary for normal glandular function. Speeds up a slow metabolism, prompting it to burn more calories.

### Helpful

Calcium	1,500 mg daily.	Involved in activation of lipase, an enzyme that breaks down fats for utilization by the body.
Choline and inositol	As directed on label.	Helps the body burn fat.
Coenzyme Q <sub>10</sub> plus	As directed on label.	Necessary for energy.

Coenzyme A from Coenzyme-A Technologies	As directed on label.	Improves the effect of coenzyme Q <sub>10</sub> , metabolizes fat, and may aid in weight loss.
Dehydroepiandrosterone (DHEA)	As directed on label.	Inhibits an enzyme that is involved in fat production.
5-hydroxy L-tryptophan (5-HTP)	As directed on label.	Suppresses appetite. <i>Caution:</i> Do not use if you are pregnant or nursing.
Gamma-amino-butyric acid (GABA)	As directed on label.	Suppresses cravings and has antidepressant qualities. (See AMINO ACIDS in Part One.)
L-arginine and L-ornithine plus L-lysine	500 mg each or as directed on label, before bedtime. Take on an empty stomach with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	These amino acids decrease body fat. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take these supplements if you have diabetes. Do not take arginine or ornithine without lysine.
L-carnitine	500 mg daily.	Has the ability to break up fat deposits and aids in weight loss by giving you more energy.
L-glutamine	As directed on label.	Lessens carbohydrate cravings.
L-methionine	As directed on label.	Assists in the breakdown of fat.
L-phenylalanine	As directed on label, on an empty stomach.	An appetite suppressant that tells the brain you are not hungry. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or suffer from panic attacks, diabetes, high blood pressure, or PKU.

L-tyrosine	As directed on label. Take at bedtime.	Suppresses cravings and has antidepressant qualities. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug.
Maitake extract	As directed on label.	Aids in weight loss.
Multivitamin and mineral complex with potassium	As directed on label. 99 mg daily.	Obesity and nutritional deficiency are parts of the same syndrome. Important in the production of energy. Sodium and potassium levels must be balanced.
Pyruvate	As directed on label.	Promotes weight loss and may aid in reducing body fat.
Taurine	As directed on label.	Taurine is a building block for all other amino acids; aids in the digestion of fats.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary.)	Needed for proper digestion.
plus extra vitamin B <sub>2</sub> (riboflavin) and vitamin B <sub>3</sub> (niacin)	50 mg 3 times daily. Do not exceed this amount.	Required for efficiency in burning calories. Lessens sugar cravings. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure. Boosts metabolism.
and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50 mg 3 times daily.	
and para-aminobenzoic acid (PABA)	1,000 mcg 3 times daily.	Needed for proper digestion and absorption. A sublingual form is best. Aids in carbohydrate and protein utilization.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Enhances the effectiveness of insulin and boosts immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
plus copper	3 mg daily.	Needed to balance with zinc.

## Herbs

- Alfalfa, corn silk, dandelion, gravel root, hydrangea, hyssop, juniper berries, oat straw, parsley, seawrack, thyme, uva ursi, white ash, and yarrow can be used in tea form for their diuretic properties.
- Aloe vera juice improves digestion and cleanses the digestive tract.
- Amla is an Ayurvedic herb that helps to increase lean body mass and reduce fat.
- Astragalus increases energy and improves nutrient absorption.

*Caution:* Do not use astragalus in the presence of a fever.

- Borage seed, hawthorn berry, licorice root, and sarsaparilla stimulate the adrenal glands and improve thyroid function.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Butcher's broom, cardamom, cayenne, cinnamon, *Garcinia cambogia*, ginger, green tea (which has gained a great deal of attention for its ability to aid in weight loss), and mustard seed are thermogenic herbs that improve digestion and aid in the metabolism of fat.

*Caution:* Do not use cinnamon in large quantities during pregnancy. Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

- Chlorella, gudmar, schizandra, and suma aid in glucose utilization, hormone production, neural regulation, and digestion.
- Fennel removes mucus and fat from the intestinal tract and is a natural appetite suppressant.
- Fenugreek is useful for dissolving fat within the liver.
- Gotu kola aids in reducing body mass and aids in adrenal processes that facilitate carbohydrate metabolism. It also increases energy.
- Guarana and kola nut are appetite suppressants.

*Caution:* These contain caffeine; those who are sensitive to caffeine should avoid them.

- Guggul, an ancient Ayurvedic herbal remedy, helps to normalize blood cholesterol and triglyceride levels. It also has a mildly stimulating effect on the thyroid.
- Siberian ginseng aids in moving fluids and nutrients throughout the body and reduces the stress of adjusting to new eating habits.

*Caution:* Do not use this herb if you have hypoglycemia, high blood pressure, or a heart disorder.

- Trifala is an Ayurvedic herbal remedy that rejuvenates glandular balance and stimulates thyroid hormones with long-term use.
- Turmeric strengthens digestion, increases energy, and cleanses the blood.

## Recommendations

- Consuming fewer calories than you burn in a day is the only way to lose weight. But consuming the right types of foods is important as well. Rotate your foods, and be sure to eat a variety of foods, especially an assortment of fruits and vegetables. Eat meals that consist of a balance of proteins, complex carbohydrates, and some fat. Proteins can increase your metabolic rate slightly and help to balance the release of insulin by prompting secretion of the pancreatic hormone glucagon. Protein-induced glucagon mobi-

lizes fats from the tissues in which it is stored, thus aiding in weight loss. By eating balanced meals you get steadier blood sugar levels and the ability to burn stored body fat for long-term weight loss. Make sure that you have some protein at each meal and snack to keep you feeling full until the next meal.

❑ Eat more complex carbohydrates that also offer protein, such as tofu, lentils and other legumes, plain baked potatoes (no toppings, except for vegetables), and sesame seeds. Other foods that are good to include in your diet are brown rice, whole grains, skinless turkey or chicken breast, and seafood. Poultry and fish should be broiled or baked, never fried. Fish is particularly important for overweight people who have high blood pressure. In one study, those who ate fish once a day lost more weight and had lower blood pressure compared to those who did not eat fish.

❑ Eat fresh fruits and an abundance of raw vegetables. Use low-calorie vegetables such as broccoli, cabbage, carrots, cauliflower, celery, cucumbers, green beans, kale, lettuce, onions, radishes, spinach, and turnips. Low-calorie, low-carbohydrate fruits include apples, cantaloupe, grapefruit, strawberries, and watermelon. The following are higher in calories and should be consumed in moderation: bananas, cherries, corn, figs, grapes, green peas, hominy, pears, pineapple, sweet potatoes, white rice, and yams.

❑ In one study, a low-carbohydrate diet that was also high in vegetable proteins from soy, nuts, fruits, vegetables, cereals, and vegetable oils was shown to promote weight loss as well as lower total cholesterol and bad-cholesterol levels compared to the typical high-carbohydrate, heart-healthy diet, which is based on low-fat and whole-grain products. The low-carbohydrate plant-based diet produced similar weight loss to an Atkins-like diet, which is also low in carbohydrates but high in animal protein and fats.

❑ Eat foods raw, if possible. If foods are heated, they should be baked, broiled, steamed, or boiled. Never consume fried or greasy foods.

❑ Eat a healthful assortment of foods that includes vegetables, fruits, grains (especially whole grains), fish, beans, seeds, nuts, and soy products. Soy is a good source of protein if you are looking to lose weight, and it may have additional benefits beyond other protein sources. Soy may specifically promote the loss of body fat, reduce the risk of heart disease, and minimize bone loss.

❑ If you drink alcoholic beverages, do so in moderation only. Alcohol provides lots of calories, but few nutrients. Wine and beer or a spirit with soda water are better choices than a Mai Tai, for example, which is made with juice and other ingredients that add additional calories.

❑ Limit your intake of foods and beverages that contain added sugar. So-called fat-free and low-fat foods are not calorie-free. To add taste, food manufacturers often add sugars. You should always check the Nutrition Facts label

on products before purchasing them. (See page 5 in Part One for how to interpret the Nutrition Facts label.)

❑ Try a Mediterranean diet—high in fish, whole grains, fruit, nuts, vegetables, and olive oil; low in meat, dairy products, and polyunsaturated fat.

❑ Drink ten 8-ounce glasses of liquids daily. Herbal teas and steam-distilled water with trace minerals (such as ConcenTrace from Trace Minerals Research) added are good. Taken before meals, they help to reduce your appetite. They are nonfattening fillers that also help to dilute toxins and flush them out of the body. Herbal teas mixed with unsweetened fruit juice are very satisfying low-calorie drinks and are also very filling. Use these between meals and when a desire for sweets hits you. Drink sparkling water mixed with fruit juice in place of sodas.

❑ Pay particular attention to the fat in your diet. Some fat is necessary, but it must be the right kind. Avocados, olives, olive oil, raw nuts and seeds, and wheat and corn germ are sources of “good” fats that contain essential fatty acids. Use these foods in moderation—no more than twice a week. Eliminate saturated fats from the diet completely. Avoid animal fat, found in butter, cream, gravies, ice cream, mayonnaise, meat, rich dressings, and whole milk. Do not eat any fried foods.

❑ Focus on eating low-glycemic-load foods. These include any meat, fish, or poultry, fats (in reasonable amounts), low-fat dairy products, and fruits and non-starchy vegetables. Anything with a grain or rice in it can increase blood sugar levels and insulin levels. Insulin is the storage hormone, so what you eat quickly turns to fat. People who adopt a low-glycemic-load diet weigh less, have less heart disease and diabetes, and have lesser incidences of fatty liver compared to those who eat a typical American diet, which tends to be high-glycemic load. It is easy to follow a low-glycemic-load diet. You can still have some bread, as long as you choose whole-grain bread and only eat one piece at a time. A baked potato is fine, but don't have it at the same meal with another starchy vegetable such as corn.

❑ If you must eat snacks occasionally to ward off hunger, make sure they are healthy. Good choices include:

- Celery and carrot sticks; in fact, any nonstarchy vegetable is fine.
- Low-fat cottage cheese topped with fresh applesauce and walnuts.
- Unsweetened gelatin made with fruit juice in place of sugar and water.
- Freshly made unsalted popcorn.
- Rice cakes topped with nut butter (but not peanut butter).
- Watermelon, fresh fruit, or frozen fruit popsicles.
- Unsweetened low-fat yogurt topped with granola or nuts and fresh fruit.

Do not eat any white flour products, salt, white rice, or processed foods. Also, avoid fast food restaurants and all junk foods.

Do not consume sweets such as soda, pastries, pies, cakes, doughnuts, or candy. These are high-glycemic-load foods. Omit all forms of refined sugar (including white sugar, brown sugar, and corn sweetener) from the diet. Sugar triggers the release of insulin, which then activates enzymes that promote the passage of fat from the bloodstream into the fat cells.

Follow a fasting program once monthly. (See FASTING in Part Three.)

Spirulina aids in fighting obesity. Take it thirty minutes before meals to decrease your appetite. Spirulina also sustains energy, aids in detoxification, and aids in maintaining proper bowel function.

Avoid eating before bedtime and during the night. Supplementation with melatonin may help with this. "Night eaters" often have low melatonin levels.

Use wheatgrass to calm the appetite. This is a very nutritious fuel from whole food that assists metabolic functions. Kelp is also beneficial.

Use powdered barley malt sweetener (found in health food stores) instead of sugar. This is highly concentrated but not dangerous. It contains only 3 calories per gram (approximately 2 teaspoons). This sweetener is also beneficial for people with diabetes or hypoglycemia.

Increase your intake of fiber. Dietary fiber intake prevents obesity by filling up your stomach and thus making you less hungry, decreasing the absorption of excess nutrients, and changing your body's hormones so that you feel full naturally. The best way to get fiber is from fruits, vegetables, and whole grains. In addition, a fiber supplement is useful. Women need 25 grams and men 38 grams of fiber a day.

Guar gum and psyllium husks are good sources of supplemental fiber. Take fiber with a large glass of liquid one-half hour before meals.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Move your bowels daily. A clean colon is important in stabilizing your weight. (See COLON CLEANSING in Part Three.)

Keep a diet diary to help you keep track of what you eat, the caloric and fat content of what you eat, and what triggers your eating. This can help you to pinpoint and eliminate trigger factors (such as allergies or depression), as well as let you see if you are eating too much of the wrong types of foods. (See *under* ALLERGIES in Part Two.)

Be active. Take a brisk walk every day before breakfast or dinner to burn off fat. Make a habit of using the stairs instead of the elevator. Walk or ride a bicycle instead of driving whenever possible. Exercise increases the metabolic rate as well as burning off calories.

Be sure to get regular aerobic exercise, such as walking, running, bicycling, or swimming, *and* do exercises for strength and flexibility, such as yoga or stretching exercises. Exercise is better than an overly strict diet for maintaining your health and controlling your weight. It is the best way to rid the body of fat and to maintain good muscle tone. Be sure to drink water during exercise to prevent dehydration and muscle cramps.

*Caution:* If you are over thirty-five and/or have been sedentary for some time, consult your health care provider before beginning an exercise program.

If you have been sedentary for some time, try exercising in water. Water aerobics is excellent for those who are overweight or who find running or walking difficult. It is also good for arthritis sufferers. Water aerobics tones the body and strengthens the heart without straining the joints. Start by taking a class at a local fitness center or YMCA.

Change your eating habits. This is extremely important not only for losing weight, but for maintaining weight loss. Begin with the following:

- Always eat breakfast. It jump-starts the metabolism at the beginning of the day. Eat small but nutrient-dense meals every three to four hours throughout the day to keep your metabolism stable, to maintain a full feeling, and to avoid wide swings in blood sugar. Good choices might include a 2-ounce portion of protein food (beans, an egg, poultry) with ½ cup fresh salad dressed with apple cider vinegar; or ½ cup of a steamed vegetable with some type of grain (½ cup brown rice or a piece of whole- or multigrain bread). If you can't limit yourself to small meals or are not hungry, go back to the traditional three-meal-a-day plan.
- Don't skip meals. This only intensifies hunger and food cravings.
- Make your main meal lunch, not dinner. Some people have had excellent results consuming no food after 3:00 P.M.
- At meals, put less food on your plate. Chew slowly. Stop eating as soon as you are no longer hungry—don't wait until you feel full. If you eat at a restaurant, stop eating when you are full. Take the leftovers home or leave them.

If you get the urge to eat, put on a tight belt. This will make you uncomfortable and remind you that you want to lose that excess fat.

Learn to ride out your food cravings. They peak and subside like ocean waves. When you get an urge to eat, tell yourself that you can satisfy the craving if you *really* want to. Then wait ten minutes. This ensures that your eating is conscious, not compulsive. Keep in mind that most cravings last only a few minutes. Try doing something to distract yourself. Also remember that food addiction is the same as any other addiction: That first bite only makes you want more. If you ultimately decide that you really do

want that food, then decide how much is reasonable and enjoy it. *Really* enjoy it. Take one bite and savor the taste. Eat slowly.

Find out what causes your cravings. A craving for salt, chocolate, or sugar may actually be an indication of an underlying condition such as a mineral deficiency, food allergy, hypoglycemia, or hypothyroidism. If you get a strong urge to snack while you're watching television, try reading a book, drinking a large glass of liquid, or taking a walk instead. If your cravings are triggered by where you are, move. If you're in the kitchen, go outside to relax, take a walk, or do yard work. If you're in the mall, avoid the food court.

If you are always tired in midmorning or midday, are always craving carbohydrates, and are always hungry, you may be consuming too many simple carbohydrates. Simple carbohydrates include refined sugars and sweet fruits; complex carbohydrates, which include whole grains, peas, and beans, provide more long-term energy. (See Carbohydrates *under* NUTRITION, DIET, AND WELLNESS in Part One.) Protein is another long-term source of energy. Think of interesting protein choices you can have for breakfast. It doesn't always have to be bacon and eggs. In some countries people eat thin slices of cheese and meat and small amounts of fish for breakfast. A little protein goes a long way to sustain you until lunch. Be sure to have a piece of fruit and one high-glycemic-index food like a slice of bread or half of a bagel as well.

Frequent bloating and water retention may be a result of excess insulin production, which makes it almost impossible to burn fat. Try lowering your carbohydrate intake and increasing your consumption of protein and fat. Excess sodium intake can also cause water retention.

Consider being tested for food allergies. Many people who have eliminated allergenic foods from their diets have stabilized their weight quickly.

Do not grocery shop on an empty stomach. You will be tempted to buy forbidden foods and will often buy more food than you need or can use before it loses its freshness.

Read labels. A bottle of juice or a salty snack package may look like one serving, but often is more—sometimes two or three times more. You also may have noticed the new 100-calorie snack packages. While these may be convenient, when you see how small the portions are, you may be tempted to have more than one. But the calories add up quickly, so avoid them if you can't limit yourself to one.

Avoid crash dieting. A very low-calorie diet causes the metabolism to slow down, resulting in fewer calories being burned. Instead, increase your activity level. This will raise your metabolic rate, burn fat, and help prevent the loss of lean tissue.

To maintain weight loss, calculate how many calories you need daily by multiplying your weight by 10. Then add 30 percent (about one-third) of that amount to the result. As-

suming a moderate activity level, consuming anything less than that number of calories should allow you to lose weight. This is the number of calories you can consume daily without gaining the weight back. Most diet plans allow for a 500-calorie reduction per day, which would produce one pound per week of weight loss. This is a healthy approach to losing weight. Remember, you didn't gain it all in one week; it likely took years. It should come off at the same pace to avoid rebounding to your starting weight.

Losing weight sensibly and safely requires setting reasonable weight-loss goals, changing eating habits, and getting adequate exercise. Women and inactive men *generally* need to consume approximately 1,700 to 2,000 calories to maintain weight; men and very active women may consume up to 2,000 to 2,500 calories per day.

### Considerations

Dieting may conjure up visions of eating little but fruits and vegetables, but you can enjoy all foods as part of a healthy diet so long as you don't overdo it on fat (especially saturated fat and meat), sugars, salt, and alcohol. Portion sizes must be limited. Some foods high in calories—such as cookies, cakes, french fries, whole milk, whole milk cheese, cream, butter, ice cream, fatty fresh and processed meats, poultry skin and fat, lard, palm oil, coconut oil, miscellaneous fats, oils, and spreads—must be eliminated.

The best way to lose weight—and virtually the only way to maintain weight loss—is to adopt a healthier, more active lifestyle. A lifestyle that includes a natural, healthy diet and regular exercise will keep you healthy; give you more energy; lower your risk of heart disease, stroke, and cancer; and still allow you to lose weight. Those who choose fad diets over such a lifestyle can count on gaining back their lost weight and more. Almost 95 percent of all dieters regain their lost weight within a year and have to diet all over again.

If you do one form of exercise, walking seems to be the best. In one study, those who walked just 15 minutes a day (not counting regular walking for normal activities) gained less weight compared to a group of non-walkers. Walking is easy, convenient, and only requires a good pair of shoes. It can be done outdoors, or if the climate is too cold, shopping malls offer the perfect venue. Increasing your time will afford greater benefits.

Dieting may be dangerous for people older than sixty, as malnutrition may result. Exercise if you want to lose weight, but don't stop eating essential foods that you need, such as proteins, fruits, and vegetables. The best thing to do is eat nutrient-dense foods; that is, those that have a lot of nutrition in every bite. You can't eat junk foods and expect to lose weight.

Fad diets may produce some results, but the fact is that not only can these diets be unhealthy (particularly if you jump from one diet to the next), but once you go off the

diet, the weight often returns—along with some added pounds. Much of the rapid weight loss you see with some of the diets and/or products available can be attributed to loss of water weight. However, using a reasonable fad diet for twelve weeks won't do any harm and, if it helps you to lose weight, it may be a good incentive for further weight loss. Regardless of which diet you choose, allow yourself to lose no more than one to two pounds a week.

❑ To ensure good health, any type of diet you follow should be closely monitored by a health care professional and/or a nutritionist.

❑ Repeated crash dieting is not healthy and can increase the risk of heart disease. Quick weight loss tends to come back rapidly. This rapid weight gain often results in elevated cholesterol levels and can also damage vital organs. In one study, a third of people who had gone on crash diets of 500 calories or less per day were found to have developed gallstones. The fourteen-year Framingham Heart Study showed that those whose weight changed a lot or changed often had higher death rates than other people. They also ran a greater risk of coronary heart disease. The study showed that weight fluctuation seemed to pose as great a risk of heart disease and premature death as being overweight.

❑ A weight cyler is someone who has lost ten pounds more than three times and gained it back. Although there appears to be no increased risk of heart disease or death from weight cycling, data from weight cyclers showed that it is fairly easy to lose weight but hard to keep it off. If you do lose weight, try to keep it off for one year. This will be harder than losing it in the first place. It requires a commitment to lifestyle change such as increasing the amount of exercise you do in addition to dietary modifications.

❑ Thermogenesis is a term used to describe the body's natural process for burning calories. Scientists studying thermogenesis are focusing on understanding and improving the thermogenic process, which may aid in weight loss. Many new weight-loss products focus on thermogenesis.

❑ A study conducted by the U.S. Department of Agriculture showed that one of every four teenagers carries enough excess weight to put him or her at high risk of heart attack, stroke, colon cancer, gout, and other health problems later in life—regardless of whether the individual slims down as an adult. The prevalence of obesity among children aged six to eleven years more than doubled in the past twenty years, going from 6.5 percent to 17 percent. The rate among adolescents aged twelve to nineteen years more than tripled, increasing from 5 percent to 17.6 percent. In a group of children aged five to seventeen years, 70 percent had at least one heart disease risk factor, such as high cholesterol levels.

❑ The thinking once was that people who regularly use artificial sweeteners tend to gain, not lose, weight. However, newer data suggests otherwise. If you are overweight, it may be better to choose the low-calorie food or beverage

that contains artificial sweeteners than to choose the higher caloric options. If you would rather use a low-calorie sweetener from a natural source, try stevia, which is derived from a plant.

❑ A person whose body has a high ratio of muscle to fat will have a higher metabolic rate than a person of the same weight with a lower muscle-to-fat ratio, and therefore will require more calories. This is because it takes more calories to maintain muscle tissue than fat tissue. Conversely, obese persons tend to have lower than normal metabolic rates.

❑ Calories derived from fat are more easily converted into body fat than calories from other sources. Only 3 percent of fat calories are burned in the digestive process. By contrast, 25 percent of calories from complex carbohydrates (fruits, vegetables, whole grains) are burned in the course of digestion.

❑ An omega-6 fatty acid known as gamma-linolenic acid (GLA) has been shown to stimulate the body's metabolic ability to burn fat. GLA, an active ingredient found in black currant seed oil, flaxseed, and evening primrose oil, helps to control the metabolism of fats. In particular, it mobilizes the metabolically active fat called brown adipose tissue (BAT).

❑ Many people feel the need to eat something sweet after meals, but this is an acquired habit and it *can* be broken. In many cultures, sweetened foods are reserved only for rare special occasions (and even then are less sweet tasting than many of the foods Americans eat every day).

❑ Eating a low-fat diet that is high in complex carbohydrates does *not* mean eating tasteless, bland foods. There are many delicious and healthy foods available that can be eaten. The goal is to reduce the total fat, saturated fat, and cholesterol in the diet and to increase the amount of complex carbohydrates. Potatoes, pasta, bread, corn, rice, and other complex-carbohydrate-rich foods are not the cause of obesity, as some people think. They are the cure. The exception to this rule involves people who are addicted to carbohydrates. (See *Are You a Carbohydrate Addict?* on page 617.)

❑ A study sponsored by the U.S. Department of Agriculture revealed that the trace mineral boron may speed the burning of calories. Raisins and onions are good food sources of boron.

❑ In human studies, the hormone dehydroepiandrosterone (DHEA) has led to a loss of body fat by blocking an enzyme that is known to produce fat tissue. (See *DHEA THERAPY* in Part Three.)

❑ Researchers have found that weight reduction can be improved with the use of a combination of the amino acids L-ornithine and L-arginine, enhanced by L-lysine (see the *Nutrients* table in this section for recommended dosages). L-ornithine helps to release growth hormone, normally lacking in adults, which burns fat and builds muscle. This combination works best while the body is at rest.

*Note:* Never take an amino acid that contains L-arginine but not L-lysine. Too much L-arginine without L-lysine can

## Are You a Carbohydrate Addict?

Carbohydrate addicts respond to carbohydrates in a way that can be compared to the way alcoholics respond to alcohol. When they consume carbohydrates, it results in a release of insulin that is even greater than is needed, which in turn leads to even less of a feeling of satisfaction, so the urge to eat sets in again. Because of this, carbohydrate addicts end up trying to satisfy their hunger by eating more and more carbohydrates.

People who are addicted to carbohydrates should limit their intake of foods high in complex carbohydrates (or

high-glycemic-load foods) to one serving per meal and avoid *all* simple carbohydrates (very high-glycemic-load foods). The carbohydrates from fruits and vegetables don't count, as they have virtually no effect on insulin production. Chromium picolinate has been shown to reduce carbohydrate cravings. In addition, be sure to include a protein at each meal. Keeping a daily record of what you eat and when, and how you feel afterward, is a simple way to reveal possible carbohydrate addiction.

cause an imbalance of amino acids, possibly causing an outbreak of cold sores or previously dormant herpes.

Gastric bypass surgery may be recommended for extreme obesity. You are a candidate for this surgery if you are twice your ideal body weight. Your doctor may recommend this surgery even if you don't meet the weight criteria but you have one or more comorbidities that may improve by losing weight, such as diabetes or heart disease. The surgery is done by restricting the amount of food consumed by creating a small pouch using part of the stomach. This small pouch is then hooked up to the lower part of the intestine. This reduces the amount of food absorbed into the body. Obviously, this is a drastic measure. However, the complication rate for gastric bypass surgery is small. Death rates were 0.1 percent to 2.0 percent and complications (such as an inability to digest food) after surgery were 13 percent. Other devices, such as a gastric-band (LAP-BAND), which makes you feel satiated, are available, and pose less surgical risk, but still pose some risk. Given the many health risks that come with remaining obese, some people decide it makes sense to have a surgical procedure. This, of course, is something to discuss with a skilled health care professional. If you do decide on surgery, be sure to choose a surgeon who has performed many of these procedures and that the hospital has an experienced support team of nurses and dietitians to help you recover and go back to eating sensibly.

The U.S. Food and Drug Administration has approved the use of a synthetic fat called olestra in certain foods. A synthetic compound of fatty acids and sugar, olestra is neither absorbed nor digested by the body and therefore contributes no calories. For the same reason, however, it can cause indigestion, gas, and diarrhea, and possible anal leakage or loose stools. Scientists have also raised concerns because it may inhibit the absorption of necessary fat-soluble vitamins. A warning label had been added to olestra-containing foods that stated "Olestra inhibits the absorption of some vitamins and other nutrients. Vitamins A, D, E and K have been added." If you are trying to adjust your intake of vitamins in accordance with a therapeutic plan,

you should probably steer well clear of olestra-containing foods. The FDA dropped its requirement for the label in August 2003. The product, however, has not changed. All of the products that contain olestra seem to be snack-type foods, in any case—foods that should be avoided on any sensible diet plan. However, if you are overweight, it may still be better to use these products than to eat the full-fat version of other foods.

There are many drugs, such as sibutramine (Meridia) and orlistat (Xenical), on the market today that doctors may prescribe to fight obesity. All of these drugs have potential side effects. If you are considering prescription weight-loss medication, do as much research as possible on the drugs available, and discuss with your doctor how these medications could affect your health. Scientists also are studying hormones and other compounds in the blood that regulate food intake, such as ghrelin, leptin, and adiponectin, in hopes of coming up with a new generation of drugs to treat obesity. In addition to new drugs, scientists are exploring different diets and how they can be used to change hormone levels and promote weight loss. For example, a high-protein diet (30 percent protein) increases energy expenditure (how many calories the body burns during sleep and wake), satiety, fat burning, and ghrelin levels.

There are many nutritional products available today that may aid in weight reduction, including the following:

- CelluRid from BioTech Corporation is an herbal product intended to reduce the appearance of cellulite. Ingredients include kelp, uva ursi, juniper berries, lecithin, milk thistle, and cayenne.
- Cravex from Natrol contains the herb *Gymnema sylvestre*, chromium picolinate, L-glutamine, and other nutrients intended to reduce food cravings, especially cravings for sweets.
- Ripped Fuel from Twinlab contains a blend of bitter orange and St. John's wort and has been shown to reduce body weight when used with a sensible diet.

**Caution:** St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anti-coagulants.

- Ripped Fuel Extreme from Twinlab contains a blend of *Acacia catechu* and *Scutellaria baicalensis* with green tea extract. It has been shown to reduce body weight.

**Caution:** Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

- Everslender from Twinlab contains conjugated linoleic acid, shown to reduce body fat.
- Carb Intercept from Natrol has white bean extract, shown to promote weight loss. It is thought to work by blocking the absorption of carbohydrates.
- Chromium picolinate such as the one from Nature's Way has been shown to reduce body fat.

## OILY SKIN

Oily skin occurs when the sebaceous (oil-secreting) glands produce more oil than is needed for proper lubrication of the skin. This excess oil can clog pores and cause blemishes. Oily skin is probably largely a matter of heredity, but it is known to be affected by factors such as diet, hormone levels, pregnancy, birth control pills, and the cosmetics you use. Humidity and hot weather both stimulate the sebaceous glands to produce more oil. Because skin tends to become dryer with age, and because of the hormonal shifts of adolescence, oily skin is common in teenagers, but it can occur at any age. Many people have skin that is oily only in certain areas and dry or normal in others, a condition known as combination skin. In general, the forehead, nose, chin, and upper back tend to be oilier than other areas.

Oily skin has its positive aspects. It is slow to develop age spots and discoloration, fine lines, and wrinkles. It often doesn't freckle or turn red in the sun—on the contrary, it tans evenly and beautifully. On the negative side, oily skin is prone to "breakouts" well past adolescence and has a chronically shiny appearance, an oily or greasy feeling, and enlarged pores.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Flaxseed oil capsules or liquid or primrose oil	1,000 mg daily.  1 tsp daily.  Up to 500 mg daily.	Supplies needed essential fatty acids. A good healer for most skin disorders.  Contains linoleic acid, which is needed by the skin.
Vitamin A with mixed carotenoids	25,000 IU daily for 3 months, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Necessary for healing and construction of new skin tissue.
Vitamin B complex plus extra vitamin B <sub>12</sub>	As directed on label.  1,000–2,000 mcg daily.	B vitamins are important for healthy skin tone.
<b>Important</b>		
Kelp	1,000–1,500 mg daily.	Supplies balanced minerals needed for good skin tone.
Vitamin E	200 IU daily or 400 IU every other day.	Protects against free radicals. Use d-alpha-tocopherol form.
Zinc  plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.  3 mg daily.	For tissue repair. Enhances immune response. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.
<b>Helpful</b>		
Grape seed extract	As directed on label.	A powerful antioxidant that protects skin cells.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote overall skin health.
L-cysteine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Contains sulfur, needed for healthy skin. (See AMINO ACIDS in Part One.)
Lecithin granules or capsules	1 tsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Needed for better absorption of the essential fatty acids.
Superoxide dismutase (SOD)	As directed on label.	A free radical destroyer.
Tretinoin (Retin-A)	As prescribed by physician.	Acts as a gradual chemical peel; unclogs pores and speeds up sloughing off of top layers of skin, exposing new, fresh skin. Available by prescription only.

## Herbs

- Aloe vera has excellent healing properties. Apply aloe vera gel topically, as directed on product label or as needed.
- Burdock root, chamomile, oat straw, and thyme nourish the skin.

**Caution:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may in-

teract with warfarin or cyclosporine, so patients using these drugs should avoid it.

Lavender is very good for oily skin. Mist your skin with lavender water several times daily.

A facial sauna using lemongrass, licorice root, and rosebuds is good for oily skin. Two or three times a week, simmer a total of 2 to 4 tablespoons of dried or fresh herbs in 2 quarts of water. When the pot is steaming, place it on top of a trivet or thick potholder on a table, and sit with your face at a comfortable distance over the steam for fifteen minutes. You can use a towel to trap the steam if you wish. After fifteen minutes, splash your face with cold water and allow your skin to air-dry or pat it dry with a towel. After the sauna, you can allow the herbal water to cool and save it for use as a toning lotion to be dabbed on your face with a cotton ball after cleansing.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Witch hazel applied to the skin is excellent for absorbing oil.

## Recommendations

Drink plenty of quality water to keep the skin hydrated and flush out toxins.

Reduce the amount of fat in your diet. Consume no fried foods, animal fats, or heat-processed vegetable oils such as those sold in supermarkets. Do not cook with oil, and do not eat any oils that have been subjected to heat, whether in processing or cooking. If a little oil is necessary, such as in salad dressing, use cold-pressed canola or olive oil only.

Do not drink soft drinks or alcoholic beverages. Avoid sugar, chocolate, and junk food.

Keep your skin very clean. Wash your face two or three times in the course of a day—but no more, because too much washing will stimulate your skin to produce more oil. Use your hands instead of harsh scrubs or washcloths. Sterile gauze pads are also good for cleaning the skin. (Do not use a pad more than once.) Do not use harsh soaps or cleansers. Use a pure soap with no artificial additives, such as E-Gem Skin-Care Soap from Carlson Laboratories. Do not use cleansers or lotions that contain alcohol. After cleansing, apply a natural *oil-free* moisturizer to keep the skin supple.

Use hot water when washing your face. Hot water dissolves skin oil better than lukewarm or cold water.

Try using a clay or mud mask. White or rose-colored clays are best for sensitive skin.

Choose cosmetic and facial care products specifically designed for oily skin.

Alpha-hydroxy acids are a group of naturally occurring acids (found mostly in fruits) that help to stimulate

cell renewal, aid the skin in retaining water, and give it a smoother, less oily appearance. Oily skin can benefit from the use of products containing alpha-hydroxy acids because they aid in removal of the top layer of dead skin cells, which stimulates healthy skin growth and may diminish large pores. Glycolic acid is probably the best of the alpha-hydroxy acids for this purpose. If you decide to try an alpha-hydroxy acid product, begin with a product containing 5 percent alpha-hydroxy acid (not more), and apply it at night only. First wash your face, then wait five minutes before applying a small amount of the product. After two or three weeks of nighttime application, you can begin applying the product in the morning as well. As your skin becomes accustomed to the effects of alpha-hydroxy acids, you may wish to work your way up to higher-concentration products.

Products containing benzoyl peroxide are effective for oily skin. Start with a mild-strength formula to minimize possible irritation.

Choose an astringent that contains acetone, which is known for dissolving oil.

Two or three times a week, use a loofah sponge and warm water for the face to boost circulation, remove dead skin cells, and remove many of the impurities found in oily skin. Avoid using the loofah around your eyes, and do not use it on areas with open sores.

To clear away excess oil, use a clay or mud mask. Blend together well 1 teaspoon green clay powder (available in health food stores) and 1 teaspoon raw honey. Apply the mixture to your face, avoiding the eye area. Leave it on for fifteen minutes, then rinse well with lukewarm water. Do this at least three times a week—or more often if necessary. White or rose-colored clays are best for sensitive skin.

Once or twice daily, mix equal parts of lemon juice and water. Pat the mixture on your face and allow it to dry, then rinse with warm water. Follow with a cool-water rinse.

Look for facial powder that contains talcum powder. It is oil-free and blots the oil on your skin.

For combination skin, simply treat the oily areas as oily skin and the dry areas as dry skin. (See DRY SKIN in Part Two.)

Do not smoke. Smoking promotes enlargement of the pores and impairs the overall health of the skin.

## Considerations

Caring for oily skin does *not* mean trying to dry the skin out. Despite having excess oil, skin may still lack moisture. Moisture is a term that is used to refer to the amount of water inside the skin cells, not the amount of oil on the surface of the skin. While oil and moisture levels are related (the oil helps prevent loss of moisture through evaporation), the two are not the same. There are products available that help to supply and protect moisture without

adding oil. Vitamin E 12,000 IU Deep Moisturizing Crème from Derma-E Skin Care is a good nongreasy moisturizer.

❑ Many companies that specialize in skin care have developed foil-wrapped packets of wipes saturated in alcohol for skin care away from home. These can be placed in your briefcase or purse for cutting through the oil and freshening up the skin.

❑ Although it is a common myth, oily skin doesn't actually cause acne. Although there is an association between the severity of acne and the amount of oil a person's skin produces, not all people with oily skin have acne.

❑ See also ACNE in Part Two.

## ORTHOSTATIC HYPOTENSION

## OSTEOMALACIA

See RICKETS/OSTEOMALACIA.

## OSTEOPOROSIS

Osteoporosis is a progressive disease in which the bones gradually become weaker and weaker, causing changes in posture and making the individual extremely susceptible to bone fractures. The term *osteoporosis*, derived from Latin, literally means "porous bones." Because of the physiological, nutritional, and hormonal differences between males and females, osteoporosis affects many more women than men. However, men also suffer from bone loss, often as a side effect of certain medications, such as chemotherapy drugs, thyroid hormone, corticosteroids, and anticonvulsants, or as a result of other illnesses. Fifty-six percent of women and eighteen percent of American men fifty years of age and older show signs of some degree of osteopenia (low bone mass) or osteoporosis.

Bone is constantly restoring itself. Cells called osteoblasts are responsible for making bone, and other cells, called osteoclasts, are needed to remove old bone as its minerals are absorbed for use elsewhere in the body. If the osteoclasts break down the bone more quickly than it is replaced, then bone tends to become less dense and is therefore likely to break more easily.

Bone is at its strongest when a person is around age thirty, and thereafter begins to decline. In women, this decline begins to accelerate at menopause. If you have not accumulated sufficient bone mass during those formative times in childhood, adolescence, and early adulthood, or if you lose it too quickly in later years, you are at increased risk of osteoporosis.

A diagnosis of osteoporosis is reached by measuring bone density. The standard of measurement for that diagnosis has been determined by the World Health Organization and was obtained by measuring the bone mass of people who have not had fractures related to low bone mass. The standard measurement is therefore the bone density of a thirty-year-old premenopausal woman. The bone density measurement is referred to as a T-score or an SD (standard deviation) score. T-scores of less than 1 standard deviation (SD) indicate a low risk of fracture, T-scores of 1 to 2 are considered to indicate osteopenia, and T-scores of more than 2.5 standard deviation from the norm confirm a diagnosis of osteoporosis. But the T-score alone is not the only determinant of fracture risk. Heavy women are less likely to fracture a bone in a fall than thin women; women taking medications that may cause disturbances in balance are more likely to fall and suffer from a fracture. So two women with the same T-score may have a different fracture risk.

Many women, then, can be diagnosed with osteoporosis yet suffer few, if any, ill effects from the condition. The T-score is based on a comparison with the bone of a thirty-year-old, so the standard is set very high. Moreover, it is possible to have osteoporosis in one area of the skeleton and not in another. The spine and hips are the areas that cause most concern because hip fractures in older adults take a long time to heal and osteoporosis in the spine may lead to loss of height and curvature of the spine. With the techniques now being used to diagnose this condition early, so that treatment can begin before fractures occur, many people will probably discover the beginnings of osteoporosis before it is diagnosed due to a fracture. Osteoporosis is not a curable condition as yet, but there are various methods that may slow down the process of bone loss.

Many people have the impression that osteoporosis is caused solely by a dietary calcium deficiency and that it therefore can be remedied by taking calcium supplements. This is not quite correct. It is the way calcium is absorbed and used by the body that seems to be the important factor, not necessarily the amount of calcium consumed. Also, the *type* of calcium consumed is important.

While calcium supplementation is important in dealing with osteoporosis, there are other considerations as well. The correct balance of magnesium, boron, potassium, folic acid, and vitamins C, D, E, and K all play vital roles in battling osteoporosis, as does protein. Of these, vitamin D, K, and boron have been shown to be the most useful. There is some debate on the subject of osteoporosis and dietary protein. Some research has indicated that consuming large quantities of protein may cause an acid imbalance in the body, which the body attempts to counteract by releasing minerals from the bone—including calcium. A contrary point of view holds that protein consumption increases the production of insulin-like growth factor-1 (IGF-1), which is responsible for maintaining muscle and bone strength. What we do know is that all protein-containing foods leave

an acid residue in the blood, which is capable of causing bone erosion. However, if it is balanced with alkaline-producing foods such as fruits and vegetables, then the acidity is neutralized and protein has no effect.

In the United States alone, 44 million people are affected by osteoporosis—68 percent of whom are women. Of that total, 10 million people have osteoporosis already and 34 million more have low bone mass. Osteoporosis can appear at any age. It is responsible for more than 850,000 fractures annually. In those sixty-five years of age or older, 74 percent were fractures of the hip, 38 percent of the wrist, 22 percent of the shoulder, and 19 percent of the ankle. Hospitals and nursing homes in the United States spend an estimated \$14 billion each year in direct costs for osteoporosis and related fractures.

There are three basic types of osteoporosis. Type I is believed to be caused by hormonal changes, particularly a loss of estrogen, which causes the loss of minerals from the bones to accelerate. Type II is linked to dietary deficiency, especially a lack of sufficient calcium and of vitamin D, which is necessary for the absorption of calcium. Type III occurs in men and women at any age and is caused by drug treatment for other illnesses or other diseases unconnected with osteoporosis. Many women mistakenly believe that osteoporosis is something they need to be concerned about only after menopause. However, recent evidence indicates that osteoporosis often begins early in life and is *not* strictly a postmenopausal problem. Although bone loss accelerates after menopause as a result of the drop in estrogen levels, it begins much earlier. A number of factors are known to influence an individual's risk of developing osteoporosis. The first, and probably the most important, is the peak bone mass achieved in adulthood; the larger and denser the bones are to begin with, the less debilitating bone loss is likely to be. Small, fine-boned women therefore have more reason for concern than women with larger frames and heavier bones. Race and ethnicity also appear to play roles. Women of northern European or Asian ancestry are more likely to develop osteoporosis, while women of African descent are less likely to be affected.

Dietary and lifestyle habits are important as well. Insufficient calcium intake is one factor, but equally important are other dietary practices that affect calcium metabolism. Caffeine, alcohol, and many other drugs appear to have a detrimental effect on calcium absorption. Bone density also depends on exercise. When the body gets regular weight-bearing exercise (such as walking), it responds by depositing more mineral in the bones, especially the bones of the legs, hips, and spine. Conversely, a lack of regular exercise accelerates the loss of bone mass. Other factors that make one more likely to develop osteoporosis include smoking, late puberty, early menopause (natural or artificially induced), a family history of the disease, hyperthyroidism, chronic liver or kidney disease, and the long-term use of corticosteroids, antiseizure medications, or anticoagulants.

The dosages given below are for adults.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Bone Defense from KAL or JCTH from Right Foods	As directed on label.	Contains calcium, magnesium, phosphorus, and other valuable bone-reinforcing nutrients.
or Osteo-B Plus from Biotics Research	As directed on label.	A combination formula that contains almost all of the nutrients mentioned in this table. Contains calcium, magnesium, zinc, and other vitamins and minerals.
Boron	3 mg daily. Do not exceed this amount.	Improves calcium absorption. <i>Note:</i> If you are taking a complex containing boron, omit this supplement.
Calcium	Women under 50 and men under 65: 1,200 mg daily. Women over 50 and men over 65: 1,500–2,000 mg daily.	Necessary for maintaining strong bones. Injections (under a doctor's supervision) may be needed. (See Calcium and Osteoporosis on page 623.)
Copper	3 mg daily.	Aids in the formation of bone.
Floradix Iron+ Herbs from Salus Haus	As directed on label.	Provides organic iron and other nutrients needed for optimum health. Postmenopausal women usually do not need supplemental iron. <i>Caution:</i> Only use after checking with your health care provider.
Glucosamine plus chondroitin	As directed on label.	Nutrients necessary for the development of bone and connective tissue.
Magnesium	1,000 mg daily.	Important in calcium uptake.
Phosphorus	As directed on label.	Works with calcium to increase bone strength.
Potassium	300–1,000 mg daily.	Needed to counteract high-acid diet. Shown to increase bone matrix, reduce calcium loss in the urine, and lower blood pressure. <i>Caution:</i> Check with your health care provider before using these amounts.
Silica	As directed on label.	Supplies silicon, for calcium utilization and bone strength.
Soy isoflavones	As directed on label.	They have an estrogenic effect on the body. Estrogen promotes bone mass.
Ultra Osteo Synergy from American Biologics	As directed on label.	To support bone renewal.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	As directed on label. 200 mg daily. Do not exceed this amount. 1,000–2,000 mcg daily.	Provides strength to protein in bone tissue and promotes the production of progesterone.
Vitamin D	As directed on label.	Needed for the absorption of calcium.
Vitamin K	As directed on label.	Essential for the production of bone protein.

**Very Important**

L-lysine and L-arginine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aid in calcium absorption and connective tissue strength. (See AMINO ACIDS in Part One.)
Methylsulfonylmethane (MSM) (OptiMSM from Cardinal Nutrition)	As directed on label. Do not exceed the recommended dose.	A natural sulfur compound found in foods and present in body tissues. It is used by the body to build healthy new cells. MSM provides the flexible bond between the cells and provides support for tendons, ligaments, and muscles. Use a capsule form for easier absorption.
Multienzyme complex with betaine hydrochloride (HCl) plus proteolytic enzymes	As directed on label. Take with meals.	Needed for proper absorption of calcium and all nutrients. <i>Note:</i> Do not use a formula containing HCl if you have an ulcer or suffer from stomach acidity.
Vitamin A with mixed carotenoids and vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 daily. 200 IU daily or 400 IU every other day.	Important in retarding the aging process. Use emulsion forms for easier assimilation. Aids in the use of vitamin A and protects it from destruction by oxygen. Use d-alpha-tocopherol form.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily	Important for calcium uptake and immune function. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.

**Helpful**

Chromium picolinate	400–600 mcg daily.	Improves insulin efficiency, which improves bone density.
DL-phenylalanine (DLPA)	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 3,000 mg vitamin C for better absorption.	Good for bone pain. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
Kelp	2,000–3,000 mg daily.	A rich source of important minerals.
Manganese	As directed on label. Take separately from calcium.	Vital in mineral metabolism.
Multivitamin and mineral complex	As directed on label.	To supply essential minerals. Use a high-potency formula.
Trace mineral complex (Trace Supreme from International Health Products)	As directed on label.	Trace (also called micro) minerals are important for healthy bone formation.
Vitamin C with bioflavonoids	3,000 mg and up daily.	Important for collagen and connective tissue formation

**Herbs**

Alfalfa, barley grass, black cohosh, boneset, dandelion root, nettle, parsley, poke root, rose hips, and yucca help to build strong bones.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Do not use boneset on a daily basis for more than one week, as long-term use can lead to toxicity.

Feverfew is good for pain relief and acts as an anti-inflammatory.

*Caution:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

Oat straw contains silica, which helps the body absorb calcium.

Red clover isoflavones may mimic the effects of estrogen by slowing the degenerative breakdown of bone mass.

Common herbs such as sage, rosemary, and thyme can inhibit the breakdown of bone that contributes to osteoporosis.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

**Recommendations**

Eat plenty of foods that are high in calcium and vitamin D. The most potent sources are dairy products, but not all dairy has vitamin D. Check the label, as calcium and vitamin D should be consumed at the same time. Other good sources of easily assimilated calcium include broccoli, chestnuts, clams, dandelion greens, most dark green leafy vegetables, flounder, hazelnuts, kale, kelp, molasses, oats, oysters, salmon, sardines (with the bones), sea vegetables, sesame seeds, shrimp, soybeans, tahini (sesame butter), tofu, turnip greens, and wheat germ.

Consume whole grains and calcium foods at different times. Whole grains contain a substance that binds with calcium and prevents its uptake. Take calcium at bedtime, when it is best absorbed and also aids in sleeping.

Include garlic and onions in the diet, as well as eggs (if your cholesterol level is not too high). These foods contain sulfur, which is needed for healthy bones.

If you are a menopausal or postmenopausal woman with osteoporosis, include plenty of soy products in your diet. Soy is rich in phytoestrogens, which may, to some extent, substitute for your body's own estrogen if it is manufacturing too little. The latter effect is very important for osteoporosis. Estrogen depletion is strongly associated with osteoporosis.

Avoid phosphate-containing drinks and foods such as soft drinks and alcohol. Avoid smoking, sugar, and salt.

## Calcium and Osteoporosis

People in the United States consume more dairy products and other foods high in calcium per capita than the citizens of any other two nations on earth put together. We even have orange juice and antacids that are fortified with calcium. Yet we eat far less total food, take in less calcium, and get less exercise that stimulates bone growth than our grandparents did. At the same time, we consume more animal protein and phosphate-containing foods such as soft drinks. Perhaps not surprisingly, therefore, we also have the world's highest rates of osteoporosis and bone fractures among elderly people. Obviously, we need to eat more of the right foods and take high-quality supplements in some form as well.

If you are depending on your diet to supply your calcium requirements, it is useful to know that you can get about 300 milligrams of calcium from the following foods: 1 cup of low-fat yogurt, 2¼ cups of broccoli, 1½ ounces of cheese, 8 cups of spinach, and 1½ cups of kale. Green vegetables, sardines, salmon (including the bones), beans, and almonds also contain calcium. In addition to supplying enough calcium, your diet needs to be balanced with the correct amounts of other vitamins and minerals that allow the calcium to be absorbed and used to nourish bone. Among these are magnesium, potassium, and vitamin K. Magnesium and potassium are found in all fruits and vegetables. Vitamin K is found in dark green leafy vegetables, including broccoli, collard greens, kale, and spinach. If you find that you cannot meet the suggested requirements and other nutrients from your diet, then you should consider a supplement.

Drugstores and health food stores carry a bewildering array of vitamin and mineral supplements in a variety of brands and forms. There can be significant nutritional differences between the various supplements available.

Where calcium is concerned, the number on the label does not necessarily reflect the amount of calcium you can expect to absorb from the product. For example, if a label says "calcium lactate 600 milligrams," this may mean that each tablet weighs 600 milligrams—but out of 600 milligrams of calcium lactate, only 13 percent is actually calcium that is available for absorption. This is because minerals cannot be turned into tablets in their pure state; they must be combined with some other substance or substances to make a stable compound.

The important information to look for is the amount of *elemental* calcium that is present in the supplement. It is the elemental calcium that is absorbed by the body. Then, too, some supplements may contain large amounts of calcium, but in a form that is not absorbed, or is not well absorbed, by the body. The letters *USP* (U.S. Pharmacopeia) on the label are an indication that the standard for absorbability has been met.

The following are some of the common forms of calcium found in calcium supplements:

- *Calcium carbonate* usually contains a relatively large percentage of elemental calcium, and is as easily absorbed by the body as milk calcium. It contains 40 percent elemental calcium by weight. It is the lowest cost supplement as well.
- *Calcium citrate* is absorbed by the body more quickly. However, many calcium citrate products contain about half as much elemental calcium. Calcium citrate can be used if you have low stomach acid levels, which is common in postmenopausal women and people who take antacid medications. This type of supplement contains 21 percent elemental calcium by weight. You will have to take many more pills to get the same amount of calcium.
- *Calcium gluconate* contains 9 percent elemental calcium. This form of calcium can sometimes cause diarrhea and nausea.
- *Calcium lactate* contains 13 percent elemental calcium, along with lactic acid.
- *Calcium lactate gluconate* contains 13 percent elemental calcium.
- *Calcium phosphate* contains phosphorus and vitamin D in addition to calcium. This helps the body absorb the calcium. This type of supplement contains 38 or 31 percent elemental calcium (depending on whether it is tricalcium or dicalcium phosphate). (Tums contains calcium phosphate.)

For men, problems with calcium appear to be more complex than was originally thought. Research conducted over ten years by the Physicians' Health Study—the group that discovered aspirin's effect on heart attack risk—found that men who consumed two and a half servings of dairy products per day were 30 percent more likely to develop prostate cancer than men who did not. Calcium is known to lower body levels of 1,25-dihydroxy vitamin D. This is the most active form of vitamin D and is not the same form of vitamin D that is sometimes added to milk. Low levels of this vitamin may protect men against prostate cancer. In a previous study, the same group of researchers found that men who consumed high amounts of dairy foods had 70 percent increased risk of prostate cancer, and that calcium supplements increased the risk of prostate cancer by 30 percent. For now, men can continue to get calcium from foods, but taking calcium supplements is something that should be discussed with a health care provider. Calcium increases the risk of prostate cancer. Ask about this as well if you are concerned.

Limit your consumption of citrus fruits and tomatoes; these foods may inhibit calcium intake.

❑ Avoid yeast products. Yeast is high in phosphorus, which competes with calcium for absorption by the body.

❑ If you are over fifty-five years old, include a calcium supplement in your daily regimen, and take hydrochloric acid (HCl) supplements. In order for calcium to be absorbed, there must be an adequate supply of vitamin D as well as sufficient HCl in the stomach. Older people often lack sufficient stomach acid.

❑ If you take thyroid hormone or an anticoagulant drug, increase the amount of calcium you take by 25 to 50 percent.

❑ Vitamin K<sub>1</sub>, found in dark green vegetables like kale, cooked greens, spinach, Brussels sprouts, broccoli, asparagus, and some lettuces, retards bone loss. A three-year study in the *Journal of Clinical Endocrinology and Metabolism* found that taking the Upper Limit of vitamin K (500 micrograms per day) with 600 milligrams of calcium and 400 IU of vitamin D did not aid in additional bone health of the spine or hip. Do not take more vitamin K than 500 micrograms without consulting your health care professional. Continue to eat foods high in vitamin K.

❑ If you take a diuretic, consult your physician before beginning calcium and vitamin D supplementation. Thiazide-type diuretics increase blood calcium levels, and complications may result if these drugs are taken in conjunction with calcium and vitamin D supplements. Other types of diuretics increase calcium requirements, however.

❑ Keep active, and exercise regularly. A lack of exercise can result in the loss of calcium, but this can be reversed with sensible exercise. Walking is probably the best exercise for maintaining bone mass. Other activities that strengthen bones include dancing, tennis, stair climbing, aerobics, skating, and weight lifting. Although swimming and cycling are good for your cardiovascular system, they are not weight-bearing and do not affect bone density. If you are overweight, inflammatory proteins called cytokines are released due to excess body fat. These increase the loss of bone. Weight loss increases bone loss as well. However, engaging in aerobic exercise while losing weight reduces inflammation and increases bone mineral density.

### Considerations

❑ In a study published in the *American Journal of Clinical Nutrition*, women in the early stages of menopause did not reduce postmenopausal bone loss by including isoflavone-enriched foods in their diet. These women consumed 110 milligrams of isoflavone aglycones a day from the foods. It is possible that this amount was too low to show an effect. However, long-term trials using soy extracts have shown conflicting results. Women who have breast cancer or are at risk for it should consult their health care provider before using soy or isoflavone-enriched foods.

❑ In one study, taking 1,200 milligrams of calcium per day for four years was shown to reduce the risk of fractures by 72 percent. However, the participants in the study were followed for six more years; they did not get this much calcium, and the risk of fractures increased again.

❑ Some studies have reported an adverse effect on bones with high vitamin A intakes. It appears that vitamin A is safe if vitamin D intake is adequate. Be sure to take vitamin D with vitamin A supplements.

❑ Getting at least 400 micrograms per day of folic acid was shown to improve bone density, but riboflavin and vitamin B<sub>12</sub> had no effect over a five-year study.

❑ Women are about four times more likely than men to develop osteoporosis, or weak, porous bones. But a study links vitamin B<sub>12</sub> deficiency with low bone mineral density in men, and confirms similar, previously reported findings in women. Researchers funded by the Agricultural Research Service (ARS) reported the findings in the *Journal of Bone and Mineral Research*. While vitamin B<sub>12</sub> deficiency has been linked with low levels of markers of bone formation, the mechanism behind the relationship is not known. The scientists examined the relationship between vitamin B<sub>12</sub> blood levels and indicators of bone health measured in 2,576 men and women, aged thirty to eighty-seven, participating in the Framingham Osteoporosis Study. They found that those with vitamin B<sub>12</sub> levels lower than 148 picomoles per liter (pM/L) were at greater risk of osteoporosis than those with higher levels. Plasma B<sub>12</sub> levels below 185 pM/L are considered "very low," according to some experts. The study found that those with vitamin B<sub>12</sub> concentrations below 148 pM/L had significantly lower average bone mineral density—at the hip in men, and at the spine in women—than those with concentrations above this level. This study suggests adequate vitamin B<sub>12</sub> intake is important for maintaining bone mineral density. Animal protein foods, such as fish, liver, beef, pork, milk, and cheese are good sources of vitamin B<sub>12</sub>.

❑ A study conducted by the *Journal of Clinical Nutrition* reported that women who are vegetarians experience significantly less bone loss than women who consume meat. Soy, beans, peas, and lentils supply proteins, and green vegetables are all very rich in calcium, as well as containing abundant amounts of other vitamins and minerals.

❑ Klinefelter's syndrome, which results in low testosterone levels in men, also leads to osteoporosis.

❑ A study reported in the *Journal of the American Medical Association* revealed that senior citizens who took tranquilizers suffered 70 percent more hip fractures than did other people their age. Very often, medications can affect balance. You should discuss this particular side effect with your physician before taking any medication.

❑ One study purports to have identified a link between osteoporosis and high blood levels of the amino acid homocysteine. Homocysteine is involved in methionine me-

tabolism, and is normally recycled into methionine or converted into cysteine in the body. High levels result in possible increased risk of heart disease and stroke.

☐ Caffeine has been linked to calcium loss. In one study, adults given 300 milligrams of caffeine excreted more than the normal amount of calcium in their urine. Another study revealed that caffeine is associated with decreased bone minerals in women.

☐ Carbonated soft drinks contain high amounts of phosphates. These cause the body to eliminate calcium as the phosphates themselves are excreted, even if calcium must be taken from the bones to do this.

☐ Bone disintegration with pain in the hips, lower back, or legs and vertebral fractures (usually affecting people over fifty years old) is common.

☐ A balloon kyphoplasty, in which a balloon is inserted into a spinal fracture, inflated, and injected with a bone cement, can provide support and pain relief for people with some spinal fractures.

☐ The use of sodium fluoride, which was once thought to be helpful in building bone, has been shown to be ineffective for the treatment of osteoporosis. While sodium fluoride does increase bone mass in the vertebral column, the bone itself is of inferior quality. Women participating in a study at the Mayo Clinic in Rochester, Minnesota, were three times as likely to suffer from a fracture of the arm, leg, or hip if they took sodium fluoride than if they took a placebo. Some of the participants also suffered from unusual lower leg pain, perhaps due to stress fractures.

☐ A number of different prescription drugs are sometimes prescribed for people with osteoporosis, including:

- Alendronate (Fosamax) is a type of drug known as a bisphosphonate. It inhibits the resorption of bone. Other drugs in this class are risedronate (Actonel) and ibandronate (Boniva), which are taken orally one or more times a month. A newer option is an intravenous drug (Reclast), which can be taken just once a year.
- Calcitonin (sold under the brand names Cibacalcin and Miacalcin) is said to prevent further loss of bone mass in 70 percent of the people who take it. It should not be taken by anyone with a history of kidney stones.
- Raloxifene (Evista) is a selective estrogen receptor modulator (SERM)—a drug that acts *like* an estrogen in some respects but is not estrogen.
- Teriparatide (Forteo) is a new drug that is a synthetic version of parathyroid hormone and works by increasing the action of osteoblasts, the body's bone-building cells. This causes bones to become denser and more resistant to fractures. It is the first drug to stimulate new bone growth, but it requires giving yourself daily injections, and the drug can only be used for up to two years.

All of these drugs have potential side effects. They are not suitable for everyone. If bone mass is still decreasing

after two years on the same medication, doctors usually prescribe another drug.

☐ Hormone replacement therapy is often prescribed for people who have osteoporosis. There are risks attached to this treatment. Before agreeing to it, you need to consider whether the risks outweigh the benefits. (See Hormones, Hormone Therapy, and Menopause on page 580.)

☐ The FDA has approved three drugs for men with osteoporosis—alendronate (Fosamax), risedronate (Actonel), and zoledronic acid (Reclast). These are all bisphosphonates. Teriparatide (Forteo) has also been approved for men.

☐ Dehydroepiandrosterone (DHEA) and human growth hormone (HGH) are two hormones whose production progressively declines with age. Research suggests that supplementation with either of these hormones may help increase bone strength and treat osteoporosis. However, these hormones should be used only by those with true growth hormone deficiencies. (See DHEA THERAPY and GROWTH HORMONE THERAPY in Part Three.)

☐ Research conducted by the World Health Organization concluded that people who were given a protein supplement recovered more quickly from hip fractures than those who were not. In addition, they found that people who took protein supplements were less likely to suffer a hip fracture in the first place.

☐ A study reported in the March 2000 issue of *The Journal of Family Practice* found that taking vitamin C can help to prevent nerve pain after a fracture.

☐ Tests for bone loss are very easy and noninvasive. Dual energy x-ray absorptiometry (DEXA) is probably the most reliable method of determining osteoporosis. It is easier to fix bone problems before too much loss has occurred. So, women should be tested in their mid-thirties and then every five to ten years until menopause and more frequently after menopause. Exposure to radiation from this test is less than in other methods used to detect this condition. Another type of test, the collagen cross-linked N-telopeptide (NTx) test, is particularly useful for women in that it shows how fast you are losing bone mass. It is performed on a urine sample.

☐ See also RICKETS in Part Two.

## PAGET'S DISEASE OF BONE

Paget's disease of bone (named for Sir James Paget, who first described it) is a chronic disorder characterized by excessive bone degeneration combined with the creation of new bone that is deficient in calcium and therefore more fragile than normal bone. The result is enlarged and deformed bones in one or more sections of the skeleton, bone degeneration, bone pain, arthritis, noticeable deformities, and an increased susceptibility to fractures.

Paget's disease most often affects the bones of the pelvis, the spine, the thighs, the skull, the hips, the shins, and the

upper arms. It affects more than 3 to 5 percent of Americans over the age of fifty and about 10 percent of those over the age of eighty, although in rare instances it has been reported in young adults. It affects men and women nearly equally.

In the early stages, the disease usually causes no symptoms, although there may be mild pain in the affected bones. As it progresses, bone pain tends to become more severe and persistent, especially at night, and to worsen with exertion. Paget's disease can also lead to neck and/or back pain; pain and/or stiffness in affected joints; warming of the skin over the area of the affected bones; unexplained bone fractures; hearing loss; headaches; dizziness; ringing in the ears; and impaired mobility. If the pelvis or a thighbone is involved, there may be hip pain. The disease follows a pattern of alternating remissions and flare-ups. Over time, the flare-ups gradually become worse. Sometimes joints adjacent to the affected bone become involved, and osteoarthritis may develop. Over time, deformities such as bowed legs, an increasingly barrel-shaped chest, a bent spine, and/or an enlarged forehead may develop as well.

Other possible late complications include kidney stones (caused by immobilization), congestive heart failure, deafness or blindness (caused by the skull pressing on the brain), high blood pressure, and gout. In approximately 5 percent of cases, the affected bone undergoes malignant changes, leading to osteosarcoma (bone cancer). High-output cardiac failure can occur from prolonged increased blood flow. The life expectancy of individuals with Paget's disease is somewhat reduced, but most live with the disease for at least ten to fifteen years.

Because this disease usually does not cause significant symptoms, especially in the early stages, most cases go undetected unless discovered accidentally when X-rays or blood tests are taken for another reason. The cause is unknown, although some researchers suspect a slowly progressing viral infection of the bone is involved. Multiple cases of the disease within families have been reported. However, Paget's disease does not appear to be transmitted from one generation to another, a finding more consistent with an infectious disorder than with a hereditary condition.

Paget's disease is often confused with hyperthyroidism and other disorders that cause bone lesions, such as bone cancer, fibrous dysplasia, and multiple myeloma. To diagnose Paget's disease, doctors may use bone scans or X-rays to detect bone changes characteristic of the disease. Blood tests may detect elevated levels of alkaline phosphatase, an enzyme produced by bone-building cells. Urine tests and CT scans also may be used to arrive at a diagnosis of Paget's disease.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Calcium plus boron and magnesium and vitamin D	1,500 mg daily. 3 mg daily. Do not exceed this amount. 750 mg daily. 400 IU daily.	For the formation of strong bones. Use a chelate form. Nutrients that are needed for calcium absorption.
Copper	3 mg daily.	Aids in the formation of bone.
Glucosamine Plus from FoodScience of Vermont plus chondroitin and methylsulfonylmethane (MSM)	As directed on label. As directed on label. As directed on label.	Contains nutrients necessary for healthy development of bone and connective tissues. Helpful for pain.
Kyolic-EPA from Wakunaga	As directed on label.	Supplies essential fatty acids, vital for proper growth and cell formation.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub> from Wakunaga	As directed on label.	Aids in red blood cell formation and energy production.
Manganese	2 mg daily.	Required for normal bone growth.
Phosphorus	1,200 mg daily.	Required for bone formation.
Primrose oil or Ultimate Oil from Nature's Secret	As directed on label. As directed on label.	To supply essential fatty acids vital for proper growth and cell formation.
Silica	As directed on label.	Necessary for bone formation.
Vitamin A with mixed carotenoids including natural beta-carotene	10,000 IU daily.	To improve immune function and promote proper bone growth.
Vitamin B complex plus extra vitamin B <sub>12</sub> and folic acid	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 1,000–2,000 mcg daily. 400 mcg daily.	Involved in energy production. Assists in nutrient absorption and aids in cell formation. Needed for energy production.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Enhances immunity and aids in proper bone growth.
Zinc	30 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Promotes a healthy immune system. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Helpful</i>		
Bone Builder from Ethical Nutrients	As directed on label.	Contains minerals and the organic matrix that makes up bone.
DL-phenylalanine (DLPA)	As directed on label.	Alleviates chronic pain. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or suffer

		from panic attacks, diabetes, high blood pressure, or PKU.
Floradix Iron + Herbs from Salus Haus	As directed on label.	Provides organic iron and other nutrients needed for optimum health and fitness. Ask your health care provider about your need for iron.
Reishi extract or shiitake extract	As directed on label. As directed on label.	To help reduce inflammation.

## Herbs

Alfalfa contains minerals needed for proper bone formation and that help to reduce inflammation.

Angelica, cayenne (capsicum), feverfew, hops, passionflower, skullcap, valerian root, and white willow bark work well for pain.

*Caution:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

Black cohosh and St. John's wort help both to reduce inflammation and to alleviate pain.

*Cautions:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Boneset, dandelion root, nettle, parsley, poke root, rose hips, and yucca help to build strong bones.

*Caution:* Do not use boneset on a daily basis for more than one week, as long-term use can lead to toxicity.

Echinacea, goldenseal, and licorice aid in reducing inflammation.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

## Recommendations

Eat plenty of calcium-rich foods. These include brewer's yeast, buttermilk, carob, goat's milk and other dairy products containing vitamin D, all leafy greens, salmon, sardines, seafood, tofu, whey, and yogurt.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Include plenty of garlic in the diet. Garlic is beneficial for circulation and helps to keep inflammation down.

Eat fresh papaya and pineapple frequently. These fruits contain enzymes that help to reduce inflammation.

Avoid nightshade vegetables. These include tomatoes, potatoes, eggplant, cayenne peppers, chili peppers, sweet peppers, paprika, and pimiento. These vegetables are high in alkaloids, chemical substances with strong physiological effects. They affect the metabolism of calcium and, through a mechanism not yet understood, cause calcium from the bones to be deposited in other areas of the body where it does not belong, such as the arteries, joints, and kidneys.

Use barley grass and/or kelp to supply valuable minerals and other nutrients needed for bone formation.

Use heat to alleviate pain. Hot soaks, hot compresses, and heat lamps are all effective.

Follow an exercise program recommended by your health care provider to combat immobility.

Sleep on a very firm mattress or use a bed board. This will lessen the chance of developing spinal deformities.

During active phases of the disease, rest in bed and move or turn often to prevent pressure sores.

Accident-proof your home to help prevent fractures. Remove throw rugs and avoid slippery flooring. Install handrails next to the bathtub and toilet.

Avoid placing extreme physical stress on the bones.

Get regular medical checkups to screen for early bone cancer and to detect hearing loss. If hearing loss occurs, consider a hearing aid.

## Considerations

There is no known cure for Paget's disease. However, most patients never develop symptoms and so do not require treatment. For those who do, drug treatment can relieve and manage symptoms. Drug therapy for Paget's disease may include:

- *Analgesics or nonsteroidal anti-inflammatory drugs (NSAIDs)* can be useful in relieving pain.
- *Bisphosphonates* increase bone density and also slow the progression of Paget's disease. These include: alendronate (Fosamax), etidronate (Didronel), pamidronate (Aredia), risedronate (Actonel), and zoledronic acid (Zometa).
- *Calcitonin* (Cibacalcin, Fortical, Miacalcin) is a natural hormone given by injection or through the nose for bone metabolism.
- *Pliamycin* (Mithracin), an antitumor drug, can produce a remission of symptoms within two weeks, and further

improvement in two months. However, this drug can also cause kidney damage and destruction of red blood cells.

□ For names and addresses of organizations that can provide more information on Paget's disease, see Health and Medical Organizations in the Appendix.

**PAGET'S DISEASE OF THE NIPPLE**

See under BREAST CANCER.

**PANCREATITIS**

Pancreatitis is an inflammation of the pancreas, a five- to six-inch-long leaf-shaped gland situated behind the lower part of the stomach and extending downward toward the spleen and left kidney. It has two primary functions: to produce digestive enzymes that break down proteins, fat, and carbohydrates in the small intestine; and to release the hormones glucagon and insulin, which regulate blood sugar levels. The pancreas can become inflamed if digestive enzymes build up inside it and begin to attack it.

The disease can be either acute or chronic. The leading cause of acute pancreatitis is excessive alcohol use over many years. This condition can also come about as a result of infection (such as with hepatitis A or D or Epstein-Barr virus) or the use of certain drugs (such as divalproex [Depakote], used to prevent seizures and treat bipolar mood disorder; azathioprine [Imuran], sometimes used for rheumatoid arthritis; and 6-MP [Purinethol], a cancer chemotherapy agent). In very rare cases, acute pancreatitis may be caused by injury to the abdomen.

Acute pancreatitis usually causes severe pain that comes on suddenly, starting in or around the area of the navel and radiating to the back. The pain is typically exacerbated by movement and relieved by sitting, and may be accompanied by nausea and vomiting, sometimes severe. Other symptoms include upper abdominal swelling and distension, excessive gas, upper abdominal pain described as burning or stabbing, fever, sweating, hypertension, muscle aches, and abnormal, fatty stools. The incidence of this acute form is increasing by 5 percent per year, mainly owing to an increase in biliary pancreatitis. Infectious complications are a major concern. The infections are thought to be started by small-bowel bacterial overgrowth that eventually crosses the intestinal tract into the bloodstream.

Chronic pancreatitis is a condition in which the inflammation has caused irreversible changes in the microscopic structure of the gallbladder tissue. Repeated episodes of gallbladder infection and gallstones are often involved. (See GALLBLADDER DISORDERS in Part Two.) The symptoms of chronic pancreatitis may be hard to distinguish from those of acute pancreatitis, except that the pain tends to be chronic rather than coming on suddenly. In addition, chronic pancreatitis may be punctuated with periodic episodes of acute

disease. In the majority of cases, chronic pancreatitis is caused by long-term alcohol use.

Because the pancreas is the gland that produces the hormones insulin and glucagon, which regulate blood sugar levels, pancreatitis—especially if chronic—often leads to glucose intolerance (diabetes) and digestive difficulties.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Chromium picolinate	300–600 mcg daily.	Important in maintaining stable blood sugar levels.
Garlic (Kyolic from Wakunaga)	As directed on label.	Powerful antiviral and antioxidant.
<i>Very Important</i>		
Calcium and magnesium	1,500 mg daily. 1,000 mg daily.	Works closely with magnesium. Counteracts glandular disorders. Use chelate forms.
Digestive enzymes with ox bile (Digestive Aid #34 from Carlson Labs)	As directed on label.	Needed for proper digestion and gallbladder function. Important if gallbladder has been removed.
Kyo-Dophilus from Wakunaga	As directed on label.	To replace the 'friendly' bacteria and aid in digestion.
Pancreatin	As directed on label. Take with food.	Pancreatic enzyme deficiency is common in people with pancreatitis.
Proteolytic enzymes	As directed on label. Take between meals and at bedtime, on an empty stomach.	Aids in reducing inflammation; reduces strain on the pancreas by aiding protein digestion. <i>Caution:</i> Do not give this supplement to a child.
Raw pancreas glandular	As directed on label.	Contains certain proteins needed to repair the pancreas. (See GLANDULAR THERAPY in Part Three.)
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin) and vitamin B <sub>5</sub> (pantothenic acid)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. Do not exceed this amount. 100 mg 3 times daily.	Antistress vitamins. Niacin and pantothenic acid are important in fat and carbohydrate metabolism. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
<i>Important</i>		
Choline and inositol	As directed on label. As directed on label.	Fat emulsifiers that aid in fat digestion.

and/or lecithin	As directed on label.	
and/or lipotropic factors	As directed on label.	
Vitamin C with bioflavonoids	1,000 mg 4 times daily.	Potent free radical scavengers. Use a buffered form.
<b>Helpful</b>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	75 mg daily. As directed on label.	A powerful antioxidant and oxygen carrier. Works well with coenzyme Q <sub>10</sub> and increases energy, supports adrenal glands, processes fats, removes toxins from the body, and boosts the immune system.
CTR Support from PhysioLogics	As directed on label.	Helps diminish damage caused by inflammation and protects against future damage.
DL-phenylalanine (DLPA)	As directed on label.	To relieve pain in acute cases. <i>Caution:</i> Do not take this supplement if you are pregnant or nursing, or if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
Grape seed extract	As directed on label.	A powerful anti-inflammatory and antioxidant.
L-cysteine	As directed on label.	Protects the liver.
Vitamin E	200 IU daily or 400 IU every other day.	A powerful antioxidant and oxygen carrier. Important in tissue repair. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Facilitates proper enzyme activity for cell division, growth, and repair. Plays a role in the manufacture of insulin. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Burdock root, milk thistle, and red clover aid in cleansing the bloodstream and liver, reducing the burden on the pancreas.

Cedar berries, echinacea, gentian root, and goldenseal stimulate and strengthen the pancreas.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Dandelion root stimulates bile production and improves the health of the pancreas.

Detoxigen from Nature's Plus is an herbal formula that detoxifies the body and oxygenates cells.

Licorice root supports all glandular functions.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Olive leaf extract acts as an anti-inflammatory agent and is helpful if you have an infection.

## Recommendations

If you develop symptoms of pancreatitis, call your physician. This is an extremely serious condition that requires medical attention.

Eat a diet low in fat and sugar. This is very important for recovery. High levels of sugar and fats in the blood are common in pancreatitis. See DIABETES in Part Two and follow the dietary guidelines. Sometimes intravenous feeding is needed, which quiets the pancreas down. Alternatively, a feeding tube may be inserted in the nose or through the abdomen to supply a highly digested formula.

Consume no alcohol in any form.

Never use probiotics, even if you are taking antibiotics. In a study of patients with acute pancreatitis, there was no difference in the number of infections between those taking probiotics and those who were given a placebo. However, those taking probiotics had twice the death rate as the placebo group. The probiotics used in this study included: *Lactobacillus acidophilus*, *L. casei*, *L. salivarius*, *L. lactis*, *Bifidobacterium bifidum*, and *B. lactis*.

If you smoke, stop, and try to avoid secondhand smoke. Recent studies point to a distinct link between chronic pancreatitis and cigarette smoking.

See FASTING in Part Three and follow the program. Fasting can improve the health of all organs, including the pancreas.

## Considerations

Pancreatic cancer is the fourth leading cause of cancer deaths in the United States, causing about 35,000 deaths every year. Pancreatitis can lead to the development of this type of cancer. Improving the health of the pancreas may help to prevent it. In one study, the incidence of pancreatic cancer was higher in those with low vitamin D intakes (less than 600 IU per day). Another study found a connection between pancreatic cancer and high intakes of sugars (fructose, sucrose, and high-fructose corn syrup). In another study, taking folic acid and vitamin B<sub>6</sub> and B<sub>12</sub> supplements did not reduce the risk of pancreatic cancer. However, those who got these vitamins from foods had a modest protection against developing pancreatic cancer.

A high level of triglycerides (fat) in the blood is a factor in pancreatitis.

## PANIC ATTACK

See under ANXIETY DISORDER.

## PARKINSON'S DISEASE

Parkinson's disease (PD) is a degenerative disease affecting the nervous system. The underlying cause is unknown, but symptoms appear when there is a lack of dopamine in the brain. Dopamine is a neurotransmitter that carries messages from one nerve cell to another. In healthy persons, it exists in balance with another neurotransmitter, acetylcholine. In people with what is called primary Parkinson's disease, the *substantia nigra*—the area of the brain containing cells that manufacture dopamine, noradrenaline, and serotonin—are damaged or dying, and the brain loses the ability to manufacture these chemicals.

The disease may start almost imperceptibly, with a mild to moderate tremor of the hand or hands while at rest, a general slow and heavy feeling, muscular stiffness, bradykinesia (slowness of movement), and a tendency to tire more easily than usual. Later symptoms may include muscular rigidity; drooling; loss of appetite; a stooped, shuffling gait; tremors, including a characteristic "pill rolling" movement in which the thumb and forefinger rub against each other; impaired speech; and a fixed facial expression. The body gradually becomes rigid and the limbs stiffen. Depression and/or dementia may accompany the physical symptoms.

While tremors can be a sign of Parkinson's disease, not all tremors can be attributed to it. Hand tremors are common in middle age and later. There are different types of tremors. Parkinsonian tremors are most pronounced during rest, can be aggravated by tension or fatigue, and disappear during sleep. Intention tremors occur only when a muscle is being used, rather than at rest. Essential tremor is a condition characterized by more or less continuous up-and-down tremors that seems to run in families. Essential tremors usually affect both hands and become milder with rest, more severe with activity and/or stress. Attempts to stop this type of tremor through willpower often seem to make the trembling worse. Any persistent or recurrent tremor deserves investigation, especially if it interferes with normal activity, but it should be kept in mind that most tremors are *not* an indication of Parkinson's disease.

Parkinson's disease is one of the most common debilitating diseases in North America. There are approximately 1 million people with the disease throughout the United States and Canada. It affects men more often than women. Recent statistics indicate that 3 percent of the population over sixty-five years of age has the disease. For those between sixty and seventy years of age, about 15 percent of adults have it, and for those between seventy-five and eighty-four years it rises to 30 percent. There is no known cure. Treatment is focused on relieving the symptoms and maintaining independence as long as possible. Drug ther-

apy, physical therapy, and surgery are among the treatment methods used.

While the cause of the loss of brain cells that causes Parkinson's disease remains unknown, a number of different theories have been developed. One is that oxidative stress plays a prominent role in the degeneration of the nerves that secrete dopamine and that this causes the tremors that are a common symptom of Parkinson's disease. High homocysteine levels cause oxidative stress. It's customary to give all three B vitamins (B<sub>12</sub>, B<sub>6</sub>, and folic acid) to lower homocysteine levels in patients with heart disease. However, in those with Parkinson's disease, it turns out that only B<sub>6</sub> is effective at lowering homocysteine levels. This is because B<sub>6</sub> is the major driver required to convert homocysteine to cysteine, which in turn allows for the increased production of glutathione. Glutathione is a major antioxidant that seems to protect the nerve endings.

Others have hypothesized that the cells are destroyed by toxins within the body that the liver is unable to filter out, metabolize, or detoxify because as the body ages, the liver loses its ability to work as effectively and as efficiently as it once did. Another theory is that exposure to environmental toxins, such as herbicides and pesticides that leach into groundwater, is responsible.

The dosages given below are for adults.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Calcium	As directed on label.	People with Parkinson's disease often develop porous bones and are in danger of fractures. Calcium also supports the nervous system. Use calcium citrate form.
and magnesium	As directed on label.	Important for the function of nerves and muscles.
and potassium	As directed on label.	Aids nerve impulse transmission and muscle contraction.
Coenzyme Q <sub>10</sub>	As directed on label.	Allows cells to produce energy. May slow brain cell death and slow progression of the disease.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works well with coenzyme Q <sub>10</sub> to streamline metabolism, ease depression and fatigue, and increase energy.
Creatine	As directed on label. Never exceed the recommended dose.	Often used by body builders to increase muscle stamina. Research is ongoing in the use of creatine in muscle-depleting illnesses.
5-hydroxy L-tryptophan (5-HTP)	As directed on label.	Increases serotonin levels in the brain, which helps overcome insomnia and depression.
Glutathione	As directed on label.	Often depleted in people with Parkinson's disease. Found in

		the substantia nigra in the brain, where cells are dying.
L-phenylalanine and L-tyrosine	As directed by physician.	Amino acids that are converted into dopamine. <i>Caution:</i> Do not take these supplements if you are pregnant or nursing; if you take an MAO inhibitor drug or levodopa; or if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
Vitamin B complex	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Extremely important in brain function and enzyme activity. Use a high-potency sublingual formula. Consider injections (under a doctor's supervision).
plus extra vitamin B <sub>2</sub> (riboflavin)	50 mg 3 times daily, with meals.	A lack of this vitamin causes depression, nerve damage, and a reduction in neurotransmitter levels.
and vitamin B <sub>3</sub> (niacin) or niacinamide	50 mg 3 times daily, with meals. Do not exceed this amount.	Helps to maintain a strong immune system and overcome depression and irritability. Flushing may occur from niacin use—this is normal. Niacinamide does not cause flushing. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
and vitamin B <sub>6</sub> (pyridoxine)	50–75 mg 3 times daily, with meals.	Dopamine production depends on adequate supplies of this vitamin. Consider injections (under a doctor's supervision). <i>Caution:</i> Do not take this supplement if you are taking a levodopa preparation.
Vitamin C and vitamin E plus selenium	3,000–6,000 mg daily, in divided doses 200 IU daily or 400 IU every other day. 200 mcg daily. Do not exceed this amount.	Antioxidants that may slow progression of the disease and postpone the need for drug therapy. A powerful antioxidant.

**Very Important**

Dimethylamino-ethanol (DMAE)	As directed on label.	Stimulates the production of choline for brain function. Improves memory and learning ability.
Dimethylglycine (DMG)(Aangamik DMG from Food-Science of Vermont)	50 mg twice daily.	Enhances tissue oxygenation.
Floradix Iron + Herbs from Salus Haus	As directed on label.	Contains iron derived from natural food sources, beneficial in the treatment of Parkinson's disease. Ask your health care provider if you should take iron.
Gamma-aminobutyric acid (GABA)	As directed on label.	Functions as a neurotransmitter that stabilizes neuron activity. (See AMINO ACIDS in Part One.)
Grape seed oil	As directed on label.	Contains a high level of vitamin E as well as the essential fatty acid linoleic acid.

Lecithin granules or capsules and/or phosphatidylcholine	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals. As directed on label.	To supply choline, important in transmission of nerve impulses.
Nicotinamide adenine dinucleotide (NADH)	10 mg daily.	A form of vitamin B <sub>3</sub> that is important in the creation and transfer of chemical energy, especially during breathing.
Pycnogenol or grape seed extract	As directed on label.	Potent bioflavonoids and free radical scavengers.
Superoxide dismutase (SOD)	As directed on label.	An enzyme that retards oxidation, protecting neurons and sparing neurotransmitters like dopamine.
Trimethylglycine (TMG)	As directed on label.	A natural phytochemical extracted from sugar beets that has been shown in laboratory tests to increase muscle mass, reduce body fat, and increase bone density. Reduces levels of homocysteine.
<b>Helpful</b>		
Multienzyme complex (Novenzyme from International Health Products)	As directed on label.	To aid digestion and assimilation of all nutrients, especially the B vitamins.
Multivitamin and mineral complex with potassium	As directed on label. 99 mg daily.	To correct nutritional deficiencies, common in people with Parkinson's disease.
Primrose oil or omega-3 essential fatty acid complex	2,000–4,000 mg daily, in divided doses. As directed on label.	May reduce the severity and frequency of tremors.
Raw brain glandular	As directed on label.	A glandular extract that improves brain function. (See GLANDULAR THERAPY in Part Three.)

**Herbs**

Degenerative disease is often facilitated by the accumulation of toxins in the body. The following herbs have detoxifying properties.

Burdock root, dandelion root, ginger root, and milk thistle detoxify the liver.

Cayenne (capsicum), goldenseal, mullein, Siberian ginseng, and yarrow stimulate the thymus and lymphatic system.

*Cautions:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

Hawthorn, licorice, red clover, and sarsaparilla cleanse the blood.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Yellow dock cleanses the blood and detoxifies the liver.

Black cohosh, catnip, lemon balm, passionflower, skullcap, and valerian root have antistress properties and can help nourish the nervous system.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Ginkgo biloba helps to improve memory and brain function. Source Naturals offers an excellent extract.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

To reduce inflammation, use holy basil, also known as tulsi or bai gka-prow (*Ocimum sanctum*), or thunder god vine (*Tripterygium wilfordii*).

*Caution:* Use only the roots of thunder god vine. The stems and leaves are highly toxic.

## Recommendations

Eat a diet consisting of 75 percent raw foods, with seeds, grains, nuts, and raw milk.

Include in the diet foods containing the amino acid phenylalanine, such as almonds, Brazil nuts, fish, pecans, pumpkin seeds, sesame seeds, lima beans, chickpeas, and lentils.

*Caution:* Brazil nuts contain high levels of selenium, over 500 mg per ounce of nuts. If you eat Brazil nuts, adjust your supplement dosages accordingly.

Reduce your intake of protein, especially if you are taking levodopa (see *under* Considerations, below). This can help with control of coordination and muscle movements. You still need protein to stay healthy; a minimum of about 60 grams (about 0.36 gram of protein per pound) a day from high-biological proteins is best. These include tofu, yogurt, beans and lentils and other legumes, meat, fish, and poultry. Try to consume your protein at times that you are not taking this medicine. Fat interferes with absorption of levodopa, so limit its intake as well.

Fiber is important; those with Parkinson's disease need about 25 to 35 grams a day.

If your work or a hobby exposes you to chemicals or metals such as lead or aluminum, always wear protective clothing, including gloves and a face mask.

## Considerations

Some people with Parkinson's disease have been found to have high levels of lead in their brains. Chelation ther-

apy is the only way to remove lead from the body. (See CHELATION THERAPY in Part Three.)

Because there are no definitive tests for Parkinson's disease, people with hypoglycemia are sometimes misdiagnosed as having the condition. (See HYPOGLYCEMIA in Part Two.)

Fasting and chelation are both beneficial and may help to halt the progression of Parkinson's disease. (See FASTING and CHELATION THERAPY in Part Three.)

Physical therapy, including active and passive range-of-motion exercises, plus daily moderate exercise like walking, can help to maintain normal muscle tone and function.

A study conducted by the National Institute on Aging using rhesus monkeys shows a long-term low-calorie diet may offer protection from Parkinson's disease.

In one study, high intakes of vitamin B<sub>6</sub> (greater than 1.74 milligrams per day) led to a 31 percent reduction in the risk of developing Parkinson's disease. No effect was seen for B<sub>12</sub> or folic acid.

Patients with Parkinson's disease who suffer from depression were shown to benefit from taking fish oil capsules, regardless of whether the fish oil was taken with or without antidepressants.

"Green drinks" may significantly reduce symptoms. (See JUICING in Part Three.)

Octacosanol, a substance found in wheat germ oil, has been shown to have beneficial effects on neuron membranes, and may make it possible to reduce the dosage of levodopa required.

Iron supplementation appears to be beneficial to some people with Parkinson's disease. The production of tyrosine hydroxylase, an enzyme involved in the production of dopa (the precursor of dopamine), apparently can be stimulated by iron supplementation. Check with your physician before taking iron supplements.

A study published in *The New England Journal of Medicine* concluded that when the drug selegiline (Eldepryl), also known as deprenyl, is taken in the early stages of the disease, the onset of the more disabling symptoms seems to be delayed. The drug's mechanism of action is to prevent the breakdown of a chemical in the brain called dopamine; low levels are associated with Parkinson's disease. Selegiline needs to be taken with other Parkinson's medications. Talk to your doctor about which prescription medicines and over-the-counter preparations you are using. This drug produces side effects when combined with alcohol or foods containing tyramine, such as avocados, bananas, fava beans, chocolate, aged cheeses, sausage/pepperoni, sauerkraut, soy sauce, tap beer, and red wine. It has not been proved that selegiline can actually delay or slow the disease process, as opposed to easing symptoms.

❑ Treatment with the hormone dehydroepiandrosterone (DHEA) may help to prevent Parkinson's disease. (See DHEA THERAPY in Part Three.)

❑ The use of antioxidant supplements may delay the need for the levodopa therapy in people with Parkinson's disease, in some cases by as much as two to three years. In one study, people with Parkinson's disease were given 3,000 milligrams of vitamin C and 3,200 international units of vitamin E daily. The results strongly suggested that the progression of the disease can be slowed significantly by the administration of high dosages of antioxidants. If Parkinson's disease is related to free radical damage of dopamine-producing brain cells, in theory, a person who takes antioxidants while still healthy might never develop Parkinson's disease. Other research is exploring the role of a naturally occurring substance, glial-cell-line-derived neurotrophic factor (GDNF), which nourishes the neurons that produce dopamine.

❑ The first line of defense in treating Parkinson's disease is levodopa (sold under the brand names Dopar and Lardopa). However, as the disease progresses, the benefit from levodopa may wear off. A combination of levodopa and a drug called carbidopa (Parcopa, Sinemet) is also used. This drug also reduces stiffness. Other drugs that may be prescribed for people with Parkinson's disease are bromocriptine (Parlodel), pramipexole (Mirapex), and ropinirole (Requip). Some of these drugs can be used either on their own or with levodopa; others must be used with levodopa. All of these medications can cause side effects.

❑ Another drug class is anticholinergics. These drugs, which include trihexyphenidyl (Artane), benzotropine (Cogentin), and biperiden (Akineton), dampen acetylcholine, a neurotransmitter that works in conjunction with dopamine to produce smooth movement. Some of the nerve cells in the brain are specialized to use either dopamine or acetylcholine to send different messages, depending on their purpose. Smooth muscle control requires a balance of dopamine and acetylcholine. In Parkinson's, there is an imbalance between the two.

❑ A treatment for episodes of hypomobility, or "off-periods," in which a person with Parkinson's disease becomes immobile or unable to perform daily activities, is apomorphine (Apokyn). Because of possible side effects and drug interactions, it should only be used under the guidance of a physician. It is the first and only prescription medication that reverses off-episode motor symptoms.

❑ Pallidotomy is a surgical procedure sometimes recommended for people with Parkinson's disease. In this technique, the surgeon uses targeted electrical current to destroy the area in the brain that is causing involuntary movements. Although this has become safer and more accurate, it is still a high-risk operation.

❑ The transplantation of brain tissue from an animal that is still manufacturing dopamine into the brains of people

with Parkinson's disease has proved successful in relieving symptoms in some cases.

❑ Brain stimulators to curb involuntary movements are much like pacemakers for the heart. They can be implanted in the brain and operated by the individual when needed. A device called the Activa Tremor Control System stimulates targeted cells in the thalamus via electrodes that are implanted in the brain and connected to a neurostimulator implanted near the collarbone. The electrical stimulation can be adjusted for each person's needs. These devices require the services of a physician to obtain, implant, and maintain. Information about Activa Parkinson's Control System is available from the manufacturer, Medtronic. (See Manufacturer and Distributor Information in the Appendix.)

❑ Additional information on Parkinson's disease and its management is available from the National Parkinson's Foundation. (See Health and Medical Organizations in the Appendix).

## PEPTIC ULCER

A peptic ulcer is a spot where the lining of the stomach or small intestine and the tissues beneath—and sometimes part of the stomach muscle itself—have been eroded, leaving an internal open wound. The surrounding tissue is usually swollen and irritated. Ulcers can occur anywhere along the gastrointestinal tract, but are most common in the stomach (gastric ulcers) and duodenum (duodenal ulcers), the portion of the small intestine closest to the stomach. Peptic ulcers affect approximately 4.5 million Americans each year, and it is estimated that they will affect approximately 10 percent of Americans at some point in their lives. The incidence of peptic ulcers has declined in the United States in part due to the increased use of proton-pump inhibitor drugs like omeprazole (Prilosec).

The symptoms of a peptic ulcer include chronic burning or gnawing stomach pain that usually begins forty-five to sixty minutes after eating or at night, and that is relieved by eating, taking antacids, vomiting, or drinking a large glass of water. The pain may range from mild to severe. It may cause the individual to awaken in the middle of the night. Other possible symptoms include lower back pain, headaches, a choking sensation, itching, and possibly nausea and vomiting.

An ulcer results when the lining of the stomach fails to provide adequate protection against the effect of digestive acids and enzymes, which, in effect, start to digest the stomach itself.

It was once believed that stress and anxiety were the main causes of ulcers. However, evidence has shown ulcers to be the result of infection with *Helicobacter pylori* bacteria combined with the presence of stomach acid. *H. pylori* can live on the lining of the stomach and small intestine, where it can cause damage to the lining and also to the mucous layer that protects the lining from digestive acids. Many

health care professionals believe that the bacteria are transmitted from person to person through close contact. However, many health care professionals still consider stress to be a risk factor for peptic ulcers, as it increases stomach acid production. Certain drugs and supplements also may increase acid production. Taking aspirin or nonsteroidal anti-inflammatory drugs (NSAIDs), especially over a long period of time, can increase stomach acidity and lead to ulcers. Steroids, such as those taken for arthritis, can contribute to stomach ulcers. Those who consume alcohol and heavy smokers are more prone to developing ulcers, and have greater trouble getting ulcers to heal. African-Americans and Latinos are twice as likely as Caucasians to have ulcers. If left untreated, ulcers can cause internal bleeding or perforation of the stomach or small intestine.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### Stomach Acid Self-Test

If you suffer from stomach pain, you can determine whether the problem is caused by excess stomach acid with this simple test. When you have the pain, swallow a tablespoon of apple cider vinegar or lemon juice. If this makes the pain go away, you most likely have too little stomach acid, not too much. If it makes your symptoms worse, then you may have an overly acidic stomach. The suggestions in this section should help to correct the problem. If your pain is significant and has continued for several days, seek medical care.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Acid-Ease from Enzymatic Therapy	As directed on label.	Balances acidity in the body, reducing symptoms. For some people, may be able to replace ulcer medications such as ranitidine (Zantac).
L-glutamine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Important in the healing of peptic ulcers. ( <i>See</i> AMINO ACIDS in Part One.)
Pectin	As directed on label.	Helps relieve duodenal ulcers by creating a soothing protective coating in the intestines.
Vitamin E	200 IU daily or 400 IU every other day.	A potent antioxidant that aids in reducing stomach acid and in relieving pain. Helps promote healing. Use d-alpha-tocopherol form.

### Helpful

Acidophilus (Kyo-Dophilus from Wakunaga)	2–3 capsules, 1 to 3 times daily.	To provide flora for the small intestine that improve assimilation of nutrients and aid in digestion. Use a nondairy formula that requires no refrigeration.
Bromelain	250 mg 3 times daily.	An enzyme from pineapple that improves digestion and relieves symptoms. Chewable papaya tablets are also good.
Curcumin	250–500 mg 2 to 3 times daily, between meals.	Promotes healing.
Essential fatty acids (MaxEPA, primrose oil, or salmon oil)	As directed on label.	Protects the stomach and intestinal tract from ulcers.
Iron	As directed by physician. Take with 100 mg buffered or esterified vitamin C for better absorption.	Helps to prevent anemia, which may occur with bleeding ulcers. Use ferrous chelate or ferrous fumarate form. <i>Caution:</i> Do not take iron unless anemia is diagnosed.
or Floradix Iron + Herbs from Salus Haus	As directed on label.	A nontoxic form of iron from food sources.
Multivitamin and mineral complex	As directed on label.	To provide a balance of essential nutrients.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label. Take between meals. As directed on label.	Works on undigested food remaining in the colon, and helps to reduce inflammation. <i>Caution:</i> Do not use a formula containing HCl.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Powerful free radical scavengers that also act as anti-inflammatories and strengthen tissues.
S-Adenosylmethionine (SAME)	200 mg twice a day, in the morning and in the evening.	Aids in relief of stress and depression, eases pain, and produces antioxidant effects. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. A very small number of people taking high doses have reported gastrointestinal disturbances. If this happens, discontinue the supplement. Do not give to a child under twelve.
Vitamin A emulsion or capsules	50,000 IU daily for 1 month; then 25,000 IU daily for 1 month; then reduce to 10,000 IU daily. 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for healing. Protects the mucous membranes of the stomach and intestines. Emulsion form is recommended for easier assimilation and greater safety at high doses. One study found that higher intakes of vitamin A, retinol, and provitamin A carotenoids (beta-carotene) were associated with 40 to 60 percent lower rates of gastric cancer.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual	Needed for proper digestion. A sublingual type is best.

plus extra vitamin B <sub>6</sub> (pyridoxine)	vitamins in a complex will vary.) Do not exceed a total of 25 mg vitamin B <sub>3</sub> (niacin) daily from all sources. 50 mg 3 times daily.	Needed for enzyme production and wound healing.
Vitamin C	3,000 mg daily.	Promotes wound healing and protects against infection. Use a buffered or esterified form.
Vitamin K	100 mcg daily.	Needed for healing and to prevent bleeding; promotes nutrient absorption and has a neutralizing effect on the intestinal tract. Deficiency is common in those with digestive disorders.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Promotes healing. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

- Alfalfa is a good source of vitamin K.
- Aloe vera aids in pain relief and speeds healing. Take 4 ounces of aloe vera juice or gel daily. Be sure to buy a food-grade product.
- Bupleurum, used in combination with angelica and licorice root, is good for treating ulcers.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Cat's claw is cleansing and healing to the digestive tract. Cat's Claw Defense Complex from Source Naturals is a combination of cat's claw and other herbs, plus antioxidant nutrients such as beta-carotene, N-acetylcysteine, vitamin C, and zinc.

*Caution:* Do not use cat's claw during pregnancy.

- Comfrey is beneficial for treating ulcers.

*Caution:* Do not take this herb internally for more than one month, and use it only under the close supervision of a health care professional.

- Garlic is an antimicrobial and may aid in eradicating ulcers.
- Hops, passionflower, skullcap, and valerian root are good for promoting a restful sleep. These supplements can be found in a single complex.
- Kava kava and St. John's wort have calming effects and reduce stress.

*Cautions:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. St. John's wort may

cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

- Licorice promotes healing of gastric and duodenal ulcers. Take 750 to 1,500 milligrams of deglycyrrhizinated licorice (DGL) two to three times daily, between meals, for eight to sixteen weeks. Studies have shown that DGL may be as effective as the pharmaceutical drug cimetidine (Tagamet) or ranitidine (Zantac) in treating peptic ulcers.

*Caution:* Do not substitute ordinary licorice root for the deglycyrrhizinated variety. Ordinary licorice can elevate blood pressure if used on a daily basis for more than seven days in a row, and should be avoided completely by persons with high blood pressure. Deglycyrrhizinated licorice has had a component known as glycyrrhizinic acid removed, which should eliminate this side effect.

- Malva tea calms the stomach and reduces intestinal irritation.
- Marshmallow root soothes irritated mucous membranes.
- Rhubarb, taken in juice or tablet form, is good for treating intestinal bleeding, which sometimes accompanies peptic ulcers.
- Other beneficial herbs include bayberry, catnip, chamomile, goldenseal, myrrh, and sage. All of these can be taken in tea form.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

## Recommendations

- Eat plenty of dark green leafy vegetables. These contain vitamin K, which is needed for healing and is likely to be deficient in people with digestive problems.
- Do not consume coffee (even decaffeinated) or alcoholic beverages.
- Drink freshly made cabbage juice daily. Drink it immediately after juicing. (See JUICING in Part Three.)
- If symptoms are severe, eat soft foods such as avocados, bananas, potatoes, squash, and yams. Put vegetables through a blender or food mill. Eat harder vegetables like broccoli and carrots occasionally—well steamed.
- Eat frequent small meals; include well-cooked millet, well-cooked rice, goat's milk, and soured milk products

such as yogurt, cottage cheese, and kefir. Drink barley, wheat, and alfalfa juice. They contain chlorophyll, making them potent anti-ulcer treatments.

If you have a bleeding ulcer, consume organic baby foods or steamed vegetables blended in a blender or mashed. Add nonirritating fiber such as guar gum and/or psyllium seed. These foods are easy to digest and nutritious, and they contain no chemicals.

For rapid relief of pain, drink a large glass of water. This dilutes the stomach acids and flushes them out through the stomach and duodenum.

Avoid fried foods, tea, caffeine, chocolate, animal fats of any kind, and carbonated drinks. Instead of drinking soda, sip distilled water with a bit of lemon juice added.

Avoid salt and sugar. They have been linked to increased stomach acid production.

Reduce your intake of refined carbohydrates, as they have been linked to peptic ulcers.

Do not drink cow's milk. Even though it neutralizes existing stomach acid, the calcium and protein it contains actually stimulate the production of more acid, and it is known to be associated with the occurrence of ulcers. Soymilk is a good substitute.

Chew your food thoroughly. This improves digestion. Taking bitters also improves digestion. Place 10 to 15 drops under your tongue before meals.

Allow teas and other hot beverages to cool before drinking them. Otherwise, they may trigger gastric discomfort.

Keep the colon clean. Make sure the bowels move daily, and take cleansing enemas periodically. (See COLON CLEANSING and ENEMAS in Part Three.)

Do not smoke. Smoking can delay or even prevent healing, and makes relapse more likely.

Avoid painkillers such as aspirin and ibuprofen (Advil, Nuprin, and other products) that can aggravate the ulcer.

Try to avoid stressful situations. Learn stress-management techniques. (See STRESS in Part Two and Meditation under PAIN CONTROL in Part Three.) Music therapy may be helpful. (See MUSIC AND SOUND THERAPY in Part Three.)

### Considerations

Physicians can use two procedures to locate a peptic ulcer: an upper gastrointestinal (GI) series, in which you drink a chalky barium liquid and have a series of X-rays taken of the stomach and duodenum; and an endoscopy, in which a physician inserts a thin lighted tube attached to a camera down through your throat and into the stomach or duodenum.

Infection with *H. pylori* is very common. About one out of six infected people develops ulcers. There are several tests available to test for *H. pylori*. They include: a direct

biopsy of the stomach lining, a blood antibody test, a urea breath test, or a stool antigen test. A blood test is the most common.

Because many ulcers stem from *H. pylori* bacteria, doctors use a two-pronged approach to peptic ulcer treatment: Kill the bacteria and reduce the level of acid in your digestive system to relieve pain and encourage healing. Accomplishing these two goals may require the use of at least two, and sometimes three or four, of the following medications: antibiotics to kill the organism; acid blockers to relieve ulcer pain and encourage healing; antacids to neutralize stomach acid; proton pump inhibitors to reduce acid; and cytoprotective agents that protect the tissues that line your stomach and small intestine.

Acid blockers—also called histamine (H-2) blockers—reduce the amount of hydrochloric acid released into your digestive tract, which relieves ulcer pain and encourages healing. Acid blockers are available by prescription or over the counter and include: ranitidine (Zantac), famotidine (Pepcid), cimetidine (Tagamet), and nizatidine (Axid). People who take cimetidine (Tagamet) or ranitidine (Zantac) for ulcers should be cautious about ingesting alcohol. These drugs can magnify the effects of alcohol on the brain.

Antacids are often recommended for people with ulcers. An antacid may be taken in addition to an acid blocker or in place of one. Instead of reducing acid secretion, antacids neutralize existing stomach acid and can provide rapid pain relief. If you must take antacids, avoid products containing aluminum, which has been linked to Alzheimer's disease. (See ALZHEIMER'S DISEASE in Part Two.) Maalox has been known to cause a gray film on the tongue in rare instances. Discontinue use if this occurs.

Another way to reduce stomach acid is to shut down the "pumps" within acid-secreting cells. Proton pump inhibitors reduce acid by blocking the action of these tiny pumps. These drugs include the prescription and over-the-counter medications omeprazole (Prilosec), lansoprazole (Prevacid), rabeprazole (Aciphex), and esomeprazole (Nexium). However, long-term use of proton pump inhibitors, particularly at high doses, may increase your risk of hip fracture. Ask your doctor if you need a calcium supplement while taking these medications.

In some cases, your doctor may prescribe cytoprotective medications that help protect the tissues that line your stomach and small intestine. They include the prescription medications sucralfate (Carafate) and misoprostol (Cytotec). A nonprescription cytoprotective agent is bismuth subsalicylate (Pepto-Bismol).

Peptic ulcers were once thought to be a chronic illness that one "just has to live with." However, it is now known that 90 percent of peptic ulcers can be cured with appropriate treatment.

If an ulcer does not heal, your physician may perform a biopsy to rule out cancer.

❑ The combination of two prescription medications, omeprazole (Prilosec) and clarithromycin (Biaxin, an antibiotic), may be prescribed for people with *H. pylori* infection and duodenal ulcer.

❑ Gastroesophageal reflux disease (GERD) and peptic ulcers cause very similar symptoms. However, GERD is both more common and, usually, less serious than a peptic ulcer. (See HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE [GERD] in Part Two.)

❑ Some believe that food allergies may be a cause of ulcers. See ALLERGIES in Part Two and follow the self-test program to identify possible problem foods.

## PERIODONTAL DISEASE

Periodontal disease is second only to the common cold as the most prevalent infectious ailment in the United States. It affects 75 percent of Americans over the age of thirty-five and is responsible for 70 percent of adult tooth loss. The rate of periodontal disease increases with age; it is only 50 percent in adolescents.

*Periodontal* means “located around a tooth.” Periodontal disease therefore can refer to any disorder of the gums or other supporting structures of the teeth. Gingivitis (inflammation of the gums) is the early stage of periodontal disease. It is caused by plaque—sticky deposits of bacteria, mucus, and food particles—that adheres to the teeth. The accumulation of plaque causes the gums to become infected and swollen. As the gums swell, pockets form between the gums and the teeth that act as a trap for still more plaque. Other factors that contribute to the development of gingivitis include breathing through the mouth, badly fitting fillings and prostheses that irritate surrounding gum tissue, and a diet consisting of too many soft foods that rob the teeth and gums of much-needed “exercise.” Genetics also may be a factor, as a tendency toward periodontal disease seems to run in families. The gums become red, soft, and shiny, and they bleed easily. In some cases, there is pain, but gingivitis can also be essentially painless.

If left untreated, gingivitis can lead to a condition called *pyorrhea* or *periodontitis*. This is an advanced stage of periodontal disease in which the bone supporting the teeth begins to erode as a result of the infection. Abscesses are common. Pyorrhea causes halitosis, with bleeding and often painful gums. Poor nutrition, improper brushing, wrong foods, sugar consumption, chronic illness, glandular disorders, blood disease, smoking, drugs, and excessive alcohol consumption make an individual more likely to develop pyorrhea. It is often related to a deficiency of vitamin C, bioflavonoids, calcium, folic acid, or niacin. Smokers are more susceptible than nonsmokers to periodontitis and tooth loss. Periodontal disease can be made worse by missing teeth, food impaction, malocclusion, tongue thrusting, teeth grinding, and toothbrush trauma.

Stomatitis is inflammation of the oral tissues, and may

affect the lips, palate, and insides of the cheeks. It often occurs as part of another disease. Stomatitis produces swollen gums that bleed easily. Sores may develop in the mouth and eventually become blisterlike lesions that can affect the gums. Two common types of stomatitis are acute herpetic stomatitis (better known as oral herpes) and aphthous stomatitis (canker sores).

Problems in the mouth often are reflections of deficiencies or underlying disorders in the body. Bleeding gums may signal a vitamin C deficiency; dryness and cracking at the corners of the mouth may indicate a deficiency of vitamin B<sub>2</sub> (riboflavin). Both conditions may also signal a generalized nutritional deficiency. Dry or cracked lips can be the result of an allergic reaction. Raw, red mouth tissue may be a sign of stress; a smooth, reddish tongue can indicate anemia or poor diet. Sores under the tongue can be an early warning sign of mouth cancer. Regular dental check-ups can help detect these conditions early.

Warning signs of potentially severe periodontal disease include the following:

- Loose teeth.
- A change in the way your teeth fit together.
- A change in the fit of partial dentures.
- Red, swollen, or tender gums.
- Gums that bleed when you brush or floss.
- Gums that have pulled away from the teeth.
- Constant bad breath.
- Dry mouth.
- Bruxism (teeth grinding).

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub>	100 mg daily.	Provides energy needed for gum cell growth and healing of gum tissue.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Vitamin C with bioflavonoids	4,000–10,000 mg daily, in divided doses throughout the day.	Promotes healing, especially of bleeding gums. Bioflavonoids retard the growth of plaque.

**Very Important**

Vitamin A	25,000 IU daily for 1 month, then reduce to 10,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for healing of gum tissue. Emulsion form is recommended for easier assimilation and greater safety at high doses.
plus carotenoid complex (Betatene)	As directed on label.	Antioxidants used by the body to manufacture vitamin A as needed.
Vitamin E	200 IU daily or 400 IU every other day. Also open a capsule and rub the oil on the gums 2-3 times daily.	Needed for healing of gum tissue. Use d-alpha-tocopherol form. Do <i>not</i> use the dl-form.
plus selenium (E-Sel from Carlson Labs)	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A powerful antioxidant that works with vitamin E.

**Important**

Grape seed extract	As directed on label.	A powerful antioxidant and anti-inflammatory.
Proteolytic enzymes with pancreatin	As directed on label. Take between meals and also at bedtime.	Aids in keeping down inflammation and aids proper digestion.
Quercetin	As directed on label.	Has anti-inflammatory properties.
Vitamin B complex	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Needed for proper digestion and healthy mouth tissues.
Zinc	50-80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Enhances immune function. Needed to prevent infection and promote healing. Use zinc gluconate lozenges or OptiZinc for best absorption.
plus copper	3 mg daily.	Needed to balance with zinc.

**Herbs**

Applying aloe vera gel directly to inflamed gums eases discomfort and soothes the tissues.

Strained chamomile tea and calendula flower tea are both soothing and help to heal gum tissues.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Clove oil is good for temporary relief of tooth and/or gum pain. Simply rub a drop or two of clove oil on the affected area. If the oil is too strong in its pure form, it can be diluted with a drop or two of olive oil.

Echinacea, hawthorn berries, myrrh gum, and rose hips all help to keep down inflammation and enhance immune function. You can apply these herbs directly to the inflamed areas as a poultice or drink them in tea form.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Goldenseal destroys the bacteria that cause periodontal disease. Take 3,000 milligrams daily. Or place a drop-perful of alcohol-free goldenseal extract in your mouth, swish it around for three minutes, then swallow. For inflamed gums, place 5 drops of alcohol-free goldenseal extract on a piece of gauze or pure cotton and place this on the inflamed area. Do this immediately whenever mouth sores or inflammation starts, and you will be amazed at the results. In severe cases, it may take three to five nights for sores to heal. Be sure to pack the gauze or cotton tightly up under the inside of the front of the mouth between the lips and gums.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Sage is good for its anti-inflammatory properties. Boil 2 tablespoons of dried, crushed sage leaves in one cup of water, steep for twenty minutes, strain, and rinse your mouth several times daily.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Tea tree oil, rubbed on the gums, helps to prevent and treat gum disease.

*Caution:* Do not take tea tree oil internally.

Thyme is a natural antiseptic that reduces the level of bacteria in the mouth.

**Recommendations**

Eat a varied diet of fresh fruits, green leafy vegetables, meat, and whole grains to provide the teeth and gums with needed exercise and supply the body with the vitamins and minerals that are essential for dental health. Although all vitamins and minerals are essential for the proper formation and continued health of the teeth, adequate vitamin C intake is particularly important for the prevention of gingivitis and pyorrhea. Vitamin A seems to control the development and general health of the gums; a lack of this vitamin often results in gum infection. Vitamin A is also necessary for healthy tooth development in children. Minerals important for healthy teeth include sodium, potassium, calcium, phosphorus, iron, and magnesium.

Eat plenty of high-fiber foods, such as whole grains, vegetables, and legumes.

Avoid sugar and all refined carbohydrates. Sugar causes plaque buildup and inhibits the ability of white blood cells to fight off bacteria.

Brushing after every meal is best. Avoid snacking unless you can brush afterward. Especially avoid sugar-containing gum, candy, or other foods that are nibbled on throughout the day.

Brush your teeth with goldenseal powder every day for at least one month. You can open up a capsule of goldenseal and mix the contents with toothpaste, or use a liquid extract in the same way. Make sure not to swallow the powder and rinse your mouth thoroughly. After one month, change brands of toothpaste. Don't stay with the same brand; some brands may irritate the gums.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Change toothbrushes every month to keep the disease in check, and keep your toothbrush clean between uses. Bacteria live on toothbrushes. There are special devices that kill bacteria that you can keep your toothbrush in when not in use.

Floss your teeth at least once a day. Unwaxed dental floss is good for getting under the gum line.

Scrape your tongue each morning after you brush. Use a tongue scraper (available in health food stores and some pharmacies), the back of a spoon, or your toothbrush to brush your tongue. This is important because bacteria thrive on a moist tongue.

Stim-U-Dent, found in drugstores, is beneficial for keeping the gums massaged and clean between brushing. Make sure you soak it in water or hold it in the mouth until it softens, so as not to damage the gums. Massage between each tooth between meals. This also helps to remove plaque and should be used daily after eating.

Use your fingertips to massage your gums to increase circulation. Make sure your hands are clean.

Interdental-space brushes are good for cleaning the spaces between teeth.

Try using a dental rinse called Plax to help loosen plaque. Unlike mouthwashes, this is designed to be used before brushing.

Use a *very* soft natural bristle toothbrush. Be sure to brush your gums and tongue as well as your teeth at least twice a day, but after each meal or snack is best. The most effective way to get under the gum line is to tilt the toothbrush so that the bristles are at a 45-degree angle to the gum, and brush in a forward and backward motion using short strokes across the gums to remove bacteria.

If inflammation is present, run very hot water over the toothbrush to soften it before brushing, and be gentle until healing is complete.

Open a capsule of vitamin E and rub the oil on inflamed gums. This is very healing and helps to alleviate soreness.

For relief of toothache pain until you can get to your dentist, apply ice to the gums. Clove oil can also be helpful (*see under Herbs, above*).

Avoid taking antibiotics. The mouth is the hardest place for them to work, and they destroy needed friendly bacteria in the colon. Try goldenseal first (*see under Herbs, above*).

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

In addition to the products described above, we recommend the following tooth and gum products. Most of these can be bought at health food stores:

- Dentargile (Pierre Cattier). Contains a clay base for healing.
- Peelu Dental Chewing Gum. Contains a natural tooth whitener derived from the small peelu tree, native to the Middle East and Asia. People have chewed its branches for centuries to keep their teeth white. Also contains natural flavor, fruit pectin, sodium lauryl sulfate (from coconut oil), and vegetable glycerine. Unlike many over-the-counter tooth-whitening products, this does not irritate or damage gums.
- Healthy Teeth and Gums Toothpaste from the Natural Dentist. Fights plaque and gingivitis.
- Herbal Crème de Anise from Nature's Gate. Another good product found in health food stores.
- Herbal Mouth and Gum Therapy Mouth Wash from the Natural Dentist. Good for rinsing the mouth between brushes.
- Tom's Natural Toothpaste. Offers several different kinds of toothpaste.
- Weleda Salt Toothpaste. Contains baking soda and salt formulation with medicinal herbs and silica.
- Vicco Pure Herbal Ayurvedic Toothpaste. Contains extracts from plants, bark, roots, and flowers used in Ayurvedic medicine.

See a dentist every six months. Be sure your dentist is taking the proper steps to avoid transmitting disease. The dentist's office and waiting room should be clean. Dentists, hygienists, and dental assistants should wash their hands and change gloves between patients. Every reusable instrument should be sterilized between patients, and large equipment and all surfaces in the treatment room should be cleaned and disinfected periodically. If you have questions about your dentist's procedures, do not hesitate to ask.

### Considerations

Periodontal disease should ideally be treated by a periodontist, a dentist who specializes in this area of dentistry. Your dentist should be able to refer you to one.

- ❑ The process of periodontal disease is easier to reverse if it is caught early. It is important to know the symptoms and get regular dental checkups for periodontal disease.
- ❑ Severe cases of periodontal disease may necessitate surgery to remove the infected tissue from the gum and reshape the bone.
- ❑ Certain illnesses, such as diabetes and several kinds of blood disorders, create a higher risk for developing gum disease.
- ❑ Research suggests that people who have severe periodontal disease are at greater risk of heart disease, lung disease, stroke, ulcers, poor control of diabetes, and giving birth prematurely. Studies are ongoing regarding the effect periodontal disease has on the health of the body. It is suspected that bacteria that exist in periodontal pockets may easily enter the bloodstream. So by caring for your teeth, you may also be caring for whole-body health.
- ❑ Regular intimate contact with an infected person can transmit the bacteria that cause periodontal disease.
- ❑ Smoking is a major factor in irritating the gums and mouth. It has also been linked to mouth and esophagus cancer.
- ❑ Some people appear to be more susceptible than others to the bacteria that cause gum disease because of a genetic predisposition.
- ❑ Dry mouth, a condition in which there is not enough saliva in the mouth, can promote tooth decay and periodontal disease. Saliva is essential for ridding the mouth of plaque, sugar, and debris. Dry mouth problems increase with age; more than half of people over the age of fifty-five are affected by it. It can also be caused by alcohol consumption or by prescription or over-the-counter drugs, especially those for high blood pressure, depression, colds, and allergies. Diabetes is also associated with dry mouth. The best treatment for dry mouth is to draw more moisture from the salivary glands by chewing carrots, celery, or sugar-free gum; drinking 8 to 10 cups of water a day; chewing ice chips; and/or breathing through the nose.
- ❑ Dental implants look more natural than dentures, and many people are opting for them. Unfortunately, improperly inserted dental implants can cause or exacerbate periodontal disease. If you are interested in implants, consult an implant specialist. Often the gum disease can be treated first, and then the implants can be done.
- ❑ Researchers are studying a possible link between hormone replacement therapy (HRT) and a decrease in tooth loss. Researchers at Harvard Medical School and Brigham and Women's Hospital in Boston found a 24 percent decrease in tooth loss among woman using HRT. It is suspected that this may be because HRT aids in protecting against loss of bone-mineral density in the jaw. HRT is not without its risks, however, some of them potentially serious (*see* MENOPAUSAL AND PERIMENOPAUSAL PROBLEMS in Part Two).

- ❑ Air abrasion technology, a dental technique that painlessly removes tooth decay without drilling, allows dentists to make smaller fillings and save more of the natural tooth. The new technique, considered to be a major breakthrough, does not necessitate numbing drugs or anesthesia.
- ❑ Regular dental checkups are important in detecting oral cancer, a disease that strikes 35,000 Americans each year. If oral cancer is caught early, nine out of ten people survive.
- ❑ One advantage (perhaps the only one) to having allergies is that people who suffer from allergies are less likely to lose teeth to periodontal disease. The reason apparently is that the allergy sufferer's overactive immune system is better at fighting off the bacteria that cause periodontal disease.
- ❑ There is a tablet you can purchase at most drugstores that shows areas your toothbrush missed. Chew a tablet after brushing, then brush until the color is gone.
- ❑ Electric toothbrushes, such as the Braun or Oral B systems, help to remove plaque.
- ❑ An automatic toothbrush sanitizer has been proven effective in keeping toothbrushes free of bacteria. The device automatically turns on every half-hour for two minutes to sanitize the bristles twenty-four hours a day. As an alternative, you can store your toothbrush in hydrogen peroxide or grapefruit seed extract to kill germs (if using hydrogen peroxide, rinse it well before brushing).
- ❑ Fluoride is a mineral that strengthens the underlying structure supporting the teeth—especially important for menopausal women who have lost density in their jawbones. Fluoride also helps to protect from decay root surfaces that become exposed as gums recede with age. There is debate among health care professionals regarding the use of fluoride. Some believe in using it, while others cite claims of immune system damage and increased cancer risk as reasons not to.
- ❑ Premalignant oral lesions may occur and are usually caused by tobacco. However, certain nutrients may also have an effect. In a study of 42,000 men (the Health Professionals Follow-Up Study), the risk of this type of cancer was lower in those who had high intakes of vitamin C from foods and not supplements. In contrast, men were at increased risk when they took high doses of vitamin E and beta-carotene, and this was particularly a problem for men who smoked. Taking close to the DRI for vitamin E and about 3,500 micrograms of beta-carotene posed the lowest risk.

- ❑ *See also* BLEEDING GUMS *under* PREGNANCY-RELATED PROBLEMS in Part Two.

## PHENYLKETONURIA

*See under* RARE DISORDERS.

**PHLEBITIS**

See THROMBOPHLEBITIS.

**PHOTOPHOBIA**

See under EYE PROBLEMS.

**PINKEYE**

See under EYE PROBLEMS.

**PIRIFORMIS SYNDROME**

See under RARE DISORDERS.

**PKU**

See PHENYLKETONURIA under RARE DISORDERS.

**PLANTAR FASCIITIS**

See under HEEL OR BONE SPUR.

**PMS**

See PREMENSTRUAL SYNDROME.

**PNEUMONIA**

Pneumonia is a serious infection of the lungs that can be caused by any of a number of different infectious agents, including viruses, bacteria, fungi, protozoa, and mycoplasma. The infection causes tiny air sacs in the lung area to become inflamed and filled with mucus and pus, inhibiting oxygen from reaching the blood. Lobar pneumonia affects only a section, or lobe, of one lung. Bronchial pneumonia affects portions of both lungs. Although symptoms can vary in intensity, they usually include fever, chills, cough, bloody sputum, muscle aches, fatigue, sore throat, enlarged lymph glands in the neck, cyanosis (a bluish cast to the skin and nails), pain in the chest, and rapid, difficult respiration.

Pneumonia is typically preceded by an upper respiratory tract infection such as a cold, influenza, or measles. Factors that increase the risk of pneumonia include being either under one year or over sixty years of age, a weakened immune system, cardiovascular disease, diabetes, HIV infection, seizure or stroke, aspiration under anesthesia, alcoholism, smoking, kidney failure, sickle cell disease, malnutrition, foreign bodies in the respiratory passages, exposure to chemical irritants, and even allergies.

Bacterial pneumonia can be very dangerous and may come on either suddenly or gradually, usually as a complication of some other health problem such as respiratory disease, a weakened immune system, or viral infection. Older adults, young children, alcoholics, and people who

have just undergone surgery are also at risk. *Streptococcus pneumoniae* is the most common cause of bacterial pneumonia. Symptoms usually include shaking, chills, and a high temperature. The cough is dry at first. Then a rust-colored sputum is produced, and breathing becomes rapid and labored. Chest pain that worsens upon inhalation, abdominal pain, and fatigue are also common. This type of pneumonia is unlikely to spread from one person to another.

Viral pneumonia is more variable in course and severity. It can come on suddenly or gradually, and symptoms—which are much the same as those of bacterial pneumonia—can be mild, severe, or anywhere in between. It is less serious than bacterial pneumonia, but if not cared for properly, a second, bacterial pneumonia infection can set in.

Fungal pneumonia, especially *Pneumocystis carinii* pneumonia (PCP), is much less common than either the bacterial or viral variety, and is often associated with a weakened or suppressed immune system. People with HIV or AIDS or certain types of cancer, or people who are taking immunosuppressive drugs following organ transplantation, are most likely to be affected.

Mycoplasma pneumonia, or “walking pneumonia,” is caused by an agent that is unclassified but appears to be both bacterium and virus. This form of pneumonia usually affects people under forty. The symptoms tend to be less severe than those of viral or bacterial pneumonia and include a cough that is spasmodic, along with chills and a fever. Infants can contract pneumonia due to a *Chlamydia trachomatis* infection transferred to the child during birth. Childhood pneumonia can also be caused by the same bacteria that cause whooping cough.

Young children (especially infants), older adults, and people who have compromised immune systems are very vulnerable to the potentially life-threatening effects of this illness. Pneumonia is now the sixth leading cause of death in the United States. This is a condition that requires immediate medical attention. No matter what the cause, pneumonia usually leaves the sufferer with weakness that persists for four to eight weeks after the acute phase of the infection has resolved.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Garlic (Kyolic from Wakunaga)	As directed on label.	Protects against respiratory infections and destroys unwanted bacteria in the body.
Liquid oxygen supplement	As directed on label.	Increases oxygen intake and aids the body in eliminating toxins.

Nicotinamide adenine dinucleotide (NADH)	10 mg daily.	Important in the creation and transfer of chemical energy, especially during breathing.
Vitamin A with mixed carotenoids	Up to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Enhances immunity and promotes repair of lung tissue. Use emulsion form for easier assimilation and greater safety at high doses. Do not take such high doses in capsule form.
Vitamin C plus bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.) 100 mg twice daily.	Very important for immune response and for reducing inflammation. Needed to activate vitamin C.

**Very Important**

Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply protein, important in tissue repair.
L-carnitine plus L-cysteine plus glutathione	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To protect the lungs from free radical damage and break down mucus in the respiratory tract.
Pycnogenol and/or grape seed extract	50 mg 4 times daily. As directed on label.	Boosts the immune system and protects lung tissue; reduces the frequency and severity of colds, flu, and their complications.
Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Needed for normal digestion, production of antibodies, and formation of red blood cells, and for healthy mucous membranes. Use a sublingual form.

**Important**

Raw thymus glandular and raw lung glandular	500 mg each twice daily.	Stimulates immune response and promotes healing of lung tissue. (See GLANDULAR THERAPY in Part Three.)
Vitamin E emulsion	200 IU daily or 400 IU every other day.	A potent antioxidant that protects the lung tissues and enhances oxygen utilization. Emulsion form is recommended. Use d-alpha-tocopherol form.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for tissue repair and immune function. Zinc gluconate lozenges are very effective.

**Helpful**

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Enhances cellular oxygen utilization. Works well with coenzyme Q <sub>10</sub> and supports the immune system's detoxification of many dangerous substances.
---	--	---

Essential fatty acids (flaxseed oil, primrose oil, salmon oil, or Ultimate Oil from Nature's Secret)	As directed on label.	Needed to build new lung tissue and to reduce inflammation. Improves stamina, speeds recovery, and boosts immunity.
Maitake extract or reishi extract or shiitake extract	As directed on label. As directed on label. As directed on label.	Mushroom extracts that help to build immunity and fight infection.
Melatonin	1.5–5 mg daily, taken 2 hours or less before bedtime.	To improve sleep. This is a natural hormone produced by the pineal gland that controls the body's sleep/wake cycle. <i>Caution:</i> This supplement is not suitable for children.
Multivitamin and mineral complex	As directed on label.	To maintain a balance of all necessary nutrients in the body.
Proteolytic enzymes (Novenzyme from International Health Products)	As directed on label 3 times daily, on an empty stomach.	Aids in absorption of nutrients and reduces inflammation.

**Herbs**

- Astragalus enhances the immune system.  
*Caution:* Do not use astragalus in the presence of a fever.
- ClearLungs from RidgeCrest Herbals is an herbal combination that helps provide relief from shortness of breath, tightness in the chest, and wheezing due to bronchial congestion.
- Echinacea enhances immunity.  
*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.
- Ginger is an effective antimicrobial agent and is helpful for fever.
- Goldenseal and licorice root are natural antibiotics.  
*Cautions:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.
- Lung Tonic from Herbs, Etc. contains a variety of herbs that support the lungs.

**Recommendations**

- See your health care provider if you suspect pneumonia. This is a potentially dangerous disease.

- Eat a diet consisting of raw fruits and vegetables.
- Take a protein supplement from a vegetable source; soy is an excellent source of nondairy protein. In addition, a free form amino acid complex may be helpful. Amino acids are the building blocks of proteins.
- Drink plenty of fresh juices. Liquids help to thin the lung secretions. Fast on pure juices, fresh lemon juice, and distilled water. (See FASTING and JUICING, both in Part Three.)
- Include “green drinks” in your diet or take chlorophyll in tablet form. Earth Source Greens & More from Solgar is a good green drink product.
- If you are taking antibiotics, take acidophilus in capsule or liquid form three times each day.
- Exclude dairy products, sugar, and white flour products from your diet. Make sure to get your calcium, vitamin D, and magnesium from other foods or from supplements.
- Do not smoke.
- Use a cool mist from a humidifier or vaporizer to help ease breathing.
- Place a heating pad or a hot water bottle on your chest to relieve pain.
- Consider using a device called Air Supply from Wein Products. This is a personal air purifier that is worn around the neck. It kills and deactivates airborne viruses, bacteria, molds, and spores.
- To avoid passing the infection along to others, dispose of secretions properly. Sneeze and/or cough into disposable tissues. Flush used tissues to discard them.
- Children with pneumonia have to be carefully monitored. If you suspect that your child might have pneumonia, seek medical advice immediately.

### Considerations

- Vitamin A is necessary for maintaining the health of the lining of the respiratory passages. A deficiency of this vitamin increases susceptibility to respiratory infections, which in turn can lead to pneumonia. Deficiencies of this vitamin are almost nonexistent in the United States.
- Pneumococcal vaccine provides protection against more than twenty different strains of microorganisms that can cause pneumonia. It is recommended for anyone without a spleen, anyone with a chronic disease (especially diseases that affect the lungs), and everyone over the age of sixty-five.
- A urine test for *Streptococcus pneumoniae* takes fifteen minutes to perform. It is more efficient than diagnosis from mucus, blood, or saliva.
- The use of antibiotics for minor infections such as colds may lead to the development of antibiotic-resistant bacteria in the upper airway, which can cause pneumonia.
- See also INFLUENZA and COMMON COLD, both in Part Two.

### POISON IVY/POISON OAK/POISON SUMAC

Poison ivy, poison oak, and poison sumac are probably the most common allergenic plants in the United States. These plants grow in every state except Alaska and are common along roadsides, in forests and pastures, and along streams—even, in the case of poison ivy, in suburban backyards.

Poison ivy and poison oak are members of the same botanical family. Poison ivy is more prevalent east of the Rocky Mountains; poison oak is more common to the west and southwest. Poison sumac is common in southern swamps and northern wetlands. All three plants produce similar symptoms, and as a result all three are often referred to simply as poison ivy.

More than half the population is allergic to one of these three plants. About 15 percent of the 120 million Americans who are allergic to poison oak, poison ivy, and poison sumac are so highly sensitive that they break out in a rash and begin to swell in four to twelve hours, instead of the usual twenty-four to forty-eight hours. Sensitivity to poison ivy is acquired and is at its peak during childhood. Most susceptible are people who are sensitive to sunlight. The irritating substance in poison ivy is urushiol, a substance present in the oily sap in the leaves, flowers, fruit, stem, bark, and roots. Urushiol is one of the most potent toxins on earth; less than 1 ounce would be enough to affect every living person. The blisters, swelling, and itching are caused by an immune system response to this poisonous sap. The plant is poisonous even long after it has dried out, but it is particularly irritating in the spring and early summer, when it is full of sap. Every part of these plants is toxic.

The first symptom of poison ivy is a burning and itching sensation. This is followed by the development of a red, intensely itchy rash, often accompanied by swelling, oozing, and crusting blisters. A mild case may involve only a few small blisters, while a severe case may cause many large blisters, acute inflammation, fever, and/or inflammation affecting the face or genitals. Symptoms can appear anywhere from a few hours to seven days after contact and tend to be at their worst between the fourth and seventh days. The rash often forms a linear pattern. Exposed parts of the body, such as the hands, arms, and face, are the areas most likely to be affected. Scratching can then spread the inflammation to other parts of the body. Itching, redness, and swelling begin to heal by the second day after the appearance of the rash, and most people are completely healed within seven to fourteen days.

Direct contact with the plant is the most common means of contracting poison ivy, but the poisons can be conveyed to the skin in other ways. Some people have contracted poison ivy by petting an animal that has been in contact with it. It can also be transmitted by clothing or objects that have come in contact with the plant. People who are highly sensitive to poison ivy can develop a reaction if the plant is burned and they inhale the smoke. Severe cases of mouth

poisoning have occurred in children who have eaten the plant's leaves or grayish berries.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Vitamin C with bioflavonoids	3,000–8,000 mg daily.	To prevent infection and spreading of the rash. A natural antihistamine that reduces swelling.
<i>Helpful</i>		
Calamine lotion	Apply topically as directed on label.	Contains calamine, phenol, and zinc oxide. Has drying properties for faster healing.
Shark cartilage	1 gram per 15 lbs of body weight daily, divided into 3 doses.	Reduces inflammation.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Needed for healing of skin tissue. Also boosts the immune system.
Vitamin E oil or cream	Apply topically as directed on label.	To aid in healing and prevent scarring.
Zinc	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for repair of skin tissues. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Herbs

- Aloe vera gel helps relieve burning and itching. Apply pure aloe vera gel as directed on the product label or as needed.
- A strong tea made of equal parts lime water and white oak bark is very good for poison ivy, poison oak, or poison sumac. Apply a compress wet with this solution. Replace the compress with a fresh one as often as it becomes dry.
- Marshmallow root both soothes and heals skin.
- Tea tree oil disinfects and heals skin conditions. Melagel, an ointment that contains tea tree oil, is very effective.
- Witch hazel helps stop itching and aids in healing.
- The following herbs can be used topically as remedies for poison ivy, poison oak, or poison sumac: black walnut extract, bloodroot, echinacea, goldenseal, and myrrh. Black walnut has antiseptic properties and helps to fight infection; bloodroot reduces swelling; echinacea promotes healing of skin wounds; goldenseal is good for skin inflammation; myrrh is a powerful antiseptic. Echinacea can also be taken internally to boost the immune system.

**Cautions:** Do not use bloodroot during pregnancy. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

### Recommendations

- Treat a mild case of poison ivy with one or more of the following:
  - Apply compresses made with very hot plain water for brief intervals.
  - Apply compresses soaked in a diluted Burow's solution (use 1 pint to 15 pints of cool water). You can purchase Burow's solution at most drugstores.
  - Soak the affected skin in cool water with colloidal oatmeal (Aveeno) added, available at most drugstores.
  - For relief of itching, apply a paste made from water, cornstarch, baking soda, oatmeal, or Epsom salts. Use 1 teaspoon of water to 3 teaspoons of the dry ingredient.
  - Apply aloe vera juice, tofu, or watermelon rind to the area for cooling relief. Using 1 pint of buttermilk with 1 tablespoon of sea salt added may be helpful.
  - Use an herbal preparation suggested under Herbs, above.
  - Try homeopathic remedies. *Rhus toxicodendron* is the classic homeopathic remedy for poison ivy. It relieves itching and promotes healing. Poison Ivy/Oak Tablets from Hyland's is a homeopathic combination remedy for poison ivy.

If alternative therapies are not working, try some over-the-counter remedies. Commonly used over-the-counter medications include IvyBlock, which reduces the severity of the rash; Tecnu Skin Cleanser; Ivy Stat; Benadryl; calamine lotion; Burt's Bees Poison Ivy Soap; Ivy-Dry; and low-dose steroids.

For a severe case of poison ivy, consult a physician. Symptoms that warrant medical attention include an extensive rash that covers more than half of the body; extreme swelling and redness; and fever. You should also consult your health care provider if poison ivy occurs near the eyes, mouth, or genitals.

Stay cool. Sweating and heat can make itching worse.

### Considerations

Oral prednisone is sometimes prescribed to relieve itching and reduce swelling. However, this treatment should be reserved only for very severe cases involving fe-

ver, difficulty urinating, dangerous facial or genital swelling, or other symptoms of acute illness. Oral steroids are extremely powerful drugs and can cause serious side effects, when misused.

The toxin urushiol does not affect dogs or cats, but they can bring the irritating substance home on their fur and pass it to you. If you suspect your pet may have walked through poison ivy or poison oak, wash the animal thoroughly (wear rubber gloves and protective clothing).

Prevention is better than treatment when it comes to poison ivy, poison oak, and poison sumac. When spending time outdoors, keep the following in mind:

- Lightweight fabrics do not provide adequate protection against poison ivy or oak, because the sap can easily penetrate them. Wear gloves and heavier clothing if you might be exposed to these plants.
- Everyone, even children, should learn to recognize, and avoid, these harmful plants. Poison ivy usually grows as a vine, but it can also take the form of a shrub, growing anywhere from two to seven feet high. Its leaves always grow in clusters of three, one at the end of the stalk, the other two opposite each other. Poison oak grows as a shrub exclusively, and its leaves are lobed, like oak leaves. Like those of poison ivy, they grow in threes. Poison sumac grows as a shrub or small tree that has multiple leaflets growing on both sides of a stem. The number of leaflets may range from seven to thirteen, but it is always an odd number.
- Appropriate protective clothing should be worn for activities that take you into forests or through thick underbrush—long pants, a long-sleeved shirt, shoes, socks, and gloves. These items should be washed after they are worn; if they come into contact with poison ivy, they are not safe to wear again until they have been laundered or dry-cleaned.
- If you know or suspect that you may have come in contact with poison ivy, remove all clothing and shoes, and *immediately* scrub your skin using brown or yellow laundry soap (such as Fels Naptha) and water or alcohol to remove the irritating oil. Lather several times and rinse in running water after each sudsing. This procedure is useless if not done within ten minutes; after that time, the oil will have penetrated the skin and cannot be washed off. Wash clothing, gear, or pack material in plenty of hot, soapy water, with chlorine bleach added, if possible. Stubborn cases of poison ivy that do not respond to proper treatment are often due to repeated contact with contaminated clothing.

## POISONING

There are literally thousands of substances, both natural and synthetic, that can cause poisoning. Many of these are present in everyday items and products, including drugs,

## Poison Control Center

It is a good idea to post the number of the American Association of Poison Control Centers somewhere accessible, especially if you have young children. If you can program your telephone for automatic dialing, you may wish to add the number to your phone's programming as well. The operator at this general number will immediately forward you to your local Poison Control Center for emergency guidance.

### UNITED STATES

[www.dorway.com/poisons.html](http://www.dorway.com/poisons.html)  
800-222-1222

cleaning products, pesticides, paints and varnishes, hobby and art supplies, batteries, cosmetics, and houseplants. Some are poisonous only if ingested; others can cause problems if inhaled or absorbed through the skin or eyes.

Most cases of accidental poisoning involve young children, especially children under the age of five. Young children are very curious, and their preferred method of exploring often involves putting things in their mouths. However, there are also many cases of poisoning every year among elderly people and hospital patients (most commonly the result of overmedication or drug mix-ups), as well as adolescents, who may experiment with the ingestion of toxic substances, including recreational drugs. Other causes of poisoning include exposure to environmental pollutants and toxic substances used in the workplace. Toxins in food can also cause poisoning. (See **FOODBORNE AND WATERBORNE DISEASE** in Part Two.)

### Recommendations

If you suspect that you or another person has been poisoned, call the American Association of Poison Control Centers (see phone number listed above) and follow its directions. The appropriate measures to take depend on the toxin involved and the method of ingestion. The professionals who staff these centers will be able to tell you what to do.

Keep a bottle of syrup of ipecac and charcoal tablets, available in drugstores and health food stores, on hand at all times. However, *do not* use syrup of ipecac unless specifically directed to do so by a physician or your Poison Control Center. For some poisonous substances, it is not advisable to take anything by mouth—for example, if the poison contains an acid that will create more internal burning. If advised to do so by the Poison Control Center, take 5 charcoal tablets immediately. This will help to absorb the

poison. Do not use charcoal tablets that are not made for internal use.

☐ Childproofing your house is essential if children or grandchildren are around. Keep cleaning items up in high cupboards and not under the sink. Drain cleaner (lye) is particularly caustic if ingested, so make sure this is out of reach of children.

☐ If you are directed to go to the nearest hospital emergency room, take the container of the suspected poison with you, if possible. This can help medical personnel to deal with the situation and save precious time.

### Considerations

☐ When dealing with suspected poisoning, it is better to rely on the advice of a Poison Control Center staff member rather than the information on product packaging. Poison Control Centers keep up-to-date with the latest knowledge and practices; information provided by manufacturers may not be as current or reliable.

☐ See also ALUMINUM TOXICITY; ARSENIC POISONING; CADMIUM TOXICITY; CHEMICAL POISONING; COPPER TOXICITY; ENVIRONMENTAL TOXICITY; FOODBORNE/WATERBORNE DISEASE; LEAD POISONING; MERCURY TOXICITY; and/or NICKEL TOXICITY, all in Part Two.

## POLYPS

Polyps are benign (noncancerous) growths of various sizes that are found on stalk-like structures growing from the epithelial lining of the large intestine, cervix, bladder, nose, and other body structures. They are most common in the rectum and sigmoid colon, and usually occur in groups.

Most polyps of the colon and/or rectum cause no symptoms at all and are discovered only during routine physical examinations that include examination of the colon (colonoscopy), or during examination or treatment of other disorders. If they are very large, however, they may cause rectal bleeding, cramping, or abdominal pain. The relationship between polyps and cancer is not fully understood. Some physicians believe most colon cancers begin as polyps. However, most polyps probably do not turn into cancer. On the other hand, it is true that many people who have a cancerous growth in the colon also have multiple polyps surrounding that growth, and it does appear that the larger a polyp grows, the greater the chance that it will become malignant.

Familial polyposis is a hereditary disease in which large numbers of growths (one hundred or more) develop in the colon. If removed, they grow back. Rectal bleeding and mucous drainage are common symptoms. This disorder is more closely linked to cancer than ordinary polyps are; unless it is treated, it virtually always leads to colon cancer.

Cervical polyps line the inside of the cervix, the passage from the vagina into the uterus. Symptoms indicative of cervical polyps include a heavy, watery, bloody discharge

from the vagina. Bleeding may occur after sexual intercourse, between periods, and after menopause. The growth of cervical polyps may be caused by infection, injury to the cervix, or hormonal changes during pregnancy. Polyps are more common in women who have not had children. Women with diabetes also have a higher than normal chance of developing polyps. A Pap smear may or may not detect cervical polyps. They rarely return once removed.

Bladder polyps produce blood in the urine. Unless they are removed, cancer of the bladder may follow.

Nasal polyps usually form in the back of the nose, near the openings into the sinuses. They too can bleed and can interfere with normal breathing. People with hay fever and other nasal allergies are most prone to nasal polyps, as are people who overuse nose drops and nasal sprays.

Polyps on the vocal cords are caused by abuse (such as from repeated and prolonged episodes of screaming or, among singers especially, improper vocal technique), usually in the presence of an infection. People who smoke or have allergies are more susceptible. Vocal cord polyps usually cause painless hoarseness.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Multivitamin and mineral complex plus extra calcium and magnesium	As directed on label. 1,000–1,500 mg daily. 750 mg daily.	Provides a balance of necessary nutrients. Protects against colorectal polyps and colon cancer. Assists in the absorption of calcium.
Vitamin A with mixed carotenoids	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Protects the membranous linings. Use emulsion form for easier assimilation.
Vitamin C with bioflavonoids	5,000–10,000 mg daily, in divided doses.	Can reduce the number of polyps, and may eliminate them altogether.
<i>Very Important</i>		
Vitamin E	200 IU daily or 400 IU every other day.	A potent antioxidant. Protects against the effects of lipid peroxidation; if deficiency occurs, cells are vulnerable to damage. Use d-alpha-tocopherol form.
<i>Important</i>		
ABC Aerobic Bulk Cleanse from Aerobic Life Industries	As directed on label. Take with aloe vera juice.	Cleanses the colon, assisting in normal stool formation to aid in removing harmful toxins.

**Helpful**

Coenzyme Q <sub>10</sub>	60 mg daily.	An important antioxidant. Increases cellular oxygen levels.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works well with coenzyme Q <sub>10</sub> to support adrenal glands and boost the immune system.
ConcenTrace trace mineral drops from Trace Minerals Research	As directed on label.	Normalizes electrolytes after bowel cleansing.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, between meals.	Acts as a natural antibiotic and enhances immune function.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label.	An important antioxidant and free radical destroyer.
	As directed on label.	An antioxidant complex that contains SOD.

**Herbs**

Aloe vera juice improves digestion and cleanses the digestive tract.

Butcher's broom, cardamom, cayenne, cinnamon, *Garcinia cambogia*, ginger, green tea, and mustard seed are thermogenic herbs that improve digestion.

**Cautions:** Do not use cinnamon in large quantities during pregnancy. Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Cascara sagrada is a colon cleanser and laxative.

Coloklysis from PhysioLogics contains herbs and a blend of soluble and insoluble fiber to support healthy digestion.

**Recommendations**

A high-fiber diet with no animal fats is important. Include in your diet apricots, broccoli, brown rice, cabbage, cantaloupe, carrots, cauliflower, garlic, oatmeal, onions, green peppers, sweet potatoes, sesame seeds, spinach, sunflower seeds, and whole grains. Fruits with edible seeds, such as figs, raspberries, strawberries, and even bananas, tend to contain lots of fiber. See CANCER in Part Two and follow the diet recommended there.

Take some form of supplemental fiber daily. Barley, legumes, oat bran, psyllium husks (in Aerobic Bulk Cleanse), and rice bran are good sources of fiber.

**Note:** Always take supplemental fiber separately from other supplements and medications.

Be sure to increase your water intake when increasing fiber consumption. If you do not, it may result in bloating, gas, pain, and constipation. Increase fiber intake slowly over several weeks.

Exclude from your diet fried foods, highly processed foods, caffeine, and alcohol. Do not use tobacco.

Regular physical examinations are important, particularly after age forty. A digital rectal exam is easily performed in the physician's office and can quickly determine if there are any abnormalities along the colon wall. Beyond age fifty, a colonoscopy is recommended.

If you experience rectal bleeding, or if blood appears in the stool, consult your physician. A fecal occult blood test (FOBT) should be done to identify the source of the blood. Bleeding can be a symptom of polyps, but it also can be a sign of cancer.

**Considerations**

The treatment of choice for most polyps, regardless of location, is surgical removal. In most cases this is a relatively minor procedure, often performed on an outpatient basis.

Vocal cord polyps may be treated with humidification, speech therapy, and rest. Surgical removal of the polyps may be necessary.

For familial polyposis, a surgical procedure called a colectomy (removal of the colon) may be necessary. In some cases, the rectum is left in place and connected to the small intestine to allow for bowel evacuation. However, in most cases, polyps return in the rectum.

Research has found that men with the highest consumption of saturated fat were twice as likely to develop potentially malignant polyps as men who limited their fat intake.

**POSTURAL TACHYCARDIA SYNDROME**

See under RARE DISORDERS.

**PREGNANCY-RELATED PROBLEMS**

Many women find being pregnant a thoroughly enjoyable experience and suffer very few unpleasant symptoms, but there are those who discover that being pregnant can lead to some uncomfortable effects. Very few of these incidental discomforts threaten either the fetus or the expectant mother—but the more enjoyable a pregnancy, the better for both mother and child.

Pregnancy lasts for approximately forty weeks. This time is commonly divided into three periods, or trimesters: from the first day of the last menstrual period to week 12; from week 12 to week 28; from week 28 until delivery.

Most of the discomforts that occur during pregnancy are the result of hormonal changes within the body, nutritional deficiencies, and profound anatomical changes. This section addresses some of the most common pregnancy-related problems and offers natural remedies as well as

helpful hints and suggestions for maintaining maximum health during pregnancy. For a healthy pregnancy and birth, it is necessary to consult and work with a qualified health care professional, be it a physician, nurse practitioner, or midwife. It is also wise to work with your health care practitioner on a birth plan. (See Birth Plan on page 660.) This allows you to decide in advance what you want and what you would choose from among your options before, during, and after labor.

### PREGNANCY SELF-TEST

Over-the-counter pregnancy test kits are sold in most drugstores. You should always see your health care provider to confirm a positive result.

### ANEMIA

During pregnancy, blood volume (the amount of blood circulating in the body) increases by as much as 50 percent. The increase in volume is largely due to an increase in plasma (the liquid part of blood) rather than in red (or white) blood cells. Plasma volume, then, is increasing faster than red blood cell volume. The protein hemoglobin, which carries oxygen to the body's cells, inhabits red blood cells. Because there is a decreased proportion of red blood cells in the blood, there is also a decreased proportion of hemoglobin, and the result can be anemia.

Anemia is most likely to develop in the second trimester of pregnancy. It can cause fatigue, a rapid heartbeat, and paleness of the skin, gums, and around the inside of the eye. There may also be cravings to eat substances other than food, such as coal, dirt, ice, starch, or hair. This is called *pica* and is normally the sign of a nutritional deficiency.

Anemia is unlikely to affect the developing baby. The fetus depletes the mother's iron resources and does not suffer any deficiency itself.

### Recommendations

- Make sure you have enough folic acid, vitamin B<sub>12</sub>, and the other B-complex vitamins in your diet.
- Eat foods rich in iron, such as organically raised red meat and liver. Other foods that have lesser amounts include green leafy vegetables, prunes, raisins, and bread and pastas made from whole-grain flour.
- If your health care provider prescribes iron supplements, take them with vitamin C to help the absorption of this mineral. Iron supplements can also cause constipation, so eat plenty of high-fiber foods and increase your fluid intake.

*Note:* Do not take iron supplements unless anemia has been diagnosed.

### ASTHMA

Many women who have asthma reduce their use of asthma medication when they become pregnant to avoid harming the fetus—and as a result, their asthma symptoms become worse. It currently appears that there is more danger to a developing fetus from frequent asthma attacks than from taking asthma medications. Inhaled medications are normally preferred during this time because they are more localized in action. Asthma sufferers should be checked at least every four to six weeks by a physician during pregnancy. You should discuss your medication in detail with your physician.

### Recommendations

- Avoid anything that might trigger an attack. Keep your bedroom, at least, as a place you can go to relax and get away from any airborne pollutants that can trigger an attack.
- The Air Supply personal air purifier from Wein Products is a miniature unit that is worn around the neck. It sets up an invisible, pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants) in the air. It also eliminates vapors, smells, and harmful volatile compounds in the air.

### BACKACHE

Backache is common during pregnancy due to the considerable anatomical changes and stresses in the body. The increase in body weight, the muscle-relaxing effects of the hormone progesterone, and the shift in one's center of gravity contribute to the problem.

### Recommendations

- To minimize back pain during pregnancy, do not stay in any one position for a long period of time.
- Pay attention to your posture. Keep your shoulders relaxed and your back as straight as possible at all times.
- Swimming is a good way to relieve the strain on the back and on all other parts of the body.
- Include two to three minutes of gentle stretching exercises in your daily routine. Do not strain—stretch only to your comfort level.
- Make sure your mattress is firm enough to support you, and sleep with a pillow supporting your back. Sleep on your side, not on your back.
- Do not wear high-heeled shoes. High heels throw your body off balance and put extra strain on your back. Instead, wear well-fitting, well-padded flat or low-heeled shoes that support your feet and provide ample room for your toes. Be aware that you may require larger shoes than normal while you are pregnant.

- Teach your partner or friends how to massage your back. You can use liniments or herbal oils.
- Learn how to lift correctly, putting less pressure on the back.
- When your back hurts, try soaking a small towel in apple cider vinegar. Squeeze out any excess and lie down on your side in bed. Spread the towel directly across your back. Relax this way for fifteen to twenty minutes.
- See also BACKACHE in Part Two.

### BLADDER DISCOMFORT/INFECTION

During pregnancy, the bladder is pressed upon by an expanding uterus and must, in general, deal with far more fluids. You may need to urinate more frequently. However, the bladder may not always empty fully, so infections of the bladder are very common. These should always be treated.

#### Recommendations

- Avoid sugary foods. Infectious bacteria thrive on sugar.
- Increase your fluid intake. Drink quality bottled or filtered water rather than tap water. *Do not* cut back on liquids because of urinary frequency.
- Eat plain natural yogurt every day. This helps to maintain the correct balance of natural “friendly” bacteria in the system.
- Wear cotton underwear, or at least underwear that is cotton-lined. Avoid wearing anything tight or containing synthetic material next to your skin.
- Do not douche.
- See also BLADDER INFECTION (CYSTITIS) and CANDIDIASIS in Part Two.

### BLEEDING GUMS

During pregnancy, increasing estrogen levels cause the gums to swell and become somewhat softer than normal, and the circulation of blood to them increases. This makes the gums more prone to bleeding and infection, especially if good oral hygiene is not maintained.

#### Recommendations

- Be sure your diet contains enough calcium and high-quality, complete proteins such as soy products.
- Increase your intake of foods rich in vitamin C, as a deficiency in this vitamin can contribute to bleeding gums.
- If you smoke, quit—preferably *before* you get pregnant. Cigarette smoking reduces the oxygen supply to the developing fetus and also drains vitamin C from the body.

- Brush your teeth three to four times daily (remembering to rinse your mouth well), and massage your gums with clean fingers when necessary. Floss your teeth daily.
- See your dentist at least once during the pregnancy, and be sure to inform the dentist that you are pregnant. *Do not* permit him or her to take any dental X-rays while you are pregnant.

### CONSTIPATION

Hormonal changes during pregnancy have a relaxing effect on the muscles, including those of the digestive tract. The increasing level of progesterone in your system makes the bowels less efficient. The normal rhythmic contractions of the intestines slow down, and the result can be constipation. This happens most often in the third trimester.

#### Recommendations

- Eat fresh and dried fruit such as prunes, raisins, and figs.
- Eat fresh vegetables and salads containing a variety of raw green and colored vegetables daily.
- Increase the amount of fiber in your diet. Whole-grain breads, cereals, and bran are helpful. Begin by taking 2 teaspoons of bran in a glass of apple juice twice daily. The bran may cause some gas until your system is used to it, but after that you should not have any difficulty.
- Drink ten 8-ounce glasses of liquid, including water, each day.
- Walk at least a mile a day.
- Set a regular time each day for a bowel movement. This is very helpful for digestion and elimination. Elevate your feet and legs during elimination to relax the anal muscles.
- If your health care provider prescribes iron supplements, be aware that they can cause constipation. Increase your fluid intake and eat a diet high in fiber. Some iron supplements have a stool softener added to them; if you are having trouble with the iron supplements, ask your health care provider about them.
- Do not* take over-the-counter laxatives unless specifically recommended by your health care provider.
- See HEMORRHOIDS later in this section.
- See also CONSTIPATION in Part Two.

### COUGHS AND COLDS

Coughs and colds are more common during pregnancy and are often more difficult than usual to shake off. Once you have a cold, there is little you can do but let it run its course, so prevention is most important.

## Recommendations

- Eat a healthy diet and increase your consumption of foods containing vitamin C.
- For congestion, make a steam inhaler using essential oil of eucalyptus, lavender, or lemon.
- See COMMON COLD in Part Two for additional recommendations. You can use any of the external remedies mentioned, but consult your health care provider before taking any nutrients or other supplements internally.

## DEPRESSION

Depression is fairly common during pregnancy. It can come and go, but because of shifting hormone levels, it is not uncommon to experience at least one bout of depression at some point during the forty weeks of pregnancy. Mood swings are common too. It is not unusual to find that you are more emotional and volatile during pregnancy. It helps if people around you are sympathetic to this and know what to expect.

## Recommendations

- Do not continue to feel depressed without seeking help. Having someone to talk to and knowing that you are not alone in experiencing these feelings can help you to cope during times of depression.
- Acupuncture has been used successfully for hundreds of years to treat depression.
- Exercise can help to lessen depression.
- Be open about your fears and concerns relating to having a child. Pregnancy and childbirth are profound experiences, and many women experience feelings of anxiety about the responsibilities attached to this event. Pregnancy is a complicated emotional experience, and you should be aware that it is normal not to be happy all the time.
- If you become pregnant while taking antidepressants, consult your physician about the possible effect on the development of the fetus. You should not stop taking your medication without discussing it with your physician.

## DIABETES, GESTATIONAL

This is a form of diabetes that occurs only during pregnancy. It affects about 4 percent of pregnant women and about 135,000 cases occur each year in the United States. It occurs because insulin, which regulates blood sugar, does not work as efficiently during pregnancy due to hormones secreted by the placenta. Blood sugar can become high, and although this condition rarely causes harm to the mother, the baby's birth weight often increases, and the baby may be born with a low blood sugar level. A problem may arise if the baby's birth weight is excessive enough to make delivery complicated. *Macrosomia* (heavy birth weight), a poten-

tial complication, is defined as a birth weight over 9 pounds 14 ounces.

Women are normally tested for blood sugar levels around the twenty-eighth week of pregnancy. The 50-gram screen (gestational diabetes screening) involves drinking a glass of very sweet liquid containing 50 grams of sugar and testing the blood sugar level one hour later to see how your body has processed the sugar. Symptoms of gestational diabetes may include frequent urination, excessive thirst, and increased fatigue, but it is also likely that there will be no symptoms at all.

## Recommendations

- Eat a little at a time, but frequently. Do not miss meals, even if you are experiencing nausea.
- Discuss your dietary intake with your health care provider. Try to keep to the recommended schedule for weight gain.
- Avoid foods rich in sugar, and remember that some carbohydrates increase blood sugar levels more than sugar. (See DIABETES in Part Two.)

## Considerations

- If a baby is born with low blood sugar, sweet drinks can alleviate the condition; these are to be administered by your health care team. The baby's blood sugar level should return to normal within hours. The mother's blood sugar level also should return to normal after delivery.
- If the baby is too large, your health care provider may recommend delivering the baby early, possibly by cesarean section.

## DIZZINESS

During pregnancy, especially during the second trimester, blood pressure often drops as the expanding uterus presses on major blood vessels. The blood supply also has extra work to do, and at times the blood may pool in the lower part of the body, leaving the brain a bit short of oxygen for brief moments. These factors can cause dizziness.

## Recommendations

- Do not change positions quickly. Always go from lying down to sitting to standing slowly. Take your time and focus on what you are doing.
- If you have to stand for long periods, keep moving and flexing your muscles to make sure the blood is circulating properly.
- Do not take hot baths.
- If you feel dizzy, sit down somewhere safe. Try lowering your head to your knees until the feeling passes.

If you have diabetes, make sure your blood sugar level is well controlled. (See DIABETES in Part Two.)

## ECLAMPSIA AND PREECLAMPSIA

Preeclampsia is a complication of pregnancy characterized by high blood pressure, edema (swelling due to fluid retention), and an excess of protein in the urine. It may develop in the second half of pregnancy or later. The cause is not known, but if you have suffered from this complaint during a prior pregnancy, you are at increased risk of having it again in following pregnancies. Other risk factors include multiple births, kidney disease, diabetes, lupus, long-term high blood pressure, and heredity. A small percentage of women who develop preeclampsia go on to develop eclampsia, with seizures and/or coma.

It was once thought that eclampsia and preeclampsia were a result of toxemia—the presence of some sort of toxin or poison in the bloodstream—but it is now known that this is not the case. If you develop *any* of the symptoms of preeclampsia, you must be monitored constantly by your health care provider.

The dosages given below are for adults.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Essential fatty acids (black currant seed oil, flaxseed oil, Kyolic-EPA from Wakunaga, olive oil, or primrose oil)	As directed on label or by your physician.	Improves circulation, lowers blood pressure, and thins the blood. <i>Caution:</i> If you have blood-clotting problems, do not take this supplement.
Garlic (Kyolic from Wakunaga)	As directed on label.	Effective in lowering blood pressure.
Vitamin E	200 IU daily or 400 IU every other day.	Improves circulation. Use d-alpha-tocopherol form.

### Recommendations

- Get adequate rest. Rest is vitally important if you develop this condition.
- Make sure that your physician or midwife is aware of any risk factors you may have for preeclampsia.

### Considerations

- If you develop high blood pressure without any of the other symptoms of preeclampsia, your physician may recommend treatment for high blood pressure.
- Because the cause is not known, there is no specific treatment for eclampsia except delivery of the baby.

## ECTOPIC PREGNANCY

An ectopic pregnancy, sometimes called a tubal pregnancy, is a situation in which a fertilized egg becomes implanted

in a fallopian tube rather than in the uterus. The result is that the pregnancy is not viable because there is not room for the fetus to grow. This can happen if the fallopian tube is blocked due to inflammation, scar tissue, or endometriosis, making it impossible for the egg to pass into the uterus. Other possible causes for ectopic pregnancy include anatomical abnormalities such as a misshapen fallopian tube.

The easiest way to diagnose an ectopic pregnancy, after a pelvic examination, is to measure levels of human chorionic gonadotropin (hCG), a hormone produced by the placenta that increases in quantity until the end of the first trimester. If the hCG level is *not* increasing, a physician may decide that the pregnancy is not proceeding as it should and order more tests, such as an ultrasound, to find out where the fetus is growing.

### Considerations

- There is no known way to salvage an ectopic pregnancy. The fetus must be removed to preserve the life of the woman. This is usually done surgically and laparoscopically.
- You are more at risk for this condition if you have had a previous ectopic pregnancy. Discuss this risk with your health care provider.

## EDEMA (SWELLING) OF THE HANDS AND FEET

The rise in estrogen in the body during pregnancy increases the tendency to retain fluids. This can cause some swelling of the hands and feet, and is considered normal—but it must be monitored continually because it may be an indication of a more serious condition called preeclampsia.

### Recommendations

- Early in the pregnancy, remove any rings you wear on a regular basis. Do not wait, or the rings may have to be cut off.
- As soon as you notice your hands, legs, or feet getting puffy or larger than usual, tell your health care provider. While some swelling is acceptable, the condition should nevertheless be evaluated by a professional, as edema can also be the first sign of preeclampsia, a potentially serious complication of pregnancy.
- Avoid salt and all highly processed foods, while maintaining a well-balanced high-protein diet. *Do not* take diuretics (water pills).
- Wear loose, comfortable clothing and properly fitting shoes. You may require larger shoes than normal. Once the baby arrives, your feet will return to normal.
- When you are relaxing, sit with your feet elevated.
- Walk one mile each day. This helps to keep edema under control.
- See also EDEMA in Part Two.

## GAS (FLATULENCE)

Gas, like other digestive upsets, is a common complaint during pregnancy. Even foods that cause no difficulties at other times may begin to cause trouble.

### Recommendations

- Keep a food diary to help you determine which foods, or combinations of foods, seem to be causing the gas. Avoid any suspect foods.
- You may have to adapt your usual diet during pregnancy. Many foods you liked before may suddenly seem unappealing.
- Eat four to five small meals a day, instead of three big meals. Chew your food slowly and well. Do not overtax your digestive system. Be careful not to increase your caloric intake so much that weight gain becomes excessive.
- Eat four or more servings of fresh fruits and vegetables every day.
- Cook vegetables quickly using a perforated steamer instead of boiling them for long periods of time.
- Drink as much quality water (not tap water) as you can.
- Get adequate exercise. Walking is an excellent way to alleviate gas.
- To reduce gas-causing sulfur compounds in beans (garbanzo, pinto, navy, and so on), use the following cooking method: Place 1 cup of beans in 5 cups of water and bring them to a boil. Boil the beans for one minute. Then drain them and add 5 cups of fresh water. Bring the water to a boil and continue cooking the beans according to directions. Cabbage, cauliflower, and broccoli can also cause flatulence.
- When eating potentially gas-inducing foods, take the enzyme product Beano with the first bite. This should help to eliminate the problem.

## GROIN SPASM, STITCH, OR PRESSURE

When the round ligaments connecting the corners of the uterus to the pubic area kink and go into spasm, it feels like a "stitch" on the right side. In the later months of pregnancy, lower groin pressure may develop.

### Recommendations

- Exercise daily, using exercises recommended by your health care provider. This can help alleviate this condition.
- During spasms, breathe deeply and bend toward the point of pain in order to allow the ligament to relax. Rest in bed on one side until the spasm is over.

## HEARTBURN

Heartburn occurs more often than normal during pregnancy. This is because the expanded size of the uterus pro-

motes the reentry of stomach fluids into the esophagus, and hormones present during pregnancy tend to soften the sphincter muscles.

### Recommendations

- To prevent heartburn, do not consume spicy or greasy foods, alcohol, coffee, baking soda, or antacids containing sodium bicarbonate (such as Alka-Seltzer).
- Remain active and upright, especially after meals.
- When heartburn strikes, try drinking a glass of warm soymilk.
- Do not eat or drink anything except water for a few hours before going to bed or taking a nap.

### Considerations

- A high-carbohydrate diet can help if heartburn is a problem.
- See also* HEARTBURN/GASTROESOPHAGEAL REFLUX DISEASE (GERD) in Part Two.

## HEMORRHOIDS

Hemorrhoids are common during pregnancy. A number of factors contribute to the development of hemorrhoids, including constipation and the pressure exerted by the uterus as the fetus gains in size and weight.

### Recommendations

- Increase your intake of roughage. Eat plenty of raw vegetables, fruits, dried fruits, bran, and whole-grain breads. These fiber-rich foods help to soften stools and make elimination easier. Hard stools can be very painful to pass and can cause bleeding.
- Drink ten 8-ounce glasses of liquid each day, including water, juices, and herbal teas.
- Use cold witch hazel compresses to help shrink hemorrhoids.
- Walk one mile a day to help digestion and elimination.
- Do not strain to have a bowel movement if you are constipated. (*See* CONSTIPATION in Part Two.)
- See also* HEMORRHOIDS in Part Two.

## INFERTILITY

*See* INFERTILITY.

## INSOMNIA

Insomnia is very common during the last weeks of pregnancy when finding a comfortable sleeping position is dif-

ficult. Needing to get up to urinate can disrupt a night's sleep. Deficiencies of the B vitamins also may cause insomnia. The emotional changes that accompany pregnancy often contribute to sleep difficulties as well.

### Recommendations

- Increase your intake of foods rich in the B vitamins. (See VITAMINS in Part One.)
  - Take a warm (not hot) bath with a soothing oil (such as lavender) added to the water.
  - Consider taking up yoga or some form of meditation. These can help you to relax and may be useful during and after labor. (See BREATHING EXERCISES; GUIDED IMAGERY; MEDITATION; and RELAXATION TECHNIQUES under PAIN CONTROL in Part Three. Also see YOGA in Part Three.)
  - Do not force yourself to sleep if you are not really tired. Read, meditate, or do something else nonstrenuous until you feel sleepy.
  - Try drinking a cup of hot herbal tea with honey or lemon before bed or in the middle of the night. Herbal teas such as chamomile, marjoram, lemon balm, and passionflower are known for their sleep-inducing qualities.
- Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.
- Avoid stimulants.
  - Do not eat heavy meals before bedtime.
  - Arrange pillows behind or under your abdomen to relieve breathlessness.
  - See also INSOMNIA in Part Two.

### LEG CRAMPS

Leg cramps during pregnancy are often a result of nutritional deficiencies, electrolyte imbalances, and/or circulatory changes, in addition to the strain placed on the legs by the extra weight.

### Recommendations

- Increase your calcium and potassium intake by eating foods such as almonds, bananas, grapefruit, low-fat cottage cheese, oranges, salmon, sardines, sesame seeds, soy products (such as tofu), and low-fat yogurt and other calcium-rich dairy products to help avert leg cramps. Adequate calcium is also needed to help prevent high blood pressure and for fetal development.
- While sleeping or sitting, elevate your legs so that they are higher than your heart.
- Do not stand in one place for too long. Shift your weight from one leg to the other every few minutes.

- Do not point your toes.
- Walk at least a mile every day to stimulate the circulation of blood through the legs.
- Make sure your levels of calcium, magnesium, and potassium are correctly balanced. It is often easier to take a single formula that contains all three minerals in the correct proportions.
- To relieve cramps, flex your feet, with your toes pointing upward.
- When experiencing a cramp, apply a hot water bottle or heating pad to the cramping area and apply pressure with your hands.
- See also MUSCLE CRAMPS in Part Two.

### MISCARRIAGE (SPONTANEOUS ABORTION)

Some pregnancies are not carried to full term, resulting in a miscarriage. About 15 to 20 percent of pregnancies are miscarriages and occur in the first thirteen weeks of pregnancy. *Spontaneous abortion* is the technical term for a miscarriage. It is defined as the loss of a pregnancy before twenty weeks. The most likely reason for a miscarriage is a chromosomal abnormality in the fetus that makes it unlikely the fetus would survive. Other reasons for a miscarriage include cervical incompetence (the cervix opens and thins before the pregnancy has reached full term), ectopic pregnancy (implantation of the fertilized egg outside the uterine cavity, most commonly in one of the fallopian tubes), infection, glandular disorders, diabetes, and pregnancy-induced hypertension (high blood pressure). Miscarriages generally are *not* caused by exercise, sexual activity, heavy lifting, or falls.

### Herbs

- Taking raspberry leaf tea during the last few months of pregnancy is thought to help strengthen the uterus and minimize the risk of miscarriage.

### Recommendations

- If you experience bleeding or cramping during pregnancy, contact your health care provider immediately and follow his or her advice.
- Do not minimize any feelings of grief, depression, or guilt you may experience after having a miscarriage. Your health care provider can refer you to a grief counselor or someone who will understand how you feel. It is also important to talk to your doctor about the possible reason for the miscarriage so that he or she can reassure you about the outcome of a following pregnancy. It is also quite normal to be able to cope with a miscarriage without experiencing any emotional trauma.

## Considerations

- Bleeding is not necessarily a sign of impending miscarriage, but it should always be taken seriously. A pelvic examination will probably be necessary to determine if your cervix has started to dilate and if the membranes surrounding the fetus have broken. If both of these conditions are present, it is certain that you will have a miscarriage.
- Premature labor is the onset of rhythmic uterine contractions before fetal maturity. It usually occurs between the twentieth and thirty-seventh weeks of gestation.
- Decaffeinated coffee, rather than caffeinated coffee, is thought to be a contributing cause of spontaneous abortion during the first trimester.
- Women with either of two genetic irregularities that make them prone to blood clots may be at increased risk of multiple miscarriages. Women who have at least two miscarriages can be tested for the flaws. It has been suggested that certain blood-thinning medications might increase the chances for a healthy pregnancy. A doctor should be consulted before taking any medications while pregnant.

## MORNING SICKNESS

Approximately 50 percent of all pregnant women experience some degree of nausea and vomiting between the sixth and twelfth weeks of pregnancy. This is normal. Although it is commonly called morning sickness, it can occur at any time of day.

Abnormal vomiting—severe, continual nausea and vomiting after the twelfth week—occurs in approximately 1 percent of all pregnancies. This is called *hyperemesis gravidarum*, and it can result in dehydration, acidosis, malnutrition, and substantial weight loss. If the condition persists, it can endanger the fetus. Sometimes intravenous feeding (parenteral nutrition) is given until the nausea and vomiting subside. The reason for abnormally severe nausea is not clear, but an association has been made between it and very high levels of the hormones estrogen and human chorionic gonadotropin (hCG), a hormone produced by the placenta that increases in quantity until the end of the first trimester.

Other possible causes of abnormal vomiting include bile duct disease, drug toxicity, pancreatitis, low blood sugar, a molar pregnancy (a rare condition in which an abnormal mass rather than a fetus grows inside the uterus), problems with the thyroid, and inflammatory bowel disorders.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
L-methionine	1,000 mg daily.	Effective in preventing nausea.
Vitamin B <sub>6</sub> (pyridoxine) plus magnesium	50 mg 2 times daily.  400 mg daily, upon arising.	A combination of nutrients that helps to prevent and alleviate nausea. <i>Caution:</i> Do not take this combination for longer than six weeks.

## Herbs

- Ginger, taken in capsule or tea form, is helpful for relieving nausea. Other beneficial herbs include catnip, dandelion, peppermint, and red raspberry leaf.

## Recommendations

- Keep crackers or whole wheat toast near your bed and eat some before arising.
- Eat small, frequent meals and snack on whole-grain crackers with nut butters (but not peanut butter) or cheese. It helps to keep some food in the stomach at all times.
- Do not go without food or drink because of the nausea.
- Do not sit up or get out of bed too quickly.
- Try using *Nux vomica*, a homeopathic remedy that is good for nausea.
- Keep in mind that morning sickness usually does not last beyond the first thirteen weeks of pregnancy. If you suffer from persistent nausea or vomiting later in pregnancy, consult your health care provider. With appropriate treatment, the prognosis is good.

## NOSEBLEEDS AND NASAL CONGESTION

During pregnancy, increased blood volume often causes some of the tiny capillaries in the nasal passages to rupture, causing a nosebleed. Inner nasal passages normally swell as well. A lack of vitamin C and the bioflavonoids may be a contributing factor. These conditions disappear with the birth of the baby.

## Recommendations

- Increase your intake of foods rich in vitamin C, including broccoli, cabbage, grapefruits, lemons, oranges, peppers, and strawberries.
- If congestion is a problem, eat fewer dairy products and supplement your diet with calcium and magnesium. Dairy products tend to stimulate the secretion of mucus.
- Use a humidifier to help keep nasal tissues moisturized.
- Do not use nasal sprays or nose drops. Instead, use an empty nasal spray container filled with warm water to spray into the nostrils. This helps to moisten the nose and shrink the membranes.
- See also NOSEBLEED in Part Two.

## PREMATURE BIRTH

An infant is classified as premature when it is delivered before thirty-seven weeks of pregnancy. Premature birth is a major public health concern because underdeveloped ba-

bies are at increased risk of death in the first year of life and are more likely to develop heart, lung, and brain disorders if they survive. There are more than a half million babies born prematurely in the United States each year.

Women who take more than a year to get pregnant have a slightly higher than normal chance of giving birth prematurely.

### Considerations

Scientists have taken a big step toward developing an earlier, safer, and simple test that might make it possible to prevent many of the premature births that occur in the United States each year. Researchers say they have identified certain proteins that can indicate imminent premature birth. Now widely available, the test is performed between the twenty-fourth and thirty-fourth weeks of pregnancy on women who are considered to be at high risk. It checks for the presence of fetal fibronectin, a protein found in the uterus when the placenta begins to separate from the uterine wall. The presence of this protein signals that a woman is at high risk for giving birth within seven days, and intervention can be started.

### SCIATICA

The sciatic nerve is the longest nerve in the body. It arises from the sacral plexus, in the lower back, threads downward through the pelvis through an opening called the greater sciatic foramen, and runs through the hip joint and down the back of the thigh. Irritation of this nerve is common during pregnancy and usually disappears with the birth of the baby.

### Recommendations

Ask your health care provider to recommend a registered physical therapist or a chiropractor who has been specially trained to deal with pregnancy problems. A competent practitioner is best able to deal with this problem.

### SKIN PROBLEMS

Common skin problems during pregnancy include pimples, acne, red marks, and mask of pregnancy (dark blotches on the skin of the face). These skin changes usually disappear with the birth of the baby.

### Recommendations

- Keep your skin clean.
- If you wear makeup, use only water-based, hypoallergenic cosmetics if your skin is broken out.

### Considerations

- Folic acid, one of the most essential nutrients during pregnancy, should also help with skin problems.
- See also ACNE and OILY SKIN, both in Part Two.

### SORENESS IN THE RIB AREA

Soreness in the rib area during pregnancy is common. It is caused by the pressure of the expanding uterus.

### Recommendations

- Change positions frequently.
- Keep in mind that this problem is temporary. It often disappears in the last six weeks of pregnancy, once the baby drops into position to be born.

### STRETCH MARKS

Stretch marks are wavy stripes appearing on the abdomen, buttocks, breasts, and thighs. They start out reddish in color and gradually turn white. They are caused by rapid weight gain such as that typically associated with pregnancy, and appear when the skin becomes overstretched and the fibers in the deep layers tear. Once they appear, they are permanent, but they do become much less noticeable with time.

### Recommendations

- Try the following recipe for preventing stretch marks:

*½ cup virgin olive oil*

*¼ cup aloe vera gel*

*liquid from 6 capsules vitamin E*

*liquid from 4 capsules vitamin A*

1. Mix all the ingredients together in a blender.
2. Pour the mixture into a jar and store it in the refrigerator.

Once a day, apply the oil externally all over the abdomen, hips, and thighs—the places where stretch marks commonly appear. If you do this diligently, every day, you may be able to prevent stretch marks.

Apply cocoa butter and/or elastin cream topically as directed on the product label. These substances are very good for stretch marks.

To prevent stretch marks during pregnancy, rub your breasts and abdomen every day with a massage oil made of ½ cup sweet almond oil with 50 drops of mandarin essential oil added.

### SWEATING

While you are pregnant, your body makes sure that its temperature is perfect for your baby's development. In ad-

dition, as your size increases, the amount of effort it takes to walk, climb stairs, and do many everyday things also increases. As a result, you may find yourself sweating more than you did before.

**Recommendations**

- Wear loose, light, comfortable clothing. Choose clothing made of “breathable” natural fibers such as cotton or linen.
- Do not use a hot tub during pregnancy. This increase in body temperature can cause fetal distress. For the same reason, be careful about strenuous exercise, especially in hot weather.

**VARICOSE VEINS**

Varicose veins are enlarged veins close to the surface of the skin that often emerge during pregnancy. In some cases they disappear after the baby’s birth.

**Recommendations**

- As often as possible, sit with your feet elevated, higher than your heart.
- Change positions frequently. Do not stand for long periods of time or sit in cross-legged positions.
- Wear support hose if your health care provider recommends them. Keep them near your bed and put them on before you get out of bed.
- Walk one mile each day to promote circulation.
- Do not wear elastic-topped knee socks, garters, belts, or high-heeled shoes.
- See also VARICOSE VEINS in Part Two.

**NUTRITIONAL HEALTH IN PREGNANCY**

During pregnancy, it is more important than ever to have a balanced diet that is high in nutrients and fiber and low in bad fats and cholesterol. A prenatal multivitamin has the right mix of nutrients that you need to support your own health and that of your unborn child’s. Taking a prenatal vitamin should be done throughout your childbearing years, so that upon becoming pregnant, your body is full of essential nutrients. The following are other recommendations for maintaining health in pregnancy. Speak with your health care provider (obstetrician, midwife, etc.) before using anything on this list.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Iron	30 mg daily, or as directed by physician. Take with 100 mg vitamin C for better absorption.	Extra iron is needed during pregnancy. Increase fiber consumption, as iron supplements may cause constipation.
or		

Floradix Iron + Herbs from Salus Haus	As directed on label.	A natural, nontoxic source of iron.
Multivitamin (prenatal) with folic acid	As directed on label. 1.0–1.1 mg daily.	For women who have a hard time being compliant with taking pills, larger amounts of folic acid are sometimes prescribed (5 mg per day). Taking folic acid is key to avoiding having a baby with neural tube problems.
Protein supplement	As directed on label.	A lack of protein has been linked to birth defects. Use protein from a vegetable source, such as soy.
Quercetin	500 mg daily.	A valuable bioflavonoid that promotes proper circulation.
Vitamin B complex plus extra folic acid	As directed on label. 400 mcg daily.	To prevent deficiencies. Adequate levels of folic acid reduce the chance of birth defects such as spina bifida. Recommended for women throughout the childbearing years, and especially in the first six weeks of pregnancy.
Vitamin C with bioflavonoids	Up to 2,000 mg daily, in divided doses.	Larger doses taken before delivery may help to reduce labor pain.
Zinc	15–25 mg daily. Do not exceed 40 mg daily from all supplements.	Insufficient zinc intake may be a cause of low birth weight. Use zinc gluconate lozenges or OptiZinc for best absorption.

*Helpful*

Acidophilus or Kyo-Dophilus from Wakunaga	As directed on label. Take on an empty stomach.	To provide necessary “friendly” bacteria to prevent candidiasis (yeast infection), protect the baby at birth, and ensure proper assimilation of nutrients. The most benefit was for babies born by cesarean delivery. Using a combination of probiotics such as <i>lactobacillus</i> and bifidobacteria seems preferable.
Calcium and magnesium	1,500 mg daily. 750 mg daily.	Necessary for formation of healthy bones and teeth. May prevent hypertension and premature birth. Needed to balance with calcium.
Carotenoid complex with beta-carotene	10,000 IU daily.	Precursor of vitamin A. <i>Caution:</i> Do not substitute vitamin A for beta-carotene. Excessive intake of vitamin A during pregnancy has been linked to birth defects.

Coenzyme Q <sub>10</sub>	As directed on label.	Helps the body convert food to energy, enhances circulation, and protects the heart. CoQ <sub>10</sub> (200 mg/day) was shown to cut the chance of preeclampsia in half.
Kelp	As directed on label.	Rich in necessary minerals.
Multimineral and trace mineral complex	As directed on label.	For optimal health and to provide a balance of nutrients needed for fetal development.
Vitamin D	1,000 IU daily.	Needed for calcium absorption and bone formation.
Vitamin K or alfalfa	As directed on label.	Take for excessive bleeding. <i>See under Herbs, below.</i>

## Herbs

- Alfalfa is a good source of vitamins and minerals, especially vitamin K, which is essential for normal blood clotting.
- Red raspberry leaf tea helps the uterus contract more effectively. It also helps to enrich the mother's milk. Drink no more than 1 cup per day until the last four weeks of pregnancy. Then drink 1 quart daily.
- Avoid the following herbs during pregnancy: aloe vera (internally), angelica, arnica, barberry, black cohosh, bloodroot, cat's claw, celandine, cottonwood bark, dong quai, feverfew, ginseng, goldenseal, lobelia, myrrh, Oregon grape, pennyroyal, rue, sage, saw palmetto, tansy, and turmeric. Use caution when taking any herbs during pregnancy, especially in the first twelve weeks.

## Recommendations

- Eat a well-balanced, nutritious diet and be sure to get moderate exercise, fresh air, and plenty of rest. Pregnant women need an additional 100 to 300 calories a day. This is not a lot of food, and if you are slowing down on your regular activities, don't increase your caloric intake. The two (lack of usual movement and increased caloric need) will cancel each other out. Three hundred calories is one tablespoon of nut butter—such as almond or soy butter—and jelly on one slice of whole-wheat bread and a glass of low-fat milk. Try to include the following foods in your diet each day:

Food Group	Amount Needed Per Day
Grains	6 servings (whole wheat and other grains)
Vegetables	2–4 cups (not cooked in oil)
Fruit	1–3 servings
Meat and beans	5–7 ounces protein (½ cup of legumes/beans is about 2 ounces of protein)
Milk	3 cups (dairy or soy; rice and almond milk do not have the right mix of nutrients, especially protein)

- Stick to a weight gain schedule. Below is what is recommended by the American College of Obstetricians and

Gynecologists and depends on the starting weight of the mother.

Weight Status	Weight Gain (pounds)
Underweight	28–40
Normal weight	25–35
Overweight	15–25
Obese	At least 15
Carrying twins	35–45

- Eating vegetables has been found to be particularly important to assure a healthy baby weight and length. Eating a lot of vegetables increases the chances of a healthy-sized baby four- to fivefold. Vegetables are low in calories and rich in fiber, two good things a pregnant woman needs.
- Do not consume junk food, fried foods, or too much coffee.
- Avoid eating rare, undercooked, or raw meat, poultry, or fish. Do not eat grilled meats. Grilling has been shown to produce carcinogens in meat. In addition, to avoid a bacterial infection (listeriosis), avoid unpasteurized milk and soft cheese and prepared meats like hot dogs or deli meats unless they are reheated or steamed first, and wash fruits and vegetables well.
- Fish and fish oil have been associated with improved fetal brain function and birth weight. However, a recent study found no increased birth size in all of the women studied who consumed a lot of seafood. For overweight women, a higher consumption of seafood before pregnancy resulted in larger babies. Seafood is a good source of protein, but should be limited to twice a week to avoid consuming high levels of mercury. To be safe, try to stick with low-mercury fish.
- Do not use any medications while you are pregnant without consulting your health care provider. The first trimester is arguably the most important stage of development for your child. There are many drugs that may affect that development, so if you are planning to become pregnant—or if you are already pregnant—consult your physician about the possible consequences of any drug, prescription or otherwise, that you may be taking. If it is possible and does not harm your health, you should not take *any* medications during the first trimester of pregnancy.
- Do not smoke, consume alcohol in any form, or use drugs, except as prescribed by your health care provider.
- Do not take supplements containing the amino acid phenylalanine. Phenylalanine may alter brain growth in the fetus. Also avoid food products containing the sweetener aspartame (found in Equal, NutraSweet, and other products), which contains high levels of phenylalanine. (*See Is Aspartame a Safe Sugar Substitute?* on page 15.)
- Do not take mineral oil, which blocks the absorption of the fat-soluble vitamins. Consult your health care provider about the use of any supplements and over-the-counter medications.

## Tests Performed During Pregnancy

Your health care provider may do a number of different tests when you become pregnant—or before pregnancy, if you are planning to have a child. If you believe that some of these tests are inappropriate or unnecessary, you can, of course, decline to have them. Discuss this with your physician.

There are also tests that can be performed during pregnancy to assess the health and development of the fetus. However, some of these tests involve an element of risk for both mother and child. Therefore, they should be done only when medically indicated and should not be used routinely or for the mother's or the health care provider's convenience. If a test is suggested, be sure that you are fully aware of why it is needed and of any dangers that may be involved before deciding to have it done. Some tests are required by the admitting hospital. If you refuse to get a test, you may have to decide whether to give birth at another hospital.

### ROUTINE TESTS

The routine tests most health care providers recommend during pregnancy include the following:

- Blood pressure. This is taken to test for preeclampsia. It is usually taken at each visit.
- Blood sugar level. This is a urine test for gestational diabetes. It is usually taken at the first visit and on further visits if you are considered to be at high risk for the condition.
- Blood type. This is taken in case a blood transfusion becomes necessary and to see if there are blood type incompatibilities (Rh factor) between you and your baby. It is usually done during your first visit.
- Drug test. This is a urine test for illicit drug use. It may be taken on your first visit.
- Hemoglobin level. This is a blood test to check for anemia. It is usually done at your first visit.
- Pap smear. This is an internal swab test of the cervix to check for cancer cells. It is usually done on the first visit.
- Protein (albumin). This is another urine test for preeclampsia. It is usually done at each visit.
- Rubella antibody test. This is done to determine whether you have achieved immunity to rubella (German measles), which can be dangerous to a developing fetus in the first twelve weeks of pregnancy. It is usually taken on the first visit.
- Sexually transmitted disease testing. Genital swabs may be taken to test for signs of diseases such as chlamydia, gonorrhea, and syphilis. This is usually done during the first visit and, possibly, in later visits.
- Urinalysis. This is done to test for urinary tract infection. It is usually done at the first visit and, possibly, on subsequent visits.

### AMNIOCENTESIS

This medical procedure is sometimes performed during pregnancy to determine the health of the fetus. It is rarely

carried out unless there is a possibility of fetal abnormality. Routine amniocentesis is recommended only for women over the age of thirty-five, women who are more at risk for having a Down syndrome child, or for couples who have an increased risk of passing on a genetic abnormality to their child. A local anesthetic is administered and then a long, hollow needle is inserted through the mother's abdomen into the uterus to remove amniotic fluid for cellular analysis. The needle can be seen on ultrasound, which allows a three-dimensional real-time view of the uterus and fetus.

The amniotic fluid contains fetal cells that can be cultivated and tested. Although it has become fairly common as women are choosing to have children in later years, this procedure entails risks for both the pregnant woman and the fetus. There may be some danger of blood exchange between the mother and the fetus, infection of the amniotic fluid, peritonitis, the development of blood clots, placental hemorrhage, and premature labor. Therefore, great care must be taken in recommending, and then in performing, amniocentesis.

Amniocentesis is usually done only during the sixteenth to eighteenth week of pregnancy, and the results are not known for two weeks. This test should be performed only if you plan to terminate the pregnancy if an abnormality is found or if knowledge of any problem is necessary for proper prenatal care. Before the test, discuss with your partner and health care provider how you will handle the results if they are unfavorable.

### CHORIONIC VILLUS SAMPLING (CVS)

This test carries a slightly greater risk than amniocentesis. The chorionic villi are fingerlike projections of the embryonic sac that contain cells with the same genetic composition as the embryo. In this test, a small sample of this chorionic tissue is taken and analyzed to determine genetic abnormalities in the fetus. It can be performed earlier than amniocentesis, usually in the tenth to twelfth week of pregnancy, and takes about a half-hour to complete.

Possible dangers from CVS include infection, maternal or fetal bleeding, spontaneous abortion, Rh immunization, birth defects, and perforation of the membrane surrounding the embryo. The chief advantage is that it can be performed earlier in pregnancy, when termination, if deemed necessary, is a simpler and less dangerous procedure. As with all tests, you should weigh all the pluses and minuses carefully before making a decision.

### ESTRIOL EXCRETION STUDIES, NONSTRESS TEST, OXYTOCIN CHALLENGE TEST

These tests also are used to determine the health of the fetus. The estriol excretion study determines the best time for delivery of the baby in cases of diabetes or other difficulties in pregnancy. The nonstress test determines fetal well-being,

and the oxytocin challenge test helps to predict how well the baby will fare during the stress of labor.

If it is determined that any of these tests is necessary, your health care provider should discuss it with you in depth. When considering any type of prenatal testing, always remember that it is your body and your baby. You should be fully informed of all the advantages and all the risks of any procedure before agreeing to it.

## ULTRASOUND

Ultrasound imaging is a common diagnostic medical procedure that uses high-frequency sound waves to produce dynamic images (sonograms) of organs, tissues, or blood flow inside the body. Prenatal ultrasound examinations are performed by trained professionals, such as sonographers, radiologists, and obstetricians. The procedure involves using a

transducer, which sends a stream of high-frequency sound waves into the body and then detects their echoes as they bounce off internal structures. The sound waves are then converted into electrical impulses, which are processed to form an image, which is displayed on a computer monitor. It is from these images that videos and portraits are made.

Ultrasound is a form of energy, and even at low levels laboratory studies have shown it can produce physical effects in tissue, such as jarring vibrations and a rise in temperature. Although there is no evidence that these physical effects can harm a fetus, the fact that they exist means that prenatal ultrasound cannot be considered completely innocuous. Legitimate uses for ultrasound imaging include: diagnosing pregnancy, determining fetal age, diagnosing congenital abnormalities, evaluating the position of the placenta, and determination of multiple pregnancies.

- Avoid activities that may endanger the abdomen, or that involve jarring, bouncing, or twisting movements. Also avoid activities involving rapid starts and stops, because the body's center of gravity changes during pregnancy and it is easy to lose your balance.
- Do not use an electric blanket. Several experts warn that the invisible electromagnetic field emanating from an electric blanket may increase the risk of miscarriage and developmental problems.
- Take warm, rather than hot, showers or baths. Anything that increases the core body temperature for any length of time may cause neural tube defects in babies such as anencephaly and spina bifida. Anencephalic babies do not develop a brain and rarely survive. Spina bifida is a defect of the spinal column that can affect the baby to varying degrees, depending on the severity of the condition.

## Considerations

- Preventing malnutrition and hunger in pregnant women and children might help to prevent obesity later in life.
- Lack of zinc, manganese, and folic acid, as well as amino acid imbalances, have been linked to fetal deformities and mental retardation.
- All women of childbearing age who are thinking of becoming pregnant should take a daily supplement of iron (at least 18 milligrams per day), 400 to 800 micrograms of folic acid, and a B-vitamin complex. Iron maintains stores in the body, which are lost during monthly menses. Folic acid deficiency is linked to such neurologic birth defects as spina bifida and anencephaly. To prevent these disorders, this B vitamin must be present in the body during the first six weeks following conception, a crucial early phase in fetal neurological development. Approximately 1 in every 1,000 pregnancies is affected by neural tube defect. Since

most women do not know they have conceived until several weeks afterward, the best way to prevent these birth defects is for women who are planning to become pregnant to have an adequate supply of folic acid at all times. Supplementation is recommended because many women do not get enough folic acid from dietary sources, although all flours in the United States are now supplemented with it, so the population intakes are increasing. Folic acid also helps alleviate hemorrhaging in childbirth and improves milk production. Men too should be as healthy as they possibly can before they conceive children.

- Both partners should give up alcohol, cigarettes, and drugs—legal or otherwise—at least three to six months before they decide to conceive. Marijuana, heroin, morphine, and tobacco all reduce levels of male sex hormones and increase the risks of birth defects.
- Men should make sure to have an adequate intake of selenium, zinc, vitamins C and E, and the carotenoids.
- Taking the drug phenytoin (Dilantin) or phenobarbital, used to control epileptic seizures, creates four times the usual risk of producing a baby with heart defects. In addition, the antibiotics ampicillin (Omnipen, Polycillin) and tetracycline may cause heart malformations. Ask your physician for a *detailed* list of teratogenic agents and drugs (chemicals that cause birth defects). These include, but are not limited to, the following:
  - Some ACE inhibitors.
  - Some acne medications.
  - Some antibiotics.
  - Some blood-thinning medications.
  - Some cancer drugs.
  - Some hormone preparations.

## Birth Plan

Formulating a birth plan while you are pregnant is a good way to ensure that your wishes regarding labor and child-birth are clearly stated and respected. It allows you to decide in advance what you want and what you would choose from among the options you may face during the birth of your child. It is a good idea to work with your health care provider and your partner in drawing up the plan. The following are a number of things you should ask about, and decide upon, in developing a birth plan:

- Where will you have your child, and what options are open to you in that facility? For example, do you wish to simply stay in a bed during labor, or would you rather walk around or take a shower or sit in a tub? One study has shown that sitting in the warm water of a birth pool during the first stage of labor can soothe a woman's pain and reduce the likelihood she will need an epidural. Researchers from the University of Southampton in England had forty-nine women sit in an oval-shaped, acrylic pool during the early stages of their slowly progressing labors. The water temperatures were about 98 degrees Fahrenheit. The outcomes were compared with those of fifty women who received standard care for slow labor. Those who labored in water were less likely to need drugs to aid their contractions and said they had less pain and higher satisfaction with their freedom of movement than did those receiving standard care. Discuss all of your options for labor with your midwife or physician.
- If you have chosen to have the baby in a private home, who will be there and what additional facilities might you need?
- If you are in the hospital, can you wear your own clothes? Listen to music? Watch a video?
- How many people will be allowed to stay with you? How many people do you want to be with you? Do you want them to take photographs or videotape the birth?
- Do you want an intravenous (IV) line inserted during labor? In many places, this is considered routine procedure. However, it often is not necessary.
- Do you want to be given drugs (usually oxytocin [Pitocin]) to speed up labor? Oxytocin is often given through the IV and can make labor more painful.
- What type of medication (if any) do you want? If you decide against any pain medication at the time you write your

birth plan, will it still be available should you change your mind at any time during labor?

- If you do decide to use drugs for any pain you might experience, what are the potential side effects? Is it safe for the baby if you breast-feed immediately after using pain medication? Does your physician or midwife use homeopathic and/or natural remedies for pain?
- What methods will be used to monitor the baby during labor?
- Do you have to have your baby in the lithotomy position (flat on your back with your feet in stirrups)?
- Will you have an episiotomy? (This is an incision made to enlarge the vaginal opening either so that forceps can be used or to hasten delivery or to prevent tearing in this area, which takes longer to heal than an incision does.)
- Probably the most important question: Are you willing to have a cesarean section, and under what emergency circumstances do they perform this operation? If you had a cesarean for a previous delivery, will you be supported through a vaginal birth after cesarean (VBAC) this time? Over 32 percent of American women who give birth in hospitals undergo cesarean sections. The World Health Organization has stated that no area in the world is justified in having a cesarean rate greater than 5 to 15 percent. Cesarean births cost more than twice as much as vaginal births. It often takes longer for the mother to recover, and she has to remain in the hospital for an extra two days, on average. The most common reason for performing a cesarean is that the mother had one for a previous delivery. But VBAC is possible, and this is something you should discuss with your physician or midwife. The risk of rupturing the previous incision is very small. The reasons for *emergency* cesarean usually relate to the health of the baby. Babies that appear distressed on the fetal monitors need to be removed at once. Sometimes the mother becomes too fatigued due to a long labor and the baby is removed. Other reasons fall into the following categories: the umbilical cord presents before the baby; the baby is a breech presentation (coming down the birth canal feet first, buttocks first, or sideways, instead of head down); the placenta breaks up before the baby is born; or the baby's head is too big to fit through the pelvis (a very unusual event). Many problems can be corrected before or during labor without resorting to a major operation such as a cesarean section.

- Some seizure medications.
- Some thyroid treatment drugs.
- Chronic (long-term) alcohol intake. (Any alcohol intake increases the risk of problems.)
- Cocaine.

These teratogens that affect the development of the baby include drugs taken by men during the time of conception.

Excessive intake of vitamin A has been linked with cleft palate, heart defects, and other congenital defects. Foods rich in vitamin A may also cause problems. Foods containing natural beta-carotene, however, are not harmful because

the body converts beta-carotene to vitamin A only as needed, and not in amounts that may be toxic to the body.

□ One of the best things you can do for your child is to breast-feed your baby for at least the first three months of life—longer if possible. Mother's milk is not only the most nutritious food for a baby, but it also provides crucial disease-fighting agents. However, modern-day infant formulas are closer to mother's milk than they were just a few years ago. A new mother who breast-feeds may need to consume extra calories (up to 500 more calories per day) when nursing than she did during pregnancy. However, to lose weight gained from pregnancy, try not to eat the extra calories. Your diet must include mostly nutrient-dense foods and a substantial amount of liquids and extra portions of calcium-rich foods. Low-fat milk is a liquid that is both nutrient-dense and calcium-rich. Do not give your baby anything other than breast milk or infant formula; cow's milk does not have the right mix of macronutrients (protein, fat) and micronutrients (iron or vitamin E). Babies who are fed cow's milk may have a greater chance of developing allergies to milk and dairy products later in life.

## PREMENSTRUAL SYNDROME

Premenstrual syndrome (PMS) is a disorder that affects many women during the seven to ten days before menstruation begins. Symptoms can include any or all of the following: abdominal bloating, acne, anxiety, backache, breast swelling and tenderness, cramps, depression, fainting spells, fatigue, food cravings, headaches, insomnia, joint pain, nervousness, skin eruptions, water retention, and personality changes such as drastic mood swings, outbursts of anger, violence, and, sometimes, even thoughts of suicide. The symptoms are so numerous and various that diagnosing and treating this condition is often difficult.

While there are no hard statistics, it is estimated that as many as 75 percent of all women experience some premenstrual symptoms at one time or another. Approximately 3 to 8 percent of women have symptoms so severe as to be incapacitating (called premenstrual dysphoric disorder). Most women report symptoms severe enough to interfere with their day-to-day lives.

For many years, PMS was dismissed as a psychological problem. We now know that this is a physically based problem, although it is still far from clear what causes all the symptoms. It is possible, of course, that there is more than one cause of PMS and that there may be different causes of symptoms in different people. One of the reasons for PMS may be hormonal imbalance—excessive levels of estrogen and inadequate levels of progesterone—as well as sensitivity to fluctuating hormones. Diet may be an important contributing factor for some women. Unstable blood sugar levels are an important factor as well. PMS has also been linked to food allergies, changes in carbohydrate metabolism, hypoglycemia, and malabsorption. Other suspected

causes of PMS symptoms include serotonin dysfunction (a problem with the brain's mood regulator), erratic levels of beta-endorphin (a narcotic-like substance produced by the body), vitamin and/or mineral deficiencies (especially calcium deficiency), and an inability to metabolize fatty acids. All of these may play a part in PMS.

Unless otherwise specified, the dosages recommended here are for adults. For girls between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Breaks down metabolites of estrogen.
Calcium	1,500 mg daily.	Studies have shown that calcium supplements can reduce many symptoms of PMS by as much as 30 percent. Use a citrate or chelate form.
and magnesium	1,000 mg daily.	Deficiency may be associated with PMS. Should be taken with calcium. Use magnesium chloride or chelate form.
and vitamin D	As directed on label.	Needed for the uptake of calcium and magnesium.
Gamma-amino-butyric acid (GABA)	750 mg daily.	Assists in controlling anxiety and restlessness by increasing levels of serotonin in the brain.
Melatonin	As directed on label.	Important for regulating hormone levels. Helps combat insomnia.
Natural progesterone cream	As directed on label.	A progesterone supplement that has proved helpful for some women.
Pregnenolone	10–100 mg daily (increase the dose for the 5 days before your period, but never exceed more than 100 mg daily for 5 days).	Made from diosgenin, a compound found in some plants, this is a precursor to DHEA. In the body, it is converted into progesterone, cortisone, testosterone, DHEA, and estrogen.
or DHEA	10 mg daily.	Is converted into estrogen and testosterone.
or 7-keto DHEA	As directed on label.	Enhances memory and the immune system. Unlike ordinary DHEA, is not converted into hormones.
S-Adenosylmethionine (SAME)	200 mg twice daily.	Aids in prevention of depression. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Ultimate Cleanse from Nature's Secret	As directed on label.	A cleansing program that enhances the liver's ability to metabolize estrogen.

Vitamin B complex	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	B vitamins work best when taken together.
plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	100–200 mg daily.	Reduces stress and is needed by the adrenal gland.
and vitamin B <sub>12</sub>	50 mg 3 times daily.	Reduces water retention and increases oxygen flow to the female organs. Also aids in restoring estrogen levels to normal.
	1,000–2,000 mcg daily.	Reduces stress, prevents anemia, and is needed for all bodily functions. Use a lozenge or sublingual form.
Vitamin E	200 IU daily or 400 IU every other day.	Good for sore breasts and other PMS symptoms; improves oxygen utilization and limits free radical damage. Also helps to relieve nervous tension, irritability, and depression. Use d-alpha-tocopherol form.

Helpful		
Choline and inositol or lecithin	1,000 mg each daily. As directed on label. As directed on label.	To aid in nerve impulse transmission.
Chromium picolinate	200 mcg daily.	Stabilizes blood sugar levels.
DL-phenylalanine (DLPA)	375 mg 3 to 4 times daily.	Helpful for alleviating headaches and pain. <i>Caution:</i> Do not take this supplement if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
Floradix Iron + Herbs from Salus Haus	As directed on label. Do not take at the same time as vitamin E; iron depletes vitamin E in the body. Check with your doctor before taking iron.	To supply iron in easily assimilated natural formula. Women with heavy menstrual flow are often anemic.
Kelp	1,000–1,500 mg daily.	A good source of needed minerals. Helps to protect thyroid function.
L-tyrosine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Reduces anxiety, depression, and headache. <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed for relief of symptoms.
Vitamin A plus carotenoid complex with natural beta-carotene	10,000 IU daily. 15,000 IU daily.	Deficiency has been linked to PMS. Antioxidants and precursors of vitamin A.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Aids in relief of discomfort and breast swelling. Also boosts the immune system.

Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for proper immune function. Diuretics deplete zinc. Use zinc gluconate lozenges or OptiZinc for best absorption.
plus copper	3 mg daily.	Needed to balance with zinc.

**Herbs**

Angelica root, cramp bark, kava kava, and red raspberry have antispasmodic properties and may alleviate cramps.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

Black cohosh, blessed thistle, dong quai, false unicorn root, fennel seed, sarsaparilla root, and squawvine are hormone-balancing herbs effective in the treatment of PMS.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Black haw and rosemary are good for cramps and help to calm the nervous system.

Feverfew is good for migraines. (See MIGRAINE in Part Two.)

*Caution:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

Milk thistle cleanses the liver and helps improve liver function, thus enhancing the liver's ability to metabolize estrogen. For best results, this herb should be taken on a daily basis for a period of three months.

Peppermint, strawberry leaf, and valerian root help to stabilize mood swings and tone the nervous system.

Wild yam extract contains natural progesterone and has proved effective in alleviating many symptoms of PMS, including cramps, headache, mood swings, depression, irritability, and insomnia.

**Recommendations**

Eat plenty of fresh fruits and vegetables, whole-grain cereals and breads, beans, peas, lentils, nuts and seeds, and broiled chicken, turkey, and fish. Have high-protein snacks between meals.

Include in your diet foods that are high in complex carbohydrates and rich in fiber. These can help the body to get rid of excess estrogen if high estrogen levels are your problem.

Drink 1 quart of distilled water daily, starting a week before the menstrual period and ending one week after.

Do not consume salt, red meats, processed foods, or junk or fast foods. At the very least, omit these foods from the diet for at least one week before the expected onset of

symptoms. Reducing sodium (principally salt and foods that contain it) is especially important for preventing bloating and water retention. Salt reduction is particularly important during the luteal phase before menses.

Eat fewer dairy products. Dairy products block the absorption of magnesium and increase its urinary excretion. Refined sugars also increase magnesium excretion. Be sure to get calcium and vitamin D from other foods or supplements.

Avoid caffeine and xanthine-containing foods and beverages such as coffee, tea, cola, and chocolate. Caffeine is linked to breast tenderness, and is a central nervous system stimulant that can make you anxious and jittery. It also acts as a diuretic and can deplete many important nutrients.

Eat foods that are high in phytoestrogens such as soy products, flaxseeds, nuts, whole grains, apples, fennel, celery, parsley, and alfalfa.

Do not consume alcohol or sugar in any form, especially during the week before symptoms are expected. These foods cause valuable electrolytes, particularly magnesium, to be lost through the urine.

Fast on fresh juices and spirulina for several days before the anticipated onset of menstruation to help minimize symptoms. (See FASTING in Part Three.)

Get regular exercise. Walking, even if only one-half to one mile per day, can be very helpful. Exercise increases the oxygen level in the blood, which helps in nutrient absorption and efficient elimination of toxins from the body. It also helps to keep hormone levels more stable. Stress management practices are also helpful, such as a cognitive behavioral therapy program.

See a physician to rule out an underlying medical condition that may be causing symptoms, such as abnormal thyroid function, endometriosis, or a genuine psychological problem such as clinical depression. A food allergy test and a hair analysis to rule out heavy metal intoxication are also recommended. (See ALLERGIES in Part Two and HAIR ANALYSIS in Part Three.)

Do not smoke.

### Considerations

PMS is a syndrome with many causes, and the problem may not have one solution that fits every woman. It may be best to experiment with altering your diet, using natural progesterone cream, avoiding certain foods and drinks, taking up meditation, or trying acupuncture, and seeing which one suits you best and gives you optimum relief from your particular symptoms. Some women experience PMS coupled with depression. If you are one of these women and are not benefiting from lifestyle changes such as those mentioned here, speak to your health care professional about other treatments such as antidepressants (SSRIs or others) and ovulation suppressants. The

most important thing you can do is to get an accurate diagnosis of your condition so you can be treated effectively. Find a sympathetic health care provider. PMS is classified as a real disorder and requires the same attention as any other chronic condition.

Premenstrual depression may be due to a miscue of the biological clock that results in lower than normal levels of certain brain chemicals. Research at the University of California–San Diego suggests that some women who suffer from PMS may be deficient in melatonin, a hormone secreted at night by the pineal gland.

Studies have shown that women who regularly consume caffeine are four times more likely than others to have severe PMS.

One study showed that calcium and magnesium supplements are effective for managing symptoms of PMS. The optimal amount for women in this study was 1,000 to 1,200 milligrams of calcium and 200 milligrams of magnesium daily.

Some physicians recommend oral contraceptives for women with PMS, especially if they also are interested in reliable birth control. If you take oral contraceptives, be aware that their effectiveness at preventing pregnancy can be sharply reduced if you also take antibiotics. Oral contraceptives and other preparations containing estrogen-type substances should *not* be used if you are pregnant or if you have breast cancer, abnormal vaginal bleeding, or phlebitis (inflammation of leg veins).

Proper diet is extremely important in treating PMS. Meals high in complex carbohydrates have been found to help in dealing with stress. Researchers speculate that such a diet may increase the body's production of serotonin, a brain chemical with antidepressant properties. Conversely, eating red meat and dairy products promotes the type of hormonal imbalance that causes PMS—excessive estrogen levels and inadequate progesterone levels.

For about 20 to 25 percent of women with PMS, dietary and lifestyle changes are not enough to relieve PMS symptoms and they will need to use other treatments. Wild yam cream, which contains a natural form of the hormone progesterone, has been helpful for many women. You rub the cream into the skin on your chest, inner arms, thighs, and abdomen just after ovulation, and the active ingredient is absorbed through the skin. Progesterone creams such as those made from wild yam are prostaglandin inhibitors, which have been shown to produce some relief from symptoms of PMS. However, the American Cancer Society says that wild yam supplies a substance called diosgenin, which the human body cannot convert into progesterone. This finding is likely the reason for the lack of human studies on using wild yam to relieve symptoms of PMS.

The amino acid L-glutamine, either alone or in combination with DL-phenylalanine (DLPA), may help to reduce food cravings.

Research has discovered that many women with PMS also suffer from some form of immune system disorder or frequently suffer from some variety of yeast infection. (See CANDIDIASIS in Part Two.)

A significant number of women who suffer from PMS have some sort of thyroid dysfunction. (See HYPOTHYROIDISM in Part Two.)

Clinics specializing in the treatment of PMS are springing up all over the country. Experience and expertise can vary greatly among these establishments, however. Ask your health care provider for a referral or recommendation, or look for a clinic that is affiliated with a major local hospital. Beware of clinics that promote only one type of treatment or a quick-fix approach to this complicated disorder.

### PROLAPSE OF THE UTERUS

Uterine prolapse (sometimes called a pelvic floor hernia or a pudendal hernia) is a condition that develops when muscular support for the uterus is lost. The uterus is normally held in place by the pelvic muscles and supporting ligaments. When these muscles become weakened or injured, uterine prolapse can occur. In mild cases, a portion of the uterus descends into the top of the vagina. In more serious cases, the uterus may even protrude through the vaginal opening and can be accompanied by a cystocele (a bladder that bulges into the front wall of the vagina) or a ureterocele (a urethra that does the same). In some instances, the rectum may bulge into the back wall of the vagina, a condition known as rectocele.

Symptoms of prolapse of the uterus can include backache, abdominal discomfort, a feeling of heaviness, and urinary incontinence, especially stress incontinence (the involuntary passage of urine when straining, sneezing, or otherwise putting pressure on the abdomen). Other symptoms can include excessive menstrual bleeding, abnormal vaginal discharge or bleeding, painful intercourse, and constipation. However, a woman with a prolapsed uterus may not exhibit any symptoms at all.

Women who have borne several children and/or who have gone through difficult and prolonged labor are more prone to prolapse. Other factors that can increase the likelihood of uterine prolapse include obesity, uterine cancer, diabetes, chronic bronchitis, asthma, heavy lifting or straining (particularly if the pelvic muscles are already weakened), and a retroverted uterus (a uterus that is tilted toward the back of the body).

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Calcium and magnesium	1,500 mg daily.	Essential minerals needed for muscle tone and metabolism.
L-carnitine plus	500 mg twice daily, on an empty stomach.	Improves muscle strength in the uterus.

L-glycine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Retards muscle degeneration.
plus branched-chain amino acid complex	As directed on label.	Promotes healing of muscle tissue.
Methylsulfonylmethane (MSM) (OptiMSM from Bergstrom Nutrition)	As directed on label.	A natural sulfur compound found in foods and present in body tissues that is used by the body to build healthy new cells. MSM provides the flexible bond between the cells and provides support for tendons, ligaments, and muscles.
Multivitamin and mineral complex with mixed carotenoids and vitamin B complex	As directed on label.	All nutrients work together for healing and tissue repair.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Important for keeping bladder infections under control and to enhance immune function. Use an esterified form for best absorption.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for proper immune function, bone support, and all bodily enzyme systems. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Herbs

- Buchu has anti-inflammatory properties and aids in controlling bladder problems.
- Cranberry aids in bladder function and helps to prevent urgency incontinence. It can be taken in capsule form. Pure, unsweetened cranberry juice is good also.
- Damiana helps provide oxygen to the genital area and balances female hormones.
- Ginger can help with bowel disorders.

### Recommendations

- Eat a diet consisting of 75 percent raw fruits and vegetables plus whole grains such as brown rice and millet.
- Use a fiber supplement daily to prevent constipation.
- Do not strain during bowel movements or urination.
- Drink ten 8-ounce glasses of quality water daily.
- Try to achieve or maintain a normal weight.

### Considerations

- Doing Kegel exercises to tone the pelvic floor muscles when prolapse is beginning may prevent the condition from getting worse. These exercises can be done in two ways:

1. Tighten and squeeze the vagina and rectum by drawing the muscles inward and upward. Hold this position for five to ten seconds, then relax. Repeat as many times as possible, preferably at least 100 times a day.
  2. When urinating, start and stop the flow of urine as many times as possible. This form of the exercise is particularly useful for stress incontinence.
- If the prolapse causes no symptoms, no treatment is needed, other than perhaps adopting an exercise program designed for the individual problem and situation.
  - Natural progesterone replacement may be more beneficial than estrogen therapy.
  - A vaginal device (a ring-shaped pessary) can be inserted to hold the uterus in place. This approach can have undesirable results, however. It can interfere with sexual intercourse and may also cause an irritating discharge with an unpleasant odor and even infection.
  - Adult diapers may be necessary in extreme cases. If so, speak to your health care professional about other options such as surgery.
  - It is possible to surgically re-suspend the uterus into its normal position. This procedure is usually performed on women who wish to bear children in the future. For women who have completed childbearing, or who do not wish to have children, vaginal hysterectomy is a viable option for this condition. Women pondering a hysterectomy should give the matter close and careful consideration. (See HYSTERECTOMY-RELATED PROBLEMS in Part Two.)

## PROSTATE CANCER

The prostate is a walnut-sized gland at the base of the bladder that encircles the urethra, the tube through which urine is voided. The prostate produces prostatic fluid, which makes up the bulk of the male ejaculate and nourishes and transports the sperm. Cancer of the prostate gland is the second leading cause of cancer death among men. It is primarily a disease of aging. Men in their thirties and forties rarely develop prostate cancer, but the incidence increases steadily after the age of fifty. Prostate cancer is most likely to be diagnosed between the ages of sixty-five and seventy-four. The American Cancer Society estimates that nearly 200,000 new cases of prostate cancer are diagnosed annually, and over 28,000 men die from the disease, making it the second leading cause of cancer deaths in the United States. Many experts feel that every man will eventually develop prostate cancer if he lives long enough. It is good news that prostate cancer deaths have been declining for the past ten years, which many experts believe to be the result of better screening and earlier diagnosis. Survival is improved if the disease is diagnosed early, which means regular screening is important. Five-year survival rates are 100 percent if the tumor is localized and regional, 31 per-

cent for distant tumors, and 75 percent for unstaged tumors.

Although it is relatively common, in most cases prostate cancer is, fortunately, a slow-growing cancer. Most prostate cancers arise in the rear portion of the prostate gland; the rest originate near the urethra. Lymphatic vessels leading from the prostate gland to the pelvic lymph nodes provide a route for prostate cancer to spread to other areas of the body. Prostate cancers double in mass every six years, on average (by comparison, breast cancers commonly double every three and a half years). Possible symptoms of prostate cancer can include one or more of the following: pain or a burning sensation during urination, frequent urination, a decrease in the amount and force of urine flow, an inability to urinate, blood in the urine, and continuing lower back, pelvic, or suprapubic discomfort. However, the disease often causes no symptoms at all until it reaches an advanced stage and/or spreads outside the gland. In addition, these symptoms most often are caused not by cancer, but by an enlarged prostate, benign prostatic hyperplasia (BPH).

The exact cause or causes of prostate cancer are not known. However, there are certain risk factors that have been linked to its development. Men aged sixty-five and older, African-American men, and men who have a first-degree relative (parent or sibling) with prostate cancer are at increased risk. The incidence is higher among married men than it is among unmarried men. Also at increased risk are men who have had recurring prostate infections, those with a history of sexually transmitted disease, and those who have taken testosterone. Exposure to cancer-causing chemicals increases risk as well. Having a genetic variation of the cyclooxygenase-2 (COX-2) gene also may increase your risk for prostate cancer. This gene is involved with regulating inflammation, and too much inflammation is found to increase the risk of prostate cancer. Researchers have also found a link between a high-fat diet that is low in fruits and vegetables and prostate cancer. This may be due to the fact that heavy fat consumption raises testosterone levels, which could then stimulate growth of the prostate, including any cancer cells it may be harboring. Some studies have suggested that vasectomy may increase the risk of developing prostate cancer, although other studies contradict this hypothesis.

There is no known way to prevent this disease, but early detection can make it possible to catch the cancer before it spreads to other sites in the body. A careful digital rectal exam of the prostate is the simplest and most cost-effective approach for detecting prostate cancer. The American Cancer Society recommends that every man have an annual exam beginning at age forty; the American Urological Association suggests beginning at age fifty.

Prostate-specific antigen (PSA) is a protein produced by cells of the prostate gland. The PSA test measures the level of PSA in the blood. The doctor takes a blood sample, and the amount of PSA is measured in a laboratory. Because PSA is produced by the body and can be used to detect

disease, it is sometimes called a biological marker or a tumor marker. A PSA test result between 0 and 4 is considered within the normal range. Numbers between 4 and 10 indicate a 25 percent chance of cancer and numbers higher than 10 indicate a 50 percent chance. PSA levels rise with age even if you don't have cancer. It is important to get regular screening and to discuss with your doctor what your numbers mean. A man's PSA level alone does not give doctors enough information to distinguish between benign prostate conditions and cancer. However, the doctor will take the result of the PSA test into account when deciding whether to check further for signs of prostate cancer.

High PSA levels can be caused by factors other than cancer, including benign enlargement or inflammation of the prostate, an activity as innocuous as bicycle riding, or even the rectal exam itself. Having the test repeated every year may help a physician to better interpret the results; in healthy men, PSA levels tend to remain relatively stable, rising only gradually from year to year, while cancer causes the levels to rise more dramatically. The U.S. Food and Drug Administration (FDA) has approved the use of the PSA test along with a digital rectal exam (DRE) to help detect prostate cancer in men fifty years of age or older. Doctors often use the PSA test and DRE as prostate cancer screening tests; together, these tests can help doctors detect prostate cancer in men who have no symptoms of the disease.

Ultrasound scanning of the prostate is often done to follow up on an abnormal rectal exam or PSA test. Other diagnostic tests, including computerized tomography (CT) scans, bone scans, and magnetic resonance imaging (MRI) may be necessary, but are costly. Ultimately, if test results point consistently to the presence of cancer, a tissue diagnosis must be done to confirm it. This can be done only by microscopic examination of a needle biopsy, preferably directed under ultrasound control. Repeated biopsies may be needed in some cases. This invasive procedure may itself cause complications. Bleeding, urinary retention, impotence, and sepsis ("blood poisoning") have been reported.

Another important measure, the Gleason score, gauges the probable aggressiveness of a tumor based on the cellular characteristics of the cancer. If you develop prostate cancer, your doctor will discuss your score and its implications for survival. Tumor cells that look more similar to normal cells tend to be less aggressive, while those that are distributed randomly with uneven edges are likely to spread rapidly. The dosages given below are for adults.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily.  As directed on label.	Improves cellular oxygenation. Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.

Colostrum (Colostrum Plus from Symbiotics or Colostrum Prime Life from Jarrow Formulas)	As directed on label.	Has been shown to boost the immune system, burn fat, build lean muscle, and have an anti-aging effect.
Dimethylglycine (DMG) (Aangamik DMG from Food-Science of Vermont)	As directed on label.	Enhances oxygen utilization.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Enhances immune function. Helps to break down testosterone. Has been shown to slow cancer cell growth.
Proteolytic enzymes	As directed on label. Take with meals.	To keep down inflammation and destroy free radicals.
Selenium	200 mcg daily.	Needed for proper prostate function. The incidence of prostate cancer has been shown to be substantially lower in men with higher selenium levels.
Superoxide dismutase (SOD)	As directed on label.	Destroys free radicals. Consider injections (under a doctor's supervision).
Vitamin A  plus carotenoid complex with extra lycopene  plus vitamin E	50,000–100,000 IU daily for 10 days or as long as you are on the program.  As directed on label.  200 IU daily or 400 IU every other day.	Powerful antioxidants that destroy free radicals. Use emulsion forms for easier assimilation, and greater safety at higher doses.  Lycopene has been shown to lower the risk of developing prostate cancer. Protects against prostate cancer. Use d-alpha-tocopherol form.
Vitamin B complex  plus extra vitamin B <sub>3</sub> (niacin) and choline and folic acid plus vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 100 mg daily. Do not exceed this amount. 500–1,000 mg daily.  400 mcg daily.  100 mg daily.  2,000 mcg daily.	B vitamins necessary for normal cell division and to improve circulation, build red blood cells, and aid liver function. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.  Enhances the efficacy of zinc.  Prevents anemia. Use a lozenge or sublingual form. Consider injections (under a doctor's supervision).
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. ( <i>See</i> ASCORBIC ACID FLUSH in Part Three.)	Powerful anticancer agents. Have been shown in laboratories to inhibit the spread of prostate cancer.
Vitamin D	As directed on label.	Low levels may be linked to higher prostate cancer incidence.
<i>Important</i>		
Maitake extract	4,000–8,000 mg (4–8 gm) daily.	Inhibits the growth and spread of cancerous tumors. Also boosts immune response.

**Helpful**

Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	Has an antibacterial effect on the body. Use a nondairy formula that requires no refrigeration.
Aerobic 07 from Aerobic Life Industries	As directed on label.	An antimicrobial agent.
Berry seeds complex	1–2 tablets after each meal.	Has a regulating effect on cell function and a suppressive effect on cancer cells.
Glutathione plus L-cysteine and L-methionine	As directed on label. As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Protects against environmental toxins. Sulfur-containing amino acids that act as detoxifiers and protect the liver and other organs. (See AMINO ACIDS in Part One.)
Kelp or seaweed	1,000–1,500 mg daily. As directed on label.	For mineral balance.
L-carnitine	As directed on label.	Protects against free radical damage and toxins. Use a form from fish liver (squalene).
Multienzyme complex	As directed on label. Take with meals.	To aid digestion.
Multiglandular complex plus raw thymus glandular	As directed on label. As directed on label.	To stimulate glandular function, especially that of the thymus, site of T lymphocyte production. (See GLANDULAR THERAPY in Part Three.)
Multivitamin complex	As directed on label.	Many nutrients in this table may be found in a combination multivitamin. Do not use a sustained-release formula. Choose a product that is iron-free.
Taurine	As directed on label.	An amino acid that functions as a foundation for tissue and organ repair.

**Herbs**

- Black radish, dandelion, milk thistle, and red clover are good for cleansing the liver and the blood.
- Buchu, capsicum (red pepper), Carnivora, echinacea, goldenseal, pau d'arco, and suma have all shown anticancer properties. Take them in tea form, using two at a time and alternating among them.

**Cautions:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Damiana and licorice root have the ability to balance hormones and glandular function.

**Caution:** Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Gravel root, hydrangea, oat straw, parsley root, uva ursi, and yarrow are diuretics that also dissolve sediment.
- Green tea and lycopene may prevent tumor growth.

**Caution:** Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

- Modified citrus pectin has been shown to substantially inhibit the growth of cancer cells and is especially effective in combating prostate cancer.
- Resveratrol is a phytochemical derived from grapes that helps to maintain a healthy prostate.
- Turmeric is a spice that contains curcumin, an antioxidant that may be effective in controlling prostate cancer cells.

**Recommendations**

- Maintain a whole-foods diet. Eat plenty of whole grains, raw nuts and seeds, and unpolished brown rice. Millet cereal is a good source of protein. Eat wheat, oats, and bran. Also eat plenty of cruciferous vegetables, such as broccoli, Brussels sprouts, cabbage, and cauliflower, and yellow and deep-orange vegetables, such as carrots, pumpkin, squash, and yams. This type of diet is important for the prevention of cancer as well as for healing.
- Include in the diet apples, fresh cantaloupe, all kinds of berries, especially blueberries and strawberries; Brazil nuts; cherries; grapes; legumes, including chickpeas, lentils, and red beans; plums; and walnuts. All of these foods help to fight cancer.
- Consume freshly made vegetable and fruit juices daily. Carrot and cabbage juices are good choices.
- Eat plenty of grapefruit, watermelon, and tomatoes and tomato products such as tomato juice and tomato-based sauces. These contain lycopene, which has been shown to protect against prostate cancer.
- Include in your diet foods that are high in zinc, such as mushrooms, pumpkin seeds, seafood, spinach, sunflower seeds, and whole grains. Zinc nourishes the prostate gland and is vital for proper immune function.
- Eat salmon, mackerel, sardines, or herring. Regular consumption of these sources of omega-3 fatty acids may lower the risk of prostate cancer. One study found that eat-

ing fish more than three times a week was associated with a reduced risk of prostate cancer compared to infrequent fish consumption.

Drink at least ten 8-ounce glasses of water a day. This hydrates the body, keeps the prostate working efficiently, and helps to eliminate toxins from the body.

Restrict your intake of dairy products. Moderate consumption of soured products such as low-fat yogurt and kefir is acceptable.

If you experience difficulty urinating or notice an increasing trend toward waking up to urinate during the night, consult your health care provider. This may indicate prostatic obstruction.

Do not eat red meat. There is a definite correlation between high red meat consumption (five servings a week or more) and the development of prostate cancer.

Eliminate from the diet alcoholic beverages, coffee, and all teas except for caffeine-free herbal teas. A study conducted at the Fred Hutchinson Cancer Research Center in Seattle suggested that drinking one glass of red wine per day may reduce the risk of prostate cancer by 50 percent. We still believe that alcohol consumption is not necessarily good for the body, and until more conclusive evidence becomes available we believe abstinence to be the best practice. If there is a compound in red wine that might help, it certainly isn't the alcohol.

Strictly avoid the following foods: junk foods, processed refined foods, salt, saturated fats, polyunsaturated vegetable oils, sugar, and white flour. Instead of salt, use a kelp or potassium substitute. If necessary, a small amount of blackstrap molasses or pure maple syrup can be used as a natural sweetener in place of sugar. Use whole wheat or rye instead of white flour.

Try to avoid *all* known carcinogens. Eat only organic foods, if possible. Avoid tobacco smoke, polluted air, polluted water, noxious chemicals, and food additives. Use only distilled water or reverse-osmosis filtered water. Municipal and well water can contain chlorine, fluoride, and agricultural chemical residue.

Try following a macrobiotic diet.

Get regular physical activity. Active men maintain better health and have lower risk of developing prostate cancer.

Enjoy regular sexual activity. Regular ejaculation activates the prostate gland, keeping it from getting stagnant and inflamed.

Do not take any drugs except those that are prescribed by your physician. Always seek counsel and alternative opinions before deciding which treatments, if any, you will pursue.

### Considerations

Some nutrients, such as vitamin C and E and selenium, have been thought to reduce the risk of certain cancers, or at least delay them, because they are potent antioxidants. Two

earlier studies—the Nutritional Prevention of Cancer Study Group and the Alpha-Tocopherol, Beta-Carotene Cancer Prevention Study—showed prostate cancer risk reductions of 63 percent for selenium and 32 percent for alpha-tocopherol (vitamin E). In addition, the combination of selenium, vitamin E, and beta-carotene reduced overall cancer mortality. However, there are two newer studies, both published in the *Journal of the American Medical Association (JAMA)*; one found no benefit from supplemental selenium and vitamin E, and the other found no benefit from vitamin C and E. Both were randomized, placebo-controlled, and lasted at least seven years. There were over 50,000 men in the two studies. Keep in mind that the science of nutrition evolves, and it is considered best practice to think about all of the evidence to date and not just the recent studies. It seems safe and reasonable to take a multivitamin with all nutrients in balanced proportions. However, even doing that was shown to be ineffective at reducing the risk of early or localized prostate cancer in another study. Furthermore, these authors found that taking high single doses of selenium, beta-carotene, and zinc increased the chances of developing advanced and fatal prostate cancer. Based on this finding and the other studies, it seems prudent to avoid these nutrients in single, high-dose forms. Vitamin E from supplements appeared to not affect prostate cancer risk, but gamma-tocopherol, the form of vitamin E found in many American foods, such as margarine, butter, salad dressing, potatoes fried in corn oil, cookies, and brownies, did reduce the risk. Even though these foods are particularly unhealthy, as they lead to over-consumption and obesity, they still may help to reduce the risk of prostate cancer if eaten in moderation and occasionally.

An eight-year study published in the *British Journal of Cancer* found a 22 percent increase in risk of prostate cancer with a high intake of dairy products in men living in Europe. American studies confirmed both a higher rate of the disease and a higher mortality from dairy products. It is thought that a high intake of dairy protein may increase the production of insulin-like growth-factor-1 (IGF-1), which in turn promotes the development of prostate cancer. In addition, others think that too much calcium from dairy products suppresses the body's ability to synthesize vitamin D. Vitamin D is thought to be protective against prostate cancer. The European collaborators found that for every increase of 35 grams of dairy protein (a cup of milk has 8 grams), there was a 32 percent increase in the risk of developing prostate cancer. Calcium from foods, other than dairy products like milk and yogurt, had no effect on disease risk.

Eating fish that are rich in omega-3s (such as salmon, herring, and mackerel) once or more a week is helpful at reducing cancer risk. In one study, 2 servings a week reduced cancer risk by 26 percent; 3 to 4 servings reduced the risk by 36 percent, and more than 5 servings reduced the risk by 61 percent. This study was done in Sweden, where fish intake is already higher than in the United States. However, later researchers at the University of California—

San Francisco found that men who ate dark, fatty fish one to three times a week had a 36 percent reduction in the risk of prostate cancer compared to those who did not eat fish. Both studies looked at men who did and did not have a COX-2 gene variant. In both studies, having this gene increased the risk of prostate cancer, and eating fish regularly reduced it more than in those without the genetic variant.

❑ Diet and nutrition are important not only for treatment, but for prevention. An anticancer diet is composed primarily of brown rice, fresh raw fruits and vegetables, fresh juices, legumes, raw nuts and seeds, and whole grains, and *excludes* alcohol, coffee, refined carbohydrates, and strong tea. Regular intake of zinc (50 milligrams daily) and essential fatty acids (in supplement form or from cold-pressed sesame, safflower, or olive oil) in later life also may help to prevent the development of problems.

❑ A high-fat, low-fiber diet is linked not just to heart disease, but also to prostate cancer. Chemical reactions occur when fat is cooked, leading to the production of free radicals, which play a major role in certain cancers. Researchers theorize that a diet high in fat raises the levels of testosterone and other hormones in the body, which stimulates the prostate—and any cancerous cells in it—to grow. A high intake of milk and coffee may also increase the risk of developing prostate cancer. In addition, maintaining a normal weight during adulthood (age fourteen to fifty-nine years) reduces the risk of developing prostate cancer, and if you do get it, you get it at a later age.

❑ Research has shown that soybeans and soy products, such as tofu, tempeh, soy flour, and soymilk, have cancer-fighting powers due to the presence of a protein called genistein. Genistein apparently retards tumor growth by preventing the growth of new blood vessels to feed the tumor. It appears to be particularly effective against prostate cancer, but also works against breast cancer in women and colon cancer in both sexes.

❑ Berries help protect DNA from damage and mutation that may result in cancer.

❑ Green tea extract (200 milligrams per day) was shown to reduce the recurrence of tumors in men with high-grade prostatic intraepithelial neoplasia. Although PSA levels did not change, men randomized to the tea group developed one new tumor (out of thirty men) and those in the placebo group developed nine (out of thirty men). Moreover, men taking the tea reported reduced lower urinary tract symptoms, suggesting that this compound may benefit those with benign prostatic hyperplasia (BPH).

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

❑ Lycopene from many plant-based foods like tomatoes is a potent quencher of free radicals and an immune-

modulator. In one study, patients with metastatic prostate cancer were randomized to lycopene twice daily. The men getting the lycopene experienced a significant reduction in PSA levels and primary and secondary tumors shrank, providing better relief from bone pain and lower urinary tract symptoms, compared to men who did not get lycopene.

❑ The herbs pygeum and saw palmetto are mostly used for the management of benign prostatic hyperplasia (BPH). BPH is characterized by the enlargement of the prostate gland sufficient to cause obstruction of the urethra. With age, there is a build-up of dihydrotestosterone (DHT), which increases prostate size. There is also a shift in the normal balance of hormones in the body (less testosterone and more estrogens). These plants can inhibit 5-alpha-reductase, which slows the change of testosterone to DHT.

❑ Men who have higher levels of the enzyme 5-alpha reductase may be at greater risk for prostate cancer. This is an enzyme that transforms testosterone into dihydrotestosterone (DHT), a form of the hormone that promotes the growth of prostate cells.

❑ Prolactin is another hormone that may alter the cells of the prostate gland. Studies have shown that it may promote the growth of prostate cancer. If you have prostate cancer, you may want to consider having your prolactin levels checked. If they are elevated, the drugs bromocriptine (Parlodel), cabergoline (Dostinex), and pergolide (Permax) are effective in suppressing the release of prolactin from the pituitary gland.

❑ Researchers are looking into the role of angiogenesis (the formation of new blood vessels from existing microvessels) in prostate cancer.

❑ Research is ongoing on genes that may be related to inherited prostate cancer. Some researchers believe that mutated BRCA genes (the gene implicated in some cases of breast cancer) may slightly increase the risk of prostate cancer.

❑ With the numerous treatment methods available today, if you are diagnosed with prostate cancer, it is imperative to be educated about your treatment options. You should include your partner in your decisions.

❑ “Watchful waiting,” an option that involves no specific treatment, but close monitoring plus nutritional support and lifestyle changes, is becoming the preferred approach if the cancer is in the early stages. If symptoms develop or if tests indicate that symptoms are likely to develop, treatment is usually started. The primary benefit of watchful waiting is that the adverse effects of the existing treatment options are avoided. This may be advantageous for older men who have other serious health problems and for men who have nonaggressive, early-stage cancers. The doctor will continue to observe you, and you will probably need a PSA blood test and a digital rectal examination every six months and, possibly, a yearly biopsy of the prostate.

❑ If the cancer has not spread outside the gland, surgical options include a radical prostatectomy (removal of the en-

tire gland and some tissue around it) or a transurethral resection of the prostate (TURP). In the latter procedure, a device is inserted through the end of the penis, and a wire loop is used to cut away the cancerous tissue. This is far less radical than a prostatectomy; however, there is some risk of leaving some cancer cells in place. Radiation treatment is sometimes used if the cancer has not spread outside the gland, or has spread only to nearby tissue. Now there is a robot-assisted procedure for removing the prostate gland using a laparoscope, which reduces postoperative pain. The surgeon sits at a console and guides the instruments through a viewing device to perform surgery. So far, outcomes in terms of survival rates, urinary continence, and sexual function are the same as with conventional open prostatectomies.

The Clinical Practice Guidelines in Oncology for prostate cancer state that additional treatment may be necessary for: men in a watching phase whose PSA has doubled or increased rapidly; men who have had a radical prostatectomy and their PSA levels have not fallen below detectable limits after surgery; or men who have had other initial therapy for prostate cancer such as radiation therapy, and the PSA levels have increased by 2 ng/mL or more after having no detectable PSA level.

Hormone treatment is aimed at trying to block production of testosterone, which fuels the cancer. This can be done by means of orchiectomy (surgical removal of the testes) or through the use of hormone therapy to suppress the production and action of hormones. For the latter, either goserelin (Zoladex) or leuprolide (Lupron) is given by monthly injections (they are fundamentally the same drug). In addition, bicalutamide (Casodex) or nilutamide (Nilandron), which block your body's ability to use testosterone, can be taken orally. Together, these agents effectively shut down testosterone production and use by the body. In 2001, the FDA approved abarelix (Plenaxis), which lowers testosterone more quickly, but some people are allergic to the drug, which is given by injection. In 2009, the FDA approved degarelix, an injectable drug that is the first class of drugs called gonadotropin-releasing hormone receptor antagonists. This drug acts by blocking the body's production of testosterone. Both orchiectomy and hormone suppression result in impotence in nearly 100 percent of cases. Side effects of hormone therapy can include loss of sex drive, hot flashes, sexual dysfunction, and weight gain.

Men whose cancer does not respond to hormone therapy may benefit from a docetaxel (Taxotere) injection in combination with the steroid prednisone.

Cryosurgery (also called cryotherapy or cryoablation) is a treatment method for localized prostate cancer. In this technique, the cancerous cells are frozen by means of a metal probe. This type of treatment is less invasive than radical surgery and there is less blood loss. Brachytherapy (a form of radiation treatment in which tiny pellets containing radioactive material are implanted directly into the prostate) and neoadjuvant therapy (a combination of radi-

ation and hormonal treatment) are other approaches that may be recommended for fighting prostate cancer.

Another drug, finasteride (Proscar), is sometimes used to treat moderate prostate enlargement. It blocks an enzyme that converts the male hormone testosterone into dihydrotestosterone, which promotes the growth of prostate tissue. It also reduces the amount of prostate tissue, which can skew the results of the blood test used to detect prostate cancer.

Estrogens have been used for the treatment of prostate cancer for sixty years. However, they can cause breast growth and other feminizing effects, as well as cardiac complications. Because of these side effects, they are rarely used today.

Fresh cabbage and carrot juice have also been used in alternative clinics worldwide in prostate cancer therapy.

Several immunotherapies have been approved by the FDA for cancer treatment. Others are still under study. Regarding prostate cancer, in one therapy researchers remove dendritic cells, which regulate the immune system, from the individual's bloodstream and treat them with prostate cancer antigens. These are then infused back into the person's body, where the cells are now better equipped to deal with and attack cancer cells. In other studies, researchers are using a protein that is part of PSA as the basis for a vaccine. Monoclonal antibody research and DNA vaccines are also being explored.

See PROSTATITIS/ENLARGED PROSTATE in Part Two.

See also PAIN CONTROL in Part Three.

For names and addresses of organizations that can provide more information on prostate cancer, see Health and Medical Organizations in the Appendix.

## PROSTATITIS/ENLARGED PROSTATE

The prostate is a doughnut-shaped male sex gland, positioned beneath the urinary bladder. It encircles the urinary outlet, or urethra. Contraction of the muscles in the prostate squeezes fluid from the prostate into the urethral tract during ejaculation. Prostatic fluid makes up the bulk of semen.

The prostate is the most common site of disorders in the male genitourinary system. Generally speaking, there are three conditions that can cause problems with the prostate: prostatitis, which is inflammation of the prostate; benign prostatic hypertrophy (BPH), which is an enlarged prostate with no signs of cancer; and prostate cancer.

Prostatitis, common in men of all ages, is the inflammation of the prostate gland. The usual cause is infectious bacteria that invade the prostate from another area of the body.

Hormonal changes associated with aging may also be a cause. The inflammation can result in urine retention. This causes the bladder to become distended, weak, tender, and itself susceptible to infection. Infection in the bladder is in turn easily transmitted up the ureters to the kidneys.

There are three types of prostatitis: acute infectious prostatitis, chronic infectious prostatitis, and noninfectious pros-

tatitis. Acute infectious prostatitis is usually caused by bacteria. The onset is sudden. Symptoms may include pain between the scrotum and rectum, fever, frequent urination accompanied by a burning sensation, a feeling of fullness in the bladder, and blood or pus in the urine. Chronic (long-term) prostatitis is also a bacterial infection. Symptoms may include nothing more than a recurring bladder infection.

Noninfectious prostatitis is, as the name suggests, not caused by a bacterial infection. The cause for this inflammation is not known. Symptoms can include frequent urination possibly accompanied by pain; pain after ejaculation; and lower abdominal pain. All types of prostatitis, if untreated, can lead to impotence and difficulty with urination.

Benign prostatic hyperplasia (BPH) is the gradual enlargement of the prostate, which usually starts to occur after age forty. Fifty percent of men over sixty years of age and ninety percent of men over seventy have it. After the age of fifty or so, a man's testosterone and free testosterone levels decrease, while the levels of other hormones, such as prolactin and estradiol (a type of estrogen), increase. This creates an increase in the amount of dihydrotestosterone—a very potent form of testosterone—within the prostate. This causes a hyperplasia (overproduction) of prostate cells, which ultimately results in prostate enlargement.

While not cancerous, an enlarged prostate can nevertheless cause problems. If it becomes too large, it obstructs the urethral canal, interfering with urination and the ability to empty the bladder completely. Because the bladder cannot empty completely, the kidneys also may not empty as they should. Dangerous pressure on the kidneys can result. In severe cases, the kidneys may be damaged both by pressure and by substances in the urine. Bladder infections are associated with both prostatitis and enlarged prostate.

The major symptom of enlargement of the prostate is the need to pass urine frequently, with frequency increasing as time passes. A man may find himself rising several times during the night to urinate. There can also be pain, burning, and difficulty in starting and stopping urination. The presence of blood in the urine is not uncommon.

Testing for prostatitis and enlarged prostate usually involves a digital rectal exam plus a blood test that screens for levels of prostate-specific antigen (PSA), a protein secreted by the prostate.

The dosages given below are for adults.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Breaks down metabolites of estrogen. Use a nondairy source.
Quercetin	1,200–2,000 mg daily.	An anti-inflammatory and antitumor flavonoid.
Selenium	As directed on label. Do not take more than the prescribed amount.	Has antioxidant properties that help protect cells from toxin damage linked to prostatitis.

	Overdoses can cause toxicity.	Particularly effective when taken with vitamin E.
Vitamin B complex  plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg twice daily.	Necessary for all cellular functions. Antistress vitamins.  Has anticancer properties.
Zinc  plus copper	80 mg daily. Do not exceed a total of 100 mg daily from all supplements.  3 mg daily.	Deficiency has been linked to BPH, prostatitis, and even prostate cancer. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.
<b>Very Important</b>		
Essential fatty acids (fish oil or flaxseed oil)	As directed on label 3 times daily.	Important in prostate function.
Garlic (Kyoic from Wakunaga)	2 capsules 3 times daily.	Acts as a natural antibiotic.
L-alanine and L-glutamic acid and L-glycine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Amino acids needed for maintaining normal prostate function. (See AMINO ACIDS in Part One.)
Methylsulfonylmethane (MSM)	As directed on label.	Relieves pain and inflammation.
Raw prostate glandular	As directed on label.	To normalize prostate function.
Vitamin A plus carotenoid complex	5,000–10,000 IU daily.	Potent antioxidants and immune system enhancers.
Vitamin E	200 IU daily or 400 IU every other day.	Potent antioxidant and immune system enhancer. Use d-alpha-tocopherol form.
<b>Helpful</b>		
Berry seeds complex	1–2 tablets after each meal.	Has shown anti-inflammatory effects on benign prostatic hyperplasia.
Kelp	1,000–1,500 mg daily.	Supplies necessary minerals for improved prostate function.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	For cellular protection.
Magnesium plus calcium	As directed on label. As directed on label.	Necessary minerals for improved prostate function.
Vitamin C with bioflavonoids	1,000–5,000 mg daily.	Promotes immune function and aids healing.

**Herbs**

☐ Teas made from the diuretic herbs buchu and corn silk are helpful. Juniper berries, parsley, slippery elm bark, and uva ursi are also natural diuretics and urinary tract tonics.

- Bilberry and birch are urinary tract antiseptics.
- Chinese ginseng is beneficial for prostate health and sexual vitality

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

- Echinacea and goldenseal have antiviral and antibacterial properties that can help to alleviate infection.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Goldenseal root is a diuretic and antiseptic.
- A decoction of equal quantities of gravel root, hydrangea root, and sea holly helps to ease inflammation and reduce the discomfort of urination. Take 3 to 4 teaspoonfuls three times daily. Marshmallow leaves may be added to this mixture for their demulcent properties if burning persists.
- Olive leaf extract contains anti-inflammatory agents.
- Nettle and turmeric are anti-inflammatory agents. Combined extracts of nettle root and saw palmetto have proved effective for BPH.
- Pygeum (*Pygeum africanum*) has been proven effective in the treatment and prevention of BPH and prostatitis in many worldwide studies. It has become a primary therapy for these conditions in Europe.
- Saw palmetto has been used to treat prostate enlargement and inflammation, painful ejaculation, difficult urination, and enuresis (the inability to control urination). It reduces prostatic enlargement by reducing the amount of hormonal stimulation of the prostate gland.
- Siberian ginseng is a tonic for the male reproductive organs.

*Caution:* Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

- Other herbs beneficial for the prostate include cayenne (capsicum) and false unicorn root.

### Recommendations

- Drink more cranberry juice. This can protect against urinary tract infections, which have been linked to some forms of prostatitis.
- See Herbs, above, and try one or more of the recommended combinations. Acute inflammation or enlargement of the prostate gland often responds to certain herbal teas. If no improvement takes place or if the symptoms recur, consult a urologist.
- Take steps to reduce your blood cholesterol level. (See HIGH CHOLESTEROL in Part Two.) Studies have shown a con-

nection between high cholesterol and prostate disorders. Cholesterol has been shown to accumulate in enlarged or cancerous human prostates.

- Use hydrotherapy to increase circulation in the prostate region. One method involves sitting in a tub that contains the hottest water tolerable for fifteen to thirty minutes once or twice a day. Another form of hydrotherapy involves spraying the lower abdomen and pelvic area with warm and cold water, alternating between three minutes of hot water and one minute of cold. Still another technique involves sitting in hot water while immersing the feet in cold water for three minutes, and then sitting in cold water while immersing the feet in hot water for one minute.
- Eat 1 to 4 ounces of raw pumpkin seeds every day. Pumpkin seeds are helpful for almost all prostate troubles because they are rich in zinc. As an alternative, pumpkin seed oil can be taken in capsule form.
- Eliminate from your lifestyle such items as tobacco, alcoholic beverages (especially beer and wine), caffeine (especially coffee and tea), chlorinated and fluoridated water, and spicy and junk foods. Try to reduce your weight if you are overweight. Limit your exposure to pesticides and other environmental contaminants.
- If you have prostatitis, increase your fluid intake. Drink two to three quarts of spring or distilled water daily to stimulate urine flow. This helps to prevent cystitis and kidney infection as well as dehydration.
- Get regular exercise. Do not ride a bicycle with a standard seat, however; this may put pressure on the prostate. Special bicycle seats are available that have a central opening so that pressure is not put on the prostate. Walking is good exercise.
- If your prostate is enlarged, be cautious about using over-the-counter cold or allergy remedies. Many of these products contain ingredients that can inflame the condition and cause urinary retention.
- Avoid exposure to very cold weather.

### Considerations

- It is important that prostatitis be diagnosed correctly because the appropriate treatment depends on the cause. For bacterial prostatitis, the conventional treatment involves antibiotics. Antibiotics do not work with the noninfectious type of this condition.
- Prostate Rx from Biotec Corporation and Prost-Actin from Nature's Plus are complexes designed to promote prostate health.
- If the prostate is infected, treatment with antibiotics and analgesics may be necessary.
- Enlarged prostate may be treated surgically with a procedure called transurethral resection of the prostate (TURP). This procedure is twice as likely to provide long-term relief than drugs or other treatments are. Side effects of the procedure include retrograde ejaculation (in which the semen

is pumped back up into the bladder) and, in some cases, impotence or incontinence. About 2 to 3 percent of men who have the procedure need another operation within three years. Prostatron is a transurethral procedure that uses microwaves to destroy excess prostate tissue. In addition, another microwave procedure, Targis System, protects the urethra using a cooling system. Both procedures are done in about an hour on an outpatient basis without general anesthesia. The microwave procedures do not cure benign prostatic hyperplasia (BPH), but they reduce urinary frequency, urgency, straining, and intermittent flow.

The drugs finasteride (Proscar) and dutasteride (Avodart) may be used to treat moderate prostate enlargement. They both block an enzyme that converts the male hormone testosterone into dihydrotestosterone, which promotes the growth of prostate tissue. These increase urine flow and reduce the size of the prostate. Side effects are rare and mild and are mostly related to sexual dysfunction. Sexual performance is recovered when the drug is stopped. In addition, because it reduces the amount of prostate tissue, it can skew the results of the blood test used to detect prostate cancer.

Alpha-blockers such as terazosin (Hytrin) and doxazosin (Cardura) can be used to reduce the size of an enlarged prostate.

Engaging in sexual intercourse while the prostate is infected and irritated may further irritate the prostate and delay recovery.

Some people believe that prostatitis is caused by an inability to process uric acid, a condition that can lead to gout. (See GOUT in Part Two.)

Vasectomy for sterilization has been linked to prostate disorders and even cancer.

Zinc deficiency is linked to enlargement of the prostate. Soil used for farming is often deficient in zinc, and unless you eat husks of cereals or brewer's yeast, it is difficult to get enough zinc in the diet. Alcohol causes a deficiency of zinc and other serious nutritional deficiencies. However, too much zinc (over 100 milligrams a day) can depress immune function.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

All men aged forty or over should have a yearly rectal examination, during which the prostate gland is checked.

## PSORIASIS

Psoriasis is a chronic skin disease that affects 7 million Americans, and 150,000 cases are diagnosed each year. It appears as patches of skin on the legs, knees, arms, elbows, scalp, ears, and back that are red to brown in color and covered with silvery-white scales. Toes and fingernails can lose their luster and develop ridges and pits.

Often hereditary, this condition is linked to a rapid

growth of cells in the skin's outer layer. These growths on the epidermis never mature. Whereas a normal skin cell matures and passes from the bottom layer of the skin to the epidermis in about twenty-eight days, psoriatic cells form in about eight days, causing scaly patches that spread to cover larger and larger areas. The result of this disorder is the production of excessive numbers of skin cells in a very short time. The condition is not contagious.

Psoriasis generally follows a pattern of periodic flare-ups alternating with periods of remission, most commonly beginning between the ages of fifteen and thirty. About 75 percent of those with psoriasis develop it before turning forty years of age. Among other things, attacks can be triggered by nervous tension, stress, illness, injury, surgery, cuts, poison ivy, viral or bacterial infection, sunburn, cold weather, overuse of drugs or alcohol, smoking, or the use of nonsteroidal anti-inflammatory drugs, lithium, chloroquine (Aralen), and beta-blockers, a type of medication frequently prescribed for heart disease and high blood pressure. Some people experience an associated arthritis (psoriatic arthritis) that is similar to rheumatoid arthritis and difficult to treat.

The underlying cause of the condition is not known, but it may result from a faulty utilization of fat; psoriasis is rare in countries where the diet is low in fat. Current research points also to an immune system role in psoriasis. The buildup of toxins in an unhealthy colon also has been linked to the development of psoriasis.

The dosages given below are for adults.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Flaxseed oil or primrose oil or Ultimate Oil from Nature's Secret	As directed on label 3 times daily. As directed on label 3 times daily. As directed on label.	To supply essential fatty acids, important for all skin disorders. Aid in preventing dryness.
Vitamin A with mixed carotenoids plus natural beta-carotene	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Protects the skin tissue. <i>Note:</i> If you have diabetes, omit these supplements. People with diabetes often cannot utilize beta-carotene.
Vitamin D	As directed on label.	A hormone vital for healthy skin.
Zinc  plus copper	50–100 mg daily. Do not exceed this amount.  3 mg daily.	Protein metabolism depends on zinc. Protein is needed for healing. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.
<i>Very Important</i>		
Proteolytic enzymes	As directed on label. Take between meals.	Stimulates protein synthesis and repair.
Selenium	200 mcg daily. Do not exceed this amount. If you are pregnant, do not exceed 40 mcg daily.	Has powerful antioxidant properties.

Shark cartilage	1 gm per 15 lbs of body weight daily, divided into 3 doses. If you cannot tolerate taking it orally, it can be administered rectally, in a retention enema.	Inhibits the growth of blood vessels to stop the spread of psoriasis. Itching and scaling clear first, then redness gradually fades. Allow two to three months to see results.
Vitamin B complex	50 mg of each major B vitamin 3 times daily. (amounts of individual vitamins in a complex will vary).	Necessary for all cellular functions; antistress vitamins that help to maintain healthy skin.
plus extra vitamin B <sub>1</sub> (thiamine) and vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> and folic acid	50 mg 3 times daily. 100 mg 3 times daily. 50 mg 3 times daily. 2,000 mcg daily. 400 mcg daily.	Needed for repair and healing of skin tissue. Aids in proper adrenal function, relieving stress on this organ. Aids in reducing fluid retention, keeping down infection. Use a lozenge or sublingual form.
Vitamin C with bioflavonoids	2,000–10,000 mg daily.	Important for formation of collagen and skin tissue, and for enhancing the immune system.
Vitamin E	200 IU daily or 400 IU every other day.	Neutralizes free radicals that damage the skin. Use an emulsion form for easier assimilation. Use d-alpha-tocopherol form.

#### Important

Kelp	1,000–1,500 mg daily.	Supplies balanced minerals. A good source of iodine.
Methylsulfonylmethane (MSM)	As directed on label.	Needed for tissue repair. Often deficient in people with this disorder.

#### Helpful

Glutathione	500 mg twice daily, on an empty stomach.	A powerful antioxidant that inhibits the growth of psoriatic cells.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote overall skin health.
Lecithin granules or capsules or lipotropic factors	1 tsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals. 200–500 mg daily.	Fat emulsifiers. Lecithin also protects the cells.
Multivitamin and mineral complex with calcium and magnesium	As directed on label. 1,500 mg daily. 750 mg daily.	Needed for basic vitamins and minerals.

#### Herbs

- Burdock root and red clover cleanse the blood.
- Poultices made from dandelion, and yellow dock can help psoriasis. (See USING A POULTICE in Part Three.)
- Add 2 teaspoons of ginger to bathwater.

To reduce redness and swelling, lightly brush off scales with a loofah and apply alcohol-free goldenseal extract.

Lavender is good to use in a sauna or steam bath. It fights inflammation and soothes and heals irritated skin.

*Note:* If you are pregnant or have heart disease or high blood pressure, do not use heat treatments.

Sarsaparilla and yellow dock are good detoxifiers.

Silymarin (milk thistle extract) increases bile flow and protects the liver, which is important in keeping the blood clean. Take 300 milligrams three times daily.

Wild pansy is used to treat psoriasis.

#### Recommendations

Eat a diet that is composed of 50 percent raw foods and includes plenty of fruits, grains, and vegetables. Include fish in the diet as well.

Get plenty of dietary fiber. Fiber is critical for maintaining a healthy colon. Many fiber components, such as apple pectin and psyllium husks, are able to bind to bowel toxins and promote their excretion in the feces. Also follow the program for colon cleansing. (See COLON CLEANSING in Part Three.) A clean colon is very important.

Use fish oil, flaxseed oil, or primrose oil supplements. They contain ingredients that interfere with the production and storage of arachidonic acid (AA), a natural substance that promotes the inflammatory response and makes the lesions of psoriasis turn red and swell. Red meat and dairy products contain small amounts of AA, so you may want to avoid these foods. The biggest source of AA is vegetable oils found in most baked goods, salty snacks, margarine, and salad dressings. Using flaxseed and olive oil for salads and canola and soy oils for cooking rather than oils such as corn and cottonseed reduces your AA intake.

Apply seawater to the affected area with cotton several times a day.

Use cold-pressed flaxseed, sesame, or soybean oils.

Do not consume citrus fruits, fried foods, processed foods, saturated fats (found in meat and dairy products), sugar, or white flour.

#### Considerations

There is no known cure for psoriasis. Treatment is aimed at reducing the symptoms, and includes the use of topical corticosteroids, ointments, and creams to soften the scales combined with gentle scrubbing to remove them, which reduces the itching. Sometimes ultraviolet light (UVL) therapy is used to retard the production of new skin cells. UVL therapy is sometimes combined with tar therapy; tar is applied to the scaly patches, which are then exposed to the UV light. Another treatment involves using a drug called anthralin (Drithocrema, Dritho-Scalp). This drug can also remove some of the scalp, making the skin smoother. It stains very badly, so its use is usually short-term.

❑ Outbreaks of psoriasis seem to lessen during the summer months. It may even go away on its own, but once you have had psoriasis, it is always possible that it will return.

❑ The freezing of moderately sized psoriatic lesions using liquid nitrogen has been tested with good results.

❑ Cortisone creams, which discourage skin cells from multiplying, are often prescribed for psoriasis, but long-term use makes the skin thin and delicate.

❑ The drug methotrexate (also sold as Rheumatrex) is effective for severe psoriasis. However, this drug can cause liver damage, especially with long-term use. Drugs called retinoids such as tazarotene (Tazorac, Avage) are related to vitamin A. This group of drugs may reduce the production of skin cells in severe psoriasis that doesn't respond to other therapies. These products make the skin dry and cause itching. Since this class of products can cause birth defects, they should not be used by pregnant women. Cyclosporine (Sandimmune) therapy has been tested with good results because it suppresses the immune system, which with psoriasis is in overdrive.

❑ A skin patch, Actiderm, manufactured by ConvaTec, can be applied over most topical psoriasis medications, especially steroid (cortisone) ointments, to make them more effective. The patch allows one to achieve better results with milder steroids and fewer doses.

❑ Activated vitamin D<sub>3</sub> ointment (Dovonex), available by prescription only, has produced good results for many people with mild to moderate forms of psoriasis. It is a cream and may be used with other topical medications or phototherapy.

❑ Ultraviolet light has been effectively used to treat severe psoriasis along with a drug called methoxsalen (Oxsoalene-Ultra). The drug makes the skin more sensitive to the light therapy. This combination effectively clears or improves severe, recalcitrant, disabling psoriasis in 84 percent of patients.

❑ The FDA has approved several biological therapies for psoriasis. These include alefacept (Amervive), etanercept (Enbrel), and infliximab (Remicade). These drugs are given intravenously, intramuscularly, or subcutaneously, and are reserved for those who have failed to respond to traditional therapies. The drugs have strong effects on immune function and may cause infections.

❑ For names and addresses of organizations that can provide more information about psoriasis, see Health and Medical Organizations in the Appendix.

## RADIATION EXPOSURE

Radioactive pollution from nuclear reactors, plutonium disposal, and uranium mining is a great concern today. Cellular telephones, X-rays, nuclear medicine, computer monitors, television sets, smoke detectors, and microwave ovens are among the common items that are sources of radiation exposure. Radiation is around us all the time in both natural and artificially introduced forms. The sun is a natural source of radiation exposure, and so is radon, a naturally occurring radioactive gas that is reported to be the second leading cause of lung cancer in the United States and claims about 20,000 lives annually. The human body itself is a source of some radiation.

Radioactive elements are made up of unstable atoms that give off energy as the result of spontaneous decay of their nuclei. If the energy released by a radioactive element is strong enough to dislodge electrons from other atoms or molecules in its path, it can damage or even kill living tissue.

This type of radiation is called ionizing radiation. Even if only one cell is exposed to radiation, the radiation can destroy, damage, or alter the makeup of that cell. The alteration of cell structure by radioactive particles can lead to the development of cancer. If a cell's DNA is damaged, this can cause genetic mutations that can be passed down to offspring.

Radiation exposure in the United States comes primarily from the following sources, in order:

- Radon: 79 percent.
- Other natural sources: 11 percent.
- Medical sources: 6 percent.
- Other man-made sources: 4 percent.

Radiation exposure is measured in units called *rems*. The average American is exposed to about 360 millirem (a millirem is equal to 1/1,000 rem) of radioactivity per year. Our bodies naturally produce about 40 millirem of radiation per year from potassium 40. A chest X-ray exposes you to about 10 millirem.

The risk of dying from radiation-induced cancer increases by 8 percent for each exposure exceeding 10 rem (or 10,000 millirem). Comparing estimated years of life lost from different causes is probably the best way to see how radiation affects our lives.

Health Risk	Estimated Time Lost
Smoking 20 cigarettes/day	6 years
Overweight by 15%	2 years
Alcohol	1 year
Natural hazards	7 days
Occupational dose at 1 rem/year	51 days
Occupational dose of radiation (300 millirem/year)	15 days

Radioactive elements are structurally similar to their nonradioactive counterparts, differing only in the number of neutrons the atoms contain. This is why nutrition is important in preventing or blocking damage from exposure to radioactive elements. If you do not obtain sufficient amounts of calcium, potassium, and other minerals in your diet, your body may absorb radioactive elements that are similar in structure to these nutrients. For example, if you do not obtain enough calcium, your body will absorb radioactive strontium 90 (Sr-90) or other elements that are similar in structure to calcium, if they are available. Similarly, if you obtain sufficient potassium from your diet, your body will be less likely to retain any radioactive cesium 137 it encounters, as this element is similar to potassium.

If the cells are able to obtain all nutrients they need from your diet, they will be less likely to absorb radioactive substitutes, which are then more likely to be discarded from the body.

The effects of radiation exposure can be acute, following a single, relatively high-intensity exposure, or they can be delayed or chronic. Acute reactions to radiation are extremely dangerous. They cause symptoms of listlessness, nausea, vomiting, weakness, and loss of coordination, leading to dehydration, convulsions, shock, and even death.

Fortunately, the amount and type of exposure that causes such serious reactions are extremely rare.

Radiotherapy treatment for cancer involves the administration of fairly high doses of radiation specifically targeted at cancerous cells. The idea underlying this treatment is that the radiation kills the cancer, but healthy tissue, which is not targeted, is only minimally affected. Not surprisingly, the major side effect of this type of treatment is radiation sickness, with the classic symptoms of nausea, vomiting, headache, weakness, loss of appetite, and hair loss.

Dental checkups today often include X-rays to locate cavities. Physicians take X-rays to determine whether a bone is broken, to check cardiovascular and respiratory health, and to locate tumors and areas of dysfunction.

Women are urged to have regular mammograms, or breast X-rays, for early detection of breast cancer. Cancer research indicates that a significant percentage of women in the United States have inherited a gene, dubbed *oncogene AC*, that is sensitive to X-ray exposure. For these women, even short periods of X-ray exposure can lead to the development of cancer.

Fruits and vegetables—in fact, all foods—contain some level of radioactive material. Milk is checked in some states for the presence of strontium 90 (Sr-90), an element that is present as a result of aboveground nuclear testing (though aboveground testing is now banned in the United States). Sr-90 has a half-life of about twenty-eight years.

There is nothing that can protect a person against radioactive substances such as radon except detection and eradication of the problem. If radon is detected in your home, you need to hire trained experts to have it removed. But

good nutrition and a good supplement program will provide support and protection for your immune system. It is advisable to buy your fruit, vegetables, meat, and grains from sources that employ organic methods of farming to exclude further toxins from your diet.

Unless otherwise specified, the doses recommended here are for persons age eighteen and over. For children between twelve and seventeen, use three-quarters the recommended dose; for children between six and twelve, use one-half the recommended dose; and for children under six, use one-quarter the recommended dose.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Calcium and magnesium	1,500 mg daily.	To help prevent the body from absorbing radioactive materials.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Protects the body from harmful radiation. Works with coenzyme Q <sub>10</sub> to support the immune system and detoxify the bloodstream.
Glutathione plus L-cysteine and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To detoxify harmful substances and protect against the harmful effects of radiation.
Kelp	1,000–1,500 mg daily.	Protects against radiation. Take kelp in tablet form or eat sea vegetables.
<i>Important</i>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Stimulates and protects the immune system.
Grape seed extract	As directed on label.	A powerful antioxidant.
Oxy-5000 Forte from American Biologics	As directed on label.	This antioxidant is high in superoxide dismutase (SOD), a powerful antioxidant.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A free radical scavenger that protects against cancer.
Vitamin B <sub>5</sub> (pantothenic acid)	200 mg before and after X-ray exposure; 50 mg daily thereafter.	Protects against the harmful effects of radiation.
Vitamin C with bioflavonoids including rutin	5,000–20,000 mg daily in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	A powerful free radical scavenger. A vitamin C complex that contains 200 mg of rutin per capsule is best.
<i>Helpful</i>		
Brewer's yeast	As directed on label.	A natural source of pantothenic acid, as well as the other B vitamins.
Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Protects cell membranes from radiation.

Vitamin A with mixed carotenoids including beta-carotene	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Protects and strengthens the immune system, especially in combination with vitamin E.
Vitamin B complex plus extra inositol	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg daily.	Helps to protect against the harmful effects of radiation.
Vitamin E	200 IU daily.	Protects and strengthens the immune system, especially in combination with vitamin A. Use d-alpha-tocopherol form.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Helps to increase immunity. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Recommendations

- Include apples in the diet; they are a good source of pectin, which binds with radioactive particles. Pectin is also available in supplement form.
- Eat buckwheat, which is high in rutin, a bioflavonoid that protects against the effects of radiation.
- Consume avocados, lemons, and cold-pressed safflower and olive oils. These supply essential fatty acids.
- Drink plenty of steam-distilled water.
- If you use a cellular telephone, guard against possible contamination by purchasing an earpiece. Or buy one with a speaker and use that. No link between brain cancer and cell phone use has yet been proved, but it makes sense to be cautious. The electromagnetic waves from a cell phone are supposed to meet government guidelines, but this is uncharted territory. It is best to err on the side of caution. There are numerous products on the market that contain an earpiece and attached microphone allowing you to keep the telephone itself some distance from your body.
- If you use a computer and sit in front of a monitor all day, use a radiation/glare filter screen. Monitors are much better than they used to be, but it is wise to be cautious.
- Have your home tested for radon. This is a radioactive gas that occurs naturally in the soil in some places. It has no smell. The biggest danger is from exposure to radon inside the home, where the gas can accumulate and escape detection. People who smoke are at even greater risk from the damaging effects radon has on the lungs. Radon detection kits are available in most hardware stores and home centers. They may also be available from your local department of health and some drugstores. If the levels are too high, you can contact an expert company that can remove the radon.
- If there is even a chance you might be pregnant, do not let your doctor or dentist do any X-ray testing. Women ex-

posed to X-rays in the first three to five weeks of pregnancy are at a higher risk of having a miscarriage or delivering a baby with birth defects. Exposure between the eighth and fifteenth week can cause the baby to suffer brain damage. Childhood leukemia can occur if a fetus is exposed to X-rays during the first trimester of pregnancy.

## Considerations

- As technology improves and more becomes known about how cancer cells work, the part that radiation therapy has to play in cancer treatment has been reduced. Radiation exposure is also more carefully monitored than it was in the past.
- A study conducted at the University of Medicine and Dentistry of New Jersey in Newark showed that rats given orange juice before exposure to low-level radiation (1 to 50 rems) suffered two times less damage than rats given water before exposure.
- See also WEAKENED IMMUNE SYSTEM in Part Two.

## RARE DISORDERS

*Jumping Frenchmen of Maine* sounds like an uproarious, modern-day stage show or a new music group of some kind. But it is neither. It is actually the name of an unusual disorder that causes an extreme startle reaction to unexpected noises or sights. Though little is known about Jumping Frenchmen of Maine, the disorder and more than 6,000 other rare, or “orphan,” diseases are receiving increasing attention from the government, patient groups, and the pharmaceutical industry.

In the United States, an orphan disease is defined as a condition that affects fewer than 200,000 people nationwide; there are more than 5,000 such disorders. This includes diseases as familiar as cystic fibrosis, Lou Gehrig’s disease, and Tourette syndrome, and as unfamiliar as hamburger disease, Job syndrome, and acromegaly (or gigantism). For some diseases, there are fewer than one hundred known cases. Collectively, however, rare disorders affect as many as 25 million Americans, according to the National Institutes of Health (NIH), and that makes these diseases—and finding treatments for them—a serious public health concern.

New rare diseases are discovered every year. Most are inherited and caused by alterations or genetic mutations (defects in genes). Genes are pieces of DNA, part of the code that determines the traits and individual characteristics of all living things. Each human cell contains around 30,000 genes. Besides influencing features such as eye and hair color, genes also can play a role in the development of diseases and in their transmission from parent to child. In addition to those with genetic causes, there are some rare diseases that can be acquired as a result of environmental and toxic conditions.

## Rare Disorders and the Internet

New online support groups for people with various health problems continue to proliferate. Not only are people receiving comfort from others with the same conditions, but they are learning from each other's experiences as well. By the late 1990s, most nonprofit organizations had websites where people could ask questions and get immediate answers.

Nevertheless, people diagnosed with rare disease often are vulnerable to misguided assistance. While the National Institutes of Health's Office of Rare Diseases encourages people to use the Internet to find information, it also warns that it is dangerous to rely solely on the computer for

medical advice. It is especially important to exercise caution when claims are made for unproven remedies and "miracle" cures. Too often, misleading or inaccurate information is given out that can do more harm than good. In addition, one person's experience may vary greatly from another's. The best way to use the Internet is to complement the communication between doctor and patient, not to replace it.

Be wary also of advertisements, newsletters, and books that offer "medical or natural cures." Always keep in mind, anything that sounds too good to be true probably is.

As disparate as rare diseases are, the people who have them share many common frustrations. For example, for one-third of people with a rare disease, getting an accurate diagnosis can take one to five years. And people often are so isolated that they may never know anyone else with the same disease. They often must travel long distances to visit the few doctors knowledgeable about their illnesses, and the costs involved with diagnosis, treatment, and other related expenses can be exorbitant. Finally, they have trouble obtaining health and life insurance coverage, and if they do manage to get it, it is very expensive.

Many rare diseases or conditions can be difficult to diagnose and manage because in their early stages, the symptoms may be absent or masked, misunderstood, or confused with those of other diseases. One disease that was originally misdiagnosed as multiple sclerosis (MS) led to delayed and inappropriate treatment of the individual's true problem—adrenomyeloneuropathy (AMN). AMN is a milder form of adrenoleukodystrophy (ALD), one of a group of genetically determined progressive disorders, known collectively as *leukodystrophies*, which affect the brain, spinal cord, and peripheral nerves. This one case raised a red flag for the individual's doctor when his patient mentioned that not only had his grandfather been diagnosed with MS—and in fact had died from it—but also that he had lost two brothers and several cousins to the same disease.

Because MS is not hereditary, the doctor in this case suspected that the disease that had befallen his patient's family members, and now him, was not MS because of its genetic pattern of inheritance. An in-depth family history revealed that he and his brothers had had a 50 percent chance of having either ALD or AMN because their mother was a carrier of the defective gene involved. Following his diagnosis of AMN, two more of his brothers died of the disease.

ALD affects only 1 in about 100,000 people. This was enough, however, to form an organization, the United Leukodystrophy Foundation (ULF), a voluntary health organization. According to the ULF, the leukodystrophies are

often misdiagnosed as MS because diagnosis of neurological conditions relies on subtle and circumstantial evidence, and even the most experienced clinicians may have difficulty distinguishing between the two.

For people with rare disorders there may be no cures, but treatments of the symptoms can help. Having the support of family and friends, patient advocacy groups, and disease associations like ULF is also helpful. Participating in clinical trials may be a way to receive the most advanced care for some diseases. People who experience unexplained symptoms, recurrent infections, and pain that has gone undiagnosed for a long period of time might want to visit a referral center that is experienced in diagnosing those with rare diseases. Some rare diseases do not have clearly defined treatment guidelines and require the specific skills of an expert physician. Be sure to go to a hospital that is familiar with treating people with multiple problems.

Before the passage of rare disease laws in the United States, people diagnosed with rare diseases were denied access to effective medicines because prescription drug manufacturers rarely could make a profit from marketing drugs to such small groups. Consequently, the prescription drug industry did not adequately fund research for the development of so-called orphan products. Other potential sources, such as research hospitals and universities, also lacked the capital and business expertise to develop treatments for small patient groups. Despite the urgent health need for these medicines, they came to be known as orphans because companies were not interested in "adopting" them.

This changed in 1983 when Congress passed the Orphan Drug Act (ODA). Since 1983, the ODA has resulted in the development of nearly 325 orphan drugs, which now are available to treat a potential population of more than 17 million Americans. In contrast, the decade prior to 1983 saw fewer than ten such products developed without government assistance. As a result, treatments are available to people with rare diseases who once had no hope for survival.

Congress also approved funding for several regional Cen-

ters of Excellence on rare diseases. Support groups such as the National Organization for Rare Disorders (NORD; see Health and Medical Organizations in the Appendix) have worked aggressively in the last twenty years to draw attention to people with rare diseases, especially their lack of treatment options. Paramount in NORD's ongoing cause are efforts to promote legislation, such as the ODA, that encourages further research and continuing development of products that are necessary—and often lifesaving—and to provide easier access to such treatments.

Individuals suffering from these various rare diseases and their caregivers would be well advised to stay abreast of new research as it is reported in hopes of being able to wisely choose the best combination of therapy and nutritional supplementation. Unfortunately, our knowledge on the subject of orphan diseases is limited at this time, as the research to date is also limited. We look forward to information breakthroughs that we can share in future editions of this book.

In thinking about nutritional guidelines for rare orphan diseases, it may be helpful to consider the baffling symptoms, suspected causes, and possible nutritional supports appropriate for late-onset autism. Due to the multifaceted nature of late-onset autism and the successes and failures associated with attempted treatments, it is a disease that, when studied carefully, can give hints as to the factors influencing other rare diseases.

Late-onset autism is a rare neurological condition that afflicts young children, usually between their first and fifth years. The majority of affected families report normal development during the first year or so, but these skills then disappear and new skills fail to develop. The child ceases to socialize, and verbal abilities are usually completely lost. Temper tantrums become quite common and more severe as the child no longer has the ability to communicate his or her needs. An autistic child usually becomes intolerant of certain foods as his or her digestive system becomes less functional. His or her stool and sometimes urine can become unusually putrid, and his or her movements usually become repetitive and disassociated from surroundings. The resulting stress takes its toll on the entire family.

Most clinicians believe that a cure is impossible, but some disagree and believe that a cure will soon be found. The causes of late-onset autism are debated among researchers, clinicians, and informed parents. A few believe that the mercury compound used in some vaccines is to blame. In addition, there is often a history of frequent ear infections with much antibiotic use. Some believe that an overuse of antibiotics has killed off the friendly intestinal bacteria, leaving the gut vulnerable to the antibiotic-resistant, neurotoxin-producing bacterium *clostridium*. Other researchers suggest that, much like typical autism, there is a genetic component. In many cases, both mercury and *clostridium* are present. Perhaps all of these observations are correct to one degree or another. Hopefully, time and study will reveal the answers. For now, we can only guess which factors are to blame.

The afflicted children, whose blood tests high for mercury, may be treated with chelation therapy by licensed health care professionals. Many are reporting positive results though not a complete cure. Other practitioners are concentrating on the digestive system and are attempting to bring the overgrowth of *clostridium* bacteria under control and, again, are reporting improvement though not a cure. Most are making dietary and nutritional changes, administering antioxidants as well as many other supplements, and are reporting improvement but still no cure. As the body of evidence grows that making nutritional and dietary changes affects this form of autism, the argument for a genetic cause weakens. If external factors are to blame, avoidance of the disease, if not a cure, is probable. (For nutritional recommendations that may be of help in late-onset autism, see the recommendations under AUTISM, page 234.)

Late-onset autism is a disease where there are, in addition to chelation therapy, four primary areas of support that have shown some degree of success and perhaps can be applied when fighting other very difficult and rare diseases.

- Gastrointestinal support.
- Neurological support.
- Cardiovascular support.
- Immune system support.

Some general rules to consider when combating many diseases:

1. *Start with the gastrointestinal tract.* This should include digestive enzymes and probiotics. Care must be taken when giving digestive enzymes. Too much can result in a partial digestion of the stomach lining itself, resulting in severe inflammation, especially with small children. Digestive enzymes and probiotics and guidance for their use are available from:

Healthy Alternatives, Inc.  
10458 Moe Hall Road NW  
Garfield, MN 56332  
888-362-0401  
[www.healthyalternativesinc.com](http://www.healthyalternativesinc.com)

2. *Provide the necessary nutritional supplements for neurological support.* Neurological stress consumes excessive quantities of gamma-aminobutyric acid (GABA). GABA acts as a stabilizer by inhibiting neurological overreaction. Vitamin B<sub>12</sub>, in the methylcobalamin form, aids in the rebuilding and healing of nerve cells.

The following formula includes precursors for the production of GABA, serotonin, and other supporting nutrients, and is available under the brand name GabaMax from:

NeuroScience Inc.  
373 280th Street  
Osceola, WI 54020  
888-342-7272  
[www.neurorelief.com](http://www.neurorelief.com)

GabaMax includes the following ingredients:

- N-acetyltyrosine
- 5-hydroxy L-tryptophan (5-HTP)
- Theanine
- Glutamine
- Taurine
- Vitamin B<sub>6</sub>
- Folic acid
- Vitamin C
- Magnesium

GabaMax should be taken as directed on the bottle.

The addition of 5,000 mcg (1,000 mcg for small children) of vitamin B<sub>12</sub> in the form of methylcobalamin works well with the above formula to help heal nerve damage.

3. *Provide support for the cardiovascular system.* There are many rare diseases where the circulatory system is so compromised that nutrients have great difficulty finding their way to the areas in desperate need of them. Therefore, supplements that target the circulatory system may help. (See **CARDIOVASCULAR DISEASE**, page 306.)
4. *Strengthen the immune system to help combat microbes that may attack during times of weakness.* There is also some suspicion that a few of the orphan diseases are virally induced. (See **WEAKENED IMMUNE SYSTEM**, page 774.)

Many rare diseases are known to be of genetic origin, and in many such cases there is evidence that even they may respond positively to sound nutrition. The diseases that follow may be caused by problems in some or all of the above areas. You'll find notes for each that suggest different combinations of treatment that could help to alleviate their symptoms and/or severity.

### ACUTE DISSEMINATED ENCEPHALOMYELITIS

Acute disseminated encephalomyelitis (ADE) is characterized by inflammation of the brain and spinal cord caused by damage to the myelin sheath—the fatty insulator of the brain's nerve fibers. Both viral and bacterial infection can be associated with ADE. It can also arise as a complication of inoculation or vaccination. The onset of ADE is sudden and symptoms vary from person to person. They can include headaches, delirium, lethargy, coma, seizures, stiff neck, fever, ataxia, optic neuritis, transverse myelitis, vomiting, and weight loss. In some cases, a limb or an entire side of the body can become paralyzed. ADE strikes children more often than adults.

#### Considerations

- The treatment of ADE typically includes the use of corticosteroid medications plus symptom-relieving and supportive measures.
- The prognosis for people with ADE varies. Some patients achieve complete or nearly complete recovery, while

others continue to suffer residual symptoms. In severe cases, the disorder can prove fatal. If diagnosed early and treated promptly, however, the prognosis for ADE disorder is generally good.

- For nutritional recommendations, see **Neurological Support**, page 679; **CARDIOVASCULAR DISEASE**, page 306; and **WEAKENED IMMUNE SYSTEM**, page 774.

### AGNOSIA

Agnosia is a rare disorder characterized by the inability to recognize familiar objects or people. Agnosia can be limited to one sense such as hearing or vision. For example, a person may have difficulty identifying a sound as a cough or recognizing an object as a cup. The case made famous in neurologist Oliver Sacks's popular book *The Man Who Mistook His Wife for a Hat* (Touchstone, 1998) was one of a man with visual agnosia.

This disorder can be caused by stroke, dementia, or other neurological disorders. It can become debilitating and compromise the quality of life. Agnosia typically affects specific brain areas in the occipital or parietal lobes, areas of the brain that are important for processing and integrating information received through vision and other senses. People with agnosia may retain cognitive abilities in other areas.

#### Considerations

- The primary cause of agnosia must first be established in order to determine how best to treat symptoms.
- For nutritional recommendations, see **CARDIOVASCULAR DISEASE**, page 306; and **WEAKENED IMMUNE SYSTEM**, page 774.

### ALPHA-1 ANTITRYPSIN DEFICIENCY

Alpha-1 antitrypsin deficiency is a genetic disease characterized by a lack of the protein alpha-1 antitrypsin in the liver. This substance is used to break down enzymes in various organs of the body. The disease can lead to hepatitis and cirrhosis, or scarring, of the liver. In addition, alpha-1 antitrypsin also protects the lungs from irritants in conjunction with an enzyme released by white blood cells. A person deficient in alpha-1 antitrypsin is therefore much more susceptible to lung disease, especially emphysema.

Alpha-1 antitrypsin deficiency most commonly appears in newborn infants and is characterized by jaundice, swelling of the abdomen, and poor feeding. However, the disease may also develop in late childhood or even in adulthood. In such cases, symptoms may include fatigue, poor appetite, swelling of the abdomen and legs, or abnormal results on liver tests.

#### Considerations

- Prolastin is used for alpha-1 antitrypsin deficiency in adults with emphysema. Other treatment aims to control

abnormalities and to provide the liver with essential nutrients. Multiple vitamin supplements plus vitamins E, D, and K are typically prescribed.

Avoid consuming too much salt or protein, and get protein from vegetable sources. Avoid large doses of vitamin A, niacin, and iron from supplements. However, it is fine to get these nutrients from food.

Phenobarbital or cholestyramine is prescribed for jaundice.

For nutritional recommendations, see **CARDIOVASCULAR DISEASE**, page 306.

## ATAXIA

People with ataxia experience a failure of muscle control in their arms and legs, resulting in a lack of balance and coordination or a disturbance of gait. This can occur if parts of the nervous system that control movement are damaged. While the term *ataxia* is primarily used to describe this set of symptoms, it is sometimes also used to refer to a family of disorders.

Most disorders that result in ataxia cause cells in the part of the brain called the cerebellum to degenerate, or atrophy. Sometimes the spine is also affected. While the phrases *cerebellar degeneration* and *spinocerebellar degeneration* are used to describe changes that have taken place in a person's nervous system, neither term constitutes a specific diagnosis. Cerebellar and spinocerebellar degeneration can have many different causes. The age of onset of any resulting ataxia varies depending on the underlying cause of the degeneration. Among the more common inherited ataxias are Friedreich's ataxia and Machado-Joseph disease.

Friedreich's ataxia is an inherited disease that causes progressive damage to the nervous system, resulting in symptoms ranging from muscle weakness and speech problems to heart disease. Symptoms usually begin between the ages of five and fifteen, but can appear as early as eighteen months or as late as thirty years of age. The first symptom is usually difficulty in walking. The ataxia gradually worsens and slowly spreads to the arms and then the trunk. Foot deformities such as clubfoot, flexion (involuntary bending) of the toes, hammertoes, or foot inversion (turning in of the foot) may be early signs. Rapid, involuntary rhythmic movements of the eyeball are common. Most people with Friedreich's ataxia develop scoliosis (a sideways curvature of the spine), which, if severe, may impair breathing. Other symptoms include chest pain, shortness of breath, and heart palpitations.

Machado-Joseph disease (MJD), also called *spinocerebellar ataxia type 3*, is a rare hereditary ataxia. The disease is characterized by clumsiness and weakness in the arms and legs, spasticity, a staggering lurching gait easily mistaken for drunkenness, difficulty with speech and swallowing, involuntary eye movements, double vision, and frequent urination. Some people suffer from dystonia, or sustained

muscle contractions that cause twisting of the body and limbs, repetitive movements, abnormal postures, and/or rigidity—symptoms similar to those of Parkinson's disease. Others have twitching of the face or tongue, or peculiar bulging eyes. In Machado-Joseph disease, degeneration of cells in an area of the brain called the hindbrain leads to deficits in movement. The hindbrain includes the cerebellum, the brain stem, and the upper part of the spinal cord. MJD is an inherited, autosomal dominant disease, which means that if a child inherits one copy of the defective gene from either parent, the child will develop symptoms of the disease. People with a defective gene have a 50 percent chance of passing the mutation on to their children. The severity of the disease is related to the age of onset, with earlier onset associated with a more severe form of the disease. Symptoms can begin any time between early adolescence and about seventy years of age. MJD is also a progressive disease, meaning that symptoms get worse with time. Life expectancy ranges from the midthirties for those with severe forms of MJD to a normal life expectancy for those with mild forms. For those who die early from the disease, the cause of death is often aspiration pneumonia, which can occur if fluids or other materials are inhaled into the lungs and cannot be cleared away.

In addition to being a result of heredity, ataxia also can be acquired. Conditions that can cause acquired ataxia include stroke, multiple sclerosis, tumors, alcoholism, peripheral neuropathy, metabolic disorders, and vitamin deficiencies.

## Considerations

There is no cure for hereditary ataxias. If the ataxia is caused by another condition, that underlying condition is treated first. For example, ataxia caused by a metabolic disorder may be treated with medications and a controlled diet. Vitamin deficiency is treated with vitamin therapy. A variety of drugs may be used to treat gait and swallowing disorders. Foods mixed with thickening agents may help a person to swallow better. Physical therapy can strengthen muscles to improve gait, while devices or appliances can assist in walking and other activities of daily life. The prognosis for individuals with ataxia and cerebellar/spinocerebellar degeneration varies depending on its underlying cause. Most people with ataxia have had a stroke and may go to a nursing home until they are able to care for themselves.

There is currently no effective cure or treatment for Friedreich's ataxia. However, many symptoms and accompanying complications can be treated to help individuals maintain optimal functioning as long as possible. Diabetes and heart problems can be treated with medications. Orthopedic problems such as foot deformities and scoliosis can be treated with braces or surgery. Physical therapy may prolong the use of the arms and legs. Generally, however, a person with Friedreich's ataxia requires a wheelchair, and

in later stages of the disease, he or she is likely to become completely incapacitated. If significant heart disease is involved, a person with Friedreich's ataxia is likely to die in early adulthood, but some who have less severe symptoms live much longer.

MJD is incurable, but some symptoms of the disease can be treated. Treatment with antispasmodic drugs, such as baclofen (Lioresal), can help reduce spasticity. Physiotherapy can help people to cope with disability associated with gait problems; and physical aids, such as walkers and wheelchairs, can assist with everyday activities. Other problems, such as sleep disturbances, cramps, and urinary dysfunction, can be treated with medications and medical care.

For nutritional recommendations, *see* Neurological Support, page 679; and **CARDIOVASCULAR DISEASE**, page 306.

### BELL'S PALSY

Bell's palsy is the result of damage to the seventh cranial nerve and is characterized by weakness and paralysis of one side of the face. Currently, 40,000 Americans develop Bell's palsy each year. Although it can strike anyone at any age, pregnant women and people who have diabetes, influenza, or a cold or other respiratory ailment are particularly susceptible to the disorder. The facial paralysis usually leads to an inability to close the eye on the affected side. Other symptoms may include pain, tearing, drooling, hypersensitivity to sound in the affected ear, and even impairment in taste. Many cases of Bell's palsy are believed to be caused by viruses, especially those in the herpes family such as the herpes simplex virus, which causes cold sores.

#### Considerations

Sometimes steroid drugs (prednisone) are combined with the antiviral medication acyclovir (Zovirax) to treat this condition. However, as of 2001, the American Academy of Neurology concluded that steroids are safe but do not promote faster recovery, and that there is no conclusive evidence that the combination therapy (steroid and antiviral) actually works.

Decompression surgery also has not been shown to be effective, and side effects like permanent hearing loss have been reported.

The prognosis for people with Bell's palsy is very good. Although the condition is troublesome and even possibly alarming, 50 percent of those with the condition improve within a few weeks to a few months. Another 35 percent usually have full recovery within a year.

For nutritional recommendations, *see* Neurological Support, page 679, and add 500–1,000 mg L-lysine daily.

### BINSWANGER'S DISEASE

Binswanger's disease is a rare form of dementia, a loss of certain types of brain function. This disorder is sometimes known as *subcortical dementia*. It begins late in the fourth decade of life and increases in severity with age.

The mental disability characteristic of Binswanger's disease includes memory loss caused by the presence of cerebrovascular lesions in the deep white matter of the brain, cognitive problems, and mood changes. These problems are associated with tiny areas of tissue damage or death—multiple strokes, in effect—that occur deep within the brain's white matter (nerve cells) and that are probably due to severe high blood pressure and blood vessel disease in the head and neck.

In addition to mental symptoms, people with Binswanger's disease are often found to have blood abnormalities and heart valve disorders, and they can become incontinent, experience clumsiness, and develop difficulty with walking, speech, and physical activity in general. The ability to show normal facial expressions may become limited as well. For some people, symptoms progress steadily once they start; for others, symptoms may seem to come and go as people experience strokes followed by partial recovery.

#### Considerations

There is no known cure and no specific treatment recommended for all people with Binswanger's disease. Drug therapy may be used to control blood pressure, depression, and heart arrhythmias.

For nutritional recommendations, *see* Gastrointestinal Support, page 679; Neurological Support, page 679; and **CARDIOVASCULAR DISEASE**, page 306.

### BROWN-SEQUARD SYNDROME

This is a rare neurological condition that leads to weakness or paralysis affecting one side of the body, accompanied by a loss of sensation on the opposite side. These problems are associated with a lesion in the spinal cord that in turn may be the result of a spinal cord tumor, injury to the neck or back, a blocked blood vessel causing ischemia (oxygen deprivation) to the area, or an underlying disease such as tuberculosis or multiple sclerosis.

#### Considerations

The prognosis for people with Brown-Sequard syndrome depends on the underlying cause. Treatment therefore usually focuses on identifying and, if possible, removing the cause. Early treatment with high doses of steroids may be beneficial as well.

For nutritional recommendations, *see* Neurological Support, page 679; and **CARDIOVASCULAR DISEASE**, page 306.

## DYSTONIA

People with dystonia experience sustained, simultaneous muscle contractions that force affected body parts into abnormal and sometimes painful postures and movements. Dystonia is actually not a single disorder, but a category of them, usually divided into two types: primary dystonia, which occurs on its own and has no known cause; and secondary dystonias, which are caused by some underlying problem, such as Parkinson's disease, a brain tumor, or stroke.

### Considerations

❑ A variety of treatments, among them drug therapy, surgery, and physical therapy (including biofeedback), have been used for dystonias. These measures are useful for some people, helping to reducing pain and muscle spasms, although overall the results are decidedly mixed and a certain amount of trial and error can be involved.

❑ A relatively new treatment for dystonia involves the use of a brain implant. A system called the Activa Dystonia Therapy system, which had already been used to treat Parkinson's disease and essential tremor, consists of electrodes and a deep brain neurostimulator. The electrodes are implanted into the brain and connected by wires under the skin to the neurostimulator, which is implanted in the chest. The neurostimulator sends a constant stream of tiny electrical pulses to the brain to suppress symptoms. If both sides of the brain are affected, it is necessary to use two separate systems, one in each side of the brain. A person with the implant touches a handheld magnet over the neurostimulator to switch the device on and off. This system is manufactured by Medtronic Inc. (See Manufacturer and Distributor Information in the Appendix.)

❑ For nutritional recommendations, see Neurological Support, page 679; and CARDIOVASCULAR DISEASE, page 306.

## FABRY'S DISEASE

Fabry's disease is a lipid storage disorder resulting from a deficiency of the enzyme ceramide trihexosidase that is involved in the biodegradation of fats. Because of the enzyme deficiency, there is an insufficient breakdown of lipids, which build up in the body. This leads to a number of problems. Symptoms include burning sensations in the hands and feet that progressively worsen with hot weather and exercise, and reddish purple, raised blemishes on the skin. Eye manifestations like cloudiness of the cornea are found in some boys who suffer from the disorder. As people with Fabry's disease grow older, they become susceptible to heart attack and stroke due to impaired arterial circulation. Eventually, the kidneys are affected, and dialysis or transplantation may be required. Some people also develop gastrointestinal difficulties in which frequent bowel movements occur shortly after eating.

This serious genetic metabolic disorder affects about 1

in 40,000 to 1 in 60,000 men. Although it is believed that fewer women suffer the most serious consequences of the disease, they also can be seriously affected. People with Fabry's disease usually survive into adulthood. However, they have a higher than normal risk of heart attack, stroke, and kidney damage.

### Considerations

❑ Treatment includes therapy with antiseizure medications such as carbamazepine (Tegretol) and phenytoin (Dilantin) for pain in the hands and feet, and nutritional replacement products such as Lipisorb or digestive medications such as metoclopramide (Reglan) to control gastrointestinal hyperactivity.

❑ Recent studies have shown that enzyme replacement is effective therapy. Agalsidase beta (Fabrazyme), a version of the human form of the missing enzyme produced by recombinant DNA technology, has now been approved to treat Fabry's disease. When given intravenously, this replacement enzyme reduces a particular type of fat accumulation in many types of cells, including blood vessels in the kidneys and other organs. It is believed that this reduction of fat deposition will prevent the development of life-threatening organ damage.

❑ For patients with this condition, the Fabry Registry ([www.fabrycommunity.com](http://www.fabrycommunity.com)) is an excellent resource to learn about new treatments and developments for this condition.

❑ For nutritional recommendations, see Gastrointestinal Support, page 679; and CARDIOVASCULAR DISEASE, page 306.

## HEMORRHAGIC COLITIS (HAMBURGER DISEASE)

Hemorrhagic colitis is a gastrointestinal illness caused primarily by a particular strain of bacteria known as *Escherichia coli* (*E. coli*) O157:H7. It is actually a type of food poisoning. (See **FOODBORNE AND WATERBORNE ILLNESS** in Part Two.) In fact, it is also known as "hamburger disease" or "barbecue season syndrome" because outbreaks often are due to consuming grilled hamburger and other beef products that have not been thoroughly or properly cooked or handled. *E. coli* has been shown to come from fruits and vegetables (especially lettuce, alfalfa sprouts, and unpasteurized apple cider and other juices), and has even been found in a refrigerated cookie dough.

While other types of *E. coli* are common in the gastrointestinal tract of healthy people, the O157:H7 strain normally is not. This strain of bacteria produces extremely potent toxins that are the main cause of the symptoms related to the gastrointestinal illness. The most common symptoms of *E. coli* O157:H7 colitis include:

- Diarrhea (often with blood in the stools).
- Severe abdominal cramps.
- Vomiting.

These symptoms usually start within twenty-four hours of consuming contaminated food, but can take as long as two days to appear, and can continue for as long as two weeks. Some individuals develop fever as well with this infection.

People can get hamburger disease at any age; however, young children, older adults, and those with weakened immune systems tend to develop severe symptoms. Thousands of people become infected each year, with many local outbreaks reported in Canada, Japan, the United States, and Europe.

*E. coli* O157:H7 bacteria infect the intestines of cattle and, less frequently, the gastrointestinal tracts of other animals. Typically carried in feces, they can contaminate the meat during and after slaughtering. In addition to beef, these bacteria are associated with consuming unpasteurized milk and cheese and using contaminated water sources. The infection is highly contagious. Once someone has eaten contaminated food, hamburger disease can pass from person to person by hand-to-mouth contact. Poor hand-washing and improper food handling are factors that lead to the spread of these bacteria.

### Considerations

☐ While *E. coli* bacteria can be killed with antibiotics, the toxins they produce—and that cause the illness—remain unaffected, and there is no evidence that these drugs do anything to relieve symptoms or shorten the illness in most cases. Treatment for hemorrhagic colitis therefore focuses on supporting the affected individual, trying to ease symptoms, and taking measures to prevent the spread of the infection.

☐ If complications develop, hospitalization may be required so that proper care can be administered. Especially for small children and older people who cannot adequately hydrate themselves, receiving an intravenous fluid replacement in the emergency room may speed recovery and avoid major dehydration.

☐ Once hemorrhagic colitis is contracted, antibiotics must be taken. However, a nutritional and probiotic regimen can help prevent contraction and/or restore friendly bacteria after completing antibiotics and once the intestine is healed.

☐ For nutritional recommendations, see *Gastrointestinal Support*, page 679; and **WEAKENED IMMUNE SYSTEM**, page 774.

### HEREDITARY FRUCTOSE INTOLERANCE

Hereditary fructose intolerance (HFI) is an inherited disorder characterized by the inability to digest fructose, or fruit sugar. In people with HFI, the enzyme fructose-1-phosphate aldolase is deficient, resulting in an accumulation of fructose-1-phosphate in the liver, kidneys, and small intestine. Symptoms include severe abdominal pain, vomiting, dehydration, convulsions due to low blood sugar,

extreme thirst, excessive urination and sweating, loss of appetite, and stunted growth. Acute symptoms are made worse by the consumption of anything containing fruit sugar. If untreated, HFI can result in coma or death.

### Considerations

☐ Early treatment, primarily the adoption of a fructose-free diet, leads to a normal length and quality of life. Otherwise, the disorder can lead to serious and permanent damage to the liver and kidneys, and, eventually, death.

☐ Adhering to a diet with *no* fructose in it can be difficult in today's world. We encounter fructose not only in natural fruits, fruit juices, and some vegetables, but also in a vast array of processed food products. High-fructose corn syrup, for example, is one of the most common additives listed on food product labels, and it is present not only in foods that taste sweet. It may be worthwhile to consult a qualified nutritionist or dietitian who can help with this task.

☐ For nutritional recommendations, see *Gastrointestinal Support*, page 679.

### HYPERIMMUNOGLOBULIN E [HYPER-IgE] SYNDROME (JOB SYNDROME)

Hyper-IgE syndrome, or Job syndrome, is an immunodeficiency syndrome characterized by recurrent bacterial (staphylococcal) infections, particularly of the skin, and markedly elevated levels of a natural immune-system protein, immunoglobulin E (IgE). Experts suspect that the origin is genetic. The term Job syndrome—named for the Biblical figure who was afflicted with boils—arose because one of the symptoms of this syndrome is recurrent skin abscesses. The staphylococcal infection may involve the skin, lungs, joints, and other sites. Decreased bone density and frequent fractures are common. Signs of allergies, such as eczema, asthma, and runny nose, are sometimes present.

### Considerations

☐ There is no known cure for Job syndrome. The mainstay of treatment is bacterial infection control. Treatment consists of intermittent or continuous antibiotics. Long-term trimethoprim/sulfamethoxazole, a combination antibiotic, is not particularly effective in treating infection.

### IDIOPATHIC THROMBOCYTOPENIC PURPURA

Idiopathic thrombocytopenic purpura (ITP) is a disorder of the blood that leads to low levels of platelets, which are essential for normal clotting activity. This can be due to problems with platelet production, abnormal destruction of platelets, or other factors. The main symptom is abnormal bleeding, which can be manifested as ecchymosis (bruising) and petechiae (tiny red dots on the skin or mucous

membranes). In some instances, bleeding from the nose, gums, or digestive or urinary tracts may also occur. In rare cases, there is bleeding within the brain.

Some cases of ITP are caused by drugs. Others are associated with infection, pregnancy, or immune disorders such as systemic lupus erythematosus. (See LUPUS in Part Two.) About half of all cases are classified as idiopathic, meaning that there is no known underlying cause.

Acute, or temporary, thrombocytopenic purpura is most commonly seen in young children and first diagnosed between two and four years of age. Boys and girls are equally affected. Symptoms often, but do not necessarily, follow a viral infection. About 80 percent of children recover within six months. Thrombocytopenic purpura is considered chronic if it lasts for more than six months. Adults more often have the chronic form of the disorder and females, in this case, are affected two to three times more than males.

### Considerations

❑ If use of a drug is the cause of the thrombocytopenia, standard treatment involves discontinuing the drug's use. Infection, if present, is treated vigorously, since control of the infection can return the platelet count to normal.

❑ The treatment of idiopathic thrombocytopenic purpura is determined by the severity of the symptoms. In some cases, no therapy is needed. In most cases, drugs that alter the immune system's attack on the platelets are prescribed. These include corticosteroids such as prednisone (Delta-sone and others) and/or intravenous infusions of immune globulin. Another treatment that usually results in an increased number of platelets is removal of the spleen, the organ that destroys antibody-coated platelets. A splenectomy is needed if prednisone doesn't work.

❑ Except in certain situations, such as internal bleeding and preparation for surgery, platelet transfusions usually are not beneficial and are seldom performed. Because all therapies can have risks, it is important that overtreatment based solely on platelet counts rather than symptoms be avoided.

❑ In some instances, lifestyle adjustments may help to prevent bleeding due to injury. These would include using protective gear such as helmets and avoiding contact sports if there are symptoms or if platelet counts are less than 50,000 mm<sup>3</sup>. Downhill skiing or any other activity where you can significantly hurt yourself is not advised. Otherwise, most people can carry on normal activities, but final decisions about activity should be made in consultation with a hematologist (a physician who specializes in blood disorders).

❑ For nutritional recommendations, see **CARDIOVASCULAR DISEASE**, page 306; and **WEAKENED IMMUNE SYSTEM**, page 774.

### LEUKODYSTROPHIES

Leukodystrophy refers to progressive degeneration of the white matter of the brain due to imperfect growth or devel-

opment of the myelin sheath, the fatty covering that acts as an insulator around nerve fiber. Myelin is a complex substance made up of at least ten different compounds. The leukodystrophies are a group of disorders that are caused by genetic defects in how myelin produces or metabolizes these chemicals. Each of the leukodystrophies is the result of a defect in the gene that controls only one of these chemicals.

The most common symptom of a leukodystrophy disease is a gradual decline in the functioning of an infant or child who previously appeared well. There may be a progressive loss in body tone, movements, gait, speech, ability to eat, vision, hearing, and behavior. There is often a slowdown in mental and physical development. Symptoms vary according to the specific type of leukodystrophy, and may be difficult to recognize in the early stages of the disease.

The prognosis and recommended treatment for most of the leukodystrophies is symptomatic and supportive, and may include medications; physical, occupational, and speech therapies; and nutritional, educational, and recreational programs. Bone-marrow transplantation is showing promise for some of these diseases, such as ALD. The prognosis for leukodystrophies varies according to the specific type of leukodystrophy. Some important types of leukodystrophy include adrenoleukodystrophy (ALD), Alexander disease, Canavan disease, Krabbe disease, metachromatic leukodystrophy (MLD), and Pelizaeus-Merzbacher disease (PMD).

### Adrenoleukodystrophy

People with adrenoleukodystrophy, ALD, accumulate high levels of compounds known as saturated very-long-chain fatty acids (VLCFA) in the brain and parts of the adrenal glands because they do not produce the enzyme that breaks down these fatty acids in a normal manner. The loss of myelin and the progressive dysfunction of the adrenal glands are the primary characteristics of ALD.

There are main subtypes of ALD. The most common is the X-linked form (X-ALD), which involves an abnormal gene located on the X chromosome; and neonatal ALD, which is caused by defective genes that are not located on the X chromosome. The distinction between the two makes a significant difference because women have two X chromosomes while men have only one. Lacking the protective effect of a second, normal X chromosome (it is highly unlikely for both of a woman's X chromosomes to be defective), men are generally more severely affected by the disease—although a mild form of ALD is occasionally seen in women who are carriers of the disorder. Symptoms include progressive stiffness, weakness or paralysis of the lower limbs, ataxia, excessive muscle tone, mild peripheral neuropathy, and urinary problems. In contrast, neonatal ALD can affect either male or female babies, with symptoms including mental retardation, facial abnormalities, seizures, retinal degeneration, weak muscle tone, enlarged liver, and adrenal dysfunction. This form usually is present from birth and progresses rapidly.

The onset of X-ALD, on the other hand, can occur either in childhood or adulthood. The childhood form, with symptoms usually starting between the ages of two and ten years, is the more severe. The most common symptoms are usually behavioral changes such as abnormal withdrawal or aggression, poor memory, and poor school performance. Other symptoms include visual loss, learning disabilities, seizures, poorly articulated speech, difficulty swallowing, deafness, disturbances of gait and coordination, fatigue, intermittent vomiting, increased skin pigmentation, and progressive dementia.

In the milder adult-onset form, which typically begins between the ages of twenty-one and thirty-five, symptoms may include progressive stiffness, weakness or paralysis of the lower limbs, and ataxia (disturbances in coordination and motor function). Although adult-onset ALD progresses more slowly than the classic childhood form, it can also result in deterioration of brain function.

### Considerations

- Adrenal function must be tested periodically in all patients with ALD. Treatment with adrenal hormones can be lifesaving.
- Symptomatic and supportive treatments for ALD include physical therapy, psychological support, and special education.
- Some evidence suggests that administering a mixture of oleic acid and erucic acid, known as Lorenzo's oil (and made famous in the movie by that name) to boys with X-ALD can reduce or delay the appearance of symptoms in those who have not developed symptoms yet. It is important to eat a low-fat diet coupled with Lorenzo's oil.
- Bone marrow transplants can provide long-term benefit for boys who have early evidence of X-ALD, but the procedure carries substantial and serious risks, and is not recommended for those whose symptoms are already severe or who have the adult-onset or neonatal forms.
- The administration of the omega-3 essential fatty acid docosahexaenoic acid (DHA) may help some infants and children with neonatal ALD.
- The overall prognosis for people with ALD is generally poor because of the progressive neurological deterioration it causes. Death usually occurs within one to ten years after the onset of symptoms.
- For nutritional recommendations, *see* WEAKENED IMMUNE SYSTEM, page 774.

### MERALGIA PARESTHETICA

Meralgia paresthetica is a disorder characterized by tingling, numbness, and burning pain in the outer side of the thigh. The disorder is also known as *Bernhardt-Roth syndrome* and *lateral femoral cutaneous nerve entrapment*.

Meralgia paresthetica is caused by compression of the lateral femoral cutaneous nerve, which transmits sensation from the outer thigh to nerves in the spinal cord, as it exits the pelvis. The disorder occurs in men more than women, and is generally found in middle-aged or overweight individuals. Affected individuals often complain that the symptoms worsen after walking or standing, and that the skin is sensitive to touch. Meralgia paresthetica disorder is associated with wearing clothing that is too tight, as well as with pregnancy, diabetes, and obesity.

### Recommendations

- If you are overweight, lose the extra pounds. (*See* OBE-SITY in Part Two for recommendations.)
- Try wearing looser clothing.
- Avoid standing or walking for prolonged periods of time. Also avoid any position that places pressure on the outer thigh.

### Considerations

- Treatments include acetaminophen, or other nonsteroidal anti-inflammatory drugs (NSAIDs) like Advil. In addition, steroid injections and tricyclic antidepressants are used. Gabapentin (Neurontin) or pregabalin (Lyrica) may be prescribed to help alleviate symptoms.
- In very few cases in which pain is persistent or severe, surgical intervention to relieve pressure may be needed. Surgery is not always successful, however.
- Meralgia paresthetica usually eases or disappears after treatment. In some cases, the disorder simply goes away on its own.
- For other nutritional recommendations, *see* Neurological Support, page 679; and CARDIOVASCULAR DISEASE, page 306.

### MULTIPLE SYSTEM ATROPHY WITH ORTHOSTATIC HYPOTENSION

*See* ORTHOSTATIC HYPOTENSION in this section.

### ORTHOSTATIC HYPOTENSION

Orthostatic hypotension is a sudden decrease in blood pressure when a person stands upright. Other known names for this disorder are *postural hypotension* and *Bradbury-Eggleston syndrome*. The condition may be caused by a decreased amount of blood in the body resulting from excessive use of diuretics, vasodilators, or other types of drugs. Dehydration and prolonged bed rest can also cause orthostatic hypotension. Symptoms appear upon standing (the more suddenly one stands, the more serious the problem) and generally include dizziness, light-headedness,

blurred vision, and syncope or temporary loss of consciousness. Most people have experienced the dizzy feeling upon standing abruptly from a lying-down position; this is normal and is not to be confused with this condition.

Other diseases are sometimes associated with the disorder, including Addison's disease, atherosclerosis, diabetes, and certain neurological disorders like multiple system atrophy with orthostatic hypotension. Formerly known as Shy-Drager syndrome, multiple system atrophy with orthostatic hypotension is a progressive disorder of the central and autonomic nervous systems that is characterized by orthostatic hypotension—an excessive drop in blood pressure when standing up, causing dizziness and fainting. Multiple system atrophy can occur without orthostatic hypotension, but is very rare.

The disorder is classified into three types:

1. The Parkinsonian-type, which includes symptoms similar to those of Parkinson's disease such as slow movement, stiff muscles, and tremor.
2. The cerebellar-type, which causes problems with coordination and speech.
3. The combined-type, which includes symptoms of both Parkinsonism and cerebellar failure.

Problems with urinary incontinence, constipation, and sexual impotence in men occur early in the course of the disease. Other symptoms may include generalized weakness, double vision or other vision problems, difficulty breathing and swallowing, sleep disturbances, and decreased sweating. The disease can take years to diagnose because its features resemble those of so many other health problems.

### Considerations

- If orthostatic hypotension is caused by hypovolemia (a decreased amount of blood in the body) due to medications, the disorder may be reversed by adjusting the dosage or by discontinuing the medication.
- If the condition is caused by prolonged bed rest, simply sitting up with increasing frequency each day may yield some improvement.
- In some cases, physical counterpressure such as elastic hose or whole-body inflatable suits may be required.
- Dehydration is treated with salt and fluids. The prognosis for most people with orthostatic hypotension depends on the underlying cause of the condition.
- There is no cure for multiple system atrophy with orthostatic hypotension. Treatment is aimed at controlling symptoms. Medications include fludrocortisone (Florinef), pyridostigmine (Mestinon), and epoetin (Procrit).
- People with multiple system atrophy with orthostatic hypotension should sleep with their heads elevated. Those who have breathing and swallowing difficulty may need to use an artificial breathing or feeding tube.

The prognosis for individuals with multiple system atrophy with orthostatic hypotension is poor. People usually die within seven to ten years after the onset of symptoms. A problem with the respiratory system is the most common cause of death.

For nutritional recommendations, *see* Neurological Support, page 679; and CARDIOVASCULAR DISEASE, page 306.

### PHENYLKETONURIA

Phenylketonuria (PKU) is an inherited error of metabolism caused by a deficiency of the enzyme phenylalanine hydroxylase, which is responsible for processing the essential amino acid phenylalanine. Lack of the enzyme results in a buildup of phenylalanine in the body, which over time can lead to mental retardation, organ damage, abnormal posture, and in some cases, severely compromised pregnancy. Symptoms in affected infants include drowsiness, lethargy, difficulty feeding, and light eyes, as well as light pigmentation in skin and hair. A rash similar to eczema may develop.

If left untreated, PKU can develop into severe mental retardation, and also can cause neurological symptoms such as seizures, hyperactivity, clumsy walking, unusual posture, aggressive behavior, or psychiatric disturbances. Fortunately, the problem is detectable through blood tests within the first days of life. Screening for PKU has been a part of routine testing for newborns in the United States since 2008.

### Considerations

- If treated properly with a carefully controlled, phenylalanine-restricted diet, mental retardation can be prevented. Among the things that people with PKU absolutely *cannot* consume are products containing the artificial sweetener aspartame (found in Equal, NutraSweet, and many processed food products), which has as one of its components the amino acid phenylalanine.
- For nutritional recommendations, *see* Neurological Support, page 679.

### PIRIFORMIS SYNDROME

Piriformis syndrome is a rare neuromuscular disorder that occurs when the piriformis muscle (a narrow muscle located deep in the buttocks) compresses or irritates the sciatic nerve, the largest nerve in the body. As with sciatica, caused by a herniated or ruptured disc, compression of the sciatic nerve causes pain, frequently described as tingling or numbness, in the buttocks and along the nerve, often extending down the leg. The pain may worsen with prolonged periods of sitting, or by climbing stairs, walking, or running.

### Considerations

- Treatment generally begins with stretching and massage. Anti-inflammatory drugs may be prescribed.

- It may be advisable to stop, or at least take a break from, physical activities that aggravate the problem.
- The prognosis for piriformis syndrome is good. Once symptoms are addressed, individuals can usually resume their normal activities. In some cases, exercise regimens may need to be modified in order to reduce the likelihood of recurrence or worsening symptoms.
- For nutritional recommendations, *see* Neurological Support, page 679.

### POSTURAL TACHYCARDIA SYNDROME

People who suffer from postural tachycardia syndrome (POTS) experience a pulse rate that is too fast when they stand. Symptoms include rapid heartbeat, light-headedness with prolonged standing, headache, chronic fatigue, and chest pain. The underlying cause or causes of POTS usually cannot be identified, but the disorder is not thought to progress to heart disease.

#### Considerations

- The severity of symptoms usually determines the course of treatment for POTS. Individuals with the disorder are usually advised to increase their fluid and salt intake. Body stockings may provide some relief. Drug therapy, with fludrocortisone (for those on a high-salt diet), beta-blockers, or midodrine in low doses to increase blood volume and narrow blood vessels, can be beneficial. Physical exercise, especially calf muscle resistance training, also may help. Avoid heavy meals. Drinking 16 ounces of water before getting up can help raise blood pressure.
- Some people with postural tachycardia syndrome may require and benefit from insertion of a cardiac pacemaker.
- The prognosis for people with POTS varies. Many individuals improve with one or more of the treatments outlined above, although severe POTS can be disabling for years.
- For nutritional recommendations, *see* Neurological Support, page 679; and **CARDIOVASCULAR DISEASE**, page 306.

### REFSUM DISEASE

Refsum disease is a hereditary disorder of fat metabolism caused by the deficiency of an enzyme that breaks down phytanic acid, a type of fatty acid. The result is an abnormal accumulation of phytanic acid in blood plasma and body tissues. Phytanic acid is not made in the human body; it comes from consuming dairy products, beef, lamb, and some seafood.

Symptoms of the disorder may include visual impairment, peripheral neuropathy (damage to nerves that can cause pain, tingling, burning, and other sensations in the extremities), ataxia (disturbances in coordination and motor function), impaired hearing, and bone and skin changes. Nystagmus (rapid, involuntary to-and-fro eye movements),

anosmia (loss of the sense of smell), and ichthyosis (dry, rough, scaly skin) may also occur.

The onset of Refsum disease usually occurs in early childhood, although some people will not develop symptoms until they are in their forties or fifties. The disorder affects both males and females.

#### Recommendations

- Strictly limit or avoid consumption of foods that contain phytanic acid, including dairy products; beef and lamb; and fatty fish such as tuna, cod, and haddock. The body also converts phytol, a substance found in green leafy vegetables, to phytanic acid, so limiting them may be helpful as well.

#### Considerations

- In addition to making dietary changes, plasmapheresis (the removal and reinfusion of blood plasma) may be required periodically to manage Refsum disease.
- The prognosis for individuals with Refsum disease varies. With treatment, symptoms of peripheral neuropathy and ichthyosis generally disappear. However, while treatment may forestall further deterioration of vision and hearing, it cannot undo damage to vision and hearing that may have occurred.
- For other nutritional recommendations, *see* Gastrointestinal Support, page 679.

### TOURETTE SYNDROME

Tourette syndrome (TS) is an inherited neurological disorder distinguished by repeated involuntary movements and uncontrollable vocal sounds called *tics*. There may be facial tics and eye-blinking, head-jerking, neck-stretching, foot-stamping, body-twisting and -bending, throat-clearing, coughing, sniffing, and grunting, yelping, barking, or shouting noises. Tics can be suppressed for a short time, but when stress increases, eventually a tic will escape. In limited cases, such tics can include the compulsive use of inappropriate words and phrases.

The onset of TS generally appears before the age of eighteen, and the majority of cases are mild.

#### Considerations

- Medication is available to control tics that interfere with daily functioning, but the majority of people with TS require no medication.
- There is no cure for Tourette syndrome. However, while TS is generally a chronic lifelong condition, it does not get progressively worse. In fact, many people find that their symptoms improve as they mature.
- For nutritional recommendations, *see* Neurological Support, page 679; and **CARDIOVASCULAR DISEASE**, page 306.

## RASH

See SKIN RASH.

## RAYNAUD'S DISEASE / RAYNAUD'S PHENOMENON

Raynaud's disease is a circulatory disorder that results in the hands, and sometimes the feet, being hypersensitive to cold. When the hands are exposed to cold temperatures, the small arteries that supply the toes and fingers suddenly contract and go into spasm. As a result, the fingers and toes are deprived of adequate amounts of oxygenated blood, and become whitish or bluish in color. Over time, the condition may result in a general shrinkage of the affected area. Ultimately, ulcers may form, damaging the tissues and resulting in chronic infection under and around the fingernails and toenails. In severe cases, gangrene may result from prolonged and persistent contraction of the arteries. This condition is more common in women than in men. Raynaud's phenomenon is a condition similar to Raynaud's disease that is caused by complications of surgery, injury, frostbite, autoimmune diseases such as lupus or rheumatoid arthritis, or some other underlying condition. Dressing warmly and avoiding activities in the cold can eliminate many of the severe symptoms.

Certain drugs that affect the blood vessels—such as calcium channel blockers, ergot preparations, and alpha- and beta-adrenergic blockers—have been known to produce symptoms similar to those of Raynaud's as a side effect. Recent research has also linked Raynaud's with other conditions involving abnormal constriction of blood vessels, including migraine and Prinzmetal's angina, a type of angina caused by spasms in the coronary arteries. (See CIRCULATORY PROBLEMS in Part Two.)

Unless otherwise specified, the doses recommended here are for persons age eighteen and over. For children between twelve and seventeen, use three-quarters the recommended dose; for children between six and twelve, use one-half the recommended dose; and for children under six, use one-quarter the recommended dose.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100–200 mg daily.  As directed on label.	Improves tissue oxygenation.  Works well with coenzyme Q <sub>10</sub> in supporting the immune system's detoxification of many dangerous substances.
Vitamin E	200 IU daily.	Improves circulation; acts as an anticoagulant, dissolving clots in the legs, heart, and lungs. Use d-alpha-tocopherol form. Use emulsion form for easier assimilation and greater safety at higher doses.

## Very Important

Calcium and magnesium and zinc	1,500 mg daily, at bedtime. 750 mg daily. 50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	To protect the arteries from stress caused by sudden blood pressure changes.
Chlorophyll or Kyo-Green from Wakunaga	As directed on label. As directed on label.	Helps to fight infection and enhance blood flow. A fresh "green drink" made from leafy greens that supplies chlorophyll and other nutrients.
Choline and inositol	As directed on label.	Lowers cholesterol and helps circulation.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	1 tablet 3 times daily.	Improves tissue oxygenation.
Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Lowers blood lipid levels.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine) and folic acid plus vitamin B <sub>3</sub> (niacin)	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 50 mg daily. 400 mcg daily. 100 mg daily. Do not exceed this amount.	B vitamins are necessary for metabolism of fat and cholesterol. Use a high-potency formula.  Dilates small arteries, improving circulation. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.

## Important

Aerobic 07 from Aerobic Life Industries	As directed on label.	Improves tissue oxygenation.
Bee propolis or royal jelly	As directed on label. As directed on label.	To strengthen the cardiovascular system and act as a natural antibiotic.
Flaxseed oil or primrose oil or salmon oil	1,000 mg daily. 1,000 mg daily. As directed on label.	To supply essential fatty acids, which are necessary for circulation and help prevent hardening of the arteries.

## Herbs

Black cohosh aids circulation and lowers cholesterol levels.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Butcher's broom, cayenne (capsicum), ginkgo biloba, and pau d'arco can be used separately or in combination to improve circulation and strengthen blood vessels.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Hyssop may prove helpful for problems affecting the circulation.

**Recommendations**

Eat a diet composed of 50 percent raw foods. See NUTRITION, DIET, AND WELLNESS in Part One and follow the dietary guidelines.

Avoid fatty and fried foods.

Avoid caffeine. This stimulant constricts the blood vessels.

Keep your hands and feet warm. A warm climate is best. Wear comfortable shoes and do not go barefoot outdoors. Always wear gloves and warm socks when you feel cold and not just when others do.

Avoid stress as much as possible.

Avoid drugs that constrict the blood vessels, such as birth control pills and migraine headache medicine.

Do not smoke, and avoid exposure to secondhand smoke. Nicotine constricts the blood vessels.

**Considerations**

The calcium channel blocker nifedipine (Adalat, Procardia) is a generally accepted treatment for Raynaud's phenomenon. Some people get relief from alpha blockers like prazosin (Minipress) or doxazosin (Cardura). Some doctors prescribe vasodilators such as nitroglycerine cream to relax blood vessels and eventually heal skin ulcers. Like all drugs, this can have side effects.

See also CIRCULATORY PROBLEMS in Part Two.

**REPETITIVE MOTION INJURY**

See CARPAL TUNNEL SYNDROME.

**RETINITIS PIGMENTOSA**

See under EYE PROBLEMS.

**REYE'S SYNDROME**

Reye's syndrome is a rare, serious disease that affects many internal organs, particularly the brain and liver. It primarily strikes children between the ages of four and twelve. Most cases of Reye's syndrome occur in children who were given aspirin or aspirin-containing medications for a viral infection such as the flu or chickenpox. Reye's syndrome has also been associated with Epstein-Barr virus, influenza B, and enteroviruses (viruses that infect mainly the gastrointestinal tract).

Four to six days after the onset of the viral illness, the child

suddenly develops a fever and severe vomiting. Other symptoms include mental and personality changes that may manifest themselves as confusion, drowsiness, lethargy, memory lapses, and/or unusual belligerence and irritability. In addition, the child may experience weakness and paralysis in the arms or legs, double vision, palpitations, speech impairment, impaired skin integrity, and/or hearing loss. Convulsions, coma, brain damage, and even death may follow, usually the result of cerebral edema or respiratory failure. Fortunately, due to increased awareness of the disease, and especially of the importance of early detection and prompt treatment, the mortality rate has declined in recent years. A high of 555 cases in 1980 has dwindled to about 37 cases a year. Forty percent of the cases were in children under five years of age; ninety percent were children under fifteen years.

The exact cause of Reye's syndrome is unknown, but as a result of research conducted in the early 1980s, it is known that the combination of aspirin and viral illness dramatically increases the risk of developing this dangerous disorder. This is why aspirin is no longer recommended for routine use as a pain reliever for children and acetaminophen (Tylenol) is recommended in its place.

The following supplements are designed for use once appropriate medical measures, including hospitalization, have been taken and recovery has begun. Discuss any supplements with a health care professional before using them. Unless otherwise specified, the recommended doses are for persons age eighteen and over. For children between twelve and seventeen, use three-quarters the recommended dose; for children between six and twelve, use one-half the recommended dose; and for children under six, use one-quarter the recommended dose.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Branched-chain amino acid complex	As directed on label.	Prevents muscle depletion. (See AMINO ACIDS in Part One.)
Flaxseed oil	As directed on label.	To supply essential fatty acids.
Garlic (Kyolic from Wakunaga)	As directed on label.	Increases energy and enhances immune function.
Lecithin granules or capsules	1 tbsp 3 times daily. 1,200 mg 3 times daily.	To supply choline, important in transmission of nerve impulses and in energy production.
or phosphatidyl choline	As directed on label.	
L-methionine plus glutathione	As directed on label. As directed on label.	Powerful antioxidants that protect and detoxify the liver.
Raw brain glandular	As directed on label.	To improve brain function.
Vitamin A plus carotenoid complex with beta-carotene	5,000 IU daily. 15,000 IU daily.	Helps in formation of healthy skin cells. Used by the body to make vitamin A as needed.

Vitamin B complex	50–100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	Needed for all enzyme systems and to support healing.
Vitamin E	200 IU daily.	To protect against free radical damage. Use d-alpha-tocopherol form.

## Herbs

The following are herbal remedies that can be useful once the acute phase of the illness has passed and recovery has begun:

- Alfalfa, hawthorn berry, hyssop, milk thistle, pau d'arco, Siberian ginseng, and wild yam help to rebuild and strengthen the liver.

*Caution:* Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

- A lotion containing aloe vera, calendula, and/or chamomile can be used to nourish and heal the skin.
- Catnip or chamomile tea helps to reduce anxiety.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Ginger and peppermint are good for relief of nausea.
- Gravel root, hydrangea, oat straw, parsley root, and uva ursi have diuretic properties.
- Korean (or Chinese) ginseng (*Panax ginseng*) helps to reduce fatigue.

*Caution:* Do not use this herb if you have high blood pressure.

Before administering them, discuss any herbal remedies you wish to use with your health care provider.

Because the main component of the herbs meadowsweet and white willow bark are related to aspirin, these should *not* be given to a child with a fever that may be due to viral illness, including colds, flu, measles, or chickenpox.

## Recommendations

Be alert for the following warning signs any time your child is recovering from a viral infection such as a cold, the flu, an ear infection, or chickenpox:

- Prolonged and heavy vomiting, followed by drowsiness.
- Agitation, disorientation, and delirium.
- Fatigue, lethargy, and lapses in memory.

If you have *even a suspicion* that you (or your child) may be developing the disease, seek professional help at once.

Reye's syndrome progresses rapidly and is extremely dangerous. Go to the nearest hospital emergency room immediately and explain the situation.

Be sure that any supplements your child is taking *do not* contain glutamine, as it can lead to an accumulation of ammonia in the blood. Be aware that although the names glutamine, glutamic acid (also sometimes called glutamate), glutathione, gluten, and monosodium glutamate sound similar, these are all different substances.

If Reye's syndrome is diagnosed, follow your health care provider's recommendations regarding treatment and care, both during the period of hospitalization and afterward, at home.

*Never* give aspirin to a child with a fever or other sign of viral illness. To be safe, many experts recommend against giving children aspirin for any reason. Use acetaminophen (Tylenol, Datril, and others).

## Considerations

There is no cure for Reye's syndrome. Treatment focuses on balancing chemical levels in the blood, while monitoring and supporting the functions of the lung, liver, heart, and brain. The measures that may be taken depend upon the stage of the disease, but treatment almost always involves hospitalization. Typical hospital care includes the administration of intravenous fluids to restore blood electrolytes and glucose levels, and sometimes a diuretic to help eliminate waste and excess fluid. In some cases, surgery may be performed to reduce swelling and pressure on the brain.

One way that Reye's syndrome can be detected is through a spinal tap, a procedure that involves inserting a needle into the spinal canal, usually at the lower back, to withdraw a sample of cerebrospinal fluid for examination.

If a person with Reye's syndrome receives an intravenous solution of glucose (sugar) and electrolytes (mineral salts) within twelve to twenty-four hours after the heavy vomiting starts, the chance of recovery is excellent. This treatment is safe.

The British aspirin industry withdrew all children's aspirin products from the British market a number of years ago in response to the discovery of the link with Reye's syndrome.

A study done by the U.S. Centers for Disease Control and Prevention found that 100 percent of the children who had Reye's syndrome had been given aspirin in the presence of a viral illness (chickenpox or flu). The study also indicated a direct correlation between the amount of aspirin taken and the severity of the disease. The makers of aspirin are now required to alert users to the link between aspirin and this potentially life-threatening condition.

*See also* CHICKENPOX; COMMON COLD; and INFLUENZA, all in Part Two.

## RHEUMATIC FEVER

Rheumatic fever is a complication of a streptococcal infection. It typically develops following strep throat, tonsillitis, scarlet fever, or ear infection. It most often affects children aged five to eighteen. Rheumatic fever develops as a result of the buildup of antibodies that have been produced to fight off the strep infection—only the antibodies end up attacking the body's own tissues. This disorder may affect one or several parts of the body, among them the heart, brain, and joints. If the heart is affected, permanent damage to one or more heart valves may result.

The first signs of rheumatic fever are typically pain, inflammation, and stiffness in a large joint such as the knee, accompanied by fever. The pain and swelling can travel from one joint to another. There may be an accompanying skin rash. Other symptoms may include bumps or nodules over a joint or joints, fatigue, and uncontrollable jerky movements of the arm, leg, or facial muscles. After one occurrence, the disease tends to recur.

Long-term effects of rheumatic fever can include heart failure, skin disorders, anemia, endocarditis (inflammation of the heart lining), heart arrhythmias, pericarditis (inflammation of the sac surrounding the heart), Sydenham's chorea (a disorder of the nervous system), and arthritis.

Unless otherwise specified, the following recommended dosages are for persons over the age of eighteen. For children between twelve and seventeen years old, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under six years old, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Especially important if antibiotics are prescribed. Use a nondairy formula.
Chondroitin sulfate	500–1,000 mg daily.	To provide nutritional support for strengthening joints, ligaments, and tendons.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic that boosts immune function and fights infection. Destroys free radicals.
L-carnitine	500 mg twice daily, on an empty stomach.	Protects the heart.
L-methionine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	An important free radical fighter. (See AMINO ACIDS in Part One.)
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Boosts immune function and aids in reducing pain and swelling.

## Helpful

Calcium plus magnesium	1,500 mg daily. 1,000 mg daily.	Important nutrients that work together. Use chelate forms.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Boosts immune function. Enhances the effectiveness of coenzyme Q <sub>10</sub> .
ConcenTrace from Trace Minerals Research	As directed on label.	To supply trace minerals needed for bone and joint health. Increases energy.
Dimethylsulfoxide (DMSO)	Apply topically as directed on label.	To relieve joint pain. Should be used by adults only. <i>Note:</i> Use only DMSO from a health food store. Products from hardware and other stores are not suitable for use in healing.
Flaxseed oil	As directed on label.	Reduces pain and inflammation.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply protein, needed to strengthen the body and for tissue repair. Use a formula containing all essential amino acids.
Kelp	1,000–1,500 mg daily.	Contains essential nutrients.
Multivitamin and mineral complex	As directed on label.	To maintain a balance of all necessary nutrients.
Proteolytic enzymes	As directed on label. Take between meals.	An important antioxidant.
Raw thymus glandular	As directed on label.	An important antioxidant. Stimulates the immune response.
S-Adenosylmethionine (SAME) (SAME Rx-Mood from Nature's Plus)	As directed on label.	Deficiency results in inability to maintain cartilage properly. Aids in reducing pain and inflammation. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give this supplement to a child under twelve.
Vitamin A plus carotenoid complex with beta-carotene	10,000 IU daily. As directed on label.	Important antioxidants. Use emulsion forms for easier assimilation.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	For healing and improved immune function.
Vitamin D or cod liver oil	400 IU or more daily. As directed on label.	Needed for healing and absorption of minerals, especially calcium.
Vitamin E emulsion or capsules	200 IU daily.	Increases tissue oxygenation and reduces fever. Emulsion form is recommended for easier assimilation.

## Herbs

Bayberry bark, burdock root, milk thistle, nettle, pau d'arco, sage, and yellow dock purify the blood, fight infection, and aid in recuperation after the trauma of illness.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Birch leaves and lobelia both help to reduce pain.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Catnip tea is a nerve tonic. It can also be used as an enema to reduce fever. (See ENEMAS in Part Three.)

Cordyceps, a Chinese herb, is beneficial for the heart. It can slow the heart rate, increase blood supply to the arteries and heart, and lower blood pressure.

Dandelion has a long history in the treatment of fever.

Ginkgo biloba can benefit the cardiovascular system by preventing the formation of free radicals. Use a ginkgo extract containing 24 percent ginkgo flavone glycosides.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Goldenseal is a natural antibiotic.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Hawthorn leaf, myrrh gum, and red clover detoxify and deacidify the blood.

Wintergreen oil can be applied to the chest in compress form to relieve pain.

## Recommendations

Drink plenty of fresh juices and distilled water.

Eat no solid food until the fever subsides and joint pain begins to ease. Then keep to a light diet, including fresh fruits and vegetables, yogurt, cottage cheese, and fruit juices.

Do not consume any caffeine, carbonated soft drinks, fried foods, processed or refined foods, salt, or sugar in any form during the recovery period. These foods slow healing.

Get plenty of bed rest. This is vital for recovery.

If antibiotics are prescribed, take acidophilus following antibiotic treatment to replace the needed "friendly" bacteria. Antibiotics are usually necessary to combat the underlying *Streptococcus* infection and help prevent permanent

heart damage. Do not take the acidophilus at the same time as the antibiotics, however, or the antibiotics will kill the friendly bacteria.

Do not give aspirin to a child with a fever. Use acetaminophen or ibuprofen instead.

If you (or your child) are experiencing symptoms of strep throat, see a physician to be tested and, if appropriate, treated. Symptoms of strep throat include a severe sore throat accompanied by a fever of over 101°F without any other cold symptoms, or a mild sore throat that does not dissipate after several days.

Use homeopathic treatments to ease symptoms. Homeopathic remedies that have been used to treat rheumatic fever include *Aconite*, *Bryonia*, *Pulsatilla*, and *Rhus toxicodendron*.

## Considerations

Massage therapy and mild exercise such as yoga can be helpful for preventing muscle atrophy during bed rest. (See MASSAGE THERAPY in Part Three.)

If you develop rheumatic heart disease, you may need surgery to repair the damage to the heart.

See also ARTHRITIS; FEVER; and/or SORE THROAT, all in Part Two.

## RHEUMATOID ARTHRITIS

See under ARTHRITIS.

## RICKETS/OSTEOMALACIA

Rickets and osteomalacia are two terms for the disorder caused by vitamin D deficiency. In children, this disease is called rickets, and results either from inadequate intake of vitamin D or from too little exposure to sunlight (sunlight causes vitamin D to be synthesized in the skin). The lack of vitamin D in turn affects the body's ability to absorb calcium and phosphorus. Early signs include nervousness, painful muscle spasms, leg cramps, and numbness in the extremities. Ultimately, bone malformations may develop due to softening of the bones—bowed legs, knock-knees, scoliosis (abnormal curvature of the spine), a narrow rib cage, a protruding breastbone, and/or beading at the ends of the ribs—as well as decaying teeth, delayed walking, irritability, restlessness, and profuse sweating. Rickets is now virtually eliminated in the United States. It was most often seen in children aged six to twenty-four months old.

In adults, vitamin D deficiency disease is referred to as osteomalacia and is usually related to the body's inability to absorb phosphorus and calcium properly. It is most likely to occur in pregnant women and nursing mothers, whose nutritional requirements are higher than normal, or in people with malabsorption problems. It may also affect

individuals who do not get enough exposure to sunshine or those whose diets are so low in fat that adequate bile cannot be manufactured and vitamin D cannot be absorbed. This condition can be caused by chronic renal failure. Osteomalacia is difficult to diagnose and is often misdiagnosed as osteoporosis.

Unless otherwise specified, the dosages recommended in this section are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Boron	3 mg daily. Do not exceed this amount.	Enhances calcium absorption.
Calcium	1,500 mg daily.	Necessary to remineralize bone. Do not use bone meal or dolomite as a source of calcium, as these may contain lead.
Phosphorus	As directed on label.	Needed for bone and tooth formation.
Silica	500 mg daily.	Supplies silicon, which strengthens bones and connective tissue. Aids calcium absorption.
Vitamin D	400–600 IU daily. Do not exceed this amount.	Necessary for utilization of calcium and phosphorus.
<i>Important</i>		
Betaine hydrochloride (HCl)	As directed on label.	May be needed for proper digestion.
Fish oil	As directed on label.	A good source of vitamins A and D.
Multivitamin and mineral complex plus extra vitamin B <sub>12</sub>	As directed on label. 1,000–2,000 mcg daily.	If malabsorption is a problem, take higher amounts of all vitamins and minerals.
Proteolytic enzymes	As directed on label. Take between meals.	Important in digestion.
Vitamin A with mixed carotenoids	10,000 IU daily.	Necessary for growth.
Zinc	30 mg daily.	Needed for calcium absorption. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Herbs

Dandelion root, nettle, and oat straw promote bone building and are all good sources of calcium and magnesium.

### Recommendations

- Change your diet. To get rickets your diet would have to be very deficient in calcium and vitamin D. The best sources are milk and some other dairy products. All dairy products have calcium, but not all have vitamin D. Eat more raw fruits and vegetables, raw nuts and seeds, yogurt and cottage cheese, and sardines. A diet high in calcium is essential.
- Sunlight exposure is important as well, if a guaranteed source of vitamin D is not available from foods.
- Do not consume sugar, junk foods, or carbonated beverages.
- Have a hair analysis done to check for mineral deficiencies. (See HAIR ANALYSIS in Part Three.)
- Be watchful if a child has severe allergies; celiac disease, asthma, bronchitis, or colon disturbances. These conditions can result in absorption problems. This may be difficult to detect at first because growth and weight are usually normal with these conditions.

### Considerations

- Food allergy testing may be beneficial.
- There are a number of combination supplement products available that contain many of the nutrients recommended in the table above. Bone Builder from Ethical Nutrients, Bone Defense from KAL, and Cal Apatite from Metagenics are good products for promoting proper bone growth.
- See also OSTEOPOROSIS in Part Two.

### RINGWORM

See under FUNGAL INFECTION.

### ROSACEA

Rosacea is a chronic skin disorder that most often affects the forehead, nose, cheekbones, and chin. Groups of capillaries close to the surface of the skin become dilated, resulting in blotchy red areas with small bumps and, sometimes, pimples. The redness can come and go, but eventually may become permanent if blood vessels under the skin become dilated, a phenomenon known as telangiectasia. The skin tissue can swell and thicken, and may be tender and sensitive to the touch.

The inflammation of rosacea can look a great deal like acne, but it tends to be more chronic, and blackheads and whiteheads are almost never present. It is a fairly common disorder—about 14 million Americans have it to some degree—but many never realize they have it. Rosacea usually begins with frequent flushing of the face, particularly the nose and cheeks. The flushing is caused by the swelling of

the blood vessels under the skin. This "red mask" can serve as a flag for attention. Inflammation can then spread across the face, and small bumps may appear. Later, swelling of the nose may occur. However, it can take years from the beginnings of this condition before the later stages develop. Rosacea can also cause a persistent burning and feeling of grittiness in the eyes or inflamed and swollen eyelids. In severe cases, vision can be impaired.

The underlying cause or causes of rosacea are not understood, but certain factors are known to aggravate the condition, including the consumption of alcohol, hot liquids, and/or spicy foods; exposure to sunlight; humidity; extremes of temperature; and the use of makeup and skin care products containing alcohol. Stress, vitamin deficiencies, and infection can be contributing factors. The things that aggravate one person's rosacea may have no effect on another person.

Rosacea is most common in white women between the ages of thirty and fifty. One survey showed that 44 percent developed the disease between thirty and fifty years of age; 39 percent developed it after fifty years; and 17 percent before thirty years of age. When it does occur in men, rosacea tends to be more severe, and is usually accompanied by rhinophyma (a nose that becomes chronically red and enlarged). Fair-skinned individuals seem to be more susceptible to this condition than darker-skinned people. People who flush easily seem to be more prone than others to develop rosacea.

In rare cases, rosacea may affect the skin in other parts of the body as well as the face. It is not a dangerous condition, but it is chronic and can be distressing for cosmetic reasons. Without proper care, it can develop into a disfiguring condition.

The dosages recommended below are for adults.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Primrose oil	500 mg 3 times daily.	A good healer for many skin disorders. Contains linoleic acid, which is needed by the skin.
Pycnogenol	As directed on label.	Powerful antioxidant that moderates allergic and inflammatory responses by reducing histamine production.
Vitamin A with mixed carotenoids	25,000 IU daily for 3 months, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Necessary for healing and construction of new skin tissue.
Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin) and vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg daily. 1,000–2,000 mcg daily.	Antistress vitamins that are necessary in all cellular functions and help to maintain healthy skin.  B vitamins that have been shown to be particularly useful in the treatment of rosacea.

### Important

Kelp	1,000–1,500 mg daily.	Supplies balanced minerals needed for good skin tone.
Multivitamin and mineral complex	As directed on label.	To ensure optimum nutrition and guard against deficiencies.
Vitamin E	200 IU daily.	Protects against free radicals. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	For tissue repair. Enhances immune system response. Use zinc gluconate lozenges or OptiZinc for best absorption.

### Helpful

Ageless Beauty from Biotec Foods	As directed on label.	Protects the skin from free radical damage.
Chlorophyll or alfalfa	As directed on label.	Aids in cleansing the blood, preventing infections. Also supplies needed balanced minerals. <i>See under Herbs, below.</i>
Flaxseed oil capsules or liquid	1,000 mg daily. 1 tsp daily.	To supply needed essential fatty acids.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote skin health.
L-cysteine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Contains sulfur, needed for healthy skin. ( <i>See AMINO ACIDS in Part One.</i> )
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Aids absorption of the essential fatty acids.
Proteolytic enzymes	As directed on label. Take between meals.	Helps to reduce inflammation.
Selenium	200 mcg daily. Do not exceed this amount. If you are pregnant, do not exceed 40 mcg daily.	Encourages tissue elasticity and is a powerful antioxidant.
Superoxide dismutase (SOD)	As directed on label.	A free radical destroyer.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Promotes immune function, strengthens capillaries, and acts as a mild anti-inflammatory.

### Herbs

- Alfalfa is a good source of chlorophyll, which has detoxifying properties. It also supplies many needed vitamins and minerals.
- Aloe vera has excellent healing properties. Apply pure aloe vera gel topically to dry skin as directed on the product label or as needed.

*Note:* Some people with rosacea may experience irritation as a result of using aloe vera. If this occurs, discontinue use.

Borage seed, dandelion root, dong quai, parsley, sarsaparilla, and yellow dock root improve skin tone.

Bromelain and turmeric (curcumin) help to control inflammation.

Burdock root and red clover are powerful blood cleansers. Burdock also helps to improve skin tone.

Calendula, cayenne (capsicum), fennel seed, ginger, marshmallow root, sage, and slippery elm bark nourish the skin and promote healing.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Milk thistle aids the liver in cleansing the blood.

Nettle and rosemary improve skin tone, nourish the skin, and promote healing.

### Recommendations

Eat a diet that emphasizes raw vegetables and grains, organically grown if possible.

Avoid fats, especially saturated fats, and all animal products. Saturated fats promote inflammation. Also avoid alcohol, caffeine, cheese, chocolate, cocoa, dairy products, eggs, fish, salt, sugar, and spicy foods.

Do not drink hot beverages such as coffee or tea. Allow your food to cool to room temperature before eating it.

Investigate the possibility of food allergies. Keep a food diary for one month to see which foods may be aggravating the condition. Then avoid those foods. (See ALLERGIES in Part Two for further information.)

Once a month, follow a fasting program. (See FASTING in Part Three.)

Keep the skin scrupulously clean, but treat it gently. Use a mild natural soap and lukewarm to cool (never cold or hot) water for cleansing. Pat the skin dry after washing—do not rub it. Avoid touching the skin except when cleansing it.

Avoid extremes of temperature, especially heat. Keep baths and showers short, and use water that is as cool as you can tolerate comfortably. Avoid saunas (including the type used for facials and steam inhalations), steam baths, and hot tubs. If you need to increase the humidity in your home, use only a cool mist humidifier.

As much as possible, avoid wearing makeup. If you do use cosmetics, choose all-natural, water-based products.

Do not use topical steroid creams. These only make the condition worse.

Friction is extremely irritating, so avoid wearing tight clothing such as turtlenecks that can rub against the skin. Be careful about anything that comes close to or into con-

tact with your face. Even holding the telephone receiver against your face for a while can raise the local temperature and irritate sensitive skin.

In severe cases, a laser or electrical device can be used to remove the excess tissue. Dermabrasion also has helped some people with rosacea.

### Considerations

There is no known cure for rosacea. Topical and/or oral antibiotics, usually tetracycline, are often prescribed to keep the inflammation under control. As with any drug, these can have side effects, especially with long-term use. Moreover, if you stop taking the antibiotics, the condition may rebound. More information is available from the National Rosacea Society. (See Health and Medical Organizations in the Appendix.)

An underlying vascular disorder may be involved in the development of rosacea. Several findings support this theory. First, there are structural abnormalities in the small blood vessels in the facial skin of people with rosacea. Second, the condition is exacerbated by the use of drugs that dilate blood vessels, such as theophylline and nitroglycerin. Finally, people with rosacea are more likely than most to suffer from migraines, a type of headache also linked to vascular malfunction.

*Demodex folliculorum*, a type of microscopic mite that lives on cast-off skin cells and is normally present on human skin, has been found in significantly higher than normal numbers in skin samples taken from people with rosacea. Researchers speculate that this organism, or some type of reaction to it, may be involved in rosacea.

### SCABIES

Scabies is a parasitic infection that causes a persistent, itchy rash. It is caused by a tiny mite that burrows into the top layer of the skin to lay its eggs. This results in groups of small red lumps. The scabies skin mite, so small it can hardly be seen without a microscope, infects over 300 million people worldwide every year. When the rash first appears, you may see fine, wavy lines emanating from some of the lumps if you look closely. The skin may then become dry and scaly, and the itching can be intense, especially at night. Scratching can set the stage for a bacterial infection as well.

Scabies can be a particular problem in institutional settings such as nursing homes and day care centers. It is spread primarily by skin-to-skin contact, and it is highly contagious. The areas most commonly affected are the buttocks, genitals (in men), nipples (in women), wrists, and armpits, as well as the skin between the toes and fingers.

To diagnose the condition, a physician usually takes a scraping of skin from the affected area and examines it un-

der a microscope. Children under the age of fifteen have the highest incidence of scabies, and are usually the first in the family to contract it. It is also considered to be a sexually transmitted disease.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Has antiparasitic and antibiotic properties.
Primrose oil	1,000 mg 3 times daily.	A good healer for most skin disorders.
Vitamin A with mixed carotenoids	25,000 IU daily for 3 months, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Necessary for healing and for construction of new skin tissue.
<i>Important</i>		
Kelp	1,000–1,500 mg daily.	Supplies balanced minerals.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	For tissue repair. Enhances immune system response. Use zinc gluconate lozenges or zinc methionate (OptiZinc) for best absorption.
<i>Helpful</i>		
Colloidal silver	Apply topically as directed on label.	To prevent secondary infection.
Vitamin E	200 IU daily.	Promotes healing. Use d-alpha-tocopherol form.

### Herbs

- Aloe vera has excellent healing properties. Apply gel topically to the affected area as directed on the product label.
- Balsam of Peru, goldenseal, and/or tea tree oil can be applied topically to fight the infection.
- Goldenseal can also be taken internally to bolster the immune system.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Black walnut, garlic, and wormwood are useful for parasitic infections.

**Caution:** Do not use wormwood in high doses or for extended periods because it contains the chemical compound thujone that can be poisonous. Do not use wormwood if you suffer from any type of seizure disorder or are pregnant.

- Comfrey and/or calendula salve helps to soothe itching and irritation.

**Caution:** Comfrey is recommended for external use only.

- Rhubarb helps the body to rid itself of parasitic infections.

### Recommendations

- Diet alone cannot cure scabies. To get rid of the mites, apply permethrin cream 5 percent (Elemite) topically to the entire body from the neck down, as directed on the label or as prescribed by your physician. Other medications include sulfur ointment and crotamiton (Eurax). All are fine for children as young as two years of age.
- Because scabies is easily spread from one person to another by close contact, if one household member develops it, thoroughly wash all clothing, towels, and bed linens in the house.
- Practice scrupulous personal hygiene. Avoid contact with infested persons or their clothing.
- To promote healing, eat plenty of foods high in zinc, such as soybeans, sunflower seeds, wheat bran, whole-grain products, yeast, and blackstrap molasses.
- Do not drink soft drinks or alcoholic beverages. Consume no sugar, chocolate, or junk foods.
- Drink at least ten 8-ounce glasses of clean water a day.
- Avoid fried foods and all animal products. Use cold-pressed vegetable oils only.

### Considerations

- A topical scabicide called lindane (gamma benzene hexachloride, found in the product Kwell) was once considered a standard treatment for scabies. In recent years, however, it has largely been replaced by permethrin, which is believed to be safer and cause fewer side effects. Do not use lindane unless the permethrin is not working.
- Scabicides are not recommended for children under the age of six or for pregnant women. In such cases, a milder sulfur solution is usually recommended.
- It may take one to two weeks for the itching to subside, even after treatment. An antihistamine or a cortisone cream may be recommended to provide relief. Calendula salve, cool compresses, and cool oatmeal baths are natural alternatives to those medications.
- Crowded, unsanitary, or institutional living conditions are conducive to the spread of scabies.

## SCHIZOPHRENIA

Schizophrenia is a disorder that makes it impossible to differentiate between what is imagined and what is real. The characteristic symptoms include disordered thinking, speech, and perception; a lack of curiosity; diminishing emotional contact with others; lethargy; emotional changes such as tension and/or depression; and more dramatic behavioral disturbances, ranging from catatonia to violent outbursts and delusions. People with schizophrenia lose, to some degree, their hold on reality, and many seem to withdraw into their own worlds. Hallucinations are not uncommon.

There are five basic types of schizophrenia:

1. *Catatonic schizophrenia* is characterized by unusual rigid postures, lack of movement, or frenzied movement.
2. *Disorganized schizophrenia*, which used to be called hebephrenic schizophrenia, is characterized by a lack of the normal range of emotions along with speech that displays a disorganized way of thinking.
3. *Paranoid schizophrenia* is characterized by hallucinatory and delusional symptoms.
4. *Undifferentiated schizophrenia* involves a mixture of different symptoms from the types above.
5. *Residual schizophrenia* is a type of schizophrenia in which the severity of schizophrenia symptoms has decreased. Hallucinations, delusions, or other symptoms may still be present but are considerably less than when the schizophrenia was originally diagnosed.

While the onset of the disorder is often related to a stressful life event, the underlying cause or causes of schizophrenia are not known. Some researchers believe that schizophrenia is hereditary, and there is evidence that some cases of schizophrenia are the result of an inherited defect in body chemistry in which brain chemicals called neurotransmitters function abnormally. Others theorize that schizophrenia results from external factors, such as complications during birth; head injury; a reaction to a virus, including the influenza virus; or environmental poisons that reach and damage the brain. There is a high incidence of childhood head injuries and birth complications among people with schizophrenia. A wide range of drugs also can cause schizophrenic-type symptoms.

Yet another theory focuses on nutritional factors. There is some indication that schizophrenia might be associated with high copper levels in body tissues. When copper levels are too high, the levels of vitamin C and zinc in the body drop. A zinc deficiency may result in damage to the pineal area of the brain, which normally contains high levels of zinc, which in turn may make an individual vulnerable to schizophrenia or other psychoses. Other clues come from the seasonality of the disorder. The incidence of schizophrenic episodes tends to peak in cold-weather months, when zinc intake tends to be lower. Magnesium deficiency could also be a factor. Some research has shown that mag-

nesium levels in the blood of people with active schizophrenia are lower than normal and that the levels are higher in persons whose schizophrenia is in remission. It has been hypothesized that a type of vicious cycle may be at work here; the high level of stress experienced by those with severe psychiatric disorders may lead to magnesium deficiency, which in turn would exacerbate symptoms such as anxiety, fear, hallucinations, weakness, and physical complaints.

Levels of, and the balance between, the neurotransmitters dopamine, serotonin, epinephrine, and norepinephrine, and the way in which the brain responds to these substances, are thought to play a profound role in the development of schizophrenia.

Approximately 2.4 million American adults, or about 1.1 percent of the population age eighteen and older, have schizophrenia. It affects men and women evenly; it first appears in men in their late teens or early twenties, in contrast to women, who generally are affected in their twenties or early thirties. One interesting thing that was found is that there seems to be more schizophrenia in the developed countries than in developing nations. Researchers advise extreme caution in drawing any conclusions from this, however, as there could be numerous social and economic factors skewing the results.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
5-hydroxy L-tryptophan (5-HTP)	As directed on label.	Increases the body's production of serotonin, a vital brain chemical.
Flaxseed oil	As directed on label.	To supply essential fatty acids, needed for proper brain and nerve function.
Folic acid	2,000 mcg daily.	Deficiency has been found in approximately 25 percent of those hospitalized for psychiatric disorders.
and vitamin B <sub>12</sub>	1,000 mcg twice daily.	Folic acid works best when taken with vitamin B <sub>12</sub> and vitamin C.
and vitamin C with bioflavonoids	5,000 mg daily.	
Gamma-aminobutyric acid (GABA)	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Essential for brain metabolism. Aids in proper brain function. (See AMINO ACIDS in Part One.)
Garlic (Kyolic from Wakunaga)	As directed on label.	Enhances brain function.
Glutathione or	As directed on label.	Deficiency can affect the nervous system.

cysteine plus glutamic acid and glycine	As directed on label.	Nutrients used to synthesize glutathione.
L-asparagine	As directed on label.	Maintains balance in the central nervous system.
L-glutamic acid	As directed on label.	Important in brain metabolism. Acts as a neurotransmitter.
L-methionine	As directed on label.	Helps to counteract histamine, which is found in high levels in people with schizophrenia.
L-phenylalanine	As directed on label.	An amino acid that is converted into tyrosine, which is important for synthesis of both dopamine and norepinephrine.
Pycnogenol or grape seed extract	As directed on label.	Antioxidants useful for dementia and other syndromes of the brain.
Zinc plus manganese	Up to 80 mg daily. Do not exceed 100 mg daily from all supplements.	Balances copper, often found in high concentrations in people with this disorder.
	As directed on label. Take separately from calcium.	Enhances action of B vitamins necessary for brain function.

**Very Important**

Free form amino acid	As directed on label. Take on an empty stomach.	Needed for normal brain function. Use a formula containing all the essential amino acids.
Raw liver extract injections	1 cc 3 times weekly for 3 weeks, then twice weekly for 3 months. Then reduce to 1 cc once weekly.	To supply B vitamins and other valuable nutrients. B vitamin deficiencies are related to brain malfunction. Many people with brain disorders have found this program helpful. All injectables can be combined in a single shot.
or vitamin B complex injections	1 cc 3 times weekly for 3 weeks, then twice weekly for 3 months. Then reduce to 1 cc once weekly.	
plus extra vitamin B <sub>6</sub> (pyridoxine)	½ cc 3 times weekly for 3 weeks, then twice weekly for 3 months. Then reduce to ½ cc once weekly.	
and vitamin B <sub>12</sub> or vitamin B complex	1 cc 3 times weekly or as prescribed by physician.	If injections are not available, use a sublingual form.
plus extra vitamin B <sub>6</sub> (pyridoxine)	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	
plus vitamin B <sub>3</sub> (niacin) or niacinamide	100 mg twice daily.	Required by the nervous system; necessary for normal brain function. Deficiency has been linked to schizophrenia. Injections (under a doctor's supervision) are best.
	100 mg 3 times daily. Do not exceed this amount.	<i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
Vitamin E emulsion or capsules	200 IU daily.	An antioxidant that improves brain circulation. Emulsion form is recommended for easier assimilation and greater safety at high doses.

**Important**

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Enhances cerebral oxygen utilization.
Essential fatty acids (black currant seed oil or primrose oil)	As directed on label 3 times daily.	Helps cerebral circulation.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Improves brain function. Contains choline and inositol. Works well with vitamin E.
L-glutamine	1,000–4,000 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed for normal brain function. (See AMINO ACIDS in Part One.)

**Helpful**

Kelp	1,000–1,500 mg daily.	Contains balanced essential minerals.
Multivitamin and mineral complex with calcium and magnesium	As directed on label.	All nutrients are needed for normal brain function.
Raw thyroid glandular	As directed on label.	Reduced thyroid function results in poor cerebral function. (See HYPOTHYROIDISM in Part Two and GLANDULAR THERAPY in Part Three.)

**Herbs**

Ginkgo biloba improves brain function and cerebral circulation, and enhances memory.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Kava kava and passionflower are good for relief of stress and depression.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

**Recommendations**

Eat a high-fiber diet that includes plenty of fresh raw vegetables and quality protein, and try eating more frequent small meals rather than three larger ones each day. This helps to keep blood sugar levels stable, which in turn has a stabilizing influence on mood and behavior. See HYPOLYCEMIA in Part Two for additional suggestions.

Include the following in your diet: breast of chicken or turkey, brewer's yeast, halibut, peas, sunflower seeds, and tuna. Also eat foods rich in niacin, such as broccoli, carrots, corn, eggs, fish, potatoes, tomatoes, and whole wheat.

*Caution:* Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Do not consume caffeine. It promotes the release of unwanted norepinephrine, a stimulating neurotransmitter.

Avoid alcohol. Alcohol consumption depletes the body of zinc. Many psychological disorders are known to be adversely affected by zinc deficiencies.

Keep environmental pressures under control. Overstimulation from very strong emotions or an excessive workload can exacerbate symptoms. Also avoid understimulation.

### Considerations

Sometimes extremely high doses of certain vitamins are needed to keep the mind functioning well.

Hair analysis reveals mineral imbalances that may contribute to mental difficulties. (See HAIR ANALYSIS in Part Three.)

Some experts believe that many suicides among the young may be related to undiagnosed schizophrenia.

Psychiatrists found a link between schizophrenia and pellagra, a vitamin B<sub>3</sub> (niacin) deficiency disease. Taking several grams of niacinamide daily (under a doctor's supervision) has been tried with good results.

Undiagnosed celiac disease, caused by an intolerance to gluten, can cause symptoms similar to those of schizophrenia. Gluten intolerance can also cause severe depression. (See CELIAC DISEASE in Part Two.)

Drug therapy is usually the medical treatment of choice for schizophrenia. However, there is no single medication that is effective in all cases. It may be necessary to try several different drugs in order to find the one that works best to keep symptoms under control.

With newer drugs there is a tendency to gain weight and develop a condition called metabolic syndrome. This causes increases in blood sugar, cholesterol, and blood pressure. Be sure that your doctor is monitoring your weight and these medical tests, so that if treatment is needed, it can be provided early.

Olanzapine (Zyprexa) has been used since the mid-1990s to treat schizophrenia. When using this drug, tell your doctor if you eat grapefruit or drink grapefruit juice because of potential interactions, and be sure to drink plenty of water. This drug was supposed to reduce tremors associated with older drugs such as haloperidol (Haldol). It is highly effective, but does promote weight gain. Monitor your weight if you are taking this drug.

Some people are prescribed ziprasidone (Geodon). It is best absorbed with a meal that contains at least 500 calories and any amount of fat. If you are gaining weight with this drug, opt for low-fat meals (less than 30 percent of calories).

The essential fatty acids in the red blood cells and spinal fluid of patients with schizophrenia differ from those without the condition. In one study, the omega-3 fat DHA was lower in the brain and higher in the spinal fluid of those with schizophrenia. This finding will likely provoke new research into the area of fatty acids and brain function.

If you are taking prescription drugs for schizophrenia, do not stop taking your medication without first consulting a physician. Do not take any of the supplements listed above that might affect dopamine, serotonin, or norepinephrine synthesis without consulting a physician.

Some cases of schizophrenia have been linked to food allergies. Many people find their symptoms improve after they fast. (See also ALLERGIES in Part Two and FASTING in Part Three.)

For more information concerning schizophrenia, you can consult [www.schizophrenia.com](http://www.schizophrenia.com). (See Health and Medical Organizations in the Appendix).

### SCIATICA

See under BACKACHE.

### SCOTOMA

See under EYE PROBLEMS.

### SEASONAL AFFECTIVE DISORDER (SAD)

See under DEPRESSION.

### SEBACEOUS CYST

Sebaceous cysts are skin growths that contain a mixture of sebum (oil) and skin proteins. They generally appear as small, slowly growing swellings on the face, scalp, or back. A whitehead is actually a tiny sebaceous cyst.

These nodules feel firm but movable and rarely hurt unless they become infected. If infection sets in, there may be redness and swelling, and the area may become sensitive to the touch. Sebaceous cysts are benign, but they can become a site of chronic, usually bacterial, infection. With chronic infection, an abscess may form.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Primrose oil	1,000 mg 3 times daily.	A good healer for most skin disorders.
Vitamin A	25,000 IU daily for 3 months, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Necessary for healing and construction of new skin tissue.
plus carotenoid complex with beta-carotene	As directed on label.	Used by the body to make vitamin A as needed.
Vitamin B complex plus extra vitamin B <sub>12</sub>	As directed on label. 1,000–2,000 mcg daily.	Antistress and antiaging vitamins. Needed for healthy skin.
<b>Important</b>		
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Has anti-infective properties.
Kelp	1,000–1,500 mg daily.	Supplies balanced minerals needed for good skin tone.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	For tissue repair. Enhances immune system response. Use zinc gluconate lozenges or OptiZinc for best absorption.
<b>Helpful</b>		
Superoxide dismutase (SOD)	As directed on label.	A free radical destroyer.

## Herbs

- Aloe vera is soothing and healing. Apply pure aloe vera gel to the affected area as directed on the product label.
- Burdock root and red clover are both powerful blood cleansers.
- Goldenseal extract or tea tree oil can be applied topically to fight infection.
- Milk thistle aids the liver in cleansing the blood.
- Witch hazel, applied to the skin, is excellent for absorbing oil.

## Recommendations

- Avoid fats, especially saturated fats, and all fried foods. Also avoid alcohol, caffeine, chocolate, cocoa, dairy products, eggs, fat, fish, meat, salt, and sugar.
- Follow a fasting program. (See FASTING in Part Three.)
- Apply warm compresses several times daily.
- Use hot water when washing your skin. This helps to dissolve skin oil.

## Considerations

- If the cyst is inflamed, your doctor may inject it with a steroid medicine to reduce swelling.

If an antibiotic is prescribed, be sure to take an acidophilus supplement to replace necessary “friendly” bacteria. Do not take acidophilus at the same time of day as the antibiotic.

If you develop an inflamed or infected sebaceous cyst, your physician may suggest surgical drainage, a procedure that is performed in the doctor’s office.

See also OILY SKIN in Part Two.

## SEBORRHEA

Seborrhea, or seborrheic dermatitis, is characterized by scaly patches of skin that result from a disorder of the sebaceous (oil-secreting) glands. Seborrhea most often occurs on the scalp, face, and chest, but can appear on other parts of the body as well. It may or may not be itchy.

Seborrheic skin may be yellowish and/or greasy or dry and flaky. The scaly bumps may coalesce to form large plaques or patches. Seborrheic dermatitis can occur at any age, but is most common in infancy (“cradle cap”) and middle age. The exact cause is not known, but it may be linked to nutritional deficiencies (especially a lack of biotin and vitamin A) or the effects of a yeast organism, *Pityrosporum ovale*, which normally lives in the hair follicles. Heredity and climate probably also play a role. Adult seborrheic dermatitis, which usually affects the scalp and face, is often associated with stress and anxiety. Other factors associated with an increased chance of developing seborrhea include infrequent shampooing, oily skin, obesity, Parkinson’s disease, AIDS, and other skin disorders, such as acne, rosacea, and psoriasis.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Essential fatty acids (primrose oil or Ultimate Oil from Nature’s Secret)	As directed on label.	Important for many skin disorders; contains needed linoleic acid.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	As directed on label. 50 mg 3 times daily.	The B vitamins, especially vitamin B <sub>6</sub> , are needed for protein metabolism, which is essential for healing and repair. Use a super-high-potency formula. A sublingual form is recommended for best absorption. Consider injections (under a doctor’s supervision).
and biotin	300–400 mcg 3 times daily.	Deficiency has been linked to seborrhea.

Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important for healing. Enhances immunity. Use zinc gluconate lozenges or OptiZinc for best absorption.
------	--	--

**Important**

ConcenTrace from Trace Minerals Research	As directed on label.	Contains essential trace minerals to nourish the skin.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains amino acids, vitamins, and herbs that promote skin health and remove toxins.
Methylsulfonylmethane (MSM)	As directed on label.	Possesses healing and nutritional properties for the skin.
Panoderm I from American Biologics	As directed on label.	Contains squalene, a substance found in healthy skin. Acts as a natural antioxidant and prevents damage to the skin due to cosmetics, wind, sun, and pollutants.
Pycnogenol or grape seed extract	As directed on label.	Powerful antioxidants that strengthen the skin to resist disease.
Vitamin A plus carotenoid complex with beta-carotene plus vitamin E	Up to 50,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Deficiency may cause or contribute to seborrhea.
	200 IU daily.	Speeds healing. Increases oxygen intake.

**Helpful**

Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	To replenish "friendly" bacteria. Especially important if antibiotics are prescribed. Use a nondairy formula.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	An important free radical scavenger that supplies oxygen to the cells. Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Increases oxygenation of tissues.
Free form amino acid	As directed on label.	For healing and repair of tissues.
Kelp	1,000–1,500 mg daily.	Contains balanced minerals. A good source of iodine.
Lecithin granules or capsules	1 tsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	For cellular protection.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.

**Herbs**

Dandelion, goldenseal, and red clover, taken internally, are good for most skin disorders.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Emu oil, applied topically, has an anti-inflammatory effect on skin tissues.

Oat straw may be used in a bath to reduce symptoms, especially inflammation and itching.

Olive leaf extract has healing properties for the skin.

Tea tree oil is a natural antiseptic and antifungal that can be applied directly to the affected area. If it is too strong, it can be diluted with an equal amount of jojoba oil (available in health food stores) or distilled water.

Wild pansy (*Viola tricolor*) grows wild in parts of Europe, the Near East, and Africa, as well as in parts of North America. The aerial parts can be dried and used topically to treat various skin ailments, including seborrhea, cradle cap, and eczema. To make a compress or rinse, pour ½ cup of boiling water over 2 teaspoons of wild pansy, steep for ten minutes, and strain. Use the resulting liquid to make a hot compress, to be removed from the affected area when dry or cold. Use this treatment several times a day.

**Recommendations**

Eat a diet composed of 50 to 75 percent raw foods and soured products such as low-fat yogurt.

Avoid chocolate, dairy products, white flour, fried foods, seafood, nuts, and anything containing sugar.

Do not eat any foods containing raw eggs. Egg whites contain high levels of avidin, a protein that binds biotin and prevents it from being absorbed. Biotin is needed for healthy hair and skin. Eating uncooked eggs also poses a risk of *Salmonella* poisoning (see **FOODBORNE/WATERBORNE ILLNESS** in Part Two).

If antibiotics are prescribed, take extra B-complex vitamins and an acidophilus supplement to replace the "friendly" bacteria destroyed by the antibiotics.

Try changing your hair products. Choose products without chemicals.

To minimize the frequency and severity of flare-ups, dry your skin thoroughly after bathing, and wear loose-fitting clothing made of natural fibers that "breathe."

*Echinacea purpurea*, a homeopathic preparation, can be used to reduce symptoms.

Avoid using over-the-counter ointments to treat seborrhea. Use can cause an overload on the skin.

- Do not pick at or squeeze the affected skin.
- Avoid using irritating soaps, but make sure you keep the affected areas clean. Avoid greasy ointments and creams.
- Keep your hair clean and make sure you use a non-oily shampoo.
- If dietary changes and nutritional supplementation do not produce an improvement, seek the advice of a qualified health care professional.
- Follow a fasting program once a month. (See FASTING in Part Three.)

**Considerations**

- Dermatologists usually prescribe topical steroids to reduce inflammation and control itching. Anti-fungal shampoos are available without a prescription such as Selsun Blue (with selenium sulfide) and Head and Shoulders (with pyrithione zinc).
- An absence of intestinal flora may be responsible for biotin deficiency in infants. Studies have shown that treating both the nursing mother and her infant with biotin can be successful in resolving cradle cap. For adults, treatment with biotin alone does not appear to be effective, but supplementation with biotin combined with the whole vitamin B complex and essential fatty acids produces improvement in many cases. Do not give your infant anything without speaking to a pediatrician first.
- Consuming raw egg whites has produced seborrheic dermatitis in laboratory tests.
- Colloidal silver is a natural topical antibiotic that has been known to fight skin conditions such as seborrhea.
- Some findings suggest that many skin disorders, including eczema and psoriasis, may be related to gluten allergy. A gluten-free diet may be helpful. See CELIAC DISEASE in Part Two for dietary suggestions.
- Taking supplemental vitamin B complex has been shown to be the most effective treatment in many cases.
- See also DANDRUFF and DERMATITIS in Part Two.

**SEIZURE**

See under EPILEPSY.

**SENILITY (DEMENTIA)**

Senility was once considered an inevitable consequence of aging. However, we now know that it is a physically based disease resulting from a loss of brain cells. Brain function, or certain aspects of brain function, decline to the point that mental disability results. Forgetfulness, fearfulness, depression, agitation, difficulty absorbing new information, loss of normal emotional responses, and an ability to remember things that happened years ago, but not things

that took place a few minutes ago, are typical. Other signs include mood swings, jealousy, paranoia, frustration, anger, insensitivity to the feelings of others, fear of being alone, repeating conversations, inability to make decisions or complete a task, lack of a sense of time, hoarding, failure to recognize people, and self-neglect. The disorder usually gets progressively worse. Complications that may occur include injuries (primarily due to falls), inadequate nutrition, constipation, and a variety of infections.

Dementia can be caused by several diseases affecting brain function, among them alcoholism, Alzheimer’s disease, kidney or liver failure, hypothyroidism, multiple strokes, atherosclerosis, multiple sclerosis, or diabetes, to name a few. It can also result from nutritional deficiencies, especially deficiencies of vitamins B<sub>1</sub> (thiamine), B<sub>3</sub> (niacin), B<sub>6</sub> (pyridoxine), and B<sub>12</sub>. Older adults who develop gait abnormalities seem to be more prone to getting vascular or other non-Alzheimer’s type dementia according to one study. This is a valid early warning signal because such individuals are more than three and a half times more likely to develop dementia as compared with those who have the same basic risk factors but who do not have the gait problem. Blood pressure medication, dietary changes, and nutritional therapy aimed at lessening the risk of stroke might help.

Many people diagnosed as senile actually suffer from *pseudodementia*—symptoms that mimic dementia but that are actually caused by depression, deafness, brain tumors, thyroid problems, liver or kidney problems, the use of certain drugs, or other disorders. A thorough medical and psychological examination by a qualified professional, preferably a specialist in the field, is necessary for an accurate diagnosis.

Dementia is considered incurable. However, because generally declining health contributes to the problem, proper diet and nutritional supplements can help. The following supplements are helpful for improving brain function. When choosing supplements, avoid heavily coated or sustained-release products. These are difficult to break down. Instead, choose liquids, powders, or sublingual forms.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Helps to maintain mental acuity and enhances immune function.
Essential fatty acids (flaxseed oil or primrose oil)	As directed on label.	Promotes brain and nerve function as well as a healthy immune system.
Free form amino acid	As directed on label.	To supply protein, needed for normal brain function. Protein deficiency is common among older adults.

Gamma-amino-butyric acid (GABA)	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Essential for brain function and metabolism. Has a calming effect. (See AMINO ACIDS in Part One.)
Garlic (Kyoic from Wakunaga)	As directed on label.	Enhances brain function; helps to reduce stress and anxiety.
L-asparagine	As directed on label, on an empty stomach.	To maintain balance in the brain and central nervous system.
L-phenylalanine	As directed on label, on an empty stomach.	Promotes alertness, aids memory, and helps overcome depression. <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug, or if you suffer from panic attacks, diabetes, high blood pressure, or PKU.
L-tyrosine	As directed on label, on an empty stomach.	Promotes brain function and helps fight depression. <i>Caution:</i> Do not take tyrosine if you are taking an MAO inhibitor drug, commonly prescribed for depression.
Melatonin	2–3 mg daily, taken 2 hours or less before bedtime.	Aids sleep, helps maintain equilibrium, and strengthens the immune system.
Nicotinamide adenine dinucleotide (NADH)	As directed on label.	A coenzyme form of niacin that is essential for production of energy and various neurotransmitters.
Phosphatidyl choline	As directed on label.	Aids in treating neurological disorders, memory loss, and depression. Is safe and effective. However, if you have bipolar mood disorder, you should not take large amounts.
Phosphatidyl serine	As directed on label.	Has been known to reverse depression and symptoms of Alzheimer's disease, and to enhance memory and learning abilities. The brain normally produces it, but production dwindles with age.
Pregnenolone	As directed on label.	May treat symptoms of aging, increase brain function, and enhance mood, memory, and thinking.
Vitamin B complex injections	1 cc once weekly or as prescribed by physician.	All B vitamins are necessary for brain and nerve health. Older adults often have deficiencies because the ability to absorb the B vitamins declines with age. Injections (under a doctor's supervision) are best.
plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> injections	½ cc once weekly or as prescribed by physician.	Vital for mental health and for maintaining proper electrolyte balance in the body.
plus liver extract injections or vitamin B complex	As prescribed by physician. 1 cc once weekly or as prescribed by physician. 100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	A good source of B vitamins and other valuable nutrients. If injections are not available, use a sublingual form.

vitamin B <sub>3</sub> (niacin)	100 mg daily. Do not exceed this amount. Take with 100 mg niacinamide to reduce flushing.	Improves cerebral circulation and lowers cholesterol levels. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50 mg daily.	
	2,000 mcg daily.	Needed to prevent anemia. Also prevents nerve damage and may assist memory and learning. Use a lozenge or sublingual form.

**Very Important**

S-Adenosylmethionine (SAME)	400 mg 2 times daily.	Aids in relieving stress and depression, eases pain, and produces antioxidant effects. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants.
Trimethylglycine (TMG)	500–1,000 mg in the morning.	Assists the body in utilizing vitamin B <sub>6</sub> , vitamin B <sub>12</sub> , and folic acid. Also helps to rid the body of toxic elements (such as homocysteine) and increases levels of the natural mood elevator S-adenosylmethionine.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Reduces blood clotting tendency, improving cerebral circulation.
Vitamin E	200 IU daily.	Improves cerebral circulation and boosts immunity, which declines with age. Use d-alpha-tocopherol form.

**Important**

GH3 from Gero Vita	As directed on label.	Helps to promote brain function. Consider injections (under a doctor's supervision). <i>Caution:</i> Do not use GH3 if you are allergic to sulfites.
--------------------	-----------------------	---

**Helpful**

Coenzyme Q <sub>10</sub> plus	100–200 mg daily.	Free radical scavenger and immunostimulant. Increases cellular oxygen levels.
Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Kelp	As directed on label.	Reported to be very beneficial to brain tissue, the membranes surrounding the brain, the sensory nerves, and the spinal cord.
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	For brain cell protection and function.
L-glutamine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Needed for normal brain function. (See AMINO ACIDS in Part One.)
Multivitamin complex	As directed on label.	For necessary vitamins. Use a high-potency formula.

Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Aids in heavy metal detoxification and enhancing immunity. Use zinc gluconate lozenges or OptiZinc for best absorption.
------	---	---

## Herbs

Anise, blessed thistle, and blue cohosh appear to sharpen brain power.

Ginkgo biloba improves cerebral circulation, enhances brain function and memory, and destroys free radicals to protect brain cells. Three times a day, place ½ dropperful of alcohol-free liquid extract under your tongue and hold it there for a few minutes before swallowing. Or take 400 milligrams in capsule form three times daily.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Gotu kola, ginseng, and mullein oil all aid with memory function.

*Caution:* Do not use ginseng if you have high blood pressure or are pregnant or nursing.

Kava kava and St. John's wort help to calm people who anger easily.

*Cautions:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

The Chinese herb qian ceng ta (*Huperzia serrata*) increases memory retention. It is the source of the compound huperzine A. Pure standardized extracts of this compound have been shown to increase mental sharpness, language ability, and memory in a significant percentage of people with Alzheimer's disease. It is a potent blocker of acetylcholinesterase, an enzyme that regulates the activity of acetylcholine, which is an important brain chemical involved in maintaining healthy learning and memory functions.

Valerian root promotes better sleep patterns when taken at bedtime.

## Recommendations

Eat a diet consisting of 50 to 75 percent raw foods, along with seeds, whole-grain cereals and breads, raw nuts, and low-fat yogurt and other soured products. Eat Swiss cheese, brown rice, and plenty of fiber daily.

Drink plenty of liquids, even if you are not thirsty—as we grow older, our “thirst system” does not work as well.

Move the bowels daily. Oat bran, rice bran, and a high-fiber diet are important. ABC Aerobic Bulk Cleanse from

Aerobic Life Industries, a colon cleanser, is very helpful. Enemas may be needed. (See ENEMAS in Part Three.)

Keep active. Exercising, walking, engaging in mental activity, and doing things you enjoy, like pursuing a hobby, are important. Seek out companionship and new experiences. Some people withdraw and keep to themselves as they get older because it seems easier and/or safer, but this can lead to loneliness and depression. If getting out and about is a problem, consider investing in and learning to use a computer. There are a number of online services geared to seniors that can serve as a source of companionship as well as information.

Be sure to maintain a safe environment at home.

Protect against head injury by wearing your seat belt and by wearing protective headgear when participating in activities such as bicycle riding.

Have a complete physical examination to rule out the possibility of underlying illness as a cause of symptoms.

## Considerations

To make an accurate diagnosis of senile dementia, a physician needs to be thoroughly informed about symptoms—exactly what they are, how often they occur and under what circumstances, and any factors that have been noted to improve or worsen them. He or she will also need to know about any medical conditions you may have and what types of medications (prescription and over-the-counter) and supplements you are taking, as these can have an effect on memory. To rule out other conditions, the doctor may perform a number of tests, including blood tests, memory testing, an electrocardiogram (EKG) to measure heart activity, an electroencephalogram (EEG) to measure brain waves, brain scans, and/or a spinal tap.

There is no cure for most types of dementia. Often, treatment is aimed at controlling anger, depression, delusions, and other symptoms that are present as a result of the condition. Antidepressants and tranquilizers are some of the types of medications that may be recommended.

Evidence suggests that many cases of dementia may be prevented by “stroke reduction” measures—not smoking, controlling high blood pressure, pursuing chelation therapy to remove toxic metals from the body, adhering to a proper diet, and taking appropriate nutritional supplements.

Ultimately, a person with long-term dementia is unable to live independently, and often requires full-time nursing care.

Feelings of isolation, loneliness, frustration, anger, fatigue, and loss of a social life often accompany this condition—and this can be overwhelming. Frequent time spent with family members and friends, along with psychological care, can help to alleviate these feelings.

Smoking may increase your chance of getting dementia.

People who have atherosclerosis and high blood pressure have a higher risk of developing senility. (See ARTERIOSCLEROSIS/ATHEROSCLEROSIS and HIGH BLOOD PRESSURE in Part Two.)

Food allergies can cause mental as well as physical symptoms. (See ALLERGIES in Part Two.)

Toxic metals in the body can produce symptoms similar to those of senility. A hair analysis can reveal whether the body is incurring damage due to the presence of toxic levels of metals like aluminum and lead. (See HAIR ANALYSIS in Part Three.)

See ALUMINUM TOXICITY; ALZHEIMER'S DISEASE; and PARKINSON'S DISEASE, all in Part Two.

See also BINSWANGER'S DISEASE and PICK'S DISEASE under RARE DISORDERS in Part Two.

## SEXUAL DYSFUNCTION IN WOMEN

Sexual dysfunction is the inability to experience pleasure from sexual intercourse, characterized by a general lack of sexual desire and responsiveness. The term frigidity was once commonly used to describe sexual dysfunction in women. However, the term sexual dysfunction is preferred. It is usually of psychological origin, stemming from fear, anxiety, guilt, depression, conflict with one's mate, and/or feelings of inferiority. Early traumatic sexual experience or other unpleasant childhood and adolescent episodes are often factors.

Sexual dysfunction may also be a result of physiological factors. Some women find intercourse painful due to insufficient lubrication, inadequate stimulation, underlying illness or infection, or some other physical cause. The pain causes them to fear and shrink from sexual contact. Vitamin deficiency can cause a deficiency in estrogen levels and result in improper lubrication. A chronic illness, some medications, low testosterone levels, and certain medical conditions can also greatly diminish sexual desire. The supplement program outlined below should help.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Kelp	2,000–2,500 mg daily.	A good source of iodine and other important minerals.
Vitamin B complex	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary).	Calms the nervous system and aids in reducing anxiety.
Vitamin E	200 IU daily.	Necessary for the functioning of the reproductive system and glands. Use d-alpha-tocopherol form.
<b>Helpful</b>		
Fish liver oil	As directed on label. Take with meals.	Supplies vitamins A and D.

Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 2,400 mg 3 times daily, with meals.	Contains essential fatty acids and aids in proper nerve function.
L-phenylalanine and L-tyrosine	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. Do not exceed the recommended dosage.	Amino acids needed for synthesis of crucial neurotransmitters involved in mood and nervous system function. Cautions: Do not take phenylalanine if you are pregnant or nursing a baby, or if you suffer from panic attacks, diabetes, high blood pressure, or PKU. Do not take tyrosine if you are taking an MAO inhibitor drug.
Para-aminobenzoic acid (PABA)	100 mg daily.	A B vitamin that stimulates vital life functions.
Vitamin C with bioflavonoids	3,000–6,000 mg daily, in divided doses.	Important in glandular function and stress response.
Zinc plus copper	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	Zinc deficiency can result in impaired sexual function. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed to balance with zinc.

## Herbs

Chives (*Allium schoenoprasum*) contain minerals required for the manufacture of sex hormones.

Damiana (*Turnera aphrodisiaca*) is the "woman's sexuality herb"—one of the most popular of plant aphrodisiacs. It contains alkaloids that directly stimulate the nerves and organs and have a testosterone-like effect. Damiana is excellent for supporting the sexual organs and enhancing sexual pleasure. For best results, place a dropperful of damiana extract under your tongue an hour or two before sexual activity. It may take several days for the difference to become apparent.

Kava kava, traditionally valued for its mellowing effects, may help with issues of anxiety and nervousness.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

Wild yam contains a natural steroid called dehydroepiandrosterone (DHEA) that rejuvenates and gives vigor to lovemaking. Take it for two weeks, then stop for two weeks, and so on.

Other herbs that are good for promoting energy and sexuality include fo-ti, gotu kola, sarsaparilla, saw palmetto, and Siberian ginseng.

*Caution:* Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

## Recommendations

❑ Make sure to include the following in your diet: alfalfa sprouts; avocados; eggs that come fresh from hens (not those stored cold in the supermarket); olive oil; pumpkin seeds and other seeds and nuts; soy and sesame oil; and wheat.

❑ Try taking supplemental bee pollen to increase energy.

*Caution:* Bee pollen may cause an allergic reaction in some people. Start with a small amount at first, and discontinue use if a rash, wheezing, discomfort, or other symptom occurs.

❑ Avoid poultry, red meat, and sugar products. Get your protein from vegetable-based foods like soy and legumes.

❑ Avoid smoggy conditions. Smog is highly toxic and dangerous; it adversely affects immune function and hormonal activity, as well as a host of other body functions.

## Considerations

❑ There are medical alternatives that can help some women by alleviating painful intercourse. Painful intercourse may also be a sign of certain gynecological diseases.

❑ If sexual dysfunction is due to interpersonal conflict or psychological causes, help from a couples counselor or other mental health professional is advised.

❑ Sexual dysfunction in men can be caused by psychological issues. Psychological erectile dysfunction in men can be based on early sexual trauma, anxiety, fear, guilt, and other psychological conflicts. (See ERECTILE DYSFUNCTION in Part Two.)

❑ Depression or hypothyroidism may be the underlying problem. (See DEPRESSION and HYPOTHYROIDISM in Part Two.)

## SEXUALLY TRANSMITTED DISEASE (STD)

There are numerous diseases that are passed on either exclusively or primarily through intimate sexual contact. These include acquired immunodeficiency syndrome (AIDS), chancroid, chlamydia, genital herpes, gonorrhea, lymphogranuloma venereum (LGV), granuloma inguinale, some types of hepatitis, syphilis, and trichomoniasis. Genital candidiasis also can be transmitted through sexual contact.

Crabs (pubic lice) and scabies also are sexually transmitted, but are considered parasitic infestations rather than infectious diseases. This section deals primarily with two of the more common sexually transmitted diseases, gonorrhea and syphilis.

Gonorrhea is caused by a microorganism called *Neisseria gonorrhoeae*. These bacteria are commonly referred to as gonococci. The U.S. Centers for Disease Control and Prevention (CDC) estimates that there are some 700,000 new cases of gonorrhea in the United States each year, but that only half are reported. Most, about 75 percent of the cases, are

found in people aged fifteen to twenty-nine years. The rate of gonorrheal infection is 121 people per 100,000. In women, gonorrhea often causes no symptoms. When it does, they include frequent and painful urination, vaginal discharge, abnormal menstrual bleeding, acute inflammation in the pelvic area, and rectal itching. Men with gonorrhea usually do experience symptoms, including a yellow discharge of pus and mucus from the penis and slow, difficult, and painful urination. Symptoms usually appear between two and twenty-one days after sexual contact.

If not treated, the infection can travel through the bloodstream and go into the bones, joints, tendons, and other tissues, causing a systemic illness with mild fever, achy feeling, inflamed joints, and, occasionally, skin lesions. At this stage, the organism is difficult to detect, and the condition is often misdiagnosed as simple arthritis. In men, complications of gonorrhea can include sterility and urethral stricture. In women, the infection can spread into the uterus and fallopian tubes, resulting in pelvic inflammatory disease (PID). This can cause ectopic pregnancy and infertility in as many as 10 percent of affected women.

Syphilis is fairly rare in the United States, but it seems to be making a comeback. Between 2005 and 2006, the number of reported cases increased 12 percent. Health officials have had over 36,000 cases reported to them. Most cases occurred in persons aged twenty to thirty years.

Syphilis is caused by a type of bacteria called *Treponema pallidum*. This disease is occasionally contracted through close physical contact such as kissing, as well as through sexual intercourse. If not treated, the illness progresses, usually over the course of many years, through three basic stages. In the first stage, ten to ninety days after contact, a chancre (pronounced SHAN-ker)—a red, painless ulcer—appears at the spot where the bacteria entered the body. In the second stage, perhaps four to ten weeks after contact, a rash and patches of flaking tissue appear in the mouth, palms of the hands, soles of the feet, or genital area. There may be systemic symptoms, usually mild, as well—headache, nausea, and general discomfort. If the disease progresses to its third stage (which is quite rare in the United States), a year or more after the initial infection, brain damage, hearing loss, heart disease, and/or blindness can occur. This disease can remain dormant for up to twenty years.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label 3 times daily, on an empty stomach.	To restore "friendly" bacteria. Important when taking antibiotics, which are usually prescribed for STDs. Use a nondairy formula.

Free form amino acid	As directed on label.	Needed for tissue repair. Use free form amino acids for quicker absorption and assimilation.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic and immune system stimulant.
Vitamin C with bioflavonoids	750–2,500 mg 4 times daily.	Boosts immune system function and is an antiviral agent.
Zinc	100 mg daily. Do not exceed this amount from all supplements.	Important for the health of the reproductive organs. Promotes wound healing and boosts immune function to fight a broad range of microbes. Use zinc gluconate lozenges or OptiZinc for best absorption.

#### Important

Colloidal silver	Use topically as directed on label.	An antiseptic that rapidly reduces inflammation and promotes healing of lesions.
Kelp	1,000–1,500 mg daily.	Supplies balanced vitamins and minerals.
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Necessary in all cellular enzyme system functions.

#### Helpful

Coenzyme Q <sub>10</sub>	30–60 mg daily.	A powerful free radical scavenger.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance. Use a high-potency formula.
Raw glandular complex plus raw thymus glandular	As directed on label.	Promote immune function.
Vitamin K or alfalfa	100 mcg daily.	Antibiotics destroy the intestinal bacteria that produce vitamin K, which is necessary for blood clotting. See <i>under</i> Herbs, below.

## Herbs

Alfalfa is a good source of vitamin K, which is needed for blood clotting and healing. This vitamin is depleted by antibiotics.

Astragalus helps to protect the immune system.

*Caution:* Do not use astragalus in the presence of a fever.

Echinacea, goldenseal, pau d'arco, and suma may alleviate symptoms. Alternate among two or more of these herbs. Consume three cups of herbal tea daily or take herbs in capsule or extract form as directed on the product label.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with cau-

tion if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Hops helps to relieve pain and stress.

Red clover acts as an antibiotic and anti-inflammatory agent, and aids relaxation.

Suma enhances the immune system and helps prevent stress. This herb is sometimes referred to as Brazilian ginseng.

## Recommendations

Use a latex (not sheepskin) condom for any sexual activity until the infection has cleared completely. These diseases are highly contagious. Be aware, however, that even the use of a condom does not guarantee protection against STDs. Abstinence is the only way to avoid any chance of transmitting the infection.

If you are taking penicillin or another antibiotic for a sexually transmitted disease, be sure to add some form of acidophilus to your diet to replace lost "friendly" bacteria.

## Considerations

Antibiotics are the usual treatment for both syphilis and gonorrhea. It is important to take any prescribed antibiotic for the full course, even if symptoms abate. Do not stop taking the medication early.

In a child of any age, the presence of a sexually transmitted disease is automatically considered to be a sign of sexual abuse, which should be pursued accordingly.

See also AIDS (ACQUIRED IMMUNODEFICIENCY SYNDROME); CANDIDIASIS; CHLAMYDIA; HERPES INFECTION; WARTS; and/or YEAST INFECTION, all in Part Two.

## SHINGLES (HERPES ZOSTER)

Shingles, also known as herpes zoster, is a disease caused by the varicella-zoster virus, the same virus that causes chickenpox. It affects the nerve endings in the skin. Shingles can appear anywhere on the body; however, it is most commonly found on the skin of the abdomen underneath the ribs, leading toward the navel. Other commonly affected areas are the vaginal tissues and the inside of the mouth.

Most adults have already contracted chickenpox. This common childhood disease causes a fever and a rash that itches maddeningly but rarely does any permanent damage. However, once the varicella-zoster virus enters the body and has caused chickenpox, it doesn't go away. It may lie dormant in the spinal cord and nerve ganglia for years until activated, usually by a weakening (temporary or permanent) of the immune system. Then the varicella-zoster infection spreads to the very ends of the nerves, causing them to send impulses to the brain that are interpreted as severe

## Early Symptoms of Sexually Transmitted Diseases

It is important to detect sexually transmitted diseases in their early stages so that prompt treatment can begin and, in the case of some diseases, irreparable damage to the body can

be prevented. Use the table below to familiarize yourself with the beginning stages of various STDs.

Disease	First Symptoms
AIDS (acquired immunodeficiency syndrome)	Headache, night sweats, unexplained weight loss, fatigue, swollen lymph glands, persistent fever, oral thrush (a heavy, whitish coating on the tongue and the insides of the mouth), recurrent vaginal yeast infections, persistent diarrhea, lung infections.
Candidiasis	Itching in the genital area, pain when urinating, a thick odorless vaginal discharge.
Chlamydia	For women: a white vaginal discharge that resembles cottage cheese, a burning sensation when urinating, itching, painful intercourse. For men: a clear, watery urethral discharge. Often, however, there are no symptoms at all.
Genital herpes	Itching, burning in the genital area, discomfort while urinating, a watery vaginal or urethral discharge, weeping, fluid-filled eruptions in the vagina or on the penis.
Genital warts	Soft, cauliflower-like growths appearing either singly or in clusters in and around the vagina, anus, penis, groin, and/or scrotal area.
Gonorrhea	For women: frequent and painful urination, a cloudy vaginal discharge, vaginal itching, inflammation of the pelvic area, rectal discharge, abnormal uterine bleeding. For men: a yellowish, pus-filled urethral discharge.
Pelvic inflammatory disease (PID)	A pus-filled vaginal discharge with fever and lower abdominal pain.
Syphilis	A sore on the genitalia, rash, patches of flaking tissue, fever, sore throat, sores in the mouth or anus.
Trichomoniasis	For women: vaginal itching and pain, with a foamy, greenish or yellow foul-smelling discharge. For men: a clear urethral discharge.

pain, itching, or burning, and rendering the overlying skin much more sensitive than usual. One out of every five people who has had chickenpox is likely to get shingles. Those who have never had chickenpox have very little chance of developing shingles because it is not very contagious.

An attack of shingles is often preceded by three or four days of chills, fever, and achy feelings. There may also be pain in the affected area. Then crops of tiny fluid-filled blisters surrounded by a red rim appear. The affected area becomes excruciatingly painful and sensitive to the touch. Other symptoms can include numbness, fatigue, depression, tingling, shooting pains, swollen and painful lymph nodes, fever, and headache. This phase of shingles lasts seven to fourteen days. The blisters eventually form crusty scabs and drop off. Scarring can occur in severe cases.

The chance of an attack of shingles can be increased by many factors, including stress; cancer; the use of anticancer drugs; spinal cord injuries; and conditions that suppress the immune system, such as the human immunodeficiency virus (HIV); or the use of medications such as corticosteroids or cyclosporine. However, serious illness is not required to activate the virus. Any type of physical or emotional stress can make one susceptible. Often, something as innocuous as a minor injury or a mild cold can

lead to an attack in an otherwise healthy person. In most cases, it is never determined just what the trigger is.

Ten to 20 out of every 100 persons will get shingles in their lifetime. Most get it only once; about 4 in every 100 persons will have it more than once. It can appear at any age, but is most common in people over the age of fifty, when immune function naturally begins to decline as a result of aging. Most cases of shingles run their course within a few weeks. More severe cases may last longer and require aggressive treatment.

In some cases, the pain continues for months, even years, after the blisters have disappeared. This syndrome, called postherpetic neuralgia (PHN), is more likely to occur in older people. If shingles develop near the eyes, the cornea may be affected and blindness may result. The acute pain of shingles and the chronic pain of PHN are called neuropathic pain. Both originate in the nerve cells, but their duration and the reaction to treatment is different. Pain that occurs with the initial outbreak responds to treatment and is limited in duration. In contrast, PHN lasts longer, is often difficult to treat, and can be incapacitating. The skin of many people with PHN becomes so sensitive that they cannot tolerate wearing clothing or even feeling a light breeze on the affected area. Described as agonizing, excruciating, and burning, the pain can

have a severe impact on daily living, leading to a loss of independence and, ultimately, to depression and isolation.

For people with immune deficiencies, shingles and its aftermath can be devastating. The disease is capable of affecting the internal organs, attacking even the lungs, kidneys, and liver. Disseminated shingles can cause permanent injury—including blindness, deafness, or paralysis, depending upon the area of the body that is served by the infected nerves—if it goes unchecked. Death can occur as the result of a secondary bacterial infection or viral pneumonia brought on by shingles.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
L-lysine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Important for healing and for fighting the virus that causes shingles. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement for longer than 6 months at a time.
Vitamin C with bioflavonoids	2,000 mg 4 times daily.	Aids in fighting the virus and boosting the immune system.
<b>Very Important</b>		
Beta-1,3-D-glucan	As directed on label.	Useful for treating bacterial, viral, and fungal infections.
Vitamin B complex plus extra vitamin B <sub>12</sub>	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 1,000 mcg twice daily.	Needed for nerve health and to counteract deficiencies. Injections (under a doctor's supervision) may be necessary. Use a lozenge or sublingual form.
Zinc	80 mg daily for 1 week, then reduce to 50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Enhances immunity and protects against infection. Use zinc chelate lozenges or zinc picolinate in sublingual form for faster absorption.
<b>Important</b>		
Calcium plus magnesium	1,500 mg daily. 750 mg daily.	For nerve function and healing, and to combat stress. Use chelate forms.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Excellent for building the immune system.
S-Adenosylmethionine (SAME) (SAME Rx-Mood from Nature's Plus)	As directed on label.	Aids in reducing pain and inflammation. A natural antidepressant. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give this supplement to a child under twelve.

Vitamin A emulsion  or capsules plus carotenoid complex with beta-carotene	50,000 IU daily for 2 weeks, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 10,000 IU daily.  As directed on label.	Boosts the immune system and protects against infection. Emulsion form is recommended for easier assimilation and greater safety at higher doses.  To protect immune function and enhance healing.
Vitamin D	1,000 IU twice daily for 1 week, then reduce to 400 IU daily.	Aids in tissue healing and is needed for calcium absorption.
Vitamin E	200 IU daily. You can also open a capsule and apply the oil directly to the affected areas of skin.	Helps prevent formation of scar tissue. Also helps to alleviate pain from long-term cases of shingles. Use d-alpha-tocopherol form.

### Helpful

Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Provides "friendly" bacteria to the intestines and stimulates immune function. Use a nondairy formula.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	A free radical scavenger that boosts immune function. Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Colloidal silver	As directed on label.	A natural antibiotic that has shown effectiveness in treating shingles. Use topically only.
Essential fatty acids (flaxseed oil or primrose oil)	As directed on label.	Promotes healing of skin and nerve tissue.
Grape seed extract	As directed on label.	A powerful antioxidant that protects skin cells and decreases the number of outbreaks of blisters.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Builds the immune system and fights infection.
Inf-zyme Forte from American Biologics	4 tablets 3 times daily, with meals.	Has antioxidant properties and aids in proper breakdown of proteins, fats, and carbohydrates.
Maitake extract or reishi extract or shiitake extract	As directed on label. As directed on label. As directed on label.	Has immune-boosting and antiviral properties.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.

### Herbs

☐ Alfalfa, chamomile, and dandelion promote healing by helping to restore the body's normal acid/alkaline balance. Dandelion also helps to detoxify and support the liver. A cool chamomile compress can aid in soothing the blisters.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may in-

teract with warfarin or cyclosporine, so patients using these drugs should avoid it.

Astragalus root and echinacea boost immune function.

**Caution:** Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Bi phaya yaw (*Clinacanthus nutans*), an herb used in traditional Thai medicine, has been shown in clinical studies to shorten the time it takes to recover from shingles in some cases. It is applied in cream form.

Burdock and red clover cleanse both the lymph nodes and the bloodstream.

Cayenne (capsicum) contains a substance called capsaicin, which relieves pain and aids in healing. It also acts as a detoxifier. Cayenne is available in tablet and capsule form.

Goldenseal has powerful antibiotic properties and reduces infection.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Green tea has antiviral, anti-inflammatory, and antioxidant properties. The polyphenols it contains have been found to fight herpesviruses.

**Caution:** Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Licorice extract can be used topically to treat shingles and postherpetic neuralgia. It appears to interfere with the growth of the virus.

**Caution:** Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Milk thistle protects the liver and promotes healthy liver function.

A combination of oat straw, St. John's wort, and skullcap helps to reduce stress and itching. Mix equal amounts of oat straw, St. John's wort, and skullcap tinctures together, and take 1 teaspoon of this mixture four times daily.

**Caution:** St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Olive leaf extract aids in fighting the virus.

Rose hips are high in vitamin C and are good for preventing infections on the skin.

Valerian root calms the nervous system. Taken at bedtime, it acts as a sleep aid.

## Recommendations

Eating fruits and vegetables is particularly important to prevent developing shingles. In one study, those who ate no fruits had three times the risk of developing shingles as those who ate three servings a day. In those over sixty years of age, eating both fruits and vegetables reduced the risk.

Include in the diet brewer's yeast, brown rice, garlic, raw fruits and vegetables, and whole grains.

**Caution:** Brewer's yeast can cause an allergic reaction in some individuals. Start with a small amount at first, and discontinue use if any allergic symptoms occur.

Eat plenty of foods that contain vitamin B<sub>6</sub>, including bananas, nuts, potatoes, and sweet potatoes.

Go on a cleansing fast. (See FASTING in Part Three.)

Use bee pollen or propolis, chlorophyll, and/or kelp to fight the virus and promote healing.

**Caution:** Bee pollen may cause an allergic reaction in some individuals. Start with a small amount, and discontinue use if a rash, wheezing, discomfort, or other symptoms occur.

Keep stress to a minimum. Stress reduces the immune system's effectiveness in fighting off infection. Studies have found that people with shingles report having recently been through stressful periods more often than other people.

Avoid drafts. Allow the affected area to be exposed to sunlight for fifteen minutes each day. Wash the blisters gently when bathing, and otherwise avoid touching or scratching them.

If you are suffering from a rash or blisters of an unknown origin, see a dermatologist—he or she can administer a test for shingles that only takes a few minutes.

See an ophthalmologist if the shingles appear on the forehead, near the eyes, or on the tip of the nose. Untreated ophthalmic herpes zoster can lead to vision loss.

Try using essential oils. Bergamot oil, calophyllum oil (related to St. John's wort), eucalyptus oil, geranium oil, goldenseal oil, and lemon oil can be used singly or in combination. These highly concentrated plant essences have strong antiviral properties. The best way to use them is to add a few drops of essential oil to a tablespoon of a carrier oil such as almond, peanut, or olive oil, and apply the mixture directly to the lesions at the first sign of an outbreak. In most instances, the lesions dry up and disappear completely within three to five days after this treatment.

Consider using homeopathic remedies to alleviate symptoms. *Apis mellifica*, *Arsenicum album*, *Clematis erecta*, *Iris versicolor*, and *Rhus toxicodendron* are homeopathic remedies that may be helpful.

## Considerations

The severity and duration of a shingles attack can be reduced by immediate treatment with antiviral drugs such

as acyclovir (Zovirax), valacyclovir (Valtrex), or famcyclovir (Famvir). Steroids, antidepressants, anticonvulsants, and topical creams are sometimes prescribed for the aftermath.

❑ In 2006, the FDA approved a vaccine (Zostavax) for people over sixty years of age who have had chickenpox. Its use cut the number of people developing shingles in half, and there was a decrease in the severity of the virus in those who developed it. The vaccine seems to be less effective with advancing age. If you are over sixty and are concerned about the possibility of developing shingles, ask your doctor for more information.

❑ Adenosine monophosphate (AMP), a compound that occurs naturally in the body, has been found to be effective against shingles.

❑ In treating postherpetic neuralgia, doctors often must resort to treating only the residual pain, whether with medication or other approaches.

❑ Pain medication such as acetaminophen (Tylenol, Datril, and others) or nonsteroidal anti-inflammatory drugs (NSAIDs) may be used to control inflammation and mild or moderate pain. Narcotics may be needed for severe pain.

❑ Capsaicin has been attracting attention for its ability to relieve pain in persons suffering from postherpetic neuralgia. Capsaicin is not a product of chemical engineering, but a component found in plants of the same family as red peppers. Researchers in Toronto found that 56 percent of people with postherpetic neuralgia who were treated with capsaicin cream (Zostrix) for four weeks experienced significant relief of pain, and that 78 percent had at least some improvement in pain. Clinical studies suggest that capsaicin directly reduces the amount of substance P, a neurotransmitter responsible for the transmission of pain impulses. If there is a deficiency of substance P, the nerves are unable to transmit sensations of pain. Capsaicin is easy to use—you simply apply it topically to the affected area three or four times a day. In addition, capsaicin does not interact with any other drugs or medications, which makes it an especially attractive option for elderly people, who are often taking one or more drugs on a regular basis. Capsaicin cream is sold over the counter in most drugstores and health food stores. It should not be applied until the blisters caused by shingles have healed completely, however, or extreme burning pain may result.

❑ Topical lidocaine (Lidoderm) may be prescribed for pain that has been going on for longer than one month. The medication in the patch penetrates the skin, reaching the damaged nerves just under the skin without being absorbed significantly into the bloodstream. This means that the patch can be used for long periods of time without serious side effects. Possible side effects of this drug include redness and swelling. However, this is usually mild and does not last long.

❑ People with compromised immune systems may be given serum or other biological products obtained from the

pooled blood of people who have recently recovered from shingles to assist their own immune systems in resisting the virus. Physicians are now more likely to administer huge doses of antiviral drugs to try to destroy or cripple the virus.

❑ Dimethylsulfoxide (DMSO) has been used with success to relieve the pain of shingles and promote healing of the lesions. This liquid, a by-product of wood processing, is applied topically to the affected area as needed. Only DMSO from a health food store can be used for therapeutic purposes.

*Caution:* Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

❑ Transcutaneous electrical nerve stimulation (TENS) therapy uses a device that generates low-level pulses of electrical current. The TENS unit is applied to the skin's surface, causing tingling sensations and offering some people pain relief. One theory as to how TENS works is that the electrical current stimulates production of endorphins, the body's natural painkillers. (See TENS UNIT THERAPY under PAIN CONTROL in Part Three.)

❑ As a last resort, nerve blocks may be used to provide temporary relief. These procedures usually entail the injection of a local anesthetic into the area of the affected nerves. Postherpetic neuralgia (PHN) most commonly affects older adults; because they are often unable to tolerate medication, the nerve block becomes a viable option.

❑ An injection directly into the spine is another option for relief of pain. A Japanese clinical study reported in *The New England Journal of Medicine* (November 2000) found that an injection of the steroid methylprednisone combined with the anesthetic lidocaine reduced pain by more than 70 percent in one patient group compared with groups that received lidocaine alone or an inactive substance.

❑ While shingles itself is not very contagious, a person with shingles may infect previously uninfected persons, particularly children, with chickenpox.

❑ If conservative measures are not effective, an antidepressant such as amitriptyline (Elavil, Endep) may be prescribed. These drugs not only ease the emotional impact of unrelenting pain, but they seem to alleviate the pain itself. They appear to do this by causing an increase in the production of endorphins, the body's own natural painkillers.

❑ Experiments are being conducted in which live chickenpox vaccine is given intravenously in an attempt to prevent shingles. Since you cannot develop shingles if you never contract chickenpox, researchers theorize that a vaccine that prevents chickenpox would therefore also prevent shingles. Detractors argue that while this approach may produce immunity in those who have never had chicken-

pox, the virus in the vaccine may also take refuge in the central nervous system and cause shingles years or decades later.

❑ One of the biggest obstacles to researchers in learning more about the varicella-zoster virus is the fact that there are no animals in which it can be studied; chickenpox and shingles occur only in humans, and the virus grows poorly in laboratory cultures. Nonetheless, research continues into the biology of varicella-zoster, with the hope of developing a better understanding of how the immune system controls it and perhaps finding ways to ease the suffering caused by shingles and postherpetic neuralgia.

❑ See also PAIN CONTROL in Part Three.

❑ For names and addresses of organizations that can offer further information about shingles, and on pain control, see Health and Medical Organizations in the Appendix.

## SINUSITIS

Sinusitis is an inflammation of the nasal sinuses. There are sinuses located above the eyes (frontal sinuses); to either side of the nose, inside the cheekbones (maxillary sinuses); behind the bridge of the nose (sphenoid sinuses); and in the upper nose (ethmoid sinuses). Sinuses are air-filled pockets in the skull that are connected to the nose and throat by passages designed to drain away mucus. The sinuses are the first line of defense in protecting the lungs against infection. Most cases of sinusitis affect the frontal and/or maxillary sinuses, but any or all of the sinuses may be involved, and each individual tends to have problems with a particular set of sinuses. If the sinuses are too small or poorly positioned to handle the volume of mucus produced, they can become clogged. Pressure in the sinuses increases, causing pain. Sinuses that are clogged for a long time seem to invite infection.

Sinusitis can be either acute or chronic. Acute sinusitis is frequently caused by bacterial or viral infections of the nose, throat, and upper respiratory tract, such as the common cold. Air travel also can lead to acute inflammation of the sinuses, because of changes in air pressure. Chronic sinusitis problems may be caused by small growths in the nose, injury of the nasal bones, air pollution, dental complications, emotional stress, smoking, and exposure to irritant fumes and smells. Allergic sinusitis may be caused by hay fever or food allergies, especially allergies to milk and dairy products. People with compromised immune systems (such as those with HIV) or with abnormal mucus production (such as in cystic fibrosis) are susceptible to fungal sinusitis, a potentially dangerous condition that requires aggressive treatment.

Symptoms of sinusitis include fever (usually low-grade, but higher in some cases), cough, headache, earache, toothache, facial pain, cranial pressure, difficulty breathing through the nose, loss of the sense of smell, and tenderness over the forehead and cheekbones. If tapping the forehead

just over the eyes, the cheekbones, or the area around the bridge of the nose causes pain, the sinuses may be infected. Sometimes sinusitis produces facial swelling followed by a stuffy nose and thick discharge of mucus. The symptoms suffered by those with sinusitis can have other unpleasant effects such as pain. Postnasal drip can cause a sore throat, nausea, and bad breath; difficulty breathing can cause snoring and loss of sleep.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Replaces good bacteria in the colon. Important if antibiotics are prescribed. Use a nondairy formula.
Bee pollen	Start with ½ tsp daily and increase slowly to 1 tbsp daily, taken in juice.	Increases immunity and speeds healing. <i>Caution:</i> Bee pollen may cause an allergic reaction in some individuals. Discontinue use if at any time a rash, wheezing, discomfort, or other symptoms occur.
Flaxseed oil	As directed on label.	Reduces pain and inflammation. Enhances all body functions.
Multivitamin and mineral complex	As directed on label.	To improve overall health and assure proper nutrition.
Quercetin plus bromelain	As directed on label.	Protects against allergens and increases immunity.
or Anti-Allergy formula from Freeda Vitamins	As directed on label.	Enhances the effectiveness of quercetin. Contains quercetin, calcium pantothenate, and calcium ascorbate to provide nutritional support and reduce allergic response.
Raw thymus glandular	500 mg twice daily.	Protects immune function and health of the mucous membrane cells.
SinuCheck from Enzymatic Therapy	2 capsules 4 times daily.	A natural decongestant to help clear blocked nasal passages due to colds and sinusitis.
Vitamin A with mixed carotenoids	10,000 IU daily.	Enhances the immune system; protects against colds, flu, and other infections. Helps maintain the health of the mucous membranes.
including natural beta-carotene	15,000 IU daily.	Precursor of vitamin A.
Vitamin B complex plus extra	75–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Helps to maintain healthy nerves and reduce stress. A sublingual form is best.

vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	100 mg 3 times daily, with meals.  50 mg 3 times daily, with meals.  1,000 mcg 3 times daily.	Aids in the formation of antibodies.  Aids immune system function.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Boosts immune function and aids in preventing infection and decreasing mucus.
Vitamin E	200 IU daily.	Improves circulation and speeds healing. Use d-alpha-tocopherol form.
<b>Helpful</b>		
Coenzyme Q <sub>10</sub>	60 mg daily.	Valuable immune system stimulant. Increases cellular oxygenation.
Colloidal silver	As directed on label.	A natural antibiotic.
Dimethylsulfoxide (DMSO)	As directed on label.	Relieves pain and strengthens the immune system. Use only DMSO from a health food store.
Garlic (Kyojic from Wakunaga)	2 capsules 3 times daily.	An immune system stimulant that helps to keep infection in check.
Methylsulfonyl- methane (MSM)	As directed on label.	Use for pain relief and to reduce inflammation.
Proteolytic enzymes (Novenzyme from International Health Products)	As directed on label. Take with meals and between meals.	Destroys free radicals. Also aids in digestion of foods.
Pycnogenol or grape seed extract	As directed on label.  As directed on label.	Powerful antioxidants that reduce inflammation and the frequency of colds and flu, and neutralize allergic reactions.
Sea mussel	As directed on label.	Provides needed amino acids and aids in the functioning of the mucous membranes. Reduces inflammation.
Zinc lozenges	1 15-mg lozenge every 2 to 4 waking hours for 1 week. Do not exceed this amount.	Antiviral agent and immunity booster.

## Herbs

- Anise, fenugreek, marshmallow, and red clover help to loosen phlegm and clear congestion.
- Bayberry is a decongestant and astringent.
- Bitter orange oil can be used to swab nasal passages for local relief.
- Cat's Claw Defense Complex from Source Naturals contains a combination of herbs designed to strengthen the body and help the body deal with outside elements.

*Caution:* Do not use cat's claw during pregnancy.

- ClearLungs from RidgeCrest Herbals contains Chinese herbal ingredients to restore free breathing, ease mucus accumulation, and enhance tissue repair. Echinacea boosts the immune system and fights viral infection.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- P.S.I. from Terra Maxa relieves nasal and sinus congestion.
- Ginger root can be crushed and applied as a poultice to the forehead and nose to stimulate circulation and drainage.
- Goldenseal is effective in combating sinusitis. Its benefits can be enhanced by combining it with 250 to 500 milligrams of bromelain, an enzyme present in fresh pineapple. Goldenseal can be taken as a tea, or the tea can be used as an intranasal douche. Or put a dropperful of alcohol-free goldenseal extract in your mouth, swish it around for a few minutes, then swallow. Do this three times daily.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Horehound helps to relieve symptoms.
- Mullein reduces inflammation and soothes irritation.
- Nettle is good for all types of allergies and respiratory problems.
- Olive leaf extract has antibacterial and anti-inflammatory properties.
- Rose hips are a good source of vitamin C.

## Recommendations

- Eat a diet consisting of 75 percent raw foods.
- Drink plenty of distilled water and fresh vegetable and fruit juices. Also consume plenty of hot liquids such as soups and herbal teas. These help the mucus to flow, relieving congestion and sinus pressure. Adding cayenne pepper, garlic, ginger, horseradish, and raw onion to soups or teas may bring even faster relief.
- Eliminate sugar from your diet. Reduce your salt intake.
- Do not eat dairy foods, except for low-fat soured products like yogurt and cottage cheese. Dairy products increase mucus formation.
- Go on a cleansing fast. (See FASTING in Part Three.)
- Mix a solution of 1 cup warm water, ½ teaspoon of sea salt, and a pinch of bicarbonate of soda. Use a squeeze spray bottle (available over the counter in drugstores) or an eyedropper to instill the solution in the nostrils, one side at a time. Repeat this procedure three or four times a day as necessary for relief from stuffiness.
- Try using a menthol or eucalyptus pack applied over the sinuses to relieve pain and swelling. Stop if the packs cause irritation.
- Use a vaporizer to ease breathing and clear secretions.

- Use steam inhalations to promote drainage and ease pressure. Boil a pot of water and add a few drops of eucalyptus oil or rosemary oil. Remove the pot from the heat and lean your face over it at a distance of about six inches to inhale the steam. (Be careful not to get so close that irritation or scalding results.) Place a towel over your head to capture the steam and breathe in deeply. Do this several times daily for five to ten minutes at a time. Or simply take a hot shower to help relieve the pain and pressure of sinusitis.
- You can also use a Neti pot, a small teapot-like device especially designed for nasal irrigation. They are available in many health food stores. Fill the pot with sea salt and water (2 teaspoons salt to one pint water) and rinse out your nose with this solution. This should reduce inflammation and congestion.
- Use warm compresses or ice packs to help relieve pain (experiment to see which works best for you).
- Try homeopathic remedies to alleviate symptoms. *Belladonna* is good for infections accompanied by fever and pain in the face and forehead. *Kali bichromicum* is useful if there is an overabundance of mucus in the throat.
- If you are taking antibiotics for a sinus infection, be sure to add an acidophilus supplement to your program. Do not take the acidophilus and the antibiotic at the same time.
- If you use decongestants, use them only as directed and for the prescribed amount of time. If possible, avoid using nose drops and sprays. These can become addictive and interfere with normal sinus function. In addition, drops and sprays, as well as inhalers, can shrink blood vessels in the nose, eventually causing the vessels to weaken. Moreover, withdrawal from decongestants can cause a rebound effect, in which the swelling becomes worse after use is discontinued than it was to begin with. They can also cause dangerous elevations in blood pressure. Do not use these medications if you have high blood pressure or heart problems.
- If sinusitis causes your eyes to become swollen, red, or itchy, or to begin tearing, try a product called OcuDyne. Made by NutriCology, this is a complex containing vitamins, minerals, antioxidants, key amino acids, active bioflavonoids, and the herbs bilberry and ginkgo biloba to protect the eyes and boost immune function.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Do not use force when blowing your nose, as this forces mucus back into the sinus cavities. Instead, draw secretions to the back of the throat by sniffing, then expel them.
- Do not smoke, and avoid secondhand smoke. If you live in a smoggy area, consider getting an air purifier or moving to a less polluted area. Air Supply from Wein Products is a personal air purifier. Worn around the neck, it sets up a defensive shield against microorganisms and microparticles in the air wherever you go.
- If you notice swelling around the eyes, consult your physician. This is a serious sign.

- Have regular dental examinations. Infections in the mouth can easily spread to the sinuses.

### Considerations

- If nasal secretions turn clear after a week, you probably do not have an infection; if the mucus is greenish or yellowish, you probably do. If secretions are clear and you have no other symptoms of a cold, you probably have allergies.
- Antibiotics may be necessary to clear a bacterial infection. Always take antibiotics for the full course prescribed, even if symptoms seem to improve earlier. Stopping prematurely can lead to antibiotic-resistant bacteria and a worse infection.
- Sometimes physicians prescribe antibiotics even if they cannot confirm a bacterial infection. The reasoning for this is that it is very difficult to ascertain whether bacteria are causing the sinusitis, and that it may be worth it to prevent a bacterial infection from appearing later. As with any medication, it is important to know the benefits, risks, and costs of using and of not using an antibiotic.
- If sinus trouble is chronic and severe, and medication fails to relieve it, surgery may be needed to drain the sinuses, not only to relieve discomfort but to guard against serious consequences.
- Endoscopic surgery, a treatment sometimes recommended for chronic, severe sinusitis, clears nasal passages without external incisions or scars. The procedure can be performed using local anesthesia and results in minimal pain and swelling.
- While they are uncommon, polyps and benign cysts that retain mucus can develop in the sinuses, especially in the large maxillary or frontal sinuses. Intrusive or malignant growths require surgical removal.
- Anyone suffering from unremitting sinusitis should consult a health care provider to rule out an underlying immune dysfunction. In a University of Miami study, 50 percent of chronic sinusitis patients were found to be suffering from immunologic disorders.

### SKIN CANCER

Skin cancer affects more people in the United States than any other form of cancer. It is estimated that there are 1 million cases of non-melanoma skin cancer diagnosed yearly in the United States. Melanoma, the most serious type of skin cancer, accounted for about 68,720 cases of skin cancer in 2009 and most (about 8,650) of the 11,590 deaths due to skin cancer each year. This is more than twice the number diagnosed twenty years ago. Because of the dramatic increases over the past two decades, mostly because of overexposure to ultraviolet radiation from the sun, the National Cancer Institute has warned that 40 to 50 percent of all Americans who live to the age of sixty-five will eventually

develop at least one skin cancer. There are several different types of skin cancer. The two most common skin cancers are basal cell carcinoma and squamous cell carcinoma; most people who are diagnosed with skin cancer have one or the other of these types of the disease. Both are highly curable if treated early. The third major type of skin cancer is malignant melanoma, which is a more serious disease. There are approximately 15,000 new cases of malignant melanoma diagnosed each year, and half of the patients survive six to seven years.

Basal cell carcinoma is the most common of the three major types of skin cancer. It is most prevalent in blond, fair-skinned people. Unlike many other malignant growths, it does not spread until it has been present for a long period of time. The cell damage results in an ulcerlike growth that spreads slowly as it destroys tissue. A large, pearly-looking lump, most often on the face by the nose, neck, or ears, is usually the first sign. About six weeks after it appears, the lump becomes ulcerated, with a raw, moist center and a hard border that may bleed. Scabs continually form over the ulcer and then come off, but the ulcer never really heals. Sometimes basal cell carcinomas show up on the back or chest as flat sores that grow slowly. Basal cell carcinomas do not usually spread throughout the body and generally are curable. However, recurrences are common. If they are not treated, they can do substantial damage to the lower layers of skin and bone.

In squamous cell carcinoma, the underlying skin cells are damaged, and this leads to the development of a tumor or lump under the skin, most often on the ears, hands, face, or lower lip. The lump may resemble a wart or a small ulcerated spot that never heals. This type of skin cancer occurs most frequently in fair-skinned people over fifty years old. The risk is higher for those who have had long-term outdoor employment and for those who reside in sunny climates. This is a very treatable type of skin cancer if it is detected and dealt with in the early stages.

Malignant melanoma is rarer than either squamous cell or basal cell carcinoma, but is much more serious. With this type of skin cancer, a tumor arises from the pigment-producing cells of the deeper layers of the skin. It is estimated that as many as half of all cases of melanoma originate in moles. People in some families seem to have a genetically based higher risk of developing melanoma. They often have odd moles, called *dysplastic nevi*, that are irregular in shape and color and can be as large as half an inch in diameter. Dysplastic nevi may be precursors to skin cancer. This cancer can also appear in the form of a new mole. In men, melanomas tend to occur anywhere from the neck to the waist; in women, the arms and legs seem to be affected most.

If not treated at an early stage, melanoma can be life-threatening, spreading through the bloodstream and lymphatic vessels to the internal organs. However, if the disease is treated early, the chances of recovery are quite good. There are four types of melanoma, each with slightly different characteristics:

1. *Superficial spreading melanoma (SSM)*, the most common type; 70 percent of the cases fall into this category. It occurs primarily in younger people. An SSM lesion typically begins as a flat mole, most often on the lower legs or upper back, that develops a raised, irregular surface. As it grows, its borders usually become asymmetrical and notched.
2. *Acral lentiginous melanoma*, most common among people of African and Asian descent. The lesions have flat, dark-brown areas with bumpy portions that are brown-black or blue-black in color. They are most likely to appear on the palms of the hands, the soles of the feet, the nail beds of fingers and toes, and the mucous membranes.
3. *Lentigo maligna melanoma*, a type of cancer in which lesions usually occur on the face, neck, ears, or other areas that have been heavily sun-exposed for a long period of time. This type of melanoma rarely occurs before the age of fifty, and it is usually preceded by a precancerous stage called *lentigo maligna* that appears years in advance of the melanoma.
4. *Nodular melanoma*, a type of the disease that attacks the underlying tissue without first spreading across the surface of the skin. It is more common in men than in women, and the elderly get it more than the young. The lesions may resemble blood blisters, and they may range in coloration from pearly white to blue-black. Nodular melanoma tends to metastasize (spread to other sites in the body) sooner than the other types of melanoma.

Melanoma tends to progress through four different stages. The so-called *TNM system* is often used to determine the stages. In the TNM system, *T* stands for the existence of a tumor, *N* represents the fact that the tumor has spread to the lymph nodes, and *M* stands for *metastasis*, or spread of the cancer to other places in the body.

The four stages of melanoma are the following:

1. *Stage one*. The cancer is found in the top of the inner layer of skin but has not spread.
2. *Stage two*. The cancer has spread into the inner layer of skin but not yet into the lymph nodes.
3. *Stage three*. The tumor has spread to body tissue beneath the skin's outer and inner layers. There may be additional tumors near the site of the original tumor. The cancer may have spread to the lymph nodes near the tumor.
4. *Stage four*. The cancer has spread to other parts of the body, away from the original site of the melanoma.

Overexposure to the sun's ultraviolet (UV) rays is the major factor in basal cell carcinoma, squamous cell carcinoma, and melanoma. These rays disrupt the genetic material in the skin cells, causing tissue damage. They also harm the skin's normal repair mechanism. Normally, after UV exposure, this mechanism causes damaged cells to immediately cease reproducing, die, and be sloughed off to be replaced by new, healthy skin cells—this is why skin peels after a sunburn. If this repair system is impaired, damaged cells may continue to reproduce, and the skin becomes in-

creasingly vulnerable to injury from subsequent exposure to UV rays. There are two types of UV radiation, designated ultraviolet-A (UVA) and ultraviolet-B (UVB). UVA is ultraviolet radiation with a wavelength of 320 to 400 nanometers. It passes right through the Earth's ozone layer. UVB is ultraviolet radiation with a wavelength of 280 to 320 nanometers. The ozone layer absorbs most of this radiation, but a small amount gets through to the earth's surface, where it poses the same risks as UVA radiation.

UV exposure is not only the major cause of wrinkles; it is the major risk factor of most forms of skin cancer. People who have had severe or blistering sunburns, especially in childhood, are twice as likely to develop the disease later in life. People with blond or red hair, blue or green eyes, and fair skin, who sunburn or freckle easily, are at the greatest risk for skin cancer because they have less protective pigment in their skin. One sign that cumulative sun damage may have reached dangerous levels is the development of spots called *actinic* or *solar keratoses*. Considered precancerous lesions, these appear most often in and around the face, neck, and head, and take the form of rough bumps or flat patches that may be itchy or tingly. Later, these spots may become hard to the touch and grayish or brown in color. Although these abnormalities may not be dangerous in themselves, they should be evaluated and, if need be, treated, as they can develop into more serious skin cancers.

In addition to the three major types of skin cancer, there are a number of other, less common types of cancer that affect the skin. *Mycosis fungoides* is technically a type of lymphoma (lymphatic cancer), but its main effects are on the skin. Initially, it appears as an itchy rash that may last for several years. Over time, the lesions spread, become firmer, and ulcerate. Eventually, if untreated, the disease may spread to the lymph nodes and other internal organs. *Mycosis fungoides* is a rare, slow-growing cancer that can be difficult to diagnose, especially early in the disease. A skin biopsy should make correct diagnosis possible.

A type of skin cancer that has become increasingly common in recent years is Kaposi's sarcoma. This type of cancer causes raised lesions that may be pink, red, brown, or purplish in color. They may appear anywhere on the body, but the most common sites are the legs, toes, upper torso, and mucous membranes. Kaposi's sarcoma was once a rare, very slowly progressing disease seen primarily in older men of Mediterranean descent. Since the AIDS epidemic began, however, it is no longer uncommon, and is primarily associated with a poorly functioning immune system. People with AIDS tend to get a more aggressive variety of this cancer that eventually affects the lymph nodes and other internal organs. However, a new treatment called HAART (highly active antiretroviral therapy) has decreased the incidence of Kaposi's sarcoma and can keep it from advancing.

In recent years, the incidence of skin cancer has been rising steadily, and the average age of people with skin cancer has been getting lower. Women under forty are developing

the disease twice as fast as men in the same age group. Fortunately, skin cancer is quite curable when treated early.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Beta-1,3-D-glucan	As directed on label.	Can stimulate immune cells to digest cellular debris.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Improves cellular oxygenation. Works with coenzyme Q <sub>10</sub> .
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Improves cellular oxygenation.
Essential fatty acids (primrose oil)	As directed on label 3 times daily, before meals.	For cellular protection.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Enhances immune function.
Histidine	As directed on label.	May help to increase the skin's immunity to damage from the sun's rays.
Proteolytic enzymes	As directed on label. Take with meals.	Powerful free radical scavengers that also reduce inflammation and aid in proper breakdown of foods.
Quercetin	As directed on label.	A flavonoid that has antioxidant properties.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Powerful free radical scavenger. Protects against UV damage.
Superoxide dismutase (SOD)	As directed on label.	Destroys free radicals. Consider injections (under a doctor's supervision).
Vitamin A  plus natural beta-carotene and carotenoid complex (Betatene)	10,000–50,000 IU daily for 10 days or for as long as you are on the program. If you are pregnant, do not exceed 10,000 IU daily. 15,000 IU daily. As directed on label.	Powerful antioxidants that destroy free radicals. Use emulsion form for easier assimilation and greater safety at high doses. Precursor of vitamin A.
Vitamin B complex  and/or brewer's yeast	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 2 20-grain tablets 3 times daily.	Necessary for normal cell division and function.  A good source of B vitamins.
Vitamin C with	5,000–20,000 mg daily, in divided doses.	Powerful anticancer agent. Boosts immunity.

bioflavonoids	(See ASCORBIC ACID FLUSH in Part Three.)	
Vitamin E	200 IU daily.	Promotes healing and tissue repair. Use d-alpha-tocopherol form.
<b>Important</b>		
Maitake extract or reishi extract or shiitake extract	4,000–8,000 mg daily. As directed on label. As directed on label.	These mushrooms contain substances that inhibit the growth and spread of cancerous tumors and also boost immune response.
Phytocharged nutritional supplements from Schiff	As directed on label.	Dietary supplements that protect against damage from sunlight and promote health.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Antioxidants that protect against UV-induced oxidative changes in skin.
Zinc	As directed on label. Do not exceed 100 mg daily from all supplements.	Important in activity of enzymes; cell division, growth, and repair; and proper immune function. Use zinc gluconate lozenges or zinc methionate (OptiZinc) for best absorption.
<b>Helpful</b>		
Acidophilus	As directed on label. Take on an empty stomach.	Has an antibacterial effect on the body. Use a nondairy formula.
Aerobic 07 from Aerobic Life Industries	As directed on label.	Antimicrobial agents.
ConcenTrace from Trace Minerals Research	As directed on label.	To nourish skin and hair.
Dimethylsulfoxide (DMSO)	Apply topically as directed on label.	Promotes healing. Use only DMSO from a health food store.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote skin health.
Kelp	1,000–1,500 mg daily.	For mineral balance. Use kelp in tablet form and/or eat sea vegetables.
L-cysteine and L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To detoxify harmful substances. (See AMINO ACIDS in Part One.)
Multienzyme complex	As directed on label. Take with meals.	To aid digestion.
Multivitamin and mineral complex	As directed on label, with meals.	All nutrients are necessary in balance. Do not use a sustained-release formula.

N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Supplies glucosamine, which helps in the formation of mucous membrane and connective tissues.
Para-aminobenzoic acid (PABA)	25 mg daily.	Helps to protect against skin cancer.
Raw glandular complex plus raw thymus glandular	As directed on label. As directed on label.	Stimulates glandular function, especially that of the thymus, an important component of the immune system.
Taurine	As directed on label.	Functions as foundation for tissue and organ repair.
Vitamin B <sub>3</sub> (niacin) plus choline and folic acid	100 mg daily. Do not exceed this amount. 500–1,000 mg daily. 400 mcg daily.	B vitamins that improve circulation, build red blood cells, and aid liver function. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
Vitamin B <sub>12</sub> injections or vitamin B <sub>12</sub>	As prescribed by physician. 1,000 mcg 3 times daily.	To prevent anemia. Injections (under a doctor's supervision) are best. If injections are not available, use a lozenge or sublingual form.

## Herbs

Alfalfa, burdock, dandelion root, Irish moss, marshmallow root, oat straw, rose hips, and yellow dock are all beneficial for tissue repair. Rose hips are also a good source of vitamin C.

Astragalus generates anticancer cells in the body and boosts the immune system.

*Caution:* Do not use astragalus in the presence of a fever.

Bilberry, cayenne (capsicum), ginger, goldenseal, nettle, sarsaparilla, and turmeric stimulate the liver and help to stabilize blood composition, and may retard the proliferation of cancer cells.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Burdock root and red clover aid in cleansing the blood and lymph nodes.

The seeds and peel of the Chinese cucumber inhibit cancer cells.

Skin cancers may respond to treatment with poultices combining comfrey, pau d'arco, ragwort, and wood sage. (See USING A POULTICE in Part Three.)

*Cautions:* Comfrey is recommended for external use only. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Ginkgo biloba, pau d'arco, and curcumin (a naturally occurring pigment isolated from turmeric) are powerful antioxidants with immune-enhancing capabilities.

**Caution:** Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Studies have shown that green tea has anticancer properties. Drink 4 cups daily.

**Caution:** Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Tea tree oil cream, applied topically, is a natural anti-septic and antifungal that enhances healing.

## Recommendations

Eat a diet that is low in fat and high in antioxidants, such as beta-carotene-rich carrots, sweet potatoes, squash, and spinach; cruciferous vegetables such as broccoli, Brussels sprouts, cabbage, kale, and turnips; and citrus fruits.

Be aware of the warning signs of skin cancer:

- An open sore that bleeds, crusts over, and does not heal properly.
- A reddish, irritated spot, usually on the chest, shoulder, arm, or leg. It may itch or hurt, or cause no discomfort.
- A smooth growth with an elevated border and an indented center. As it becomes bigger, tiny blood vessels develop on the surface.
- A shiny scarlike area that is white, yellow, or waxy, with a shiny, taut appearance.
- An enlarging, irregular, “angry-looking” lesion on the face, lips, or ears.

Examine your skin regularly. The Skin Cancer Foundation recommends performing a full-body self-examination every three months. To do this, you need a full-length mirror, a handheld mirror, and ample lighting. Look for any changes in any moles or marks on your body, using the following A-B-C-D checklist:

- **Asymmetry.** Both sides of the mole should be shaped similarly. If not, the mole is suspect.
- **Border.** The edges of mole should be smooth, not blurred or ragged.
- **Color.** Tan, brown, and dark brown are normal. Red, white, blue, and black are not.
- **Diameter.** Any mole that is larger than ¼ inch in diameter, or whose diameter seems to be increasing, is suspicious.

In addition to keeping track of moles, look carefully for other unusual spots or growths. Any irregularities you find should be evaluated by a dermatologist. Many people over fifty years of age see a dermatologist yearly.

Stay away from tanning salons. Their equipment is sometimes said to be safer than the sun because tanning beds

emit ultraviolet-A (UVA) rays, the so-called cool rays, rather than the ultraviolet-B (UVB) rays, which are most often implicated in sunburn. It has been established, however, that UVA rays can cause skin cancer just as UVB rays can. Do not be misled by claims to the contrary. The essential differences between UVA and UVB rays are that UVA rays are more likely to penetrate deeper into the skin, and are more likely to lead to skin damage such as wrinkling and collagen damage and, perhaps, melanoma. UVB rays are more likely to burn the top layer of skin and cause skin cancers such as basal and squamous cell cancers, are at their strongest at low and high altitudes, and have a shorter wavelength than UVA rays. A study reported in the *Journal of the National Cancer Institute* indicated that women who frequented tanning salons more than once a month had a 55 percent higher chance of developing malignant melanoma. The study also revealed that natural blondes were twice as likely, and redheads four times as likely, to develop melanoma than were brown- or black-haired women.

Beware of new moles that appear after age forty. Be suspicious of any mole that appears unusual; is irregularly shaped or changes in size or color; or one that is pearly white, translucent, black, or multicolored; and that has a ridge around the edge. A mole that spreads, bleeds, or itches, or that is constantly irritated by clothing, is also suspect.

Check for discharge from moles. Have any suspicious mole evaluated by a professional.

See your health care provider if you find a growth that fits any of the descriptions in this section. Early detection is the key to successful treatment of skin cancer.

Include in the diet plenty of foods that are high in vitamin E. A diet rich in vitamin E may protect your skin against damage from UV rays. Good food sources of vitamin E include asparagus, green leafy vegetables, raw nuts, wheat germ, and organic, cold-pressed vegetable oils.

Get plenty of vitamin A in your diet and apply creams containing vitamin A on your skin as supplements. Vitamin A and related compounds stimulate skin cell renewal by increasing the rate of cell division. Natural vitamin A also may inhibit the growth of skin tumors, according to animal studies. Topical application of vitamin A can easily saturate the upper layers of the skin.

To protect against skin cancer, take protective measures. The sun’s ultraviolet rays are strongest between 10:00 A.M. and 3:00 P.M. Stay out of the sun as much as possible between these hours. When spending time outdoors, wear light-colored clothing made of tightly woven material (you can buy clothing made of materials that act as a sunblock). Wear a hat and sunglasses that block ultraviolet rays. Always use sunscreen. By themselves, sunscreens might not be effective in protecting you from the most dangerous forms of skin cancer. However, sunscreen use is an important part of your sun protection program. Used properly, certain sunscreens help protect human skin from some

of the sun's damaging UV radiation. Choose a product with a sun protection factor (SPF) of 15 or higher and one that specifies *broad-spectrum* protection. When choosing a sunscreen, it's important to know that an SPF of 30 is not twice as protective as an SPF of 15; rather, when properly used, an SPF of 15 protects the skin from 93 percent of UVB radiation, and an SPF 30 sunscreen provides 97 percent protection. Even if a sunscreen is water-resistant, you should reapply it every three or four hours for as long as you are outside—more often if you go swimming or if you are perspiring heavily. (Sunscreens can claim only to be *water-resistant*, not *waterproof*.) Wear sunscreen on cloudy days. Nearly 85 percent of the sun's UV rays penetrate through clouds. Be sure to protect your lips with a lip balm that has an SPF of 15, too. To increase awareness of the damaging potential of UV radiation, the U.S. Environmental Protection Agency and the National Weather Service have developed a UV index for use in weather reports to help individuals evaluate the level of danger from sun exposure on any given day. Following are the risk levels associated with exposure to UV rays as given in the index numbers:

Scale	Exposure level
• 0–2	Low
• 3–5	Moderate
• 6–8	High
• 9–10	Very high
• 11 or higher	Extreme

If you have a family history of melanoma, avoid the sun as much as possible and use a sunblock every day.

Avoid exposure to halogen lighting at close range. Halogen lights also emit UV radiation. The National Foundation for Cancer Research advises maintaining a distance of at least twenty inches from a 20-watt halogen bulb and three to six feet from 50 watt bulbs. However, the information was based on animal studies, and the FDA did not think the health risks were great enough at this time to warrant immediate action.

### Considerations

Skin cancer often originates in moles, but moles are not necessarily a cancer risk. They are extremely common (most people have them), and the overwhelming majority of them do *not* become cancerous.

Medical treatment for skin cancer often involves surgery. Excisional biopsy (removal of the growth for analysis) cures skin cancer in its early stages in about 95 percent of cases. More radical surgery may be necessary if excision is delayed, and if the growth is large, a skin graft may be necessary.

Other treatments sometimes used for skin cancer include:

- *Cryosurgery*, a method that uses liquid nitrogen to freeze and kill the diseased tissue, which later flakes away. This type of treatment is used frequently for people with bleeding disorders and for those who cannot tolerate anesthesia.
- *Electrosurgery*, in which the cancer is scooped out with a curette (a circular blade) and an electric current burns a border around the site to kill remaining cancer cells.
- *Laser surgery*, in which a laser is used to cut away the damaged tissue and seal off surrounding blood vessels as it goes.
- *Moh's microsurgery*, in which a surgeon shaves off cancerous tissue one thin layer at a time until healthy tissue is reached. Each layer is then examined under a microscope so that the doctor can be assured that he or she has gotten all the cancer while taking a minimum of healthy skin. This surgery is most effective for recurrent cancers and for cases in which the tumor is large or the extent of the cancer is unknown.
- *Radiation therapy*, which involves training an X-ray or an electron beam on the diseased area to kill cancerous tissue. This alternative is good for cases in which surgery poses particular risks.

A treatment called *photodynamic therapy* has been approved in the United States. A photosensitizing agent is injected into the bloodstream, which remains in cancer cells but not healthy ones. A concentrated light beam is then applied, which kills the cancer cells. The cosmetic results appear to be much better than with surgical treatments; however, there is concern that the cancer could recur.

Actinic keratoses may be treated by curettage/electrodesiccation, in which the lesion is scraped and a biopsy is taken, or shave removal or dermabrasion to remove the upper layers of skin.

Seborrheic keratoses are slightly raised, brownish spots on the skin that may appear waxy, scaly, or wartlike. They seem to be stuck on the skin and are most often found on the chest and back. They are harmless—neither cancerous nor precancerous—and appear normally as people age. They result from irregular clumping together, rather than even distribution, of skin pigment. The tendency to develop seborrheic keratoses is inherited. People often mistake these growths for melanomas. If there is any doubt as to the nature of a spot on the skin, a dermatologist should take a scraping of the area and examine the sample for cancer cells. Treatment, if any is necessary, can include curettage, cryosurgery, chemosurgery, or electrosurgery. Actinic keratoses are flatter and redder than seborrheic keratoses, and are considered a precursor of cancer. They tend to appear on areas of skin that are normally exposed to the sun.

With early detection and treatment, most people recover from skin cancer, but regular checkups are advised for at least the next five years.

☐ The average person incurs between 25 and 80 percent of all sun exposure prior to the age of eighteen. Thus, even though skin cancer is rare in children, the childhood years have a major influence on a person's tendency to develop skin cancer later in life. An infant under the age of six months should never be exposed to direct sunlight or have sunscreen applied to his or her skin. Infants should always be dressed in protective clothing when they are outside. Sunscreen can be used on a baby over six months old (choose a PABA-free formula, preferably one meant for young children), but sun exposure should still be limited, and the child should still be dressed in protective clothing. For toddlers and young children, limit time in the sun and apply sunscreen regularly whenever they are outdoors. Older children should be taught the importance of applying sunscreen regularly—an important lifelong habit.

☐ Certain medications may make the skin more susceptible to sun damage. These include antibiotics, antidepressants, diuretics, antihistamines, sedatives, estrogen, and acne medications such as retinoic acid. Ask your health care provider or pharmacist if any medication that you take might have such an effect.

☐ A study reported in the *Journal of the American Academy of Dermatology* found that well-educated white-collar men have the highest risk of developing melanoma. Researchers surmise that a pattern of many months of little sun exposure (a result of working indoors) with occasional overexposure and sunburn (such as that acquired at sunny resort vacations) may be responsible.

☐ The prescription medication tretinoin (Retin-A) may be able to reverse precancerous sun damage in skin. Skin care products containing alpha-hydroxy acids, which are available over the counter, may have a similar effect, although they are less potent.

☐ The U.S. Food and Drug Administration has approved for marketing as a sun protectant a line of clothing produced by Sun Precautions, Inc., of Everett, WA. The clothing, which carries an SPF rating of 30, is sold under the brand name Solumbra. (See Manufacturer and Distributor Information in the Appendix.)

☐ Preliminary research into the potential of beta-carotene, folic acid, retinoic acid, vitamin C, vitamin E, and minerals as inhibitors of skin cancer is encouraging.

☐ Garlic may be effective in fighting basal cell carcinoma by boosting the body's immune response.

☐ A worldwide rise in the incidence of skin cancer has been linked to the destruction of the earth's ozone layer. The ozone layer acts as a protective atmospheric sunscreen. As it becomes thinner and holes develop in it, more of the sun's harmful rays reach the earth.

☐ More information about skin cancer is available from the American Cancer Society. (See Health and Medical Organizations in the Appendix.)

## SKIN PROBLEMS

See also under FUNGAL INFECTION; PREGNANCY-RELATED PROBLEMS.

## SKIN RASH

The skin is the body's largest organ. It consists of three layers—the epidermis (outer layer), the dermis (middle layer), and the subcutaneous layer (inner layer). The skin acts as a shield between the body and the millions of foreign substances that exist in our environment. It also functions as a means of excreting toxins and other substances from the body, as do the kidneys and bowels. As a result, the skin is subject to the development of various bumps and blisters, as well as to changes in color, cracking, dryness, flaking, itching, redness, roughness, scaling, thickening, and a host of other problems.

There are many reasons for skin reactions. Some of the most common include allergies to molds, foods, chemicals, cosmetics, and other substances. Insect bites, exposure to certain plants (such as poison ivy), fungi, diaper rash, sun and wind exposure, drugs, and alcohol can pose problems as well. Reactions to detergents, jewelry, and fragrances; nervous tension; and friction, either from two parts of the body rubbing against each other or from contact with ill-fitting clothing or shoes, also contribute. (See Common Types of Rashes on page 722.)

A rash should not be taken lightly, as it can sometimes be an indication of an underlying illness—sometimes a potentially serious illness. Certain types of rashes can be valuable as early warning signals.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Bee pollen	As directed on label.	Has antioxidant properties that can aid in healing. <i>Caution:</i> Do not use if you are allergic to bee stings.
Beta-1,3-D-glucan	As directed on label.	Can attack organisms that do not belong on the body, including bacteria, viruses, and fungi.
Colloidal silver	As directed on label.	A powerful antibiotic that has been shown to be effective in fighting many skin rashes. <i>Caution:</i> Only use topically.

## Common Types of Rashes

The best way to approach treatment for a rash is to eliminate the underlying cause. Following are descriptions of some of the conditions most often responsible for skin rashes. This list is not exhaustive, and it is not meant as a substitute for diag-

nosis by a qualified health care practitioner. Any rash that persists for longer than one week, that seems to be getting worse, or that is accompanied by other symptoms, such as fever, should be evaluated by a professional.

Cause of Rash	Characteristic Features
Athlete's foot	Inflammation, scaling, cracking, and blisters on the feet, especially between the toes. Burning and/or itching may be severe.
Chickenpox	Crops of small round blisterlike pimples that crust over as they heal. Usually appears first on the torso, following a day or so of fever and headache, and then spreads to the face and extremities. Extremely itchy. Most common in children.
Dermatitis (eczema)	There are several types of dermatitis, including atopic dermatitis, nummular dermatitis, seborrheic dermatitis, and hand dermatitis. General features include patches of scaling, flaking, and thickening skin that may appear anywhere on the body. Skin color in the affected area may change. Itching is common. One type of dermatitis causes round lesions on the limbs.
Food or drug allergy	A flat pink or red rash, with possible swelling and/or itching.
Fungal infection ( <i>Candida</i> )	Moist, possibly itchy, red patches that may appear anywhere on the body, but are most common in areas where skin surfaces rub together. In babies, an inflamed, shiny diaper rash.
Herpes infection	Painful fluid-filled blisters that erupt periodically around the mouth and/or genitals.
Hives	A rash that usually appears suddenly and can take the form of patches of tiny, goose bump-like spots or red, itchy welts that cover significant areas of the body—or anything in between.
Lyme disease	A red, circular lesion that gradually expands as the center appears to clear up. This may be followed by a rash composed of small raised bumps on the torso. The rash may or may not be accompanied by flu-like symptoms of fever, chills, and nausea.
Measles	A raised red rash that usually begins on the forehead and ears and spreads to the rest of the body. The rash usually follows several days of viral symptoms including fever, cough, sneezing, runny nose, and possibly conjunctivitis. There may be tiny red spots with white centers in the mouth as well.
Mononucleosis	A lumpy red rash accompanied by headache, achiness, low-grade fever, sore throat, and persistent fatigue.
Poison ivy/poison oak/poison sumac	A red, intensely itchy rash with swelling and oozing blisters. If scratched, the rash can spread.
Psoriasis	Silvery, scaly patches that may appear anywhere on the body, but are most common on the scalp, ears, arms, legs, knees, elbows, and back. The rash follows a pattern of periodic flare-ups followed by healing. It may or may not be itchy.
Ringworm	Small, itchy round red spots that grow to be approximately ¼ inch in diameter, with scaly, slightly raised borders. They tend to clear in the center as they expand.
Rosacea	Reddening, small bumps, and pimples, usually affecting the nose and the center of the face. It resembles acne, but is chronic and is more common in middle-aged and older individuals.
Scabies	A persistent itchy rash with small red lumps that may become dry and scaly. Fine, wavy dark lines may emanate from some lumps. Most often occurs between the fingers, on the wrists and/or forearms, and on the breasts and/or genitals.
Seborrhea	Greasy yellowish, flaky patches of skin that form scales and crusts. It can appear anywhere on the body, but most often affects the scalp, face, and/or chest. It may or may not be itchy.
Shingles	Crops of tiny blisters that are extremely painful and sensitive to the touch and that eventually crust, scab, and are shed. Most common on the abdomen below the ribs, but it can occur anywhere on the body. May be preceded and/or accompanied by flu-like symptoms of chills, fever, and achiness.

Grape seed extract	As directed on label.	Has antioxidant properties that can aid in healing.
Vitamin A and vitamin C and vitamin E plus niacinamide and panthenol	As directed on label.	Vitamins that are thought to improve the health of the skin.

## Herbs

- Aloe vera gel, ginkgo biloba extract, and green tea extract have antioxidant properties that can aid in healing.
- Calendula, chamomile, elderflower, and tea tree oil can be used externally as a soothing wash on rashes.
- A poultice made with dandelion, and yellow dock root benefits many types of skin rashes. (See USING A POULTICE in Part Three.)
- Itch Relief Lotion from Derma-E Skin Care contains chamomile, tea tree oil, and vitamin E. It offers quick relief of skin irritation.
- Soak a washcloth in malva tea and apply it as a warm compress to the infected area to reduce inflammation.
- Oat straw may be used topically in a bath to reduce symptoms, especially inflammation and itching.
- Olive leaf extract has healing properties for the skin.

## Recommendations

- For quick relief of itching and inflammation, soak a clean cloth in cool water (or, for even greater soothing effect, in comfrey tea that has cooled), wring it out, and apply it to the affected area for ten minutes. Repeat this procedure as often as necessary for relief.

*Caution:* Comfrey is recommended for external use only.

- Take lukewarm showers instead of baths, and try not to shower every day during the duration of the rash. Also avoid using the same washcloth, sponge, or shower pouf each time you shower, as bacteria and fungi can grow in these moist areas.
- Whenever possible, use hypoallergenic skin care products, deodorants, shaving creams, soaps, hair products, cosmetics, household products, and laundry detergents. Keep in mind, however, that *hypoallergenic* means only that a product is *not likely* to cause allergies; not that it *will not*. Also, when choosing products, look for “fragrance-free” formulas rather than “unscented” ones.
- Wear cool, loose clothing. Next to the skin, cotton is best.
- Avoid prolonged contact with known skin irritants including chemicals, dust, direct sunlight, and water.
- Radiation and chemotherapy treatments can cause skin to become more sensitive to allergens and irritants. Occasion-

ally, radiation can also cause the skin to thin, lose elasticity, and become lighter or darker in color. Emollients and high-SPF sunscreens should be used generously on affected areas.

- Many medications cause skin rashes in people when they are exposed to sunlight. If your medication causes photosensitivity, ask your doctor if there are any alternatives.
- See Common Types of Rashes on page 722 to help you identify possible causes of a rash, and refer to the appropriate sections in Part Two for advice on treatment.

## Considerations

- Four of the most serious diseases in which skin rash is an early warning signal are Rocky Mountain spotted fever, meningococcal disease, staphylococcal toxic shock syndrome, and streptococcal toxic shock syndrome.
- Skin rashes in children are often caused by food allergies, especially to chocolate, dairy products, eggs, peanuts, milk, wheat, fish, chicken, pork, or beef. Some experts estimate that allergies to eggs, peanuts, and milk account for as many as 75 percent of all skin rashes in children.
- Many doctors recommend hydrocortisone cream for minor irritations, poison ivy, itchy insect bites, and diaper rash. Antihistamines and antibiotics are also common treatments prescribed by doctors for various types of rashes. In severe cases, a doctor may prescribe an oral steroid (such as prednisone, prednisolone, or hydrocortisone) or the use of phototherapy (procedures involving the use of ultraviolet radiation).
- Allergy testing is advised, particularly for persistent rashes. (See ALLERGIES in Part Two.)
- See also ACNE; ALLERGIES; ATHLETE'S FOOT; CANDIDIASIS; CHEMICAL ALLERGIES; CHICKENPOX; DERMATITIS; ENVIRONMENTAL TOXICITY; FUNGAL INFECTION; GANGRENE; HERPES INFECTION; HIVES; INSECT BITE; LUPUS; LYME DISEASE; MEASLES; MONONUCLEOSIS; POISON IVY/POISON OAK/POISON SUMAC; PSORIASIS; RHEUMATIC FEVER; ROSACEA; SCABIES; SEBORRHEA; SHINGLES (HERPES ZOSTER); VITILIGO; and/or WARTS, all in Part Two.

## SLEEP PROBLEMS

See under INSOMNIA; NARCOLEPSY.

## SMOKING DEPENDENCY

Every time a person smokes, he or she inhales more than 4,800 different chemicals (69 are carcinogens), including nicotine. Nicotine, which is extremely addictive, increases levels of the pleasure-inducing brain chemicals serotonin, dopamine, and norepinephrine. Tobacco has been used as a mood-altering substance for centuries. It has been ingested by various means, including chewing, sniffing, and smoking. Today it is most commonly consumed by smoking cigarettes.

Nicotine acts as a stimulant on the central nervous sys-

tem. When nicotine is ingested, adrenaline production increases, raising the blood pressure and heart rate. Nicotine also affects the overall metabolic rate, the regulation of body temperature, the degree of tension in the muscles, and the levels of certain hormones. These and other metabolic changes create a pleasurable sensation in the user that often—and paradoxically—is experienced as a feeling of relaxation. This pleasurable sensation is one of the factors that makes tobacco so addictive. Another is the fact that tolerance to the effects of nicotine develops quite rapidly. That is, the dose needed to achieve the desired effect begins to rise almost immediately, encouraging you to increase the amount you smoke—which in turn increases the likelihood of addiction. Once you become addicted, your body depends on the presence of nicotine. If you then refrain from smoking, withdrawal symptoms occur. These include irritability, frustration, anger, anxiety, difficulty concentrating, restlessness, increased appetite, headache, stomach cramps, a slowed heart rate, a rise in blood pressure, and, most of all, an intense craving for nicotine.

Once the smoking habit has been acquired, it is difficult to break. Some authorities have stated that addiction to tobacco may be harder to overcome than addiction to heroin or cocaine. This is because smoking creates both physical and psychological dependency. It may be easier to overcome the physical addiction than the psychological dependency. Acute physical withdrawal, while unpleasant, lasts for a limited period of time, usually no more than several weeks. Long-term cravings are more likely a matter of psychological dependency, and require an ongoing effort to master. By the time an individual has become addicted to nicotine, the act of smoking itself has become a source of pleasure, and it may be so intertwined in your mind with other activities—having your morning coffee, reading the newspaper, working, socializing, whatever—that you find yourself unable to imagine engaging in these activities without a cigarette in hand. In addition, smoking provides a convenient excuse for taking a momentary break, especially during times of stress, and may help to smooth over awkward moments. Many smokers also are afraid of what might happen if they stopped; they fear withdrawal symptoms, weight gain, or a decreased ability to concentrate. All of these factors combine to make quitting difficult.

Even though it can be difficult to stop smoking, many people do it every day. There is certainly no shortage of reasons to quit. There are 440,000 deaths due to cigarettes in the United States every year. This is more than the number of deaths from alcohol, illegal drugs, traffic accidents, suicide, and homicide combined. Tobacco smoking causes an estimated 30 percent of all cancer deaths, 20 percent of fatal heart attacks, and 73 percent of deaths from chronic obstructive pulmonary disease. It also accounts for at least 90 percent of lung cancer cases. Many other health problems have been linked to smoking as well, including angina, arteriosclerosis, cataracts, chronic bronchitis, circulatory ailments, colorectal cancer, diarrhea, emphysema, heartburn,

high blood pressure, impotence, peptic ulcers, respiratory ailments, urinary incontinence, and cancers of the mouth and throat, especially among cigarette smokers who also consume alcohol and/or use mouthwash containing alcohol. Smoking increases the risk of catching colds and lengthens recovery time. Tobacco smoke paralyzes the cilia (hairlike protrusions lining the nose and throat), reducing their capacity to clear the passages by moving mucus—and the cold viruses trapped within it—to the outside.

Nicotine has long been known to be a deadly toxin. A single pinhead-sized drop of liquid nicotine, introduced directly into the bloodstream, would be fatal. At the doses normally ingested by smokers, nicotine makes the heart pump faster and work harder, increasing the likelihood of heart disease. It also constricts the peripheral blood vessels, contributing to circulatory disorders such as Raynaud's phenomenon and hardening of the arteries.

And nicotine is not the only ingredient in cigarettes that poses a danger to health. In addition to nicotine, cigarette smoke contains carbon monoxide, benzene, cyanide, ammonia, nitrosamines, vinyl chloride, radioactive particles, and other known irritants and carcinogens. Carbon monoxide binds to hemoglobin, interfering with the transport of oxygen throughout the body. Carbon monoxide also promotes the development of cholesterol deposits on artery walls. These two factors increase the risk of heart attack and stroke. Hydrogen cyanide causes bronchitis by inflaming the lining of the bronchi. Over the long term, smoking dramatically reduces the flow of blood to the brain.

Men who have smoked for years are more likely to have abnormally low penile blood pressure, which contributes to impotence. This is probably because smoking damages the blood vessels, including the tiny blood vessels that supply the penis. It also contributes to sterility; the sperm of men who smoke have less ability than that of nonsmokers to penetrate, and thus to fertilize, an egg.

Female cigarette smokers tend to experience menopause earlier, face a greater risk of osteoporosis after menopause, and have a much higher risk of developing cervical or uterine cancer. They also appear less fertile and have more difficulties during pregnancy. Smokers tend to have more miscarriages, stillbirths, and premature deliveries. Their babies often are smaller and have more health problems than babies of nonsmokers. Infants whose mothers smoke both during pregnancy and after childbirth appear to be three times as likely to die of sudden infant death syndrome (SIDS) as infants of nonsmokers. Children whose fathers smoke also face an increase in health problems.

Smoking has a detrimental effect on nutrition. Smokers break down vitamin C about twice as fast as nonsmokers. This can deprive the body of adequate amounts of one of the most powerful and versatile antioxidants at our disposal. Other antioxidant vitamins are depleted as well. Cigarette smoke contains high concentrations of nitrogen dioxide ozone, a compound that oxidizes the antioxidant vitamins and is also known to do damage to DNA. The ac-

celerated antioxidant usage, in combination with the DNA damage, speeds the aging process.

Finally, smoking is increasingly a social problem. More and more nonsmokers are becoming concerned about the effects of "secondhand" smoke on their own health, and justifiably so. There is a growing body of evidence that secondhand smoke may be even more dangerous than the smoke the smoker breathes. Smoking is now prohibited in many workplaces and public buildings.

The dangers of smoking are well known today, yet people continue to smoke. Why? Some people started smoking before the hazards were widely known; others start in adolescence, when people generally feel invulnerable and are more likely to engage in risk-taking behavior—especially if it seems "adult," helps them fit in with a particular social group, and/or provokes their parents. However, surveys consistently show that no matter when or why they started, most current smokers do not smoke because they want to (well over 50 percent say they wish they had never started), but because they are addicted.

The good news is that this addiction can be overcome, and that health benefits begin almost immediately. In just twenty-four hours after your last cigarette, your blood pressure and pulse rate should return to normal, as should the levels of oxygen and carbon monoxide in your blood. Within a week, your risk of heart attack begins to decrease, your senses of smell and taste improve, and breathing becomes easier.

The nutrients and dietary suggestions below are recommended to correct probable smoking-related deficiencies and damage while you work to kick the habit. They are recommended also if you cannot avoid being a passive smoker.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Coenzyme Q <sub>10</sub>	200 mg twice daily.	Aids oxygen flow to the brain; protects heart tissue. Also acts as an antioxidant to protect cells and lung tissue.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works well with coenzyme Q <sub>10</sub> to rid the body of toxic substances.
Oxy-5000 Forte from American Biologics	2 tablets 3 times daily.	A powerful antioxidant. Destroys free radicals produced in the smoke.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Helps to protect and repair the lungs.
Vitamin B complex  plus extra	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary).	Necessary in cellular enzyme systems often damaged in smokers. Use sublingual form.

vitamin B <sub>12</sub>	1,000 mcg twice daily.	Increases energy; needed for liver function. Use a lozenge or sublingual form.
and folic acid	400 mcg daily.	Needed for the formation of red blood cells; important for healthy cell division and replication.

Vitamin C with bioflavonoids	5,000–20,000 mg daily. (See ASCORBIC ACID FLUSH in Part Three.)	Important antioxidant that protects against cell damage. Smoking drastically depletes the body of vitamin C.
------------------------------------	---	--

Vitamin E	200 IU daily.	One of the most important antioxidants, needed to protect cells and organs from damage by the smoke. Use d-alpha-tocopherol form.
-----------	---------------	---

*Very Important*

Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Antioxidants that aid in the healing of mucous membranes. Important for lung protection. <i>Caution:</i> Vitamin A supplements should include only vitamin A and not beta-carotene, which has been shown to increase the risk of dying in smokers.
-----------	--	--

Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.
------	---	--

*Helpful*

Cell Guard from Biotech Foods	As directed on label.	Provides high levels of antioxidant enzymes for cellular health.
----------------------------------	-----------------------	--

Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Detoxifies the body and helps the body maintain high energy levels.
--	-----------------------	---

Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Detoxifies the body, balances the nervous system, and boosts immunity.
---	-----------------------	--

L-cysteine and L-methionine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Potent detoxifiers that protect the lungs, liver, brain, and tissues from cigarette smoke.
plus glutathione	As directed on label.	Protects the liver.

Maitake extract	1,000–4,000 mg daily.	Inhibits carcinogenesis and protects against metastasis through the lungs.
-----------------	-----------------------	--

Multivitamin and mineral complex with selenium	As directed on label.  200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Necessary for immune system function.  Helps to prevent cell damage. Make sure the supplement contains folic acid, as it has been shown to reduce strokes related to smoking.
---	--	---

Raw thymus glandular	As directed on label.	A glandular that improves immune function.
-------------------------	-----------------------	--

## Herbs

- Burdock root and red clover help to cleanse the bloodstream of toxins.
- Cayenne (capsicum) desensitizes respiratory tract cells to irritants from cigarette smoke.
- Catnip, hops, lobelia, skullcap, and/or valerian root can be used to help reduce the nervousness and anxiety that may accompany nicotine withdrawal.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Dandelion root and milk thistle protect the liver against harmful toxins from cigarette smoke.
- Ginger causes perspiration, which helps the body to shed some of the poisons ingested through smoking. It also soothes the stomach irritation occasionally experienced with the use of cayenne or lobelia.

## Recommendations

- Consume more asparagus, broccoli, Brussels sprouts, cabbage, cauliflower, spinach, sweet potatoes, and turnips.
- Eat plenty of grains, nuts, seeds, and unpolished brown rice. Millet cereal is a good source of protein. Eat wheat, oat, and bran. Also consume yellow and deep-orange vegetables such as carrots, pumpkin, squash, and yams. Apples, berries, Brazil nuts, cantaloupe, cherries, grapes, legumes (including chickpeas, lentils, and red beans), and plums are also helpful.
- Eat onions and garlic, or take garlic in supplement form.
- Drink fresh carrot juice daily as a preventive measure against lung cancer. Also drink fresh beet juice (made from both the roots and the greens) and asparagus juice. All dark-colored juices are good, as are black currants. Also beneficial is apple juice, if it is fresh. Drink fruit juices in the morning and vegetable juices in the afternoon.
- Cook all sprouts slightly except for alfalfa sprouts, which should be eaten raw.
- Do not consume junk foods, processed refined foods, saturated fats, salt, sugar, or white flour.
- Instead of salt, use a kelp or potassium substitute. If you must, use a *small* amount of blackstrap molasses or pure maple syrup as a natural sweetener in place of sugar. Use whole wheat or rye instead of white flour. Eliminate alcohol, coffee, and all teas except for herbal teas.
- Do not eat any animal protein except for broiled fish (up to three servings per week). *Never* eat luncheon meat, hot dogs, or smoked or cured meats. Limit your consumption of dairy products to a little low-fat yogurt, kefir, or raw cheese on an occasional basis.

- Do not eat any peanuts. Limit, but do not eliminate altogether, your intake of soybean products; they contain enzyme inhibitors.
- Keep in mind that the acute craving for a cigarette usually lasts only three to five minutes. Focusing on this fact may make it easier to wait it out. Also remember that it gets easier and easier as time goes by. When cravings strike, try taking a walk, doing some sit-ups, or engaging in any activity that can momentarily take your mind off cigarettes.
- To accelerate toxin elimination, *see* FASTING in Part Three, and follow the program.
- Take coffee enemas daily. Use cleansing enemas with lemon and water or garlic and water two or three times weekly. Enemas are not for children. (*See* ENEMAS in Part Three.)
- Drink spring or steam-distilled water only.
- As much as possible, avoid stress.
- If you take any medications, consult with your physician about the possible need for an adjustment in dosage after you quit smoking. Tobacco alters the absorption and utilization of many medications, including insulin, asthma drugs, and certain antidepressants, blood pressure medications, and painkillers.

## Considerations

- The difficulty of quitting appears to be related less to how many packs a day you smoke than to how early in life you started smoking.
- Many people have been successful in the quest to stop smoking by going on a fast using only live juices and quality steam-distilled water. A live juice fast can quickly remove nicotine and other damaging chemicals from the body. Adhering to a five-day live juice fast can have amazing results.
- There are several natural products on the market that may help you deal with withdrawal symptoms, such as Smoking Withdrawal from Natra-Bio.
- A lack of beta-carotene and the B-complex vitamins has been linked to lung and throat cancer. However, the beta-carotene data is controversial. One major study (called ATBC study) published in the *Journal of the National Cancer Institute* found that smokers who take a high dose of beta-carotene (20 milligrams per day) had an increased risk of developing lung cancer, especially for heavy smokers who drink alcohol. The authors stated that smokers should avoid high-dose beta-carotene supplementation.
- Taking vitamin C and E supplements is controversial in smokers. One study showed a 19 percent increase in mortality in users of these supplements who were aged fifty to sixty-two years. However, in the same study, mortality was *decreased* by 41 percent among those aged sixty-six to sixty-nine years. Further study is needed to determine why there was this apparent age-related discrepancy.

❑ In one study, broccoli (about 1 cup a day) was shown to protect cells against damage in smokers. Other investigators have shown that eating a wide variety of fruits and vegetables containing lycopene, lutein/zeaxanthin, total carotenoids, and other natural compounds reduced the risk of developing lung cancer in smokers by 15 to 28 percent.

❑ A study cosponsored by the British and Norwegian governments found that DNA taken from the lungs of female smokers showed significantly more damage than that taken from men. DNA damage is a marker of increased cancer risk.

❑ Research at the University of Indiana found that people who drank six cups of tea a day were protected from the toxic effects cigarette smoke has on the lungs by up to 50 percent. Still, quitting is preferable since you still can get lung cancer if you smoke and drink tea.

❑ Smoking a pack of cigarettes a day or more triples the risk of needing surgery for a herniated disk, but quitting smoking reduces that risk, according to researchers at the Medical College of Wisconsin.

❑ According to a study reported in the *Archives of Internal Medicine*, smoking increases the risk of developing leukemia by 30 percent.

❑ There are alternative sources of nicotine for those who wish to quit smoking. They are available either in transdermal patch form, as chewing gum, and as nasal sprays and inhalers. Some of these are available over the counter, while others require a prescription.

❑ In July 2009, the U.S. Food and Drug Administration (FDA) announced that it is requiring manufacturers to put a Boxed Warning on the prescribing information for the smoking-cessation drugs Chantix (varenicline) and Zyban (bupropion). The warning highlights the risk of serious mental health events, including changes in behavior, depressed mood, hostility, and suicidal thoughts when taking these drugs.

❑ A diagnostic procedure called a sputum cytology test can sometimes detect the presence of cancer before there are symptoms and before other tests show the disease. In this test, sputum coughed up from the lungs and the bronchial tubes is examined for signs of tumor cells.

## SNAKEBITE

There are four types of poisonous snakes in the United States: copperheads, coral snakes, cottonmouths (or water moccasins), and a variety of rattlesnakes. Approximately 4,000 to 7,000 Americans are bitten by poisonous snakes each year, most commonly in the summer months, in grassy or rocky environments. However, only about 25 percent of these bites involve venom—that is, the snake saves its venom for its prey, not necessarily for defense. If you encounter a snake that is large enough to consider *you* prey, your problems far outweigh a simple bite!

The toxicity of snake venom, which varies from species

to species, can kill local tissue and release toxins into the body that can cause serious problems with blood pressure, heart rate, and pain. A person who has been bitten by a poisonous snake may exhibit mild to severe symptoms, which can include swelling or discoloration of the skin in the area of the bite, a racing pulse, weakness, shortness of breath, nausea, and vomiting. In extreme cases, pain and swelling can be severe, the pupils may dilate, and shock and convulsion may occur. The person may twitch and his or her speech may become slurred. In the most severe cases, paralysis, unconsciousness, and death can result. There are only about four deaths in the United States each year due to snakebite, yet this is a situation feared universally by hikers, paddlers, climbers, fishermen, hunters, and campers. Most deaths occur in children because of their smaller body mass and lack of sufficient immune system development. Improper treatment causes many injuries, and there is a lot of misinformation concerning first aid. (See What to Do in Case of Snakebite on page 728.)

It is worth emphasizing that the majority of snakes are *not* poisonous. Nevertheless, anyone who has been bitten by a snake should be seen by a professional immediately, because the severity of initial symptoms does not always reflect the seriousness of the bite. If you have a pet snake that bites, make sure that it cannot get out to harm anyone, especially small children.

The nutrients and other measures outlined here are intended to alleviate pain and hasten healing *after appropriate medical care has been administered*. They are *not* meant to substitute for it. Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Calcium and magnesium	500 mg every 4 to 6 hours until pain begins to ease. 1,000 mg with the first 500 mg of calcium.	To relieve pain. Acts as a sedative. Use calcium gluconate form. Works with calcium.
Charcoal tablets	8 tablets every 3 hours until the swelling subsides. Take with a large glass of water. If possible, start immediately after being bitten.	A powerful detoxifying agent.
Colloidal silver	Apply topically as directed on label.	An antiseptic that reduces inflammation and promotes healing of skin sores.
L-serine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Helps maintain a healthy immune system and aids in the production of antibodies.

## What to Do in Case of Snakebite

If you or someone with you is bitten by a snake, it is vital to seek appropriate medical treatment. It is equally vital to avoid making inappropriate attempts at treatment; such mistakes can cause more problems than they solve.

What to do in any particular case depends on the circumstances surrounding the bite.

### What to Do

While not all snakebites are life-threatening, it is important to follow these simple steps:

- Remain calm (or, if the victim is someone other than yourself, calm him or her).
- If possible, call for emergency assistance.
- Gently wash the area with soap and water.
- Apply a cold, wet cloth over the bite.
- Get yourself or the victim to the nearest hospital emergency room for further treatment.

### What Not to Do

The list of measures that should be *avoided* in response to snakebite include:

- *Do not* apply a tourniquet. This has been the cause of numerous amputations. It is possible that the application of a tourniquet is more dangerous than the snakebite itself.
- *Do not* pack the entire bitten area in ice. This can block circulation and cause injury to tissue, or even gangrene. An ice pack or some cubes wrapped in cloth, applied periodically to the skin, is the maximum you want to use.
- *Do not* cut the wound with a knife or razor. Older first-aid kits often contain cutters, but excessive bleeding can cause more damage. If you happen to cut an artery, the victim can bleed to death. Unless you happen to be a vascular surgeon, leave the razor blades in your pack.
- *Do not* use your mouth to try to “suck out” the venom. The average human mouth has so many bacteria in it that infection of the wound would be almost certain, complicating treatment in the long run.

- *Do not* drink alcohol (or give it to the victim).
- *Do not* use an electric shock, Taser, stun gun, cattle prod, or any such device applied to the snakebite. All you will do is make the victim more miserable, and the venom will not be broken down by the electricity.

### Other Measures

If you can *safely* kill the snake, do so and decapitate it. Bury the head and bring the body with you to the emergency room for identification. The correct *antivenin* can then be secured at the hospital. *Do not bring the head, however*, as even a decapitated snake head can bite up to an hour after its death.

There is one type of snakebite kit that is worthwhile. It is called Sawyer Extractor Pump Kit, and is available from Sawyer Products. (See Manufacturer and Distributor Information in the Appendix.) It contains a syringe-like device that does work to suck out venom without requiring you to open up the fang wounds with a tool. This prevents excessive bleeding and contamination of the wound. This kit will probably get out about half the venom if it is used quickly (within five minutes is recommended). These are available from many sporting goods stores and on the Internet for less than twenty dollars. If you are going to be someplace in snake country that is *really* far from civilization, having one of these kits in your backpack is a necessity. After you use it, transport to the nearest hospital is still required so that proper care can be administered.

Multivitamin and mineral complex	As directed on label.	All nutrients work together to promote health.
Ultimate Cleanse from Nature's Secret	As directed on label.	A two-part body-cleansing program that detoxifies the organs, blood, and the channels of elimination.
Vitamin A with mixed carotenoids including beta-carotene	10,000 IU daily.	Enhances immunity and promotes tissue healing.
Vitamin B <sub>5</sub> (pantothenic acid)	500 mg every 4 hours for 2 days.	The antistress vitamin.

Vitamin C with bioflavonoids	2,000 mg every hour for 5 to 6 hours, up to a total of 15,000 mg daily.	A powerful detoxifier. Relieves pain and discomfort and fights infection.
Vitamin E	200 IU daily.	Promotes healing and reduces blood pressure. Use d-alpha-tocopherol form.
Zinc	30 mg daily.	Boosts immune function. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Black cohosh syrup helps to relieve pain. Take ½ to 1 tablespoon of the syrup three times daily.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

Poultices of comfrey, slippery elm, or white oak leaves and bark can be used. (See USING A POULTICE in Part Three.) Comfrey salve, plantain poultice, or plantain salve can also be used.

*Caution:* Comfrey is recommended for external use only.

Echinacea, taken in tea and/or capsule form, boosts the immune system.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Olive leaf extract has antibacterial properties.

Yellow dock can be used to alleviate symptoms. Drink a cup of yellow dock tea or take 2 capsules of yellow dock every hour until the symptoms are gone.

## Recommendations

Prevention is the best cure! To reduce the possibility of snakebite, always remain on paths and hiking trails when in wooded areas.

Wear leather boots and long pants if walking in tall grass.

Carry a walking stick, especially in rattlesnake country. A snake often will strike at the stick first.

Be alert. If you see a snake, do not approach it. Stay at least six feet away.

If you come across a log, step onto the log and then over it. Never step directly over it.

If you are walking in a tall grassy area, use a long walking stick or other object to tap the ground in front of you before you step.

Take special caution when walking near or through a wet marshy area, as water moccasins can occupy these areas.

## Considerations

A poisonous snakebite is a medical emergency. In the United States, treatment is a complex process that may include the administration of antivenin plus fluid and electrolyte replacement, the administration of oxygen, and other supportive measures. If possible, it is wise to call ahead to the emergency room and alert them of the situation before your arrival so that the proper antivenin can be ready for treatment as soon as possible.

Snakebite is more likely to be life-threatening for children and for elderly people.

In a life-threatening situation, massive doses of vitamin C may save the victim's life. (See ASCORBIC ACID FLUSH in Part Three.)

Most cases of snakebite occur between sunrise and sunset. Snakes are cold-blooded and are more likely to be out then, basking in the warmth of the day.

Nonpoisonous snakebites are usually treated with antibiotics in order to prevent infection.

## SORE THROAT

Sore throats are one of the most common health complaints. They are characterized by a raw, burning, and/or scratchy feeling at the back of the throat. Most sore throats are caused by viral infections such as the common cold. Bacterial infection, especially *Streptococcus* infection, can also be responsible. In addition, a sore throat can be caused by anything that irritates the sensitive mucous membranes at the back of the throat and mouth. Some irritants include medications, surgery, radiation therapy, dust, smoke, fumes, extremely hot foods or drinks, tooth or gum infections, dental work, and abrasions. Chronic coughing and excessive loud talking also irritate the throat.

An acute sore throat usually runs its course within a few days to a few weeks. Sore throats are seldom serious, but quite often are the first symptom of another disorder. Sore throats can signal a cold, flu, strep, mononucleosis, Epstein-Barr virus, herpes simplex, as well as many childhood illnesses such as measles and chickenpox. More rarely, a sore throat may indicate chronic fatigue syndrome, diphtheria, epiglottitis, gingivitis, laryngeal cancer, or an abscess around the tonsils.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	To replenish "friendly" bacteria. Especially important if antibiotics are prescribed. Use a nondairy formula.
Bee propolis	As directed on label.	Protects mucous membranes of the mouth and throat. <i>Caution:</i> Do not use if you are allergic to bee stings.
Garlic (Kyolic from Wakunaga) or Kyo-Green from Wakunaga	2 capsules 3 times daily, with meals.	For improved immune function.
Maitake extract or	As directed on label.	Contains live enzymes, amino acids, vitamins, minerals, and chlorophyll for healing.
		To boost immunity and fight viral infection.

reishi extract or shiitake extract	As directed on label. As directed on label.	
Multivitamin and mineral complex	As directed on label.	To maintain a balance of all necessary nutrients.
Vitamin A emulsion  or capsules  plus carotenoid complex with beta-carotene	100,000 IU daily for 1 week, then 50,000 IU daily for 1 week, then reduce to 25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily for 1 week; then reduce to 10,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Aids healing and potentiates immune function. Emulsion form is recommended for easier assimilation and greater safety at high doses.  Provides important antioxidant protection. Enhances immunity.
Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Has antiviral properties.
Vitamin E	200 IU daily.	Promotes healing and tissue repair. Use d-alpha-tocopherol form.
Zinc lozenges	As directed on label.	For pain relief, healing, and improved immune function.

## Herbs

Bee pollen, blackberry, calendula, and cayenne all have been known to soothe or heal a sore throat.

*Caution:* Bee pollen may cause an allergic reaction in some people. Start with a small amount; discontinue if rash, wheezing, discomfort, or other symptom occurs.

Catnip tea enemas help to reduce fever. (See ENEMAS in Part Three.)

Echinacea and goldenseal fight bacterial and viral infection.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Fenugreek used as a gargle can relieve a sore throat and reduce the pain of swollen glands. Add 20 drops of extract to 1 cup water and gargle with the mixture three times daily.

Licorice soothes a sore, hoarse throat. Lungwort soothes throat irritation. Licorice can be found in lozenge form.

*Caution:* Licorice root should not be used during pregnancy or nursing, or by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

Marshmallow root tea soothes a scratchy, itchy throat.

Raspberry leaf tea is good for easing the pain of a sore throat as well as fever blisters.

Hot mullein poultices are soothing to sore throats. (See USING A POULTICE in Part Three.)

Olive leaf extract has been found to be a good remedy for a sore throat.

Singer's Saving Grace from Herbs, Etc. is a soothing throat spray that contains a combination of several herbs, including echinacea, licorice, and ginger.

## Recommendations

Be sure to cook all your food until it is tender. Poaching and steaming are good methods of cooking to retain moisture.

Cut your food into very small pieces—or, if necessary, grind or purée it. This will cause less irritation to the throat. Be sure to chew your food well before swallowing.

Use frozen popsicles, ice cream, yogurt, and sherbet to soothe a sore throat.

Avoid eating foods that are spicy, hot, salty, or acidic. These can be irritating to the throat.

If you are having an especially difficult time swallowing and are not able to get the proper intake of nutrients, try drinking an instant breakfast drink.

If your physician prescribes antibiotics for a bacterial throat infection, eat yogurt and take an acidophilus supplement to replace the "friendly" bacteria. Do not take the acidophilus at the same time as the antibiotic, however.

Liquid vitamin C, made by dissolving vitamin C powder in water or juice, is good to sip. Allow it to drip down the throat slowly.

Gargle alternately with chlorophyll liquid and sea salt (½ teaspoon in a glass of warm water) every few hours.

Drink plenty of liquids. Fresh juices are best.

Sip tea made from chamomile or sage, or some chicken or vegetable broth to keep your throat lubricated.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Use a mixture of raw honey and lemon juice to coat and soothe the throat.

*Caution:* Do not give raw honey to infants or to people with poor immune systems.

Try using homeopathic remedies to relieve symptoms. Aconite, Belladonna, Ferrum phosphoricum, and Gelsemium are some of the homeopathic remedies that have been used to treat sore throat.

See FASTING in Part Three, and follow the program.

If you smoke, stop. Smoking is a major cause of sore throats. (See SMOKING DEPENDENCY in Part Two.)

- Snoring can make a sore throat much more painful. If you snore, try sleeping on your side or using adhesive strips that hold the nostrils open. These can be found in drugstores and many supermarkets.
- Seek a physician's care if your sore throat is accompanied by any of the following:
  - *High or persistent fever.* A fever that is higher than 101°F should be evaluated by a physician.
  - *Rash.* This can be a sign of strep throat or other potentially serious conditions.
  - *Severe headache and stiff neck.* This can be a symptom of meningitis.
  - *Prolonged hoarseness.* This may indicate an underlying medical problem such as throat cancer or oral cancer.

### Considerations

- A constant tickle or chronic irritating cough can be an indication of food allergies. (See ALLERGIES in Part Two.)
- If sore throat recurs or lasts for longer than two weeks, you may have an underlying illness such as mononucleosis.
- Many sore throats and infections are contracted from bacteria on toothbrushes. Toothbrushes should be replaced once monthly and after any type of infectious illness. Between uses, store your toothbrush in hydrogen peroxide or grapefruit seed extract to kill germs (if you use hydrogen peroxide, rinse the toothbrush well before brushing).
- Breathing in dry air can sometimes worsen the soreness. A humidifier or vaporizer can help by adding more moisture to the air.
- See also COMMON COLD; MONONUCLEOSIS; SINUSITIS; and TONSILLITIS, all in Part Two.

### SPIDER BITES AND SCORPION STINGS

The bites of all spiders can be poisonous and painful. However, most spiders are not big enough to cause serious harm. Infants, older adults, and people of any age who have allergies are at greatest risk of having more serious reactions.

A bite from a poisonous spider may produce a wide variety of symptoms, including intense pain, numbness, redness, and swelling in the affected area, as well as generalized convulsions, difficulty breathing, dizziness, fever or chills, headache, impaired speech, itching, joint pain, muscle spasms, muscular cramping, nausea, stiffness, sweating, vomiting, and weakness.

Two types of spider—the black widow and the brown recluse—are more poisonous than most and can cause serious reactions. The black widow spider has a black body with a distinctive red hourglass shape on the main body segment. It injects a neurotoxin (nerve poison) that can cause a variety of symptoms, including immediate pain, burning, swelling, and redness at the site of the bite (dou-

ble fang marks may be visible); cramping pain and muscle rigidity in the stomach, chest, shoulders, and back; abdominal pain similar to that of appendicitis; spastic muscle contractions; headache; dizziness; rash and itching; restlessness and anxiety; sweating; swelling of the eyelids; nausea and/or vomiting; salivation and/or tearing of the eyes; weakness, tremors, or paralysis, especially in the legs; and localized tissue death. In about 1 percent of cases, black widow bites lead to anaphylactic shock and death. It is important to note, however, that symptoms similar to those of a black widow spider bite can resemble those of other conditions or medical problems. If you suspect a black widow bite, always consult your physician for a diagnosis and, if appropriate, emergency treatment.

The brown recluse spider is about an inch across, including the legs. Its body is only about 3/8-inch long and has a violin-like marking (the neck of the violin is pointed toward the rear of the spider). The venom of the brown recluse spider is necrotic (causes local tissue damage or death), and it usually creates a blister encircled by red and white rings—it looks like a deep-blue or purple area located around the bite, surrounded by a whitish ring and large red outer ring). This “bull’s-eye” appearance is used to distinguish it from other spider bites. Other common symptoms include burning, pain, itching, or redness at the site that may develop as soon as several hours or as long as several days after the bite; an ulcer or blister that turns black; headache and/or body aches; rash; fever; and nausea and/or vomiting. Death from this type of bite is even rarer than from black widow bites, but if you think you may have been bitten by a poisonous spider, you should seek medical help immediately. As with black widow bites, the symptoms of a brown recluse spider bite may resemble those of other conditions or medical problems, and a physician should be consulted for diagnosis and treatment.

Scorpions can be identified by their elongated bodies and curled tails, the ends of which are equipped with a curved “fang” or stinger. There are more than 1,500 species of scorpions, which are related to spiders. In the United States, dangerous scorpions are usually limited in range to the southwestern states, and while their stings are not necessarily deadly, they are extremely painful. Some people describe a scorpion bite as feeling like a hornet sting followed by having a nail driven through the sting site. Other symptoms may follow a scorpion sting as well, among them malaise, sweating, heart palpitations, rise in blood pressure, salivation, nausea, vomiting, and diarrhea. Compared with their U.S. counterparts, Mexican scorpions are another matter altogether; some 1,000 people a year die from their stings. Any type of scorpion sting requires emergency medical attention and should be approached in the same way as snakebite. (See What to Do in Case of Snakebite on page 728.) It is possible for hyperacute (typically allergic) reactions to occur in susceptible individuals, taking the form of blurring of consciousness, unconsciousness, convulsions, a rapid drop in blood pressure, shock, and, in extreme cases, death.

The recommendations for nutritional supplements and herbs outlined here are intended to alleviate pain and hasten healing *after appropriate medical care has been administered*. They are *not* meant to substitute for it. Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Helpful</i>		
Calcium and magnesium	1,000–2,000 mg daily until the wound heals. 500–1,000 mg daily until the wound heals.	Helps relieve pain. Use calcium gluconate form. Needed to balance with calcium.
Charcoal tablets	6–10 capsules as soon as possible after the bite or sting, taken with a large glass of water.	A powerful detoxifying agent. Take immediately after being bitten/stung if possible.
Colloidal silver	Apply topically as directed on label.	An antibiotic that reduces inflammation, promotes healing, and inhibits infection.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Enhances immunity and detoxifies the body.
Flaxseed oil	As directed on label.	Reduces pain and inflammation and aids recovery.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Promotes good skin health and detoxifies the body.
Multivitamin and mineral complex	As directed on label.	To maintain a balance of all essential nutrients.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Protects the skin, reduces inflammation, and enhances immunity.
Ultimate Cleanse from Nature's Secret	As directed on label.	Stimulates and detoxifies the organs and blood.
Vitamin A plus carotenoid complex with beta-carotene	10,000 IU daily. As directed on label.	Enhances immunity and protects the body from bacteria. Powerful antioxidants that boost the immune system.
Vitamin B complex plus extra Vitamin B <sub>5</sub> (pantothenic acid)	As directed on label. 500 mg daily.	Maintains healthy nerves and skin. A sublingual form is recommended. Has antiallergenic and antistress properties.
Vitamin C with bioflavonoids	1,000 mg every hour until pain and swelling subside.	Aids in detoxifying the venom and eliminating it from the body. Very important in crisis allergy situations.
Vitamin E oil	Apply topically to the affected area 3 to 4 times daily.	Aids healing and relieves discomfort. Purchase in oil form or cut open a capsule to release the oil.

Zinc 60–90 mg daily. Do not exceed a total of 100 mg daily from all supplements. Boosts immune response. Also acts as a natural insect repellent. Use zinc gluconate lozenges or OptiZinc for best absorption.

**Herbs**

Any of the following poultices may be beneficial (*see USING A POULTICE in Part Three*):

- A combination of dandelion and yellow dock relieves itchy skin.
- Fenugreek and flaxseed mixed with slippery elm bark is useful for treating inflammation.
- Goldenseal is good for inflammations of all kinds.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- A mixture of lobelia and crushed charcoal tablets is beneficial for insect bites and most wounds.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

A tincture made from calendula buds and alcohol should be on hand for stings and other "surface" injuries. A poultice made from the fresh flower heads is also good. (*See USING A POULTICE in Part Three*.)

A cream containing 5 percent tea tree oil helps to heal insect bites, sunburn, cuts, rashes, and other skin irritations.

Echinacea, taken in tea or capsule form, boosts the immune system.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Ginkgo biloba helps to relieve muscle pains.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Yellow dock purifies the blood and is beneficial for many problems affecting the skin. Drink as much yellow dock tea as you can, or take 2 capsules of yellow dock every hour until symptoms are relieved.

## Recommendations

Use essential oils of basil, cinnamon, lavender, lemon, sage, savory, or thyme for their antitoxic and antivenin properties. Apply a drop of essential oil on the sting.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

## Considerations

Specific treatment for a brown recluse spider bite will be determined by your physician. Treatment may include washing the area well with soap and water; applying a cold or ice pack wrapped in a cloth, or a cold, wet washcloth to the site; applying an antibiotic lotion or cream to protect against infection (especially for children); taking acetaminophen (Tylenol or the equivalent) for pain; elevating the site of the bite if possible to help prevent swelling; and, depending on the severity of the bite, administration of corticosteroids and other medications and/or surgery on the ulcerated area. Hospitalization may be needed.

Specific treatment for a black widow spider bite will be determined by your physician. Treatment may include washing the area well with soap and water; applying a cold or ice pack wrapped in a cloth, or a cold, wet washcloth to the site (ice should *not* be applied directly to the skin); application of an antibiotic lotion or cream to protect against infection (especially for children); taking acetaminophen (Tylenol or the equivalent); treatment with muscle relaxants, pain relievers, and/or other medications; plus supportive care. Antivenin may be needed, although it is usually not required. In some cases, hospitalization may be required.

Treatment of a scorpion sting may include applying an ice pack wrapped in cloth to ease pain at the site of the sting; injections of a morphine-based painkiller; and, in the case of more serious symptoms, treatment similar to those used for snakebite. The individual must receive treatment, including supportive medical treatment, as quickly as possible. There is antivenin available for scorpion venom. Its use must be overseen by a doctor.

In life-threatening cases of spider bite, massive injections of vitamin C and vitamin B<sub>5</sub> (pantothenic acid), administered by a medical professional, may be invaluable. This is something only a medical professional can decide.

For bites that do not appear to be life-threatening, a doctor may administer calcium gluconate to relieve muscle soreness and an anti-anxiety medication for muscle spasms.

Hydrocortisone ointment, calamine lotion, or a paste made from baking soda may be used to soothe the wound.

Rattlesnake and black widow venom are similar in many respects. Treatment for a black widow bite is therefore similar to that for snakebite.

If you have been bitten by any type of spider, it is important to be sure that your tetanus immunization is current.

See also BEE STING; INSECT ALLERGY; and/or SNAKEBITE in Part Two.

## SPRAINS, STRAINS, AND OTHER INJURIES OF THE MUSCLES AND JOINTS

A sprain is not the same thing as a strain. If a muscle is stressed beyond its capability, it becomes *strained*. Putting undue weight on the muscles and using the muscles for prolonged periods without rest can create muscle strain. A strained muscle may go into spasms or knot up instead of relaxing normally. Localized pain (during movement), swelling, and loss of mobility occur.

If one of the ligaments, the tissues that connect bones to muscles, is wrenched or stretched excessively, the ligament may tear, causing a *sprain*. There is likely to be a brief sharp pain followed by rapid swelling. Soft tissue surrounding the joint may be sore and bruised. Sprains can result from unexpected movement or twisting of the affected area, or from a hard fall. The joints most often sprained are the ankle, back, finger, knee, and wrist.

These types of injuries are common in athletes. In most cases, they heal on their own. The following supplement program can help these injuries heal. Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Chondroitin sulfate	500–1,000 mg daily.	Nutritional support for strengthening joints, ligaments, and tendons.
Glucosamine sulfate (GS-500 from Enzymatic Therapy) or N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Very important for the formation of bones, tendons, ligaments, cartilage, and synovial (joint) fluid.
Inf-zyme Forte from American Biologics	As directed on label. Take between meals.	To destroy free radicals released during injury.
Methylsulfonylmethane (MSM)	500–1,000 mg 3 times daily.	A sulfur compound needed for reducing pain and inflammation; also for joint and tissue repair.
<i>Helpful</i>		
Bromelain	400 mg 3 times daily, between meals.	An enzyme that helps to stimulate production of prostaglandins and reduces inflammation.

Calcium	1,500–2,000 mg daily.	Needed for repair of connective tissue. Use both calcium chelate and calcium gluconate forms to assure assimilation. Very important for the skeletal system. Calcium supplementation may increase the risk of prostate cancer.
and magnesium	750–1,000 mg daily.	
Curcumin	600 mg 3 times daily.	Reduces inflammation and aids in healing.
Desiccated liver	As directed on label.	Aids in building healthy blood cells.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience Labs)	As directed on label.	Increases tissue oxygenation.
Essential fatty acids (flaxseed oil or Ultimate Oil from Nature's Secret)	As directed on label.	Promotes cellular and cardiovascular health; improves stamina and speeds recovery.
Free form amino acid	As directed on label, on an empty stomach.	To help repair and strengthen connective tissue, reduce body fat, and increase energy.
Grape seed extract	As directed on label.	A powerful anti-inflammatory.
L-leucine plus L-isoleucine and L-valine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Branched-chain amino acids that promote the healing of bones, skin, and muscle tissue. (See AMINO ACIDS in Part One.)
Manganese	15 mg daily.	Strengthens wounded ligaments and/or tendons.
Multivitamin and mineral complex	As directed on label.	To promote good health, nutritional balance, and tissue repair.
Neonatal Multi-Gland from Biotics Research	As directed on label.	To stimulate healing of connective tissue.
Potassium	99 mg daily.	Vital for tissue repair.
S-Adenosyl-methionine (SAME) (SAME Rx-Mood from Nature's Plus)	400 mg 2 times daily.	Deficiency results in the inability to maintain cartilage properly. Aids in reducing pain and inflammation. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Silica	500 mg daily.	Supplies silicon, needed for connective tissue repair and calcium absorption.
Vitamin A plus carotenoid complex with beta-carotene	10,000 IU daily. As directed on label.	Enhances immunity and aids in protein utilization. Powerful antioxidants that boost the immune system.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid)	100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 500 mg daily.	All the B vitamins are important during stressful situations. Use a high-potency formula.  The most important antistress vitamin.
Vitamin C with	5,000–20,000 mg daily, in divided doses.	An antioxidant required for tissue growth and repair.

bioflavonoids	(See ASCORBIC ACID FLUSH in Part Three.)	Calcium ascorbate is the best source of vitamin C to use for these injuries.
Vitamin E	200 IU daily.	A free radical scavenger. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Important in tissue repair. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Boswellia, an Ayurvedic herb, is good for reducing inflammation. Choose a product standardized to contain 150 milligrams of boswellic acids per dose. Boswellia cream can be good for relieving pain as well. Boswellin Cream from Nature's Herbs is a good product.

Fenugreek and flaxseed powder can be combined with slippery elm bark to make a poultice for swelling. (See USING A POULTICE in Part Three.)

Feverfew and ginger are good for pain and soreness.

*Caution:* Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

Ginger is also a powerful antioxidant that has anti-inflammatory effects.

Green tea and nettle leaf have anti-inflammatory properties.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

Goldenseal poultices are good for reducing inflammation.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Horse chestnut extract gel, applied topically to the injured area, can reduce swelling and inflammation.

Mustard poultices are good for swelling and can relax tense muscles.

After the initial treatment of applying ice to the injury, combine turmeric and a little hot water to make a paste. Apply this mixture to the injured area with a gauze dressing. This treatment helps to reduce swelling. It is also good for bruising.

## Sports Nutrition for the Serious Bodybuilder

Nutrition and dietary supplements have become a focus of serious attention from athletes of all types, especially bodybuilders. Many of them have found that the combination of proper diet, appropriate supplements, and a good comprehensive workout plan work together to help them achieve their personal goals. There are three basic approaches to the use of supplements to build muscle: providing the body with protein that it can use to make the muscle; promoting the body's production of androgenic hormones such as testosterone so that it is inclined to build itself up in response to exercise; and providing nutrients that increase endurance, so that more—and more strenuous—exercise is possible.

*Note:* This regimen is an advanced supplementation program intended for the serious bodybuilder who has some knowledge of sports nutrition, not for the person who has just begun to exercise or tone his or her muscles.

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Beta-hydroxy-beta-methylbutyrate (HMB)	As directed on label. Take sublingually, as directed on label.	Potent cortisol inhibitor. Cortisol is an anti-anabolic agent released as a result of strenuous physical exertion. <i>Caution:</i> Do not use if you are suffering from joint problems.
Calcium D-gluconate	200–400 mg. daily.	Blocks conversion of testosterone to estrogen.
Calcium pyruvate	2,000–6,000 mg daily, with meals.	Enhances endurance by as much as 20 to 50 percent. Increases metabolism, resulting in fat loss of up to 48 percent. Increases protein uptake.
Chrysin	500–2,000 mg daily, with meals.	Prevents excess testosterone precursors from being converted to estrogen in the body. This increases lean muscle mass development.
Colostrum	2,000–3,000 mg daily.	Helps stimulate growth, regeneration, and repair of muscle, skin, bone, and cartilage. Stimulates body to catabolize adipose (fat) tissue rather than lean muscle tissue.
Conjugated linoleic acid (CLA)	750–1,500 mg daily, with meals.	Decreases body fat, improves muscle tone, and increases lean muscle mass gain and exercise tolerance.
Creatine	Loading phase: 30 g daily. Maintenance: 5 g daily.	Use micronized effervescent or micronized creatine monohydrate form. These are more easily digested than ordinary creatine. Avoid products from Asia due to quality issues.

Cross-flow microfiltered whey protein isolates (IsoPure from Nature's Best or Pro Complex from Optimum Nutrition)	1 g for every 2.2 lbs of body weight.	To promote protein synthesis. Provides glycomacropeptides, low molecular weight oligopeptides, and branched-chain amino acids.
D-ribose	2,200 mg daily. Can be taken with creatine to boost its effectiveness.	Increases effectiveness of creatine monohydrate. A precursor to ATP (the cellular energy source). Complements creatine monohydrate in its ability to generate lean muscle mass, endurance, and muscular energy.
GH Stak from Muscle-Link	As directed on label.	Increases lean muscle mass, reduces adipose (fat tissue), supports cardiac output, increases libido, increases energy. Improves blood lipid levels, slows down overall body deterioration associated with aging. Use effervescent or sublingual forms only.
Glucosamine sulfate	1,500–4,000 mg daily.	To improve joint integrity, function, and range of motion.
Human growth hormone (HGH) (Humagro or Testatropinol from Advanced Sports Nutrition)	As directed on label.	Homeopathic growth hormone 4c impacts testosterone, growth hormone, adrenaline, adrenocorticotrophic hormone, luteinizing hormone, FSH, and TSH.
Methylsulfonylmethane (MSM)	1,000–4,000 mg daily.	To improve tissue integrity in the joints.
Ornithine alpha-ketoglutarate (OKG)	1,300–2,600 mg daily, before exercise or at bedtime.	Helps prevent muscle tissue breakdown. Aids in muscle growth and stimulates growth hormone release.
7 Keto-DHEA	50–150 mg daily.	The best form of DHEA—it is not converted into estrogens in the body. Slows overall body deterioration. Enhances fat loss and lean muscle mass development.
Sodium phosphate and potassium bicarbonate	As directed on label.	Delay onset of muscular fatigue by buffering lactic acid, improving muscular power and endurance.

### HERBS

*Tribulus terrestris* (an herb whose common name is puncture vine) increases production of luteinizing hormone and testosterone in men, thereby increasing strength and lean muscle mass.

Yohimbe is a central nervous system stimulant that increases testosterone levels. It is used to increase strength and lean muscle mass, as well as to enhance libido.

*Caution:* Yohimbe should not be used by women who are pregnant or nursing. Do not use yohimbe if you have high blood pressure, heart disease, stomach ulcers, depression, or other psychiatric conditions. There have been cases of people dying from taking too much yohimbe.

## RECOMMENDATIONS

For bruises, muscle strain, and other workout-related injuries, use homeopathic *Arnica montana*.

## CONSIDERATIONS

Research performed at the University of Toronto in Canada demonstrated that by mixing a specified amount of water with a creatine monohydrate mixture containing creatine

and carbohydrates, you can vastly increase the speed at which the creatine and carbohydrates enter the bloodstream, thus enhancing your training. This is known as the osmotic acceleration principle. The following schedule applies:

Body Weight	Creatine mix	Water
0–170 lbs	9 g creatine 65 g carbohydrate	10 oz, followed by 10 oz 10 minutes later.
170–220 lbs	10 g creatine 75 g carbohydrate	20 oz, followed by 10 oz 10 minutes later.
220–300 lbs	12 g creatine 85 g carbohydrate	20 oz, followed by 12 oz 10 minutes later.

Cell-Tech from MuscleTech is a premade creatine product that can be used for this purpose.

## Recommendations

Immediately after the injury, raise the affected area—above heart level if possible—and apply ice for no longer than twenty minutes. *Do not* use heat immediately following an injury. On the first day, apply ice for twenty minutes and then remove ice for twenty minutes. Continue this throughout the day. On day two, apply ice intermittently every four hours. Then, after the inflammation has subsided, apply heat for twenty-minute periods two or three times a day. If possible, use a splint or sling to immobilize and protect the injured area.

If there is significant swelling, call your physician right away or go to a hospital emergency room to have the injury evaluated. Especially with injuries to the wrists and ankles, it is wise to have X-rays taken to make sure no bones have been broken.

Consume plenty of juices made from fresh raw vegetables, including beets, garlic, and radishes. Raw vegetables are high in valuable vitamins and enzymes.

Use homeopathic remedies to ease the discomfort. Homeopathic remedies used to treat symptoms of sprains, strains, and other types of injuries include *Aconitum napel-lus*, *Arnica montana*, *Hypericum*, *Rhus toxicodendron*, *Ruta graveolens*, and *Symphytum officinalis*.

To prevent sprains and strains, do stretching exercises both before and after exercise and other physical activity.

## Considerations

Minor sprains can usually be treated at home. However, anytime an injury becomes painful and swollen, you should see a medical professional—especially if you hear a

popping sound and find that you cannot use the injured joint normally.

Aromatherapy can be helpful. Cold compresses made with essential oils of camphor, chamomile, eucalyptus, lavender, and/or rosemary are good. Add 10 drops or so of essential oil to 1 quart of cool water and use the mixture to make the compresses.

Clay poultices can be used to treat sprains and fractures. (See USING A POULTICE in Part Three.)

The risk of injury to the muscles and joints is higher in contact sports than in other types of activity.

See Sports Nutrition for the Serious Bodybuilder, the preceding table.

See BRUISING and FRACTURE, both in Part Two.

See also PAIN CONTROL in Part Three.

## STRESS

The term “stress” refers to any reaction to a physical, mental, social, or emotional stimulus that requires a response or alteration to the way we perform, think, or feel. Change is stressful—whether the change is good or bad. Worry produces stress. Indeed, stress is an unavoidable part of life. It can result from many things, both physical and psychological. Pressures and deadlines at work, problems with loved ones, the need to pay the bills, and getting ready for the holidays are obvious sources of stress for many people. Less obvious sources include everyday encounters with crowds, noise, traffic, pain, extremes of temperature, and even welcome events such as starting a new job or the birth or adoption of a child. Overwork, lack of sleep, and physical illness put stress on the body. Excessive alcohol con-

sumption and smoking are usually increased as a reaction to stress and yet create more stress for the body. Some people create their own stress; whether there is anything objectively wrong in their lives or not, they find things to worry about. For such people, stress becomes almost an addiction.

Some people handle stress well, and it has little impact on their emotional or physical health. Others are very negatively influenced by it. Stress can cause fatigue, chronic headaches, irritability, changes in appetite, memory loss, low self-esteem, withdrawal, teeth grinding, cold hands, high blood pressure, shallow breathing, nervous twitches, lowered sexual drive, insomnia or other changes in sleep patterns, and/or gastrointestinal disorders. Stress creates an excellent breeding ground for illness. Researchers estimate that stress contributes to many major illnesses, including cardiovascular disease, cancer, endocrine and metabolic disease, skin disorders, and infectious ailments of all kinds. Many psychiatrists believe that the majority of back problems—one of the most common adult ailments in the United States—are related to stress. Stress is also a common precursor of psychological difficulties such as anxiety and depression.

Stress is often viewed as a psychological problem, but it has very real physical effects. The body responds to stress with a series of physiological changes that include increased secretion of adrenaline, elevation of blood pressure, acceleration of the heartbeat, and greater tension in the muscles. Digestion slows or stops, fats and sugars are released from stores in the body, cholesterol levels rise, and the composition of the blood changes slightly, making it more prone to clotting. This in turn increases the risk of stroke or heart attack.

Almost all body functions and organs react to stress. The pituitary gland increases its production of adrenocorticotropic hormone (ACTH), which in turn stimulates the release of the hormones cortisone and cortisol. These have the effect of inhibiting the functioning of disease-fighting white blood cells and suppressing the immune response. This complex of physical changes is called the “fight or flight” response and is apparently designed to prepare one to face an immediate danger. Today, most of our stresses are not the result of physical threats, but the body still responds as if they were.

The increased production of adrenal hormones is responsible for most of the symptoms associated with stress. It is also the reason that stress can lead to nutritional deficiencies. Increased adrenaline production causes the body to step up its metabolism of proteins, fats, and carbohydrates to quickly produce energy for the body to use. This response causes the body to excrete amino acids, potassium, and phosphorus; to deplete magnesium stored in muscle tissue; and to store less calcium. Stress also triggers the release of cortisol, an adrenal hormone that regulates carbohydrate metabolism and blood pressure. It also ages brain cells and builds fat around the body’s midsection. Further, stress increases the level of an immune system

protein called interleukin-6 (IL-6), which has direct effects on most of the cells in the body and is associated with many disorders, including diabetes, arthritis, cancer, osteoporosis, Alzheimer’s disease, periodontal disease, and cardiovascular disease. IL-6 has also been linked to frailty and functional decline in older adults. IL-6 has been shown to be affected by several controllable factors. For example, being obese compared to lean causes a greater release of IL-6 after meals. In addition, high-glycemic-load carbohydrates like potatoes evoke a greater release of IL-6 than high-fiber foods like bran. In one study, both waist circumference and cortisol release were associated with high IL-6 levels. Achieving a normal body weight and eating a low-glycemic-load diet, rich in fruits, vegetables, and whole grains, can reduce the release of IL-6 and the risk of developing the diseases associated with it.

As a result of a complex of physical reactions, the body does not absorb nutrients well when it is under stress. The result is that, especially with prolonged or recurrent stress, the body becomes at once deficient in many nutrients and unable to replace them adequately. Many of the disorders that arise from stress are the result of nutritional deficiencies, especially deficiencies of the B-complex vitamins, which are very important for proper functioning of the nervous system, and of certain electrolytes, which are depleted by the body’s stress response. Stress also promotes the formation of free radicals that can become oxidized and damage body tissues, especially cell membranes.

Anxiety, panic attacks, obsessive-compulsive disorder, post-traumatic stress disorder (PTSD), dissociative disorders, and phobic disorders are among the more serious emotional manifestations of stress. They are often a result of an event that the individual was unable to deal with at the time. Post-traumatic stress disorder in particular seems to be becoming increasingly common in our stress-filled world. The key sign of PTSD involves mentally reliving past traumatic events in a manner and to an extent that this interferes with normal life. (*See Is It Stress or Is It PTSD?* on page 739.)

Many people attribute their stress-related symptoms to “nerves,” and in fact stress usually does affect the parts of the body that are related to the nervous system first, especially through the digestive organs. Symptoms of stress-related digestive disorders may be a flare-up of an ulcer or irritable bowel syndrome. If stress that produces such symptoms is not handled properly, more serious illnesses may result.

Stress can be either acute or long-term. Long-term stress is particularly dangerous. A state of continual stress eventually wears out the body. Because of its effect on the immune response, stress increases susceptibility to illness and slows healing.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
ACES + Zn from Carlson Labs	2 capsules daily.	Contains beta-carotene, selenium, and vitamins C and E, which work together as antioxidants to disarm damaging free radicals caused by stress.
Gamma-amino-butyric acid (GABA)	750 mg twice daily. Take with 50 mg inositol and 500 mg niacinamide to enhance effectiveness.	Acts as a tranquilizer and is important for proper brain function. (See AMINO ACIDS in Part One.)
Glutathione	As directed on label.	An antioxidant that protects the cells against damage.
Inositol	250 mg twice daily.	A nutrient related to the B-vitamins. It can help with panic attacks, obsessive-compulsive disorder, and depression.
Nicotinamide adenine dinucleotide (NADH)	10 mg daily first thing in the morning.	Important in the creation and transfer of chemical energy, especially during breathing.
S-Adenosyl-methionine (SAME)	As directed on label.	Can ease depression. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Taurine (Taurine Plus from American Biologics)	As directed on label.	Essential amino acid for brain and heart protection. Use a sublingual form.
Trimethylglycine (TMG)	As directed on label.	Reduces homocysteine levels in the blood and acts like SAME to ease depression.
Vitamin B complex injections plus extra vitamin B <sub>6</sub> (pyridoxine) injections and vitamin B <sub>12</sub> injections and/or vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid)	1 cc weekly or as prescribed by physician. ½ cc weekly or as prescribed by physician. 1 cc weekly or as prescribed by physician. 100 mg of each major B vitamin daily (amounts of individual vitamins in a complex will vary). 500 mg daily.	All B vitamins are necessary for health and proper functioning of the nervous system. Intramuscular injections (under a doctor's supervision) give fast results. Take oral supplements either in addition to injections or alone, if injections are unavailable. Use a sublingual form.  An antistress vitamin needed by the thymus gland.
Vitamin C with bioflavonoids	3,000–10,000 mg daily.	Essential to adrenal gland function. Stress depletes the gland hormones, the antistress hormones.
<b>Very Important</b>		
Anti-Stress Enzymes from Biotec Foods	As directed on label.	Enzymes that remove toxic wastes and restore balance and equilibrium to the system.
Calcium and magnesium	2,000 mg daily. 1,000 mg daily.	Lost when stress is present. Use calcium chelate form. Deficiency is common in highly stressed individuals, and can result in anxiety, fear, and even hallucinations.

Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label. As directed on label.	Both of these coenzymes work to increase energy and protect the heart and immune system.
L-tyrosine	500 mg twice daily, during the day and at bedtime. Take with water or juice on an empty stomach. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Helps to reduce stress on the body. An effective and safe sleeping aid. Also good for depression. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug.
Melatonin	Start with 1.5 mg daily, taken 2 hours or less before bedtime. If this is not effective, gradually increase the dosage until an effective level is reached (up to 5 mg at night).	A natural hormone that promotes sound sleep; helpful if stress leads to occasional sleeplessness.
<b>Helpful</b>		
Fiber (oat bran or psyllium husks)	As directed on label. Take separately from other supplements and medications.	For bowel cleansing and improved bowel function. Stress often causes diarrhea and/or constipation.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply protein, which is used rapidly by the body at stressful times. Use a formula containing both essential and nonessential amino acids.
Lecithin granules or capsules	1 tsp 3 times daily, with meals. 2,400 mg 3 times daily, with meals.	For cellular protection and brain function.
L-lysine	As directed on label. Take with 50 mg vitamin C and 1 15-mg zinc gluconate lozenge.	For cold sores, often an early indicator of stress. Reduces stress so it is better handled. <i>Caution:</i> Do not take for longer than six months at a time.
Maitake extract or reishi extract or shiitake extract	As directed on label. As directed on label. As directed on label.	Adaptogens that help the body adapt to stress and normalize body functions.
Multivitamin and mineral complex with natural beta-carotene and potassium and selenium	As directed on label. 25,000 IU daily. 99 mg daily. 200 mcg daily.	Especially necessary during stress. An important antioxidant. To replace potassium lost due to excretion during stress. A potent antioxidant that decreases anxiety attacks.
Raw adrenal glandular and raw thymus glandular	As directed on label. As directed on label.	To stimulate the adrenal and thymus glands, important in the body's stress reaction.
Vitamin E	200 IU daily. Take with meals.	Needed for immune function. A powerful antioxidant. Use d-alpha-tocopherol form.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Needed for immune function and to protect the cells from free radical damage. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Is It Stress or Is It PTSD?

Post-traumatic stress disorder, or PTSD, is a serious illness that needs professional intervention and treatment. To help decide whether you (or a loved one) might have this disorder, the following five questions are important:

1. Have you ever experienced or witnessed a life-threatening event that caused you to feel intense fear, helplessness, or horror?
  - Repeated distressing memories or dreams.
  - Flashbacks or a sense of reliving the event.
  - Intense physical and/or emotional distress when exposed to things that remind you of the event.
2. Do you reexperience this event in at least one of the following ways?
  - Repeated distressing memories or dreams.
  - Flashbacks or a sense of reliving the event.
  - Intense physical and/or emotional distress when exposed to things that remind you of the event.
3. Do you avoid reminders of the event and feel numb, compared with the way you felt before, in three or more of the following ways?
  - Avoiding thoughts, feelings, or conversation concerning it.
  - Avoiding activities, places, and people who remind you of it.
  - Being unable to remember important parts of it.
4. Are you troubled by two or more of the following?
  - Problems sleeping.
  - Irritability or outbursts of anger.
  - Problems with concentration.
  - Feeling “on guard” all the time.
  - Exaggerated startle response (jumpiness).
5. Do your symptoms interfere with your daily life?
  - Losing interest in significant activities in your life.
  - Feeling detached from other people.
  - Feeling that your range of emotions is restricted.
  - Feeling as if you have no future, and that you cannot expect to have a career, long life, successful marriage, or achieve other important goals.

### Herbs

- Ashwagandha is an Ayurvedic herb that acts as a sedative and nerve tonic.
- Bilberry prevents destruction, mutation, and premature death of cells throughout the body.
- Ginkgo biloba aids in proper brain function and good circulation.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

- Milk thistle cleanses and protects the liver, and has antioxidant properties.
- Many plants produce their own antioxidants, which they use as protection against environmental stresses. Specific herbs tend to protect specific parts of the body. However, because of their strong antioxidant properties, most have important influences on other parts of the body as well. For a robust antistress tonic, mix ½ teaspoon of any three of the herbs listed below and steep in 2 cups of almost-boiling distilled water, or use alcohol-free extracts mixed in water.
- Catnip is an effective antistress herb that also causes drowsiness.
- Chamomile is a gentle relaxant. It is a good nerve tonic, soothing to the digestive tract, and a pleasant sleep aid.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Dong quai, rehmannia, and schizandra support the kidneys, adrenal glands, and central nervous system. These organs are among the most susceptible to the effects of stress.
- Holy basil (*Ocimum sanctum*), an Indian herb known locally as *tulsi*, is related to but not the same as culinary basil. It appears to lower stress and cortisol levels. A Thai derivative is known as bai kaprow.
- Hops helps to ease nervousness, restlessness, and stress. It also decreases the desire for alcohol.
- For some people, kava kava may relax the mind as well as the entire body.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

- Essential oil of mandarin, used in conjunction with bergamot oil in an aromatherapy lamp, is a proven stress reducer. Mix 5 drops of mandarin oil with 3 drops of bergamot oil.
- Passionflower is calming and is a potent addition to any antistress formula.
- Polygala root and sour jujube seed are powerful Chinese herbs known to soothe and calm the spirit.
- For some individuals, St. John’s wort is good for depression and nerve pain.

*Caution:* St. John’s wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal

symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Siberian ginseng helps the body cope with stress.

*Caution:* Do not use Siberian ginseng if you have hypoglycemia, high blood pressure, or a heart disorder.

Skullcap is good for nervous disorders. It also relieves headaches and aids sleep.

Valerian keeps the nervous system from being overwhelmed. It also is a powerful sleep aid when taken at bedtime and helps to ease stress-related headaches.

Wild oat is said to restore balance to the nervous system.

## Recommendations

Eat a diet composed of 50 to 75 percent raw foods. Fresh fruits and vegetables not only supply valuable vitamins and minerals, but are rich in compounds called flavonoids, many of which scavenge and neutralize dangerous free radicals.

Avoid processed foods and all foods that create stress on the system, such as artificial sweeteners, carbonated soft drinks, chocolate, eggs, fried foods, junk foods, pork, red meat, sugar, white flour products, foods containing preservatives or heavy spices, and chips and similar snack foods.

Eliminate dairy products from your diet for three weeks. Then reintroduce them slowly—and watch for returning symptoms of your “nervous” condition. During this time, make a point to get adequate calcium, magnesium, and vitamin D from other foods or supplements, as they are found primarily in dairy products.

Limit your intake of caffeine. Caffeine contributes to nervousness and can disrupt sleep patterns.

Avoid alcohol, tobacco, and mood-altering drugs. While these substances may offer temporary relief from stress, they do nothing to really address the problem, and they are harmful to your health. The stress will still be there the next day.

Follow a monthly fasting program. (See FASTING in Part Three.)

Get regular exercise. Physical activity can clear your mind and keep stress under control. Some people like to run or walk by themselves, while others prefer team sports or group workouts. Any type of exercise will do the trick, as long as it is *regular*. Exercising only once a month will not do much to relieve stress.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

Learn to relax. Relaxation is often difficult for people suffering from the effects of stress, but it is necessary. A technique called *progressive relaxation* can be helpful. This involves tightening and relaxing the major muscle groups one at a time, being aware of each sensation. Start at your feet

and work up to your head. Tense the muscles for a count of ten, concentrating on the tension, then let the muscles go lax and breathe deeply, enjoying the sensation of release.

Get sufficient sleep each night. This may be difficult, because stress can keep you up at night (unless you are one of those people who welcomes sleep as an escape), but it is very important. The less sleep you get, the more stress will affect you, the more your immune system will weaken, and the greater your chance of becoming ill will be.

Try meditation. Many people find that regular meditation helps them to relax and handle stress. Meditation does not have to have spiritual or religious connotations. For example, you can meditate on a word such as “peace,” “calm,” “relax,” or “warm.” Or you may find it helpful to meditate on a pleasant person, place, or event. It is good to have a store of pleasant thoughts to draw on during stressful times. While meditation can have some short-term benefits, it is more effective when practiced on a daily basis. Try meditating twice a day for ten to twenty minutes each time.

Practice deep breathing. This can be done when facing a stressful situation—at home, at work, in your car, or elsewhere. Holding your breath is also good for relieving stress. Inhale deeply with your mouth closed, hold your breath for a few seconds (do not wait until you are uncomfortable), then exhale slowly through your mouth, with your tongue placed at the top of your teeth, next to the gum line. Do this four or five times, or until the tension passes. (See Breathing Exercises under PAIN CONTROL in Part Three.)

Monitor your internal conversations. The way we talk to ourselves has a lot to do with how we feel about ourselves and our environments. Telling yourself things like “I should be able to handle this better,” or “I shouldn’t have let that idiot cut me off in traffic,” or “I’ll never get the hang of this computer” only adds to the stressfulness of situations and does nothing to resolve them. Learn to listen for—and then make yourself stop—these futile inner conversations. Some therapists recommend shouting “Get out!” (or any other phrase you choose) immediately when any intrusive and unpleasant worries enter your thoughts.

Identify the sources of stress in your life. This can be an important first step in managing stress. Take a stress inventory periodically to help you understand what is causing your problems. You can use the following list of major stressors as a starting point:

- Death of a spouse or other close family member.
- Divorce.
- Death of a close friend.
- Financial problems.
- Legal separation from spouse.
- Job loss.
- Major injury.

- New marriage.
- Scheduled surgery.
- Change in family member's health.
- Serious trouble at work.
- Increased responsibility at work or at home.
- Sexual problems.
- Change of jobs.
- Child leaving home.
- Change in residence.
- Major change in diet.
- Vacation.
- Allergies.

Remember that this list is not exhaustive and that different people react to the same events differently. Also remember that children and young adults have different lists of stressful situations, which are just as serious for them as those above are for adults.

- Take a day off—that's what weekends are for. Take a drive, listen to music, go to the beach or lake, read—whatever you find rewarding and relaxing. Try to keep your thoughts in the present during this time so that you do not think about whatever it is that is causing the stress.
- Pursue a hobby. Hobbies are great for relieving stress. Take the time to do what you enjoy. Don't feel guilty about spending time doing something for yourself. Your health is worth it.
- Avoid hassles. Identify the things that are making you feel stressed out and either eliminate them from your life or prepare yourself to cope with them. If rush hour traffic causes you stress, see if you can change your work hours slightly to avoid it. If that isn't possible, join a carpool or listen to a book on tape or a favorite piece of music while driving.
- Do not repress or deny your emotions. This only compounds stress. Admit your feelings and accept them. Keeping strong feelings bottled up only causes them to resurface later as illness. Don't be afraid to cry. Learning to cry can help you to manage stress. Crying can relieve anxiety and let loose bottled-up emotions.
- Work on creating a stress-free home environment. Keep the noise level down—noise contributes to stress. Turn down the radio, stereo, and television. Throw rugs and wall hangings absorb noise and are good additions to decor. Color is another important element of your environment to consider. Certain colors are much more calming and soothing than others. (See COLOR THERAPY in Part Three.) Also, use as much natural lighting in your home as possible. Unnatural fluorescent lighting can be especially aggravating.
- Investigate aromatherapy. This is the art of using highly concentrated distilled plant essences, called essential oils, for healing purposes. Essential oils affect both the mind and

the body by means of olfactory stimulation of the brain. Essential oils that are particularly good for relieving stress include chamomile, bergamot, sandalwood, lavender, and sweet marjoram. Add 10 to 20 drops of one or more of these oils to a warm bath and relax in the tub, or simply dab a couple of drops of oil on a tissue or handkerchief and inhale the aroma periodically during the day. (See AROMATHERAPY AND ESSENTIAL OILS in Part Three.)

- Try not to take life too seriously. Learn to laugh.
- If stress-related symptoms become chronic or recurrent, consult your doctor to rule out an underlying illness.
- If you feel you simply cannot handle the stresses in your life, consider seeking outside help. It may be worth it to consult a qualified counselor or other practitioner who can help you to handle your problems and learn effective stress-reduction techniques. It is often enlightening and beneficial to talk with someone who can offer an objective response, whether a trusted friend or a professional counselor.

### Considerations

- A study done at the University of Washington Medical School rated stressful situations according to their negative effects on physical and mental health. Rated highest was the death of a spouse. Divorce is next, followed by such circumstances as getting married, personal illness, and so on. The study found that the more stressful situations a person is experiencing, the greater the chance of illness.
- Stress in young people should never be underestimated. Problems at school, changing schools, peer pressures, personal image problems, sexual identity issues, the addition of a family member, or problems with boyfriends or girlfriends all can lead to anxiety in young children and adolescents. Moreover, young people generally have fewer mechanisms or resources to cope with these situations than adults do. Often, adolescents or young children act out their feelings of stress in ways that are difficult for adults to understand.
- Evidence shows that stress can trigger reactions to allergens and make allergic symptoms more severe.
- Stress can aggravate certain skin disorders, such as psoriasis and skin cancer, by damaging immune cells in the skin. The damage is done by a chemical released when nerve cells respond to stress.
- Dr. Hans Selye, stress expert and author of *Stress Without Distress* (Signet Books, 1991) said that it is not stress that is harmful—it is *distress*. Distress occurs when unresolved emotional stress is prolonged and not dealt with in a positive way.
- A group of Dutch researchers studied a group of eighty people for a period of six months. They found that individuals with high levels of stress had fewer than half the antibodies in their systems than subjects under less stress did.
- In a study done at the University of Pennsylvania, people who considered themselves chronic worriers found

that they could reduce their anxiety levels by setting aside a specific time to worry each day. They reserved thirty minutes each day to worry and did not permit themselves to worry at other times.

☐ Stress-related digestive problems often defy conventional treatment, but there are many mind-body techniques that can help you relax and provide a safe alternative to never-ending medication. A book entitled *Character Strengths and Virtues: A Handbook and Classification* by Christopher Peterson and Martin E. P. Seligman (Oxford University Press, 2004) categorizes and analyzes twenty-four key traits associated with mental health and happiness. A rather scholarly work that is much too large to summarize here, this book is nevertheless recommended reading. The authors argue that stress reduction is key to regaining good mental health, and that one vital element of this is simple meditation or contemplation the first thing in the morning or just before bedtime, which helps relax the body and gain control over stress. Of equal importance is good nutrition.

☐ Heavy metal intoxication and food allergies can both cause symptoms that mimic those of stress. A hair analysis can reveal heavy metal poisoning. (See HAIR ANALYSIS in Part Three; see also ALLERGIES in Part Two.)

☐ The symptoms of hypoglycemia may mimic those of stress. (See HYPOGLYCEMIA in Part Two.)

☐ See also ANXIETY DISORDER and DEPRESSION in Part Two.

**STRETCH MARKS**

See under PREGNANCY-RELATED PROBLEMS.

**STROKE**

See under ARTERIOSCLEROSIS/ATHEROSCLEROSIS; and CARDIOVASCULAR DISEASE.

**STYE**

See under EYE PROBLEMS.

**SUBSTANCE ABUSE**

See ALCOHOLISM; DRUG ADDICTION (SUBSTANCE ABUSE); and SMOKING DEPENDENCY.

**SUNBURN**

Sunburn is caused by excessive exposure to the sun’s ultraviolet (UV) rays. The amount of exposure required to cause a burn depends on the individual, the geographical location, the time, and the atmospheric conditions. There are two types of ultraviolet rays, designated ultraviolet-A (UVA) and ultraviolet-B (UVB). Both are dangerous. UVB rays attack the skin’s outer layers, while UVA rays attack the underlying layers.

Most sunburns are first-degree burns that cause the skin to become red, warm, and tender to the touch. Depending on the severity of the burn and the individual’s skin type, the burn may subsequently “cool” into a suntan or thin layers of skin may peel off. A more serious sunburn can be a second-degree burn, causing extreme reddening, swelling, pain, and even blisters. This is a sign that the burn has gone deeper than just the surface layer of the skin and has caused damage and the release of fluids from cells in the lower layers of the skin. This results in eruptions and breaks in the skin where bacteria and other infectious organisms can enter. In the most severe cases, the burn may be accompanied by chills, fever, nausea, and/or delirium. Sunburn such as this is extremely painful and, for children, extremely dangerous. Dehydration often accompanies sunburn.

Fair-skinned people are more prone to sunburn than darker-skinned individuals, but no matter what your skin color, you will burn if you get enough exposure. Symptoms do not necessarily appear while you are in the sun; they may begin from one hour to twenty-four hours after sun exposure, and usually reach their peak in two to three days.

Today, the effects of sun exposure are becoming an increasing concern because of the decline in the earth’s ozone layer. The ozone layer screens out the most harmful ultraviolet rays, but it is becoming steadily thinner all over the world, and holes that fluctuate in size have developed in various places. The incidence of skin cancer is growing at an alarming rate. Having a few bad episodes of sunburn as a child makes you much more likely to develop skin cancer as an adult. (See SKIN CANCER in Part Two.)

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Cell Guard from Biotec Foods	As directed on label.	Provides high levels of antioxidants to protect and nourish the cells.
Coenzyme Q <sub>10</sub>	60 mg daily.	Free radical scavenger that also increases the supply of oxygen to the cells.
Colloidal silver	Apply topically as directed on label.	Antiseptic to prevent infection. Subdues inflammation and promotes healing.
ConcenTrace from Trace Minerals Research	As directed on label.	Nourishes the skin by providing needed trace minerals.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Increases tissue oxygenation.

Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label.	To supply protein, needed for tissue repair.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Promotes skin health, detoxifies the body, and enhances immunity.
L-cysteine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 1,500 mg vitamin C.	Promotes healing of burns.
Multivitamin and mineral complex	As directed on label.	All nutrients are necessary in balance.
Potassium	99 mg daily.	Potassium lost through sunburn must be replaced.
Pycnogenol	As directed on label.	An antioxidant that has circulatory benefits and may reduce skin damage risks.
Vitamin A with mixed carotenoids including beta-carotene plus vitamin E	25,000 IU daily for 2 weeks, then reduce to 10,000 IU daily until healed. If you are pregnant, do not exceed 10,000 IU daily.	To destroy free radicals released by sun exposure and aid in tissue repair and healing.
Vitamin C with bioflavonoids	10,000 mg and up daily, in three fairly equal doses.	Needed for tissue repair and healing. Also reduces scarring. Use calcium ascorbate form.
<b>Helpful</b>		
Calcium and magnesium	2,000 mg daily. 1,000 mg daily.	Necessary for proper pH balance and potassium utilization. Also reduce stress on tissues.
Essential fatty acids (primrose oil or Ultimate Oil from Nature's Secret)	As directed on label.	Needed for tissue healing.
Silica	As directed on label.	Supplies silicon, needed for repair of skin tissue.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine) and para-aminobenzoic acid (PABA)	100 mg of each major B vitamin daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily, with meals. 25 mg daily, with meals.	Important for tissue healing, especially for serious burns. A sublingual form is best. Needed for protein metabolism. Good for protecting the skin.
Vitamin E oil or ointment	Once the burn has cooled and healing has begun, apply topically to the affected area 3 to 4 times daily.	Promotes healing and helps prevent scarring. Purchase in oil or ointment form, or open a capsule to release the oil.
Zinc	100 mg daily for 1 month; then reduce to 50 mg daily. Do not exceed 100 mg daily from all supplements.	Boosts the immune system and aids in tissue healing. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

- Aloe vera gel is a remarkably effective treatment for any kind of burn. It is even used in the burn units of some hospitals. Aloe relieves discomfort, speeds healing, and also helps to moisturize the skin and relieve dryness. Gently apply a thin layer of aloe vera gel to the sunburned area. Reapply it every hour until the pain is gone. Pulp taken directly from inside the fresh plant is best. If you use a commercial aloe product, make sure to choose one that contains no mineral oil, paraffin waxes, alcohol, or coloring.
- Apply a salve of calendula flowers and St. John's wort to badly burned areas. These two herbs have antiseptic properties, act as painkillers for burns, and promote healing of skin wounds.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

- An herbal bath can help minimize the stinging and pain of sunburn. Add 6 cups of chamomile tea or 6 drops of chamomile oil to a lukewarm tubful of water. Soak in the bath for thirty minutes or more. Lavender oil is also good and can be used in place of chamomile oil if you wish.
- Make a large pot of strong comfrey or gotu kola tea and let it cool. Soak sterile cotton gauze in the tea to make a compress and apply it to the affected area. Leave the compress in place for up to thirty minutes.

*Caution:* Comfrey is recommended for external use only.

- A cream containing at least 5 percent tea tree oil helps to heal sunburn and other skin irritations.
- Make a wash of apple cider vinegar diluted with an equal amount of water. Wash the area with this mixture, then rub an herbal infusion of St. John's wort oil onto the affected sunburned area.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

## Recommendations

- Eat high-protein foods for tissue repair, and raw fruits and vegetables to supply needed vitamins and minerals.
- For immediate relief of sunburn pain, use cool-water compresses or cold clay poultices. (See USING A POULTICE in Part Three.) Or dissolve 1 pound of baking soda in a tubful of cool water, and soak in the bath for about thirty minutes. The herbal treatments described above are also excellent for relieving pain and stinging.
- Strictly avoid any further sun exposure until the burn is completely healed.

When it comes to sunburn, prevention is better than cure. While most sunburns are minor burns that heal on their own, a history of sunburn is strongly linked to the development of skin cancer. Take precautions to prevent yourself from getting sunburned:

- Avoid spending time outdoors between the hours of 10:00 A.M. and 3:00 P.M.
  - When you do spend time outdoors, wear a sun hat, protective clothing, and sunglasses that specify UV protection. The best type of clothing is made of light-colored, lightweight, tightly woven material.
  - Always use a sunscreen with a sun protection factor (SPF) of 15 or higher. Apply the sunscreen to all exposed areas of skin. Reapply it frequently, at least every three to four hours, more often if you are swimming or perspiring. Make sure the sunscreen protects against both UVA and UVB rays. Keep in mind that the SPF number refers only to the level of protection against UVB rays. Avobenzene appears to provide the best protection against UVA damage.
  - Add to your sunscreen the contents of 1 capsule each of vitamin A, vitamin C, vitamin E, and selenium to help prevent free radical damage to the skin. After sunning, add these antioxidants to whatever skin cream you use for added protection and to aid in preventing wrinkles.
  - Don't neglect your lips. The lips also are susceptible to sunburn. Use a sun protection product designed for the lips as well as a sunscreen for your face and body. Choose a formula containing natural ingredients such as aloe vera and vitamin E. Your health food store should carry such products in handy stick form.
  - Do not rely on the weather to judge how strong the sun is. Cloudy or hazy days do not afford protection against sunburn; approximately 80 percent of the sun's ultraviolet rays pass through clouds. Reflections from water, metal, sand, or snow may increase—even double—the amount of ultraviolet rays you absorb. Take the same precautions on cloudy or hazy days that you do on bright, sunny days. Almost 90 percent of sunburn is caused by incidental sun exposure, not sunbathing. If you work outdoors, always wear sunscreen and protect yourself by wearing a hat.
- To prevent dehydration, drink plenty of water while spending time in the sun.
- If you desire a tan, start with only fifteen-minute periods of sun exposure, and increase your exposure slowly, adding no more than fifteen more minutes every few days. This helps to prevent burning and results in a longer-lasting tan. Self-tanning lotions may be the safest way to get a tan.
- Always wear sunglasses to protect your eyes. Make sure your glasses protect your eyes from both UVA and UVB rays.
- For ordinary sunburn apply cool—not cold—compresses to the affected area(s) as often as needed. If the burn is se-

vere, see a physician. If a child is sunburned, take special care. Do not apply any creams or anything to the burned area other than cool water or, *sparingly*, a bit of aloe vera gel twice a day. The burn will heal more readily if left exposed to the air.

If you take any medications, ask your physician or pharmacist if they may increase your sensitivity to the sun.

### Considerations

Tretinoin (vitamin A acid), the active ingredient in the prescription medication Retin-A, is sometimes prescribed to help repair skin that has been damaged by sun exposure. However, the use of tretinoin renders the skin significantly more vulnerable to additional sun damage. If you use this medication, you should *always* use a high-SPF sunblock and avoid sun exposure as much as possible. This product should not be used during pregnancy, as it may cause birth defects.

For a severe burn, a physician may prescribe silver sulfadiazine (Silvadene) cream and/or antibiotics to prevent infection, debridement to remove dead tissue, and/or hydrotherapy to loosen dead skin. Depending on the location and extent of the burn, physical therapy may be prescribed to keep muscles flexible. Muscle contractures can result from overlying skin damage and contraction.

Your doctor may recommend taking an anti-inflammatory agent such as acetaminophen (Tylenol, Datril, and others) or ibuprofen (Advil, Nuprin, and others) to help relieve pain and inflammation. You should not give an aspirin-based product to a child with a sunburn.

Berlock dermatitis is a heightened reaction to the sun caused by oil of bergamot, a common ingredient in perfumes, pomades, and colognes.

### SWEATING

See under PREGNANCY-RELATED PROBLEMS.

### SWIMMER'S EAR

See under EAR INFECTION.

### TEMPOROMANDIBULAR JOINT SYNDROME

See TMJ SYNDROME.

### TENDINITIS

See under BURSTITIS.

### THROMBOPHLEBITIS

*Phlebitis* means inflammation of a vein. This problem usually occurs in the extremities, particularly the legs. If the

inflammation is associated with the formation of a thrombus (a blood clot) in the vein, the condition is called *thrombophlebitis*.

Thrombophlebitis can be either superficial or deep. It is considered superficial if it affects a subcutaneous vein, one of the veins near the skin's surface. In superficial thrombophlebitis, the affected vein can be felt (it feels harder than normal), and may be seen as a reddish line under the skin, with localized swelling, pain, and tenderness to the touch. If there is widespread vein involvement, the lymphatic vessels (thin-walled vessels carrying fluid from the tissues to the bloodstream) may become inflamed. Superficial thrombophlebitis is a relatively common disorder. A superficial clot may be brought about by trauma, infection, standing for long periods of time, lack of exercise, and intravenous drug use. Pregnancy, varicose veins, obesity, and smoking increase the risk of superficial thrombophlebitis. Thrombophlebitis may also be associated with environmental sensitivities or allergies. Diagnosis of the condition is usually based on physical findings and/or a medical history indicating an increased risk.

Deep thrombophlebitis (known also as deep venous thrombosis, or DVT) affects the intermuscular or intramuscular veins farther below the skin's surface. DVT is a much more serious condition than superficial thrombophlebitis because the veins affected are larger and located deep within the musculature of the leg. These are the veins responsible for the transport of 90 percent of the blood that flows back to the heart from the legs. Symptoms of DVT may include pain, warmth, swelling, and/or bluish discoloration of the skin of the affected limb. These symptoms are sometimes, but not often, accompanied by fever and chills. The pain is typically felt as a deep soreness that is worse when standing or walking and that gets better with rest, especially with the leg elevated. The veins directly under the skin may become dilated and more visible. Inflammation situated in a vein in the pelvis is called pelvic vein thrombophlebitis.

Any long period of immobility—whether from being bedridden or sitting during extended periods of travel—is a risk factor for DVT. DVT has been dubbed the “economy class syndrome” due to its association with long-distance air travel, but it can just as often affect people who frequently take trips on buses or trains or in cars. Unusual and tragic cases, such as the death of thirty-nine-year-old NBC reporter David Bloom, caused by his riding for days in a cramped military vehicle while covering the Iraq war, occasionally bring DVT to the attention of the public. In fact, any situation that creates restricted blood flow—certain types of cancer, obesity, inherited clotting disorders, pregnancy, damage to the veins due to injury or orthopedic surgery, or anything else—can lead to DVT.

The primary risk associated with DVT is a sharp restriction in blood flow through the veins that can result in chronic venous insufficiency, a condition characterized by swelling, increased pigmentation, dermatitis, and ulcer-

ation of the affected leg. DVT can become life-threatening if a blood clot breaks off from the venous lining and travels through the bloodstream to the heart, lungs, or brain, where it may lodge in a blood vessel and cut off circulation to those vital organs. If the clot blocks blood flow to the heart, the result is a heart attack; if it blocks the supply of blood to the brain, a stroke may occur. If blood flow to a lung is blocked, the result is a pulmonary embolism, a less well known but equally serious scenario. Chest pain can be a symptom of both heart attack and pulmonary embolism. Other common symptoms of pulmonary embolism are unexplained shortness of breath and the coughing up of blood. If you have any symptoms of pulmonary embolism, you need emergency medical help at once. However, despite its potential seriousness, DVT can be completely without symptoms. Indeed, nearly half of all people who have it have no symptoms at all. Nine out of ten cases of pulmonary embolism are caused by blood clots that form in the legs and travel to the lungs. More than 300,000 people in the United States have a pulmonary embolism each year; 2 percent die within the first day and 10 percent have recurrent pulmonary embolism, of which 45 percent die. Pulmonary embolism occurs equally in men and women, but the risk of having pulmonary embolism increases after age sixty.

The reason or reasons for the formation of clots in the veins are often unknown. In most cases, clots are probably the result of a minor injury to the inside lining of a blood vessel. If the vessel lining receives a microscopic tear, for instance, this initiates clotting—a normal part of the body's repair processes. Platelets clump together to protect the injured area, and a series of biochemical events is initiated that results in the transformation of fibrinogen, a circulating blood protein, into strands of insoluble fibrin, which are deposited to form a net that traps blood cells, plasma, and yet more platelets. The result is a blood clot. Other possible causes of deep thrombus formation include abnormal clotting tendencies; poor circulation; certain types of cancer; and Behçet's syndrome, a condition affecting the small blood vessels that predisposes an individual to the formation of clots. Factors that increase the risk of DVT include recent childbirth, surgery, trauma, the use of birth control pills, and prolonged bed rest. For some patients, a hospital stay with a decrease in activity level also can increase their DVT risk.

A potential complication of DVT is postphlebotic syndrome, a permanent condition caused by valves in the leg veins that no longer work properly. For people with this syndrome, clotting takes a long time to clear up, and the result is sometimes an inflammatory reaction that can scar the veins, particularly the valves. These valves act as check valves, allowing the blood to flow only one way (back to the heart). If the valves are defective or become damaged, blood can flow backward, which allows it to pool in the legs to cause pain, swelling, and, sometimes, skin ulceration and varicose veins.

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Acetyl-L-carnitine	500 mg daily.	Protects the brain and blood vessels from fat accumulation.
Coenzyme Q <sub>10</sub>	100–200 mg daily.	Improves circulation and protects the heart.
Flaxseed oil or Ultimate Oil from Nature's Secret	2 tsp daily. As directed on label.	To supply essential fatty acids that minimize blood clot formation and keep veins and arteries soft and pliable, promoting cellular and cardiovascular health.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Improves circulation and thins the blood.
Heart Science from Source Naturals	As directed on label.	Contains powerful antioxidants and artery lining protectors.
L-cysteine and L-methionine	500 mg each daily, on an empty stomach. Take with water or juice, not milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Protects and preserves cells; and prevents accumulation of fat in the blood vessels. (See AMINO ACIDS in Part One.)
Lecithin granules or capsules	1 tbsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	Fat emulsifier; to increase circulation.
L-histidine	500 mg daily.	Important blood vessel dilator.
Magnesium and calcium	1,000 mg daily. 1,500 mg daily.	A natural blood-thinner that reduces abnormal clotting. Works with magnesium.
Methylsulfonylmethane (MSM)	As directed on label.	Relieves pain and inflammation.
Pycnogenol or grape seed extract	50 mg 3 times daily. As directed on label.	Antioxidants that restore flexibility to arterial walls and reduce the risk of blood vessel disease and thrombophlebitis.
Vitamin C with bioflavonoids	4,000–8,000 mg daily.	Aids circulation and reduces clotting tendencies. Prevent bruising and promote healing.
Vitamin E	200 IU daily.	Thins the blood and reduces platelet "stickiness." Use d-alpha-tocopherol form. Emulsion form is recommended for easier assimilation and greater safety at high doses.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Aids in healing of ulcers and boosts immune function. Needed to maintain proper concentration of vitamin E in the body. Use zinc gluconate lozenges or OptiZinc for best absorption.

*Helpful*

Advanced Carotenoid Complex from Solgar	As directed on label.	Contains antioxidants, immune system enhancers, free radical scavengers, potential cancer fighters, and heart disease protectors.
Body Essential Silica Gel from Natureworks	As directed on label.	Good for healing of veins and skin tissues.
Vitamin B complex	As directed on label.	Speeds healing time and aids all bodily functions.

**Herbs**

- Alfalfa, pau d'arco, red raspberry, rosemary, and yarrow are antioxidant herbs that improve blood oxygenation.
  - Butcher's broom improves circulation.
  - Cayenne (capsicum) thins the blood, eases blood pressure, and improves circulation. It can also be combined with ginger, plantain, and witch hazel in a poultice and applied directly on the affected area.
  - Ginger, skullcap, and valerian root dilate the blood vessels and aid circulation.
  - Ginkgo biloba improves circulation and brain function, and is a powerful antioxidant.
- Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.
- Leg ulcers can be treated with alcohol-free goldenseal extract. Moisten a sterile piece of gauze with a dropperful of extract and place it over the affected area.
- Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.
- Hawthorn dilates the blood vessels, lowers cholesterol levels, and protects the heart.
  - Olive leaf extract aids in preventing infection.

**Recommendations**

- Eat plenty of fresh fruits and vegetables; raw nuts and seeds; soybean products; and whole grains.
- Reduce your consumption of red meat. Better yet, eliminate it from your diet.
- Do not consume any dairy products, fried or salty foods, or processed or partially hydrogenated vegetable oils.
- Get regular moderate exercise. Walking, swimming, and other exercise improve circulation and prevent sluggishness in the veins, lessening the tendency to form clots.

*Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.

- Take alternating hot and cold sitz baths, or apply alternating hot and cold compresses using the herbs recommended above. (See SITZ BATH in Part Three.)
- Lie on a padded slant board with your feet higher than your head for fifteen minutes a day. This is particularly helpful if you stand on your feet a lot.
- Ask your pharmacist about special elastic support stockings (anti-embolism stockings) to improve circulation.
- If you smoke, *stop*. Smoking constricts the blood vessels, resulting in poor circulation and weakened blood flow. This is especially important if you are taking birth control pills. (See SMOKING DEPENDENCY in Part Two.)
- Avoid wearing tight-fitting clothing that cuts off circulation, such as girdles and knee socks with tight bands.
- If you experience a swollen, painful vein that does not get better within two weeks, talk to a health care professional.
- If symptoms of pulmonary embolism develop, sit down at once and call for emergency help (if someone is with you, have that person make the call). Getting to an emergency room quickly is your best bet.
- If you are confined to bed, move your legs as much as possible to counteract pooling of the blood in the veins.
- Clean your legs daily to remove germs that can cause infection.
- Avoid using products that can dry your skin. Contact your health care provider if you notice any redness or swelling in the legs—these may be signs of infection.
- If you develop leg ulcers, keep the ulcers clean and germ-free to prevent infection. Follow your physician's recommendations concerning proper care for your ulcers, and be forewarned that leg ulcers may take three months to a year to heal. (See LEG ULCERS in Part Two.)
- Avoid wearing socks with tight elastic at the top, which constricts the veins.
- When traveling, take the following preventive measures:
  - Do not sit inactive for an entire trip or flight. Get up, move around, stretch. Some airplanes are large enough to allow walking up one aisle and down another. Some airlines offer leaflets suggesting leg exercises that passengers can do in their seats. If you are traveling by car, stop, get out, walk around, and stretch every couple of hours.
  - Drink plenty of fluids to prevent dehydration. Dehydration causes the blood vessels to narrow and blood to thicken, increasing the risk of DVT.
  - Avoid consuming alcohol and coffee, particularly on a long trip. Both contribute to dehydration.
  - Avoid sitting with your legs crossed for long periods.

## Considerations

- To make a definitive diagnosis of DVT, a doctor must rule out a number of other disorders, including cellulitis and occlusive arterial disease. One test commonly used to diagnose DVT is duplex ultrasound. In this procedure, a handheld ultrasonic device is passed over the affected area, and a picture of the blood flow is displayed on a computer screen. A less common test is venography, in which dye is injected into a vein to make blood flow visible on an X-ray. Duplex ultrasound, chest X-ray, and other tests can be used to diagnose pulmonary embolism, as required.
- Treatment of thrombophlebitis primarily consists of using anticoagulant (blood-thinning) medications. Blood-thinners such as heparin and warfarin (Coumadin) do not dissolve clots that have already formed, but can prevent the formation of new clots. More invasive treatments, such as the use of filters that can be inserted into the veins, and the use of potent "clot buster" drugs, which can dissolve large clots quickly, are available for difficult or life-threatening situations.
- Superficial thrombophlebitis is usually treated by elevating the affected limb; applying warm moist compresses; and bed rest. A doctor may also prescribe anti-inflammatory drugs.
- DVT is a potentially serious health problem, and hospitalization may be recommended. An anticoagulant such as heparin or warfarin (Coumadin) is usually given, both intravenously and orally. Surgery may be needed to tie off the affected vein to prevent the clot from traveling to the lungs, a condition known as a pulmonary embolism. Recovery time varies, depending on the severity of the disease.
 

*Note:* Do not combine vitamin E and prescription blood-thinning drugs.
- Being overweight, having low good cholesterol (HDL), or having a diagnosis of metabolic syndrome increases your risk of a venous thrombosis by about 50 percent. If you are overweight, lose weight; if your blood cholesterol and other tests are abnormal, seek medical advice on how to correct them.
- In one study, gamma tocopherol (the major form of vitamin E in the American diet) was shown to decrease the risk of thrombotic events by reducing platelet activity.
- Behçet's syndrome is a chronic multisystem disease distinguished by thrombophlebitis, plus arthritis, iritis, uveitis, and ulceration of the mouth and genitalia. This disease is found worldwide, but is most common in young men of eastern Mediterranean and eastern Asian descent.
- Persons with Behçet's syndrome should avoid needle punctures because these can induce inflammatory skin lesions.
- See also CIRCULATORY PROBLEMS and LEG ULCERS, both in Part Two.

## THRUSH

See under HEADACHE.

## TINNITUS

See under HEARING LOSS.

## TMJ SYNDROME

About 75 percent of Americans will at some time suffer from symptoms associated with temporomandibular joint (TMJ) syndrome, a condition in which the temporomandibular joint does not function properly. Of this group, 5 to 10 percent actually meet the medical criteria for the condition. Women outnumber men 4 to 1, and Caucasians are more likely to develop it than African Americans. The temporomandibular joint is the joint that connects the temporal bone (the bone that forms the sides of the skull) with the mandible (the jawbone). This painful affliction produces pain in the muscles and joints of the jaw that sometimes radiates to the face, neck, and shoulder. There may also be difficulty opening the mouth all the way, and clicking, grinding, and popping noises may occur during chewing and movement of the joint. Headaches, muscle spasms, toothaches, dizziness, feelings of pain and pressure behind the eyes, pain and ringing in the ears, and difficulty opening and closing the jaw normally are other possible symptoms.

The jaw joint is embedded in an intricate web of nerves and muscle. The force of chewing and of clenching or grinding the teeth creates enormous tension and pressure in that region of the face. The cartilage disk that cushions the joint may become displaced or wear out. This causes the bones of the temporomandibular joint to rub against one another, rather than gliding smoothly past each other. In some instances, a misalignment of the jaw and teeth prevents smooth operation of the joint.

The most common underlying causes of TMJ syndrome are stress and a poor bite, together with clenching and grinding of the teeth (bruxism), especially at night. TMJ syndrome can also be caused by bad posture, habits such as cradling the telephone between the shoulder and jaw, repeated or hard blows to the jaw or chin, or whiplash. Poor dental work and orthodontia may aggravate the problem, as can habits such as gum chewing, thumb sucking, and chewing exclusively on one side of the mouth. A common contributing factor is hypoglycemia; people tend to clench and grind their teeth more when their blood sugar is low.

To diagnose TMJ syndrome, a physician may use X-rays and a technique called arthrography, in which an opaque dye is injected into the joint and then viewed with fluoroscopy.

A correct diet and the proper supplements, possibly in conjunction with other treatments, are valuable for TMJ syndrome and often solve the problem. They are also helpful for bruxism (teeth grinding).

Unless otherwise stated, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between the ages of six and twelve, use one-half the recommended dose, and for children under six, use one-quarter of the recommended amount.

## TMJ Self-Test

Place your little fingers in your ears so that hearing is obstructed. Then slowly and steadily open and close your jaw. If at any point you hear a clicking, popping, and/or grinding noise, the jaw joints may be out of alignment, and examination by a professional experienced in diagnosing and treating TMJ syndrome is advisable.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Calcium and magnesium	2,000 mg daily. 1,500 mg daily, in divided doses, after meals and at bedtime.	For proper muscular function and calming effect. Prevents bone softening and relieves stress. Use chelate forms.
Chondroitin sulfate plus glucosamine sulfate	500–1,000 mg daily. As directed on label.	Nutritional support for strengthening joints, ligaments, and tendons.
Kyolic-EPA from Wakunaga	As directed on label.	Increases activity of anti-inflammatory prostaglandins.
Methylsulfonylmethane (MSM)	500–1,000 mg 3 times daily.	A sulfur compound that can reduce inflammation and aid in joint and tissue repair.
S-Adenosylmethionine (SAME) (SAME Rx-Mood from Nature's Plus)	400 mg 2 times daily.	Deficiency results in an inability to maintain cartilage properly. Aids in reducing pain and inflammation. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid)	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg twice daily.	Antistress vitamins. Sublingual forms are recommended for best absorption.

Helpful		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	60 mg daily. As directed on label.	Improves oxygenation of affected tissues. Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
L-tyrosine	500 mg daily. Take at bedtime on an empty stomach with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 500 mg vitamin C for better absorption.	Improves the quality of sleep and relieves anxiety and depression. (See AMINO ACIDS in Part One.) Caution: Do not take tyrosine if you are taking an MAO inhibitor drug.
Multivitamin and mineral complex	As directed on label.	For balanced nutrients. A hypoallergenic product is best.
Vitamin C with bioflavonoids	4,000–8,000 mg daily.	Combats stress and is necessary in adrenal gland function. Also necessary for healing and repair of connective tissue.

## Herbs

Blue violet, catnip, chamomile, hops, kava kava, lobelia, St. John's wort, skullcap, thyme, passionflower, red raspberry, valerian root, and wild lettuce have calming and antistress properties.

**Cautions:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Boswellia, an Ayurvedic herb, helps to restore blood vessels around inflamed connective tissue. It also reduces inflammation.

Feverfew and ginger are good for pain and soreness. Ginger is also a powerful antioxidant that has anti-inflammatory effects.

**Caution:** Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

- Nettle leaf has anti-inflammatory properties.
- Nerve Blend SP-14 from Solaray Products combats stress and is also beneficial.
- Turmeric and willow bark are good for pain and inflammation.

## Recommendations

- Eat a diet including lightly steamed vegetables, fresh fruits, whole-grain products, whitefish, skinless chicken and turkey, brown rice, and homemade soups and breads.
- Also eat more sulfur-containing foods, such as asparagus, eggs, garlic, and onions. Sulfur is needed for the repair and rebuilding of bone, cartilage, and connective tissue. It also aids in the absorption of calcium.
- Eat fresh pineapple frequently. Bromelain, an enzyme found in pineapple, is excellent for reducing inflammation. To be effective, the pineapple must be fresh. Freezing and canning destroy enzymes.
- Avoid high-stress foods: all forms of sugar, all white flour products, all junk foods, candy, colas, potato chips, pies, and fast foods.
- Do not consume any foods or beverages containing caffeine. As a stimulant, caffeine can increase tension, which often aggravates the problem. Also avoid taking over-the-counter medications containing decongestants, which can have a similar effect.
- Do not consume alcoholic beverages. These are a common contributing factor in bruxism (teeth grinding), which can cause or aggravate TMJ syndrome.
- If you work at a desk, check your posture periodically throughout the day. Do not lean over the desk; keep your back comfortably straight, with your ears not too far in front of your shoulders. Try to keep your head aligned so that your cheekbones are over your collarbone.
- Sleep on your back to give your back, shoulder, and neck muscles plenty of rest. Do not sleep on your side or lie on your stomach with your head turned to the side. Avoid propping your head at a sharp angle to read or watch television in bed.
- Fast at least once a month to give the body and jaws a rest. (See FASTING in Part Three.)
- Do not chew gum. Avoid overly chewy foods such as red meat and bagels.
- Experiment with heat and cold therapy, and use hot or cold packs—whichever works best—for relief of pain, especially pain in the neck and shoulders.
- Be wary of any practitioner who rigidly adheres to one single approach in treating TMJ syndrome. A multidisciplinary approach is a better choice. This could include: self-care practices, physical therapy, psychotherapy, relaxation techniques, biofeedback, hypnotherapy, and acupuncture.

If possible, seek help from practitioners associated with a university dental or medical school.

### Considerations

TMJ syndrome is often treated with a special bite plate that is worn over the teeth to stabilize the bite and prevent tooth-clenching. To permanently correct the bite, you may have to have teeth reshaped, undergo orthodontia, or get crowns or a permanent oral appliance. Rarely, surgery is required to repair a damaged joint.

Stress management, combined with heat and muscle relaxants, often relieves the symptoms of TMJ syndrome.

Physical therapy is becoming a widely recognized, viable treatment for TMJ syndrome. This may involve jaw and tongue exercises to retrain stressed muscles and/or the use of a transcutaneous nerve stimulation (TENS) unit; ultrasound, which promotes tissue healing; and electrogalvanic stimulation, which helps relax muscles. These types of therapy should be prescribed in conjunction with an exercise and stress-reduction program.

Some TMJ syndrome sufferers have been helped by biofeedback readings taken from the masseter muscle (the muscle that opens and closes the jaw). This treatment, combined with relaxation techniques such as controlled breathing, has proved effective.

Orthodontists, dentists, physical therapists, and many other "specialists" now offer various treatments for TMJ syndrome. However, it is estimated that 70 to 90 percent of all cases of TMJ syndrome respond to simple, inexpensive treatments, such as those recommended in this section. It therefore makes sense to try such measures *before* investing in expensive medical or dental treatment.

TMJ syndrome is not the only disorder that can cause jaw pain. Another possible cause is rheumatoid arthritis. In this disorder, the symptoms are more severe in the morning and tend to ease somewhat as the day goes on. (See ARTHRITIS in Part Two.) This is not usually the case with TMJ syndrome.

A displaced disk can also cause jaw pain. Treatment for this disorder involves realigning the ligaments with a plastic splint.

See also BRUXISM and STRESS, both in Part Two.

### TONSILLITIS

Tonsillitis is an inflammation of the palatine tonsils, which are the accumulations of lymphatic tissue on the right and left sides of the upper throat. It can be caused by either viral or bacterial infection. Generally, younger children tend to get viral tonsillitis, while older children and adults tend to get bacterial tonsillitis—usually caused by *Streptococcus* bacteria. Symptoms include sore throat, difficulty swallowing,

hoarseness, coughing, and redness, pain, and swelling of the tonsils. Other possible symptoms include headache, earache, fever and chills, nausea and vomiting, nasal obstruction and discharge, and enlarged lymph nodes throughout the body.

This disorder is most common in children, but it can occur at any age. In adults, it may be a sign that the body's resistance to disease is lower than it should be. An improper diet that is high in refined carbohydrates and low in protein and other nutrients may also predispose one to developing tonsillitis. Some people have repeated bouts of tonsillitis, and it can become a chronic condition. If untreated, tonsillitis can lead to a very severe condition called a *peritonsillar abscess*, in which the airways become obstructed, making breathing difficult. The infection can also spread into the neck and chest area. In general, the more repeated bouts of tonsillitis a person has, the more difficult it is to cure. Each time the tonsils become inflamed, scar tissue accumulates on the tonsils. If you are concerned, see a doctor, especially with the care of children.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters the recommended amount. For children between six and twelve, use one-half the recommended dose, and for children under the age of six, use one-quarter the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Vitamin C with bioflavonoids	5,000–20,000 mg daily. (See ASCORBIC ACID FLUSH in Part Three.)	To fight infection and boost the immune response.
Zinc lozenges	1 15-mg lozenge every 2 to 3 waking hours for 3 days, then reduce to 1 lozenge 4 times daily until healed.	An immunostimulant that aids healing.
<i>Helpful</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	Necessary if antibiotics are prescribed. Use a nondairy formula.
Chlorophyll	Use as a gargle, as directed on label.	Has an antibiotic effect and can heal irritations in the mouth and throat. Use a liquid form.
Cod liver oil	As directed on label.	Aids immune response and healing of tissue.
Maitake extract or shiitake extract or reishi extract	As directed on label.	Mushroom extracts with immune-boosting and antiviral properties.
Proteolytic enzymes	As directed on label. Take between meals.	Aids in reducing inflammation.
Pycnogenol or grape seed extract	As directed on label.	Antioxidants that protect the skin, reduce inflammation, and enhance immunity.

Vitamin A with mixed carotenoids including beta-carotene	10,000 IU daily for 3 days, then reduce to 5,000 IU daily.	Needed for repair of tissue. Aids healing. Emulsion form is recommended for easier assimilation.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 100 mg daily. 50 mg daily.	To help maintain a healthy mouth and throat.  Plays a role in the production of the formation of antibodies and aids in the utilization of other vitamins. Helps reduce swelling.
Vitamin E	200 IU daily.	Destroys free radicals and enhances the immune system. Use d-alpha-tocopherol form.

## Herbs

Catnip tea enemas are good for reducing fever. (See ENEMAS in Part Three.)

Chamomile relieves fever, headaches, and pain.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

ClearLungs from RidgeCrest Herbals is an herbal combination that helps to strengthen the immune system, enhances tissue repair, and controls inflammation.

Echinacea fights infection and boosts the immune system. Make echinacea tea and drink as much of it as you can. Or take it in tincture form, ½ teaspoon every three to four hours until your symptoms improve.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

A hot infusion made from equal parts of dried elderflower, peppermint, and yarrow eases the pain of tonsillitis. Drink this throughout the day.

Flaxseed oil reduces pain and inflammation, and aids recovery.

Marshmallow tea coats inflamed mucous membranes. Steep 3 heaping teaspoons of marshmallow blossoms in 3 cups of cold water for twelve hours, then heat and strain. Drink 2 to 3 cups daily.

Hot mullein poultices are soothing. (See USING A POULTICE in Part Three.)

Pau d'arco is a natural antibiotic and potentiates immune function. It is also a powerful antioxidant.

Sage tea, made with a bit of alum, can be used as a gargle. It can also be prepared with hot malt vinegar and taken orally in 2- to 3-ounce doses.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

For sore throat, take alcohol-free extract of golden-seal or St. John's wort. Place 6 drops or ½ dropperful of extract under your tongue and leave it there for a few minutes before swallowing. Do this four times daily for three days.

*Cautions:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Thyme reduces fever, headaches, and mucus. It is good for chronic respiratory problems and sore throat.

## Recommendations

Use a warm saltwater gargle. Dissolve ½ teaspoon of salt in 1 cup of warm water and gargle with the mixture three times a day to help reduce swelling, relieve pain, and remove mucus.

Apply hot or cold compresses, whichever one provides more relief, to the throat area.

Do not smoke, and avoid secondhand smoke. Tobacco smoke irritates the throat.

Add humidity to the air at home with a humidifier, a pan of water placed on a radiator, or boiling a pot of water on the stove. Moistening steam stimulates the blood flow to the mucous membranes, promoting healing.

For relief of tonsillitis pain, inhale essential oils of bergamot, lavender, tea tree, thyme, benzoin, and lemon.

If you have a sore throat that does not improve within two weeks, consult your health care provider to determine what type of sore throat you have.

If your physician prescribes antibiotics for bacterial tonsillitis, eat yogurt and take an acidophilus supplement to replace the "friendly" bacteria. Do not take the acidophilus at the same time as the antibiotic, however.

Rest and drink plenty of fluids.

## Considerations

A cleansing juice fast for three days with vegetable broth can be helpful. (See FASTING in Part Three.)

Bee propolis is good for treating tonsillitis.

*Caution:* Do not take bee propolis if you are allergic to bee stings. Do not give this supplement to a young child.

If an abscess develops, surgical drainage may be required.

❑ If tonsillitis becomes recurrent or chronic, tonsillectomy (removal of the tonsils) may be recommended. In the past, doctors removed tonsils on a very frequent basis. Today we know that the tonsils are important for the proper functioning of the immune system. Tonsils should not be removed unless absolutely necessary.

## TOOTH DECAY

Tooth decay rivals the common cold as the most prevalent human disorder. It is not a natural process, as many people believe, but a bacterial disease. This bacteria can enter the bloodstream and cause other problems in the body. Bacteria in the mouth combine with mucus and food debris to create a sticky mass called plaque that sticks to the surfaces of the teeth. The bacteria in the plaque feed on ingested sugars and produce an acid that leaches calcium and phosphate from the teeth. Gradually, if the sticky deposits are not removed, the teeth erode—first the enamel (the outer layer) and then the dentin (the body of the tooth). If unchecked, decay can progress even further, into the pulp that contains the nerve in the center of the tooth, resulting in a toothache. Infection may result, leaving the tooth vulnerable to abscess.

Tooth decay depends on three factors: the presence of bacteria, the availability of sugars for the bacteria to feed on, and the vulnerability of tooth enamel. Poor nutrition and poor oral hygiene are probably the main factors behind most cavities. In particular, people who consume large quantities of refined carbohydrates—especially sticky-textured foods that cling to tooth surfaces—or who snack frequently without cleaning their teeth afterward are much more likely to have a problem with tooth decay. There are also some people who, for reasons not yet understood, seem to have unusually acidic saliva and/or higher than normal levels of bacteria present in their mouths, and they too are more prone to tooth decay.

Tooth decay normally causes no symptoms until it is rather far advanced. Then the tooth may become sensitive to heat, cold, and the consumption of sugar. In later stages, a toothache may occur.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Important if taking antibiotics; protects "friendly" bacteria in the colon. Use a nondairy formula.

Calcium and magnesium	1,500 mg daily. 750 mg daily.	Necessary for strong, healthy teeth. Needed to balance with calcium.
Grape seed extract	As directed on label.	A powerful antioxidant and anti-inflammatory.
L-tyrosine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 500 mg vitamin C for better absorption.	Use for relief of pain and anxiety. (See AMINO ACIDS in Part One.) <i>Caution:</i> Do not take this supplement if you are taking an MAO inhibitor drug.
Vitamin A with mixed carotenoids including beta-carotene	10,000 IU daily.	Important for healing and for tooth formation.
Vitamin B complex	As directed on label.	Helps maintain healthy nerves and gums. A sublingual type is best.
Vitamin C with bioflavonoids	3,000 mg daily, in divided doses.	Protects against infection and inflammation. Do not use a chewable form, as this may erode tooth enamel.
Vitamin D	400 mg daily.	Needed for absorption of calcium and healing of gum tissue.
Vitamin E	200 IU daily.	Promotes healing.
Vitamin K	As directed on label.	May aid in preventing tooth decay.

### Helpful

Coenzyme Q <sub>10</sub>	As directed on label.	Provides energy needed for gum cell growth and healing of gum tissue.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works effectively with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Multivitamin and mineral complex	As directed on label.	All nutrients are needed in balance.
S-Adenosylmethionine (SAME) (SAME Rx-Mood from Nature's Plus)	400 mg twice daily.	Deficiency results in an inability to maintain cartilage properly. Aids in reducing pain and inflammation. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Shark cartilage	Start with 1 gram per 15 lbs of body weight daily, divided into 3 doses. When relief is achieved, reduce the dosage to 1 gm per 40 lbs of body weight daily.	Treats pain and inflammation. Aids in repairing joints and bones.
Zinc	30 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Boosts immune function. Use zinc gluconate or OptiZinc for best absorption.

## Herbs

Calendula, chamomile, peppermint, and yarrow are naturally anti-inflammatory.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Essential oil of clove, available in most drugstores, is helpful for toothache pain. Apply 1 or 2 drops to the affected tooth with a cotton swab as needed. If you find the clove oil too strong, dilute it with olive oil.

Alcohol-free goldenseal extract can be used as an antibacterial mouthwash. If inflammation is present, put a few drops of goldenseal extract on a piece of sterile cotton and press it against the gum by the affected tooth, pushing it in place tightly, at bedtime. Leave the cotton in place overnight. Do this for three consecutive nights to destroy bacteria and reduce inflammation.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Kava kava, St. John's wort, white willow bark, and wintergreen have analgesic properties. White willow bark is also an anti-inflammatory.

*Cautions:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Sage is good for its anti-inflammatory properties. Bring to a boil 2 tablespoons of dried, crushed sage leaves in 1 cup of water. Steep for twenty minutes and strain. Cool to a comfortable temperature and use the mixture to rinse your mouth several times daily.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

Thyme is a natural antiseptic that reduces the level of bacteria in the mouth.

## Recommendations

Eat plenty of raw fruits and vegetables. These contain minerals that help to keep the saliva from becoming too acidic.

Avoid carbonated soft drinks. These are high in phos-

phates, which promote the loss of calcium from the tooth enamel.

Avoid all refined sugars.

Do not smoke.

Practice good oral hygiene. Brush your teeth after each meal and snack, if possible, and floss between the teeth daily. This is the only way to remove cavity-causing plaque. There are also mouth rinses available to enhance the plaque-removing power of brushing and flossing. Do not brush too hard. Brushing either too hard or too much can cause the gums to recede, exposing the root areas of the teeth, which are more prone to decay than the rest of the tooth. Use a soft-bristle toothbrush and replace it with a new one every month.

Do not use chewable vitamin C supplements, which can erode tooth enamel. Tablets or powders designed for swallowing do not pose this danger.

To ease the pain of toothache or abscess until you can see your dentist, rinse the affected area with warm salt water (add ½ teaspoon of salt to 8 ounces of warm water).

## Considerations

Stim-U-Dent, found in most drugstores, is beneficial for keeping the gums massaged and clean. It also aids in removing plaque. Before using one, to avoid damaging your gums, soak it in water or hold it in your mouth until it softens. Massage between all your teeth.

Regularly scheduled dental checkups are recommended at least every six months for cleaning.

Researchers are looking into adding cranberry extract to toothpaste and/or mouthwash. Evidence developed at Tel Aviv University in Israel suggests that a compound present in cranberries may reduce plaque formation.

Researchers in Britain believe that they have developed a vaccine that prevents tooth decay by eliminating bacteria from the mouth. The American Dental Association's (ADA) Division of Science may be optimistic about the findings, but it has not been approved yet.

At present, the only known way to stop tooth decay once it has started is to remove the decayed area and cover it with some type of filling. Fillings are made of various materials, such as tooth-colored composite resins, porcelain, or combinations of several materials. Silver amalgam fillings contain a variety of materials, including small amounts of mercury. Some people don't like using mercury fillings because they fear possible adverse health effects. While some medical studies have shown these fillings to be safe, they remain controversial. You may wish to discuss concerns about filling materials with your dentist before treatment.

It was once believed that having dental work done posed a risk of endocarditis, a heart infection, for some people. The American Heart Association still believes there is a risk involved in tooth-cleaning and other dental work, even

though there is not yet enough evidence to conclusively prove a link. Endocarditis rarely occurs in people with normal hearts. However, if you have certain preexisting heart conditions, you can be at increased risk if bacteria enter the bloodstream. Some of these preexisting conditions include the presence of an artificial (prosthetic) heart valve, a history of previous endocarditis, heart valves that are damaged (scarred) by conditions such as rheumatic fever, congenital heart or heart valve defects, and hypertrophic cardiomyopathy (an enlarged heart). Some congenital heart defects, including ventricular septal defect, atrial septal defect, and patent ductus arteriosus, can be successfully repaired surgically. If this is done, the individual is no longer at increased risk of developing endocarditis due to dental work.

Fluoride increases resistance to tooth decay. It is added to many toothpastes and community drinking water supplies, as discussed in WATER in Part One. Many dentists recommend routine fluoride treatments to prevent cavities, especially for children. Fluoride is a chemical compound containing the element fluorine. Fluorine is a deadly and highly reactive chemical, but the fluoride compounds used in toothpaste and in water supplies are not believed to be dangerous in small amounts. However, there is still some debate as to whether or not fluoride is a risk factor for cancer, and if you are sensitized to the issue you will probably consider fluoride in all its forms a pollutant. Before removing fluoride from your child's water, discuss the pros and cons with your child's pediatrician and pediatric dentist. Avoiding decay is the best way to avoid having to have a tooth filled.

Many Americans get medical or dental X-rays every year. These peeks inside the body can be valuable, even lifesaving, tools for diagnosing health problems. But X-rays are sometimes ordered when they are not needed. Other times, failure to follow precautions may expose people to more radiation than necessary. Our general advice is to keep X-rays to a minimum, especially ones taken for less than critical reasons. But, on the grand scale of things to worry about, dental X-rays aren't it. Below is a comparison of exposures from different sources of radiation:

Source	Estimated Exposure (millisievert [mSv])
Dental X-rays	
• Bitewings	0.038
• Full-mouth series (19 films)	0.150
Medical x-rays	
• Lower GI series	4.06
• Upper GI series	2.44
• Chest	0.08
Average in U.S. (natural sources)	3.00 (per year)

Air abrasive technology uses a targeted spray of powder to remove tooth decay with no drilling sound or vibrations.

Laser technology may be used as an alternative to the conventional dental drill.

## TOXICITY

See ALUMINUM TOXICITY; ARSENIC POISONING; CADMIUM TOXICITY; CHEMICAL POISONING; COPPER TOXICITY; ENVIRONMENTAL TOXICITY; FOODBORNE/WATERBORNE ILLNESS; LEAD POISONING; MERCURY TOXICITY; NICKEL TOXICITY.

## TUBERCULOSIS

Tuberculosis (TB) is a very old and highly contagious disease caused by the bacteria *Mycobacterium tuberculosis*. It is primarily a disease of the lungs, but it can affect any body organ, including the bones, kidneys, intestines, spleen, and liver. One of the most lethal among infectious diseases, TB is found throughout the world. It kills about 2 million people a year worldwide, and one-third of the world is infected. It is especially devastating in places such as Asia and Africa, where HIV and AIDS are widespread and have compromised the immune systems of so many people that the tuberculosis bacteria often meet with little or no resistance. It is the leading killer of people around the world who are infected with HIV. It is estimated that by the year 2020, there will be 1 billion new cases of this disease, 150 million will get sick, and 36 million people worldwide will die from it.

TB is usually spread by infected airborne droplets that are coughed up by individuals with the active disease and then inhaled by susceptible persons. Once inhaled, the bacteria normally lodge in the lungs. The body may successfully battle the infection at this point. If the immune system is not functioning optimally, however, or if another onslaught of the bacteria reaches the lungs, chances are the bacteria will multiply and proceed to liquefy and destroy lung tissue. Overcrowded, poorly ventilated housing and overpopulated prisons are fertile breeding grounds for the spread of TB. Studies in India have confirmed that smoking contributes to half the deaths from TB in that country, perhaps by weakening the immune system. Tuberculosis may also be contracted from contaminated food or from milk that has not been pasteurized. In such cases, the primary focus of the infection usually is in the digestive tract. This type of tuberculosis is more common in developing countries. It is rare in the Western world.

Not everyone infected with TB bacteria becomes sick. Some people have what is called latent TB infection. People with latent TB infection have TB germs in their bodies, but the germs are not active. A person with latent TB does not have symptoms, does not feel sick, cannot spread the TB bacteria to others, usually has had a skin test or blood test result indicating TB infection, and has had a normal chest X-ray and a negative sputum smear. These people must be treated for latent TB infection to prevent active TB disease. Usually, only one drug—isoniazid (INH)—is needed to treat latent TB infection. INH is typically taken for nine months in order to kill the TB bacteria in the body. Without treatment, however, TB bacteria may become active and multiply, and the person will get sick with TB disease.

Symptoms of TB may be slow in developing and initially resemble those of influenza—general malaise, coughing, loss of appetite, night sweats, chest pain, and low-grade fever. At first, the cough may be nonproductive, but as the disease progresses, increasing amounts of sputum are produced. As the condition worsens, fever, night sweats, chronic fatigue, weight loss, chest pain, and shortness of breath may occur, and the sputum may become bloody. In advanced cases, TB of the larynx can occur, making it impossible to speak above a whisper.

Antibiotic regimens that could successfully combat the disease have been developed, and living standards have risen so that the poor nutrition and inadequate hygienic standards that had once helped TB to spread and flourish are less prevalent in the United States. In spite of the fact that multidrug-resistant strains of TB exist (if a strain of TB is resistant to both of the drugs most often widely prescribed for TB, it is considered multidrug-resistant), rates of TB have declined. For example, between 2001 and 2002, the number of reported cases of TB declined 5.7 percent (a 43 percent decline from 1992 when it was at its peak). In 2006, the reported cases of TB were 13,299 (a rate of 4.4 per 100,000), which represented a 3.3 percent decline from the previous year. But the global epidemic of tuberculosis, together with the migration of people from one country to another, probably means that unless aggressive action is taken to eradicate TB everywhere in the world, the United States will again see an upsurge of this disease in coming decades. The best defense against tuberculosis is a strong immune system and a healthy diet.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Coenzyme Q <sub>10</sub>	75 mg daily.	Helps carry oxygen to tissues for healing.
Free form amino acid	As directed on label.	Needed for tissue repair. Free form amino acids are rapidly absorbed and assimilated by the body.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Acts as a natural antibiotic; keeps infection in check and stimulates immune function.
Grape seed extract	As directed on label.	A powerful antioxidant that enhances immunity.
L-cysteine and L-methionine	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk.	To protect the lungs and liver by detoxifying harmful toxins. (See AMINO ACIDS in Part One.)

		Take with 50 mg vitamin B <sub>6</sub> and 1,500 mg vitamin C for better absorption and prevention of cysteine kidney stones.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Protects against free radicals and promotes a healthy immune system.
Vitamin A plus natural carotenoid complex (Betatene) plus vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 25,000 IU daily. 200 IU daily.	Use d-alpha-tocopherol form.
Vitamin B complex plus extra vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>6</sub> (pyridoxine)	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 100 mg 3 times daily. 50 mg 3 times daily.	Needed for production of red blood cells and antibodies. Aids in utilization of oxygen. Use a high-stress formula. Injections (under a doctor's supervision) may be necessary. If injections are not available, use a sublingual form. The antistress vitamin. Some drugs used to fight TB can cause a deficiency of this vitamin.
Vitamin D	Start with 1,000 IU daily and decrease slowly to 400 IU daily over the course of 1 month.	Essential for utilization of calcium and phosphorus. People with TB need sunlight daily and/or vitamin D for healing.

### Important

ACES + Zn from Carlson Labs	As directed on label. Do not exceed 100 mg of zinc daily from all sources.	A formula that fights free radicals with enzymes and antioxidants.
CTR Support from Physiologics	As directed on label.	To diminish damage caused by inflammation.
Essential fatty acids (Ultimate Oil from Nature's Secret)	As directed on label.	Important in formation of all cells, including lung tissue.
Glutathione	500 mg daily, on an empty stomach.	Protects the lungs and cells from free radical damage.
Kelp	2,000–3,000 mg daily.	For a natural supply of minerals. Rich in iodine.
L-serine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Helps the body maintain immune function. (See AMINO ACIDS in Part One.)
Multienzyme complex plus proteolytic enzymes	As directed on label. Take with meals. As directed on label. Take between meals.	Needed to keep inflammation down, to digest essential nutrients, and to improve absorption.
Multimineral complex with boron and calcium and magnesium and silica	3 mg daily. Do not exceed this amount. 1,000 mg daily. 750 mg daily. 25–100 mg daily.	All nutrients are needed for strength and healing. Take with meals. Use a high-potency formula. Do not use a sustained-release formula.

Multivitamin complex	As directed on label.	To provide a balance of needed nutrients.
Oxy-5000 Forte from American Biologics	As directed on label.	An antioxidant formula with superoxide dismutase (SOD).
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Promotes immune function and healing. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

Butcher's broom, calendula, cayenne (capsicum), chamomile, peppermint, and yarrow have anti-inflammatory properties.

**Caution:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Elecampane (*Inula helenium*), taken as a tea, goldenseal root, horehound, licorice, lobelia, marshmallow root, mullein, myrrh gum, and thyme have decongestant and expectorant properties.

**Cautions:** You should not take elecampane if you have had a known allergic reaction to inulin or if you are pregnant or breast-feeding. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

A combination echinacea and pau d'arco tea is beneficial. Echinacea is a powerful antioxidant and bolsters the immune system; pau d'arco benefits the body by cleansing the blood and acting as an antibacterial agent, as well as possessing antitumor agents. Drink 3 cups of this tea daily. Or combine echinacea tincture with equal parts of tinctures of elecampane and mullein, and take 1 teaspoon of this mixture three times daily.

**Caution:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

ClearLungs from RidgeCrest Herbals is a Chinese herbal formula that relieves bronchial and lung congestion.

Lung Tonic from Herbs, Etc. supports lung function.

## Recommendations

If you suspect that you may have tuberculosis, or that you may have been exposed to it, see your health care provider. Prompt proper treatment is essential.

Follow the prescribed treatment regimen exactly. If any medications cause side effects, contact your physician. Do not discontinue taking the medications on your own.

To promote healing, eat a diet consisting of at least 50 percent raw vegetables and fruits. Also eat alfalfa sprouts, fish, fowl, pomegranates, raw cheeses, raw seeds and nuts, whole grains, and garlic.

Drink fresh pineapple and carrot juice and a "green drink" daily. Drink fresh raw potato juice; potato juice contains compounds called protease inhibitors, which block carcinogens and prevent cell mutation. (See JUICING in Part Three.)

Make a purée of steamed asparagus in a blender. Refrigerate and take 4 tablespoons twice a day with meals. Asparagus stimulates immune function and is anticarcinogenic.

Make kefir, buttermilk, and fresh sugar-free yogurt a part of your daily diet. Also take an acidophilus supplement for as long as you are taking antibiotics, to relieve stress on the gastrointestinal tract and enhance nutrient absorption. Do not take the acidophilus at the same time as the antibiotic, but do make sure you take it.

Do not smoke, consume alcohol, or use recreational drugs. All of these affect the ability of the immune system to fight infection. Smoking is even more dangerous than usual in the presence of a lung infection.

Avoid stress. Rest, sunshine, and fresh air are most important. A dry climate is recommended.

## Considerations

There are two kinds of tests that can be used to help detect TB infection—the TB skin test (TST) and special TB blood tests. A positive TB skin test or TB blood test only tells that a person has been infected with TB bacteria. It does not tell whether or not the person has progressed to TB disease. Other tests, such as a chest X-ray and a sample of sputum, are needed to see whether the person has TB disease.

Modern treatment regimens include long-term treatment with the antibiotics isoniazid (INH), rifampin (Rifadin), pyrazinamide, streptomycin, and/or ethambutol (Myambutol). Whatever antibiotic treatment is prescribed, it is important to take it for the full course recommended, even if you start to feel better.

If you are taking one of the drugs for TB and have lost weight before treatment as a result of the disease, be sure to consume adequate protein so that you restore muscle mass. In one study, weight gain was mostly as fat during the first six months. Muscle takes a lot longer to rebuild.

- ❑ People infected with TB should not use cortisone preparations. Cortisone suppresses immune function and makes the infection more difficult to treat.
- ❑ Vaccines and drugs cannot control TB if poor lifestyle practices are followed. Cleanliness and proper nutrition are vital in combating this disease.
- ❑ One large-scale study of 30,000 people found that taking 50 milligrams of vitamin E with more than 90 milligrams of vitamin C increased the risk of developing TB after exposure by 60 percent. It seems prudent to avoid taking vitamin E and C in supplement form if you live in a high-risk TB area. It is fine to obtain these vitamins from foods.
- ❑ Experts estimate that up to 90 percent of the population may have encountered the tubercle bacillus sometime in their lives, but in the majority of cases, the immune system successfully keeps a full-blown infection from developing. People who do not defeat it outright often carry the germ in a dormant state, sometimes for decades, before immunity weakens and the bacteria begin replicating and infect the host.
- ❑ The Air Supply personal air purifier from Wein Products is a small unit worn around the neck. It sets up an invisible pure air shield against microorganisms (such as viruses, bacteria, and mold) and microparticles (including dust, pollen, and pollutants) in the air. It also eliminates vapors, smells, and harmful volatile compounds in the air.
- ❑ The tubercle bacillus has an incredible capacity for reproduction. A single organism is capable of producing billions of descendants within one month.
- ❑ People with AIDS are more likely than most to have tuberculosis at some point during their illness.
- ❑ The Bacillus Calmette-Guérin vaccine (BCG), which consists of a weakened form of tubercle bacilli, can be used for vaccination against tuberculosis. This vaccine is not widely used in the United States, but it is often given to infants and small children in other countries where TB is common. The vaccine provides immunity against TB, and may be given to persons at high risk of developing TB such as those with HIV. A TB skin test may indicate if you are carrying TB bacteria even before you have symptoms of the disease. However, if you were vaccinated with BCG, you may have a positive reaction to a TB skin test.
- ❑ In 2006, the World Health Organization set new guidelines for reducing the number of new TB cases and deaths by 2015 in 196 countries and territories. The goal is a 50 percent reduction.

**TUMOR**

A tumor, or neoplasm, is an abnormal new growth of tissue. It may be localized to one area or present in many sites in the body. Tumors can appear nearly anywhere in or on

the body, and can be cancerous (malignant) or noncancerous (benign). Polyps and papillomas are examples of benign tumors. Squamous cell and basal cell carcinomas are examples of malignant tumors.

Unlike benign tumors, malignant tumors are usually serious and are likely to grow, take over other organs, and metastasize (spread). They can be a life-threatening problem if they are not detected and treated at an early stage. The prognosis for a person who develops a malignant tumor depends on the location of that tumor. If it is difficult to detect and there are few discernable symptoms, then treatment may not begin soon enough to prevent the tumor from metastasizing.

Environmental factors and diet seem to play an important role in the development of tumors of all types. Tumors have been known to decrease in size and even disappear in response to dietary changes and supplementation with high-quality vitamins and minerals. If you have a tumor, discuss your options with your doctor. Most cancer treatments like chemotherapy, radiation therapy, and surgery work better when the patient is well nourished. Thus, supplementation is important regardless of how you wish to be treated. The suggestions here are designed to enhance immune function and suppress the growth of tumors—both benign and malignant.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100 mg daily. As directed on label.	Promotes immune function; carries oxygen to the cells. Works with coenzyme Q <sub>10</sub> .
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	May help to reduce the size of tumors.
Maitake extract or reishi extract or shiitake extract	As directed on label. As directed on label. As directed on label.	Mushroom extracts that strengthen the body and improve overall health; have immunostimulant properties, have antitumor action, and reverse T cell suppression caused by tumors.
Melatonin	5–10 mg daily, at bedtime.	People with brain tumors may have an increased survival rate if they take melatonin along with their radiation therapy.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label. As directed on label.	To help the immune system and aid in the breakdown of undigested foods.

Shark liver oil	100 mg 3 times daily for 20 days, then 10 to 15 days off. Maintain this schedule.	Immune system booster that can help protect the body from radiation damage.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Promotes immune function.
Zinc	30–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Promotes a healthy immune system and wound healing, and helps maintain the proper concentration of vitamin E in the blood. Use zinc gluconate lozenges or OptiZinc for best absorption.
<b>Helpful</b>		
Kelp	1,000–1,500 mg daily.	Promotes immune function. Supplies balanced minerals.
L-arginine	500 mg daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Retards tumor growth by enhancing immune function. (See AMINO ACIDS in Part One.)
and L-cysteine	500 mg daily, on an empty stomach, with meals. 1,500 mg vitamin C to prevent cysteine kidney stones.	Detoxifies harmful toxins, protects the body against radiation, and acts against carcinogens. Helps to reduce side effects of chemotherapy and protect the liver.
plus glutathione	500 mg daily, on an empty stomach.	Used in some clinics for treatment of breast cancer.
plus taurine	500 mg daily, on an empty stomach.	
Lecithin granules or capsules	1 tsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	An important component of healthy cell membranes.
Multivitamin and mineral complex	As directed on label, with meals.	For necessary vitamins and minerals. Use a high-potency formula.
Primrose oil or flaxseed oil	1,000 mg 3 times daily, before meals. As directed on label.	To supply essential fatty acids, specifically useful for breast tumors. Both eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) are helpful in protecting the body against toxic effects of some cancer treatments.
or salmon oil	As directed on label.	
Raw thymus glandular	As directed on label.	Stimulates the thymus gland, which is important for immune function. (See GLANDULAR THERAPY in Part Three.)
Vitamin A	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.	Powerful immunostimulants and antioxidants. Emulsion forms are recommended for easier assimilation and greater safety at higher doses.
plus natural carotenoid complex (Betatene)	25,000 IU daily.	
plus vitamin E	200 IU daily.	Use d-alpha-tocopherol form.
or ACES from Carlson Labs	As directed on label.	Supplies vitamin C in addition to vitamins A and E and selenium.
Vitamin B complex	As directed on label.	Vital in intracellular metabolism and normal cell multiplication. A sublingual type is best.
plus extra vitamin B <sub>6</sub> (pyridoxine)	50 mg 3 times daily.	Required for normal cell growth and brain and nervous system function. Enhances immunity.

plus  
vitamin B<sub>5</sub>  
(pantothenic acid) 100 mg daily.

Consider injections (under a doctor's supervision). An antistress vitamin that plays a role in hormone and antibody production, energy production, vitamin production, and in treating depression and anxiety.

## Herbs

Cat's claw boosts the immune system and has anti-tumor properties. Cat's Claw Defense Complex from Source Naturals is a combination of cat's claw and other herbs, plus antioxidant nutrients such as beta-carotene, N-acetylcysteine, vitamin C, and zinc.

*Caution:* Do not use cat's claw during pregnancy.

Many people with external tumors have responded well to poultices made from comfrey, pau d'arco, ragwort, and wood sage. (See USING A POULTICE in Part Three.)

*Caution:* Comfrey is recommended for external use only.

For breast lumps, try using poultices made of poke root, which is effective in combating glandular swelling. (See USING A POULTICE in Part Three.)

*Note:* Poke root is recommended for external use only.

Other beneficial herbs include barberry, burdock root, dandelion, milk thistle, pau d'arco, and red clover. These herbs purify the blood, stimulate liver activity, act as natural antibiotics, and generally help healing.

*Caution:* Do not use barberry during pregnancy.

## Recommendations

Eat a diet consisting of 50 percent raw fruits and vegetables. If possible, purchase produce from an organic source. Nuts, seeds, whole grains, and low-fat yogurt and yogurt products also should be included in the diet. Do not consume animal protein (eat soy protein instead), dairy products (except for yogurt), processed and packaged foods, salt (if you do use salt, use sea salt, which still retains its mineral content), sugar, white flour, or white flour products. If you are eliminating dairy, be sure to get calcium, magnesium, and vitamin D from other foods or supplements.

See CANCER in Part Two and follow the recommended diet.

See FASTING in Part Three and follow the program.

## Considerations

Although benign tumors are generally limited in growth, they usually should be removed; a small percentage may later become malignant.

Malignant tumors must be treated as early as possible. Depending on the site and size of the tumor, there are many different methods of treatment. (See CANCER in Part Two.)

□ Dietary intake from foods may impact cancer outcomes. A study where all existing data on the subject were reviewed found that a low-glycemic-load diet reduced the risk of both colorectal and endometrial cancer. A low-glycemic-load diet consists of eating an abundance of fruits and vegetables and whole grains, and limiting the intake of simple sugars, fats, and nutrient-poor foods. High-glycemic-load diets are purported to promote tumor growth because they cause a high surge in insulin response following ingestion. Insulin stimulates insulin-like growth factor-1, which is a known tumor inducer. An earlier study found that following a low-glycemic-load diet seemed to have no effect on prostate, ovarian, lung, and colorectal cancer risk.

□ Which vitamins and minerals promote and arrest tumor growth is an area of intense interest for nutritional scientists. Iron deficiency has been linked to the development of tumors. However, iron supplements should be taken only if tests show a deficiency. People with cancer should *not* take supplemental iron. Similarly, vitamin E has been shown to increase the risk of lung cancer. However, for bladder cancer, taking selenium (about 100 micrograms per day) reduced its risk.

□ In one study, a reduction in the risk of two types of esophageal cancer was seen as a result of eating fruits and vegetables. Those foods that seemed to provide the most protection were: apples, peaches, nectarines, plums, pears, strawberries, citrus fruits, and spinach.

□ Plants contain lignans, which may protect against cancer. Good sources include legumes, seeds, cereals/grains, berries, dried fruit, and vegetables. In one study, the risk of colorectal cancer was reduced by 30 percent with a lignan-rich diet. High intakes of vegetables, fruit, and total dietary fiber each were associated with a lower risk for rectal cancer.

□ In one study of long-term survivors of colorectal, breast, and prostate cancer, those who participated in a regular exercise program and followed a healthy diet had a better quality of life and slower decline compared to a matched group who did not adopt a healthy lifestyle and diet.

□ Scientists studying a genetic disorder have found that a rare, noncancerous heart tumor, called a *myxoma*, also has a genetic cause. This is the same genetic defect that causes Usher syndrome, a leading cause of deafness and blindness in young children.

□ VEGF Trap, a type of drug known as a vascular endothelial growth factor (VEGF) blocker, is used to prevent angiogenesis—the formation of blood vessels that feed tumors. It is a class of drugs called monoclonal antibodies. It has shown promise in treating tumors. Drugs in this category also include bevacizumab (Avastin), which has been approved for treating colorectal cancer and lung cancer. VEGF Trap is currently undergoing clinical trials.

□ Curcuminoids, the yellow pigments found in the spice turmeric (*Curcuma longa*), appear to have properties that block the gene expression leading to tumor formation. A

member of the ginger family, turmeric is widely used in southeast Asia as a culinary spice, especially in curries. Brand-name products that contain curcuminoids include Turmeric Special Formula from Solaray.

□ Scientists at the University of California–Los Angeles School of Medicine have found that sodium linoleate, a compound that contains the amino acid linoleic acid, has the ability to fight cancer cells in the laboratory.

□ Studies done in Japan suggest that taking garlic supplements may help reduce the size of tumors.

□ Regular physical checkups and tests for various cancers, such as breast, colon, cervical, prostate, and skin cancer, should be part of your routine, especially after the age of forty. All of these cancers are more easily treated and better outcomes occur with early detection.

□ See also BREAST CANCER; CANCER; FIBROCYSTIC BREASTS; FIBROIDS, UTERINE; POLYPS; PROSTATE CANCER; SKIN CANCER; and/or WARTS, all in Part Two.

## ULCER

See BEDSORES; CANKER SORES (APHTHOUS ULCERS); LEG ULCERS; PEPTIC ULCER. See also under EYE PROBLEMS.

## ULCERATIVE COLITIS

Ulcerative colitis is a chronic disorder in which the mucous membranes lining the colon become inflamed and develop ulcers, causing bloody diarrhea, pain, gas, bloating, and, at times, hard stools. The colon muscles then have to work harder to move these hardened stools through the colon. This can cause the mucous membrane lining of the colon wall to bulge out into small pouchlike projections called *diverticula*. This usually occurs in the lower left section of the large intestine, called the *sigmoid* (S-shaped) *colon*, although it can occur in any part of the colon. Enteritis and ileitis are types of inflammation of the small intestine often associated with colitis.

Ulcerative colitis can occur in people of any age, but it usually starts between the ages of fifteen and thirty, and less frequently between fifty and seventy years of age. It affects men and women equally and appears to run in families, with up to 20 percent of people with ulcerative colitis having a family member or relative with ulcerative colitis or Crohn's disease. A higher incidence of ulcerative colitis is seen in Caucasians and people of Jewish descent. Ulcerative colitis can range from relatively mild to severe. Common complications are diarrhea and bleeding, often causing the loss of vital nutrients and fluids. A rarer complication is toxic megacolon, in which the intestinal wall weakens and balloons out, threatening to rupture.

The cause or causes of most cases of colitis are unknown, but possible contributing factors include poor eating habits, stress, and food allergies. Colitis can also be caused by

infectious agents such as bacteria. This type of colitis is often associated with the use of antibiotics, which alter the normal bowel flora and permit microorganisms that are normally held in check to proliferate. The symptoms can range from simple diarrhea to the more severe type of symptoms associated with ulcerative colitis.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount. With ulcerative colitis, the colon is highly inflamed, so it is best to only add one or two new supplements at a time so as to not further irritate the colon.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Essential</i>		
Iron	As directed by physician.	Usually depleted in people with chronic inflammatory bowel disease. <i>Note:</i> Do not take supplemental iron unless anemia has been diagnosed.
Proteolytic enzymes plus multienzyme complex with pancreatin	As directed on label. Take between meals.  As directed on label. Take after meals.	Vital for proper digestion of proteins and helps to control inflammation. Anti-inflammatory enzymes. Use a formula that is high in pancreatin and low in hydrochloric acid (HCl).
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub> and folic acid	As directed on label.  50 mg 2 times daily.  1,000 mcg twice daily.  400 mcg twice daily.	Essential for the breakdown of fats, protein, and carbohydrates and for proper digestion. Use a hypoallergenic formula.  A sublingual form is best.  Often depleted in people with this disorder. May protect against colon cancer.
<i>Very Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga) or bifidus (Bio-Bifidus from American Biologics)	As directed on label twice daily, on an empty stomach.	To normalize the intestinal bacteria. Very important if you are taking antibiotics. Use a nondairy formula.
ABC Aerobic Bulk Cleanse from Aerobic Life Industries  or psyllium husks	1 tbsp in water or juice on an empty stomach in the morning. Drink it quickly, before it thickens. Take separately from other supplements and medications.  As directed on label.	To keep the colon walls clean of toxic wastes.
Free form amino acid	As directed on label twice daily, on an empty stomach.	To supply needed protein for tissue healing.

L-glutamine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	A major metabolic fuel for the intestinal cells; maintains the villi, the absorption surfaces of the intestines. (See AMINO ACIDS in Part One.)
-------------	--	--

Vitamin A with mixed carotenoids including natural beta-carotene plus vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily.  200 IU daily.	An antioxidant that protects the mucous membranes and aids in healing.  An antioxidant that promotes healing. Deficiency has been associated with bowel cancer. Use d-alpha-tocopherol form.
---	---	--

*Helpful*

Aerobic O7 from Aerobic Life Industries	As directed on label twice daily.	Provides stabilized oxygen to the colon and destroys unwanted bacteria.
---	--------------------------------------	---

Colloidal silver	As directed on label.	A natural broad-spectrum antiseptic that fights infection, subdues inflammation, and promotes healing. Apply topically.
------------------	-----------------------	---

Essential fatty acids (flaxseed oil or primrose oil)	As directed on label.	Important in cell formation. Protects the lining of the colon.
--	-----------------------	--

Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	A natural antibiotic that has a healing effect on the colon.
-------------------------------	---------------------------------------	--

Glucosamine sulfate or N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label. As directed on label.	An important component in the protective mucous secretions of the digestive tract.
---	--	--

Multimineral complex with calcium and chromium and magnesium and zinc	As directed on label.	Malabsorption of these essential minerals is a problem with colitis. Calcium also is needed for the prevention of cancer, which may occur due to constant irritation. Use a high-potency formula.
---	-----------------------	---

Raw thymus glandular	500 mg twice daily.	Important in immune function. (See GLANDULAR THERAPY in Part Three.)
----------------------	---------------------	--

Shark cartilage	As directed on label.	
-----------------	-----------------------	--

Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Needed for immune function and healing of mucous membranes. Use a buffered form.
------------------------------	---	--

**Herbs**

ABC Aerobic Bulk Cleanse from Aerobic Life Industries contains healing herbs that cleanse the colon. Take it mixed with half fruit or vegetable juice and half aloe vera juice, before meals.

*Note:* Always take this product separately from other supplements and medications.

Alfalfa, taken in capsule or liquid form, supplies vita-

## Diet for Colitis

Ulcerative colitis can be an extremely painful and even temporarily disabling condition. Diet is probably the most significant factor in achieving and maintaining remission. Shari Lieberman, nutritionist and author, recommends the following dietary guidelines for people with colitis:

- The most important thing to do is keep a daily record of what you eat and what symptoms you experience. This way you can see which foods have aggravated or improved your condition. Some people are sensitive only to certain foods, such as yeast products, wheat products, or dairy products.
- Eat a high protein diet, containing proteins mainly from vegetable sources. Non-vegetable sources that are also acceptable include baked or broiled fish and chicken and turkey (without the skin).
- Eat lots of vegetables. If you cannot tolerate raw vegetables, steam them.
- Eat a high-fiber diet. Oat bran, brown rice, barley and other whole grains, lentils, and related products such as rice cakes are good. Be sure grains are well cooked.
- Keep excess fats and oils out of your diet, and stay away from high-fat milk and cheeses. Fats and oils exacerbate the diarrhea that comes with colitis.
- Include garlic in the diet for its healing and antibiotic properties.
- Eat cooked foods that are broiled or baked, not fried or sautéed. Avoid sauces made with butter.
- Avoid carbonated soft drinks, spicy foods, and anything containing caffeine. These substances can irritate the colon. Also avoid red meat, sugar, and processed foods.
- Try soy-based cheese instead of dairy cheese; try soymilk instead of cow's milk. If you do eat dairy foods, use nonfat types. If you are a lactose intolerant, try lactose-free milk. Many lactose-intolerant people can tolerate low-fat yogurt. Yogurts with active probiotic cultures like *Lactobacillus rhamnosus GR-1* have been shown to reduce inflammation.
- Drink plenty of liquids—at least ten 8-ounce glasses of water daily to make up for the fluid lost with diarrhea. Carrot and cabbage juices and “green drinks” are also good. Or add chlorophyll liquid to juices.
- Do not eat fruit on an empty stomach. Eat it between meals instead. Avoid acidic fruits such as oranges and grapefruit. Fruit juices should be diluted with water and taken during or after meals.

min K and chlorophyll, needed for healing. Take it as directed on the product label three times daily.

- Aloe vera aids in healing the colon, thereby easing pain. Drink ½ cup of aloe vera juice in the morning and again at bedtime.
- Boswellia, bromelain, buchu leaves, and turmeric (curcumin) reduce inflammation.
- Burdock root, milk thistle, and red clover aid in cleansing the blood. Milk thistle also improves liver function.
- Chamomile, dandelion, feverfew, papaya, red clover, and yarrow extract or tea are beneficial for colitis, as is pau d'arco tea.

**Cautions:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding.

Lobelia tea is good to drink. Also use it as an enema for inflammation of the colon; it gives quick relief. (See ENEMAS in Part Three.)

**Caution:** Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People

with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Nettle and quercetin aid in inhibiting allergic reactions.

### Recommendations

- Do not wear clothing that is tight around the waist.
- For acute pain, try drinking a large glass of water. This aids in flushing out particles caught in the crevices of the colon, relieving pain.
- During a flare-up, consume only soft foods until the pain has subsided. Put oat bran or steamed vegetables through a blender. Add 1 tablespoon of oat or rice bran daily to cereals and juice to add the bulk needed for cleansing the colon. Or add 1 tablespoon of Aerobic Bulk Cleanse to juice and drink it on an empty stomach upon arising.
- Eat plenty of dark green leafy vegetables. These are rich sources of vitamin K. Vitamin K deficiency has been linked to ulcerative colitis.
- Try eating junior baby foods for two weeks. Baby foods are easy to digest. Earth's Best baby foods are organic and are available in many health food stores and supermarkets. (See Manufacturer and Distributor Information in the Ap-

pendix.) While on the baby-food diet, take extra fiber such as glucomannan.

Glucomannan should be taken one-half to one hour before meals with a large glass of water.

*Note:* Always take supplemental fiber separately from other supplements and medications.

Do stretching exercises and take proteolytic enzymes to improve digestion.

Use cleansing enemas made with 2 quarts of lukewarm water. This helps to rid the colon of undigested foods and relieve pain. Use wheatgrass juice as a retention enema. For severe gas and bloating, use a *B. bifidus* enema. (See ENEMAS in Part Three.)

For long-term management of ulcerative colitis and to prevent flare-ups, see Diet for Colitis on the previous page and follow the suggestions there.

See FASTING in Part Three, and follow the program once a month.

### Considerations

A food sensitivity test is advised for anyone who suffers from colitis. We have seen many people with colitis do well once they make changes in their diet and lifestyle.

Some patients with irritable bowel syndrome responded to an elimination diet and probiotics. It is possible that this sort of therapy would be effective in ulcerative colitis as well.

When magnesium is given intravenously with vitamin B<sub>6</sub>, it relaxes the muscles in the walls of the bowels and can control an attack of spastic colon.

If serious complications arise and all other treatments have failed, surgery may be required.

Vitamin K deficiency has been linked to ulcerative colitis. Sulfa drugs and mineral oil deplete vitamin K.

Ulcerative colitis and Crohn's disease are both classified as inflammatory bowel diseases. Irritable bowel syndrome (IBS), although capable of causing some similar symptoms, is a condition that involves no inflammation. (See IRRITABLE BOWEL SYNDROME in Part Two.) Some investigators have shown a link between breast-feeding and a lower risk of inflammatory bowel disease. Babies who were breast-fed had a 23 percent reduced rate of developing Crohn's disease and a 13 percent lower risk of ulcerative colitis.

The earliest signs of ulcerative colitis sometimes mimic the symptoms of arthritis—an achy feeling and joint pain. These symptoms may or may not be accompanied by the abdominal discomfort typical of colitis. If you start experiencing arthritis-like symptoms, it may be beneficial to change your diet and see if improvement results. (See Diet for Colitis, previous page.)

Anyone who has had ulcerative colitis for at least five years—even if it is mild or inactive for a long time—should

undergo regular colonoscopy, since people with this disease run a much greater than usual risk of developing colon cancer. A colonoscopy is an examination performed with a long, flexible instrument that allows a physician to see inside the length of the colon.

Several nutrients have been identified to lower the risk of developing colon cancer, so those with ulcerative colitis may wish to include these in their diet. In one study, both riboflavin (5 milligrams) and folic acid (400 micrograms) normalized nutrient levels in the body. Vitamin B<sub>6</sub> has been shown to improve the effectiveness of folic acid. Because other studies have found that folic acid alone does not reduce the risk of colon cancer, there appears to be some benefit to taking folic acid with riboflavin and vitamin B<sub>6</sub>. Vitamin D at intakes of 1,000 to 2,000 IU per day have been shown to reduce the risk of colon cancer by 50 percent. In another study, calcium also was protective at 1,200 milligrams per day in both men and women. In fact, the benefits lasted five years after the study concluded. However, men should consult with their physicians before using calcium supplements, as they have been shown to increase the risk of prostate cancer. Lycopene (30 milligrams per day) may lower colon cancer risk by blocking insulin-like growth factor-1, which is thought to be responsible for colon cancer.

Omega-3 fats from fish appear to be protective against colon cancer by decreasing the formation of inflammatory eicosanoids. Eating just two servings of fish a week was shown to reduce the risk by about 25 percent. It is also helpful in controlling inflammation associated with ulcerative colitis.

See also DIVERTICULITIS and MALABSORPTION SYNDROME, both in Part Two.

### UNDERWEIGHT/WEIGHT LOSS

Some people are thinner than average all their lives and are perfectly healthy that way. For others, however, underweight may be associated with health problems. This is particularly true if the condition results from unintended, perhaps sudden, weight loss. Unintended weight loss can result from a malabsorption problem; intestinal parasites; certain types of cancer; a colon disorder such as Crohn's disease, ulcerative colitis, or diverticulitis; or a chronic illness such as diabetes, chronic diarrhea, or hyperthyroidism. Surgery, stress, or trauma, such as the loss of a loved one, can also contribute to loss of appetite and weight loss.

Underweight can also be caused by treatments such as cancer chemotherapy and radiation therapy, whose side effects include nausea, vomiting, and loss of appetite. An individual who is underweight but believes he or she weighs too much may be suffering from an eating disorder. Some patients with AIDS who are not getting the newer HAART therapy may suffer from what is known as "wasting syndrome," in which they become more and more emaciated as the disease progresses.

Weight loss may in turn cause nutritional deficiencies that further impair health and complicate recovery. Two age groups for whom poor nutrition is a special problem are the very young and the very old. Malnutrition in childhood, especially in infancy, can have permanent effects because it interferes with normal growth and development. Children also have less in the way of nutritional reserves in their bodies to draw upon if intake or absorption of nutrients is inadequate. At the other end of the life span, many elderly people find themselves less and less interested in eating as time goes by, and reduced financial resources may add to the incentive to skip meals. As a result, older people have an increased risk of becoming malnourished.

The suggestions in this section are intended for older people who require nutritional rehabilitation. The dosages are intended for adults. They may also be useful for people who have higher than normal nutritional requirements, such as people who have hepatitis or are undergoing cancer treatment, and those who are recovering from burns or trauma. A child who is undernourished or stops gaining weight should be seen by a physician.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Essential</b>		
Raw liver extract	As directed on label.	Excellent source of B vitamins and minerals. Use liver extract from organically raised beef. Use a liquid form for easy assimilation.
Vitamin A plus carotenoid complex with natural beta-carotene	10,000 IU daily. As directed on label.	Antioxidants that enhance immunity and aid in fat storage. Essential for protein utilization.
Vitamin B complex	100 mg of each major B vitamin daily, with meals. (amounts of individual vitamins in a complex will vary).	Increases the appetite and aids in digestion of fats, carbohydrates, and protein. Use a sublingual form for best absorption. Injections (under a doctor's supervision) may be necessary.
Vitamin C with bioflavonoids	3,000 mg daily, in divided doses.	Helps to prevent cancer, protects against infection, and enhances immunity.
Vitamin D	400 IU daily.	Necessary for healthy bone formation.
Vitamin E	200 IU daily.	A powerful antioxidant that helps help prevent cancer and inhibits the formation of free radicals. Use d-alpha-tocopherol form.
Zinc	80 mg daily. Do not exceed 100 mg daily from all supplements.	Improves the senses of taste and smell. Use zinc gluconate lozenges or OptiZinc for best absorption.
<b>Important</b>		
Essential fatty acids (Ultimate Oil from Nature's Secret)	As directed on label.	A most important element of the diet.

Free form amino acid	As directed on label.	To supply needed protein in a form that is readily available and easily metabolized. Use a formula containing all the essential amino acids.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Provides protection against free radicals. Contains many essential nutrients.
Inf-zyme Forte from American Biologics	4 tablets 3 times daily, with meals.	Aids in the proper breakdown of proteins, fats, and carbohydrates for better absorption of foods.
Quercetin	As directed on label.	Aids in preventing reactions to certain foods, pollens, and other allergens. Increases immunity.
plus bromelain	As directed on label.	Enhances the effectiveness of quercetin.
<b>Helpful</b>		
Brewer's yeast	As directed on label.	Stimulates the appetite and supplies B vitamins.
Floradix Iron + Herbs from Salus Haus	As directed on label. But only if your physician says you need iron.	Increases appetite and helps digestion.
Multienzyme complex	As directed on label.	Aids digestion.
Multivitamin and mineral supplement	As directed on label.	To supply a balance of all needed vitamins and minerals. Use a high-potency formula.
Spiru-tein from Nature's Plus	As directed on label. Take between meals.	A safe protein supplement.

### Herbs

Alfalfa, blessed thistle, caraway, cayenne (capsicum), celery, dill, fennel, hyssop, and lady's mantle all work to stimulate the appetite.

Astragalus protects the immune system, helps with digestion, and combats fatigue.

*Caution:* Do not use astragalus in the presence of a fever.

Fenugreek and ginseng have long been used as appetite stimulants and digestive aids, especially for older adults.

*Caution:* Do not use ginseng if you have high blood pressure, or are pregnant or nursing.

### Recommendations

If you think you may be underweight, and particularly if you are experiencing unintended weight loss, have a complete medical examination to check for an underlying physical disorder. You may have a health problem that requires treatment. An unintentional weight loss of five pounds in an adult should be a trigger to seek help. Be concerned about an infant or young child who suddenly seems to stop gaining weight normally.

Eat a diet consisting of at least 300 grams of complex carbohydrates, 100 grams of protein, and 2,500 to 3,000 calo-

ries a day. Include starchy vegetables, such as potatoes and beans, as well as grains, turkey, chicken, fish, eggs, avocados, olive oil, safflower oil, raw cheeses, nuts, and seeds. Eat only whole-grain breads, pasta, crackers, and hot and cold cereals.

Eat nondairy soy-based cream soups. Soymilk can be used in the same ways as cow's milk. Cream soups are usually higher in protein and calories than broth soups.

Drink herbal teas, fruit and vegetable juices, and mineral water. When drinking non-caloric beverages such as water and tea, add some honey to increase calorie intake.

Eat frequent but small meals and snacks, and eat them slowly. If you are undernourished, you may lose your appetite if confronted with large amounts of food at one sitting. You can always have additional servings if you are still hungry after the first.

Do not eat fried or junk foods for extra calories. Instead, eat high-calorie snacks such as the following between meals or before bedtime: raw cheese; banana soy pudding; turkey, chicken, or tuna sandwiches with cheese; raw nuts; rice crackers with nut butter; yogurt; yogurt fruit shakes; carob soymilk; almond milk; buttermilk; custard; nuts; and avocados.

Eliminate from the diet coffee, tea, and anything else (such as soft drinks) that contains caffeine.

If possible, get regular moderate exercise. Walking and similar activities are good. Moderate exercise helps in the assimilation of nutrients and in increasing the appetite. Avoid strenuous exercise.

Eat in relaxed surroundings. Do not try to eat when you are upset or nervous.

If you smoke, stop.

Investigate the possibility of food allergies. (See ALLERGIES in Part Two.) Avoid any foods you think you may be allergic to.

Consult your physician about any medications you may be taking. Some medications can cause a decrease in appetite that can result in weight loss.

If other people comment on your thinness but you feel you actually could stand to lose weight, consider professional evaluation for an eating disorder. (See ANOREXIA NERVOSA and/or BULIMIA in Part Two.)

### Considerations

Unexplained (and perhaps unwanted) weight loss among older adults can have a variety of causes, many of them physiological. These can include the following:

- As people grow older, food can lose its appeal as the senses of taste and smell diminish.
- Dental problems may hinder eating habits.
- Older people who live alone may suffer depression,

loneliness, and paranoia, and thus neglect their personal diets.

- Medications can reduce appetite or change how people taste food.

- Older people on fixed incomes may not be able to afford their favorite foods.

- Health problems associated with aging, such as cancer, often retard the appetite.

Consideration of the appearance and smell of the food, as well as the eating environment, is important when trying to stimulate a poor appetite.

The color red helps to stimulate taste buds. (See COLOR THERAPY in Part Three.)

See also APPETITE, POOR.

### URINARY TRACT INFECTION

See BLADDER INFECTION (CYSTITIS); KIDNEY DISEASE (RENAL FAILURE); and VAGINITIS.

### UTERINE PROLAPSE

See PROLAPSE OF THE UTERUS.

### UVEITIS

See under EYE PROBLEMS.

### VAGINITIS

The symptoms of vaginitis, or inflammation of the mucous membranes lining the vagina, include a burning and/or itching sensation and abnormal vaginal discharge. Vaginitis may be caused by bacterial or fungal infection, vitamin B deficiency, or irritation from excessive douching or the use of such products as deodorant sprays. Infectious vaginitis is often caused by trichomonas, gonococci, or other sexually transmitted organisms. Other factors, such as poor hygiene and tight, nonporous clothing, may contribute to the problem. Pregnancy, diabetes, and the use of antibiotics disturb the body's natural balance, creating an environment in which infectious organisms can thrive. Oral contraceptives also can produce vaginal inflammation.

Atrophic vaginitis is a condition primarily found in postmenopausal women and those whose ovaries have been surgically removed. This disorder can result in the formation of adhesions and a high susceptibility to infection. Common symptoms include itching or burning, painful intercourse, and a thin, watery discharge, occasionally tinged with blood.

Unless otherwise specified, the dosages recommended here are for adults. For a girl between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label 3 times daily, with meals. Also open 3 capsules and dissolve in 1 qt warm water with 6 drops tea tree oil added to use as a douche.	To replenish normal "friendly" bacteria. Use a nondairy formula.
Biotin	300 mcg 3 times daily.	Inhibits yeast.
Essential fatty acids	As directed on label.	Aids healing.
Garlic (Kyoalic from Wakunaga)	1 capsule 3 times daily, with meals.	Has antifungal properties.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	50–100 mg of each major B vitamin, 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	Regulates metabolism and promotes good health. Often deficient in people with vaginitis. Use a high-potency formula. Especially important if using estrogen cream for treatment of atrophic vaginitis.
Yeast-Gard from Lake Consumer Products	As directed on label.	Excellent antifungal agent. Reduces pain.
<b>Helpful</b>		
N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label.	Amino acid compound. Forms the basis of complex molecular structures that are key parts of mucous membrane tissue.
Vitamin A with mixed carotenoids including beta-carotene plus vitamin E	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. 200 IU daily.	Powerful antioxidants that aid healing. Use d-alpha-tocopherol form.
Vitamin C with bioflavonoids	2,000–5,000 mg daily, in divided doses.	Important immune system stimulant. Necessary for tissue healing.
Vitamin D with extra calcium and magnesium	1,000 mg daily. 1,500 mg daily. 1,000 mg daily.	To relieve stress. Women need supplements of these nutrients at this time.
Zinc	30 mg daily. Do not exceed a total of 100 mg daily from all supplements.	To increase immunity and promote proper utilization of vitamin A. Also reduces severity of herpes outbreaks. Use zinc gluconate lozenges or OptiZinc for best absorption.

## Herbs

- Aloe vera is helpful for infections and is known for its healing effects. Aloe vera gel can be applied topically to relieve itching. It can also be taken internally or used in a douche.
- Barberry has remarkable infection-fighting properties.
- Douche with infusions made from antiseptic herbs such as calendula, garlic, goldenseal, fresh plantain, St. John's

wort, or tea tree oil, along with herbs such as comfrey leaves, to soothe irritation. Echinacea and goldenseal can also be taken orally.

**Cautions:** Comfrey is recommended for external use only. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

Calendula and vitamin A vaginal suppositories are soothing and healing to irritated tissues. Goldenseal suppositories are useful for all types of infection.

**Caution:** Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Chamomile has antifungal properties.

**Caution:** Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

Cinnamon and dandelion inhibit the growth of *Candida albicans*. They can be used as a douche or taken internally.

**Caution:** Do not use cinnamon in large quantities during pregnancy.

Echinacea has antifungal properties and enhances the immune system. It can be taken internally or used as a douche.

**Caution:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Pau d'arco contains natural antibiotic agents and has a healing effect. It can be taken in capsule form, made into a tea, or used as a douche.

Tea tree oil is good for vaginitis. Topical tea tree oil cream is effective against fungal infection, herpes blisters, warts, and other types of infection. Tea tree oil suppositories have been used successfully for vaginal yeast infections.

## Recommendations

Eat plain yogurt that contains live yogurt cultures, or apply plain yogurt directly to the vagina. This can help fight infection and soothe inflammation. Also consume brown rice, millet, and acidophilus.

- Consume fiber daily. Oat bran is a good source.
  - Eat a diet that is fruit-free, sugar-free, and yeast-free.
  - Avoid aged cheeses, alcohol, chocolate, dried fruits, fermented foods, all grains containing gluten (wheat, oats, rye, and barley), ham, honey, nut butters, pickles, raw mushrooms, soy sauce, sprouts, sugar in any form, vinegar, and all yeast products. Also eliminate citrus and acidic fruits (grapefruits, lemons, limes, oranges, pineapple, and tomatoes) from your diet until the inflammation subsides.
  - Keep clean and dry. Wear cotton underwear, which absorbs moisture and allows air to circulate. Avoid tight clothing and synthetic fabrics. Change into dry clothing as soon as possible after swimming. Do not spend prolonged periods of time in a wet bathing suit.
  - To relieve itching, open a vitamin E capsule and apply the oil to the inflamed area.
  - Add 3 cups of pure apple cider vinegar to bathwater to treat vaginitis. Soak in the tub for twenty minutes, allowing the water to flow into the vagina.
  - Do not use corticosteroids or oral contraceptives until your condition improves. Oral contraceptives can upset the balance of microorganisms in the body.
  - Do not use sweet-smelling douches. Try douching with 2 capsules of garlic or with 1 cup of fresh garlic juice added to a quart of warm water. Alternate this treatment with acidophilus douches: Open 2 acidophilus capsules and add them to either 1 quart of warm water or to 1 cup of plain yogurt. The garlic fights infection while the acidophilus helps to restore normal flora and acid balance.
  - Avoid taking iron supplements until the inflammation subsides. Infectious bacteria require iron for growth. If a bacterial infection is present, the body naturally "hides" iron by storing it in the liver, spleen, and bone marrow to inhibit the growth of the bacteria.
- Caution:* Check with your physician before taking iron supplements.
- Drink steam-distilled water only.

### Considerations

- You may need antibiotics to clear the infection, if it is bacterial. Check with your physician if your pain and/or itching lasts more than a week. Refrain from intercourse until your infection has cleared.
- Atrophic vaginitis is often treated with prescription estrogen ointments. The use of these products increases the body's need for vitamin B<sub>6</sub>. Vaginal absorption of synthetic estrogen may be dangerous.
- Natural progesterone cream applied to the vagina is beneficial for atrophic vaginitis.
- See also BLADDER INFECTION (CYSTITIS); CANDIDIASIS; KIDNEY DISEASE (RENAL FAILURE); and SEXUALLY TRANSMITTED DISEASE (STD), all in Part Two.

### VARICOSE VEINS

Varicose veins are abnormally enlarged, bulging, bluish, and lumpy-looking veins, often associated with dull, nagging aches and pains. This is the result of malfunctioning valves inside the veins. When blood pulses through the arteries, powered by the beating of the heart, to provide nutrients and oxygen to the body tissues, it returns to the heart by means of the veins. Like the arteries, the veins are tube-shaped vessels in graduated sizes, but unlike the arteries, the veins have tiny valves on their inner walls to prevent the blood from flowing backward, toward the arteries. If the valves do not work properly, circulation is impaired and blood accumulates in the veins, stretching them. Swelling, restlessness, leg sores, itching, leg cramps, and a feeling of heaviness in the legs are characteristic of varicose veins.

Because poor circulation contributes to the formation of varicose veins, they are more common in people who sit or stand in one position for prolonged periods of time, people who habitually sit with their legs crossed, and those who lack proper regular exercise. Excess weight, heavy lifting, and pregnancy put increased pressure on the legs, increasing the likelihood of developing varicose veins. Constipation, heart failure, liver disease, and abdominal tumors can also play a role in the formation of varicose veins. A deficiency of vitamin C and bioflavonoids (mainly rutin) can weaken the collagen structure in the vein walls, which can lead to varicose veins. A tendency toward varicose veins may also run in families. Some experts believe that hormone replacement therapy (HRT) and birth control pills can contribute to the formation of varicose veins. It is estimated that approximately 50 to 55 percent of all middle-aged American women and 40 to 45 percent of men have at least some varicosities. More women than men are affected.

Most cases of varicose veins do not pose a serious problem and can be managed with simple home measures. In some cases, however, if varicose veins are not treated properly, complications such as bleeding under the skin, deep vein blood clots, an eczema-like condition near the affected veins, or ulcerated spots near the ankles may occur. Other possible, and more serious, complications that can arise include phlebitis (inflammation of a vein), thrombophlebitis (formation of a clot in an inflamed vein), post-thrombotic syndrome (indicated by a number of symptoms including leg ulcers), hemorrhage from a ruptured vein, or pulmonary embolism (a blood clot that travels to the lung and lodges there).

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Coenzyme Q <sub>10</sub>	100 mg daily.	Improves tissue oxygenation, increases circulation, and enhances immunity
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	50 mg 3 times daily.	Improves oxygen utilization in the tissues.
Essential fatty acids (Ultimate Oil from Nature's Secret)	As directed on label.	Reduces pain and helps to keep blood vessels soft and pliable.
Glutathione	As directed on label.	Protects the heart, veins, and arteries from oxidant damage.
Pycnogenol or grape seed extract	As directed on label. As directed on label.	Stimulates blood circulation, boosts immunity, neutralizes free radicals, and strengthens connective tissue, including that of the cardiovascular system.
Vitamin C plus bioflavonoid complex plus extra rutin	3,000–6,000 mg daily. 100 mg daily. 50 mg 3 times daily.	Aids circulation by reducing blood clotting tendencies. To promote healing and prevent bruising. A potent noncitrus bioflavonoid that helps maintain the strength of blood vessels.
<b>Important</b>		
Vitamin E	200 IU daily.	Improves circulation and aids in preventing heavy feeling in the legs. Use d-alpha-tocopherol form.
<b>Helpful</b>		
Aerobic Bulk Cleanse from Aerobic Life Industries	As directed on label. Take separately from other supplements and medications.	Keeping the colon clean is important.
Brewer's yeast	As directed on label.	Contains needed protein and B vitamins.
Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Fat emulsifier that aids circulation.
Multivitamin and mineral complex	As directed on label.	To maintain a balance of all necessary nutrients.
Vitamin A plus natural carotenoid complex (Betatene)	10,000 IU daily. As directed on label.	To enhance immunity, protect the cells, and slow the aging process.
Vitamin B complex  plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50–100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 50 mg daily. 300–1,000 mcg daily.	B vitamins are needed to help in digestion of foods. Sublingual forms are best for all the B vitamins.

Vitamin D plus calcium and magnesium	1,000 mg daily, at bedtime. 1,500 mg daily, at bedtime. 750 mg daily, at bedtime.	This combination helps to relieve leg cramps. Use calcium chelate form.
Zinc plus copper	80 mg daily. 3 mg daily.	Aids healing. Needed to balance with zinc.

## Herbs

- Aloe vera gel is a cooling and soothing topical treatment for varicose veins.
- Bilberry supports the health of connective tissue, including that of the veins.
- Bromelain can reduce the risk of clot formation in the blood vessels.
- Butcher's broom, ginkgo biloba, gotu kola, and hawthorn berries improve circulation in the legs.
- Cayenne helps to relieve pain and inflammation, and also expands blood vessels, reducing stress on the capillaries. It is available in capsule and cream forms.
- Dandelion alleviates tissue swelling by reducing water retention.
- Horse chestnut makes a good treatment for the discomfort of varicose veins. Mix ½ teaspoon of horse chestnut powder with 2 cups of water, and moisten a sterile cotton gauze cloth with the mixture. Rub the cloth gently over the affected area. This is soothing to inflamed veins. Witch hazel can be used in the same way to reduce discomfort.
- Horse Chestnut Cream from Planetary Formulas is a topical formula containing horse chestnut, butcher's broom, witch hazel, white oak, and myrrh. It can be used to reduce the appearance of varicose veins.
- Herbs used in traditional Chinese medicine that are helpful in alleviating symptoms include magnolia flower (*Magnolia liliflora*, also known as xho yi hua), scutellaria (*Scutellaria baicalensis*, or huang qin; also known as Baikal skullcap), trichosanthe (*Trichosanthes kirilowii*), and wild angelica (*Angelica dahurica*, or bai zhi).
- Bathing your legs or other affected area in white oak bark tea three times a day helps to stimulate blood flow. Simmer (but do not boil) a strong tea and use the tea to make compresses. Apply the compresses to affected areas.

## Recommendations

- Eat a diet that is low in fat and refined carbohydrates and includes plenty of fish and fresh fruits and vegetables.
- Eat as many blackberries and cherries as you can. These may help prevent varicose veins, or ease the symptoms if you already have them.

- Include garlic, ginger, onions, and pineapple in your diet.
- Make sure that your diet contains plenty of fiber to prevent constipation and keep the bowels clean.
- Avoid animal protein, processed and refined foods, sugar, ice cream, fried foods, cheeses, peanuts, junk foods, tobacco, alcohol, and salt.
- Maintain a healthy weight and get regular moderate exercise. Walking, swimming, and bicycling all promote good circulation. Change your daily routine to allow more time for exercise and movement for your legs.
- Wear loose clothing that does not restrict blood flow. It is a good idea to wear supportive elastic stockings; these help to support the varicose veins and prevent swelling.
- Elevate your legs above heart level for twenty minutes at least once a day to alleviate symptoms.
- Avoid long periods of standing or sitting. Avoid crossing your legs, doing heavy lifting, and putting any unnecessary pressure on your legs.
- If you sit at a desk all day at work, make sure to get up and walk around periodically. You can also flex your leg muscles and wiggle your toes to increase blood flow. If possible, try to rest your feet on an object that is elevated from the floor when seated.
- If you have to stand for long periods of time, shift your weight between your feet, stand on your toes, or take short walks to alleviate pressure.
- Elevate your feet in front of you while sitting down to read or watch television.
- After bathing, apply castor oil directly over the problem veins and massage the oil into your legs from the feet up.
- To help improve circulation and ease pain, fill a tub with cold water. Stand in the water and simulate walking.
- Try using homeopathic remedies to ease symptoms. Homeopathic remedies that have been used to treat varicose veins include *Ferrum metallicum*, *Hamamelis virginiana*, and *Pulsatilla*.
- Avoid scratching the itchy skin above varicose veins. This can cause ulceration and bleeding.

### Considerations

- Cellulose is an indigestible carbohydrate found on the outer layer of vegetables and fruits. Good for alleviating symptoms, it can be found in apples, beets, Brazil nuts, broccoli, carrots, celery, green beans, lima beans, pears, peas, and whole grains.
- Some physicians treat varicose veins by injecting a sodium tetradecyl sulfate (saline) solution into the affected vein and applying compression bandages for a period of time. The solution fuses the vein walls together permanently, closing the defective vein. The body compensates for lost vessels by finding an alternate route for blood flow.

Tell your doctor if you are pregnant or want to become pregnant. Also tell your doctor what medications you are taking; some medicines may interact with this treatment.

- Spider veins are chronically dilated capillaries near the surface of the skin. They are harmless and rarely cause any problems, although they can be distressing for cosmetic reasons.
- Hemorrhoids are actually varicose veins of the anus or rectum. Symptoms of hemorrhoids include rectal itching, pain, and blood in the stool. (See HEMORRHOIDS in Part Two.)
- Massage therapy can aid in stimulating the legs. You should not massage the veins directly, but instead massage the area around them and upward toward the heart.
- Compression therapy, in which a compression garment of some type is used to exert pressure on the legs in an effort to help the venous valves close properly, may be helpful in alleviating symptoms.
- Dimethylsulfoxide (DMSO) has been used to relieve the swelling and pain of severe varicose veins. This liquid, a by-product of wood processing, is applied topically to the affected area as needed.

*Cautions:* Do not apply DMSO to hemorrhoids. Only pure DMSO from a health food store should be used. Commercial-grade DMSO such as that found in hardware stores is not suitable for healing purposes. Any contaminants on the skin or in the product can be taken into the tissues by action of the DMSO.

*Note:* The use of DMSO may result in a garlicky body odor. This is temporary, and is not a cause for concern.

- The symptoms of varicose veins are similar to those of thrombophlebitis. In addition, the chances of developing varicose veins increase greatly if you suffer from thrombophlebitis. (See THROMBOPHLEBITIS in Part Two.)
- Sclerotherapy is a treatment sometimes recommended for varicose veins. In this procedure, an irritant is injected into the vein, causing it to become nonfunctional, and subsequently shrink and fade. There are potential mild complications with this procedure.
- Surgical removal of varicose veins is a treatment option that may be recommended if the veins are causing a considerable amount of discomfort. The operation results in scarring.
- Vein stripping is a medical treatment in which a main superficial vein is removed and the veins connected to it tied off, forcing the blood to return to the heart through the deeper leg veins.
- A more recent technique involves inserting a catheter into the vein, then heating it with radio-frequency or laser-generated heat. As the catheter is slowly withdrawn, it collapses the damaged vein. These veins then are gradually absorbed into the body. Large veins must still be removed surgically later, but the additional procedure adds little to the pain and inconvenience overall. However, this proce-

ture is performed by only a handful of surgeons and is still considered experimental.

❑ Valve repair is another treatment option for varicose veins. In this procedure, a synthetic material is used to restore the valve.

❑ See CIRCULATORY PROBLEMS in Part Two.

❑ See also under PREGNANCY-RELATED PROBLEMS in Part Two.

## VENEREAL DISEASE

See SEXUALLY TRANSMITTED DISEASE (STD).

## VERTIGO

Vertigo is a sensation of dizziness, faintness, or lightheadedness that results from an impaired sense of balance and equilibrium. The term comes from *vertere*, the Latin verb meaning “to turn.” A person suffering from vertigo may feel that he or she is sinking or falling and/or that the room and objects in it are spinning around. In some cases, the individual may feel that he or she is spinning, too. Vertigo is sometimes accompanied by nausea and hearing loss. Vertigo is not an illness in itself—it is a symptom of another condition.

Vertigo occurs when the central nervous system receives conflicting messages from the inner ears, eyes, muscles, and skin pressure receptors. This may result from any of a variety of causes including:

- Benign paroxysmal positional vertigo (BPPV). It is the most common form of vertigo and is characterized by the sensation of motion initiated by sudden head movements.
- Inflammation within the inner ear. This is known as labyrinthitis. This condition is characterized by the sudden onset of vertigo and may be associated with hearing loss.
- Ménière’s disease. It is composed of a triad of symptoms: episodes of vertigo, ringing in the ears, and hearing loss. People have the abrupt onset of severe vertigo and fluctuating hearing loss, as well as periods in which they are symptom-free.
- Acoustic neuroma. A type of tumor. Symptoms include vertigo with one-sided ringing in the ear and hearing loss.
- Decreased blood flow to the brain and base of the brain. Bleeding into the back of the brain is known as cerebellar hemorrhage and is characterized by vertigo, headache, difficulty walking, and inability to look toward the side of the bleed. The result is that the person’s eyes gaze away from the side with the problem. Walking is also extremely impaired.
- Multiple sclerosis. Vertigo is often the presenting symptom in MS. The onset is usually abrupt, and examina-

tion of the eyes may reveal the inability of the eyes to move past the midline toward the nose.

- Head trauma and neck injury. This vertigo usually goes away on its own.
- Migraine, a severe form of headache. The vertigo is usually followed by a headache. There is often a prior history of similar episodes but no lasting problems.

Because of the effects of aging on the body, older people are more prone than others to vertigo. The body maintains a sense of balance through a complex mechanism involving both the inner ears and visual input. Within the canals of the inner ears, there are structures called *otoliths*, which are minute calcium carbonate crystals that press upon the hairlike cells that line the inner membranes. Gravity acts on the otoliths so that they shift in response to head movements. This bends the hairlike cells, which, in turn, transmit signals to the brain. The brain then uses these signals to calculate the positioning of the head. As people age, tiny bits of debris may accumulate in the inner ears and press against the hairlike cells, resulting in false signals being sent to the brain. This can interfere with the sense of balance and result in vertigo. In addition, with increasing age, nerve impulses require more time to travel from the eyes to the brain and spinal cord. This can cause dizziness and loss of balance upon sudden movement.

Dizziness is not synonymous with vertigo. Anyone may occasionally experience a feeling of lightheadedness, dizziness, unsteadiness, or the sensation of feeling faint. Those with low blood pressure may have this feeling upon rising quickly from a sitting or lying position. In some cases, dizziness can be a warning sign of a heart attack, stroke, concussion, or brain damage.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Dimethylglycine (DMG) (Aangamik DMG from FoodScience of Vermont)	As directed on label.	Increases oxygen supply to the brain.
Vitamin B complex	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	B vitamins are necessary for normal brain and central nervous system function. Consider injections (under a doctor’s supervision) for better absorption. If injections are not available, use sublingual forms.
plus extra vitamin B <sub>3</sub> (niacin)	100 mg 3 times daily. Do not exceed this amount.	Improves cerebral circulation and lowers cholesterol.

and vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50 mg daily.  1,000–2,000 mcg daily.	<i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.  A sublingual form is recommended.
Vitamin C with bioflavonoids	3,000–10,000 mg daily, in divided doses.	Antioxidants that also improve circulation.
Vitamin E	200 IU daily.	Improves circulation. Use d-alpha-tocopherol form.

<i>Important</i>		
Choline and inositol and/or lecithin	As directed on label, 3 times daily.  As directed on label.	Necessary in nerve function. Help to prevent hardening of the arteries and improve brain function.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	100–200 mg daily.  As directed on label.	Improves circulation to the brain. Works well with coenzyme Q <sub>10</sub> to support the immune system's detoxification of many dangerous substances.
Vitamin A with mixed carotenoids including natural beta-carotene	10,000 IU daily.	Enhances immunity and acts as an antioxidant.
Zinc	30 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Promotes a healthy immune system and helps maintain vitamin E levels. Use zinc gluconate lozenges or OptiZinc for best absorption.

<i>Helpful</i>		
Brewer's yeast	½ tsp daily for 3 days, then increase to 1 tbsp daily.	Contains balanced B vitamins.
Calcium and magnesium	1,500 mg daily.  750 mg daily.	Important in maintaining regular nerve impulses. To help prevent dizziness.
Kelp	1,000–1,500 mg daily.	For necessary balanced minerals and vitamins.
Melatonin	1.5–5 mg daily, taken 2 hours or less before bedtime.	Helps to maintain equilibrium.
Multivitamin and mineral complex	As directed on label.	For necessary balance of vitamins and minerals.

**Herbs**

- Black cohosh lowers blood pressure.

*Caution:* Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems.

- Butcher's broom and cayenne (capsicum) help improve circulation.
- Dandelion tea or extract is very good for high blood pressure.

- Ginger relieves dizziness and nausea.
- Ginkgo biloba improves circulation and improves brain function by increasing the supply of oxygen to the brain. Take 120 milligrams of ginkgo biloba extract daily.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

**Recommendations**

- Avoid making rapid or extreme movements and rapid changes in body position.
- Limit your total sodium intake to about 2,000 milligrams per day. Too much sodium can disrupt the workings of the inner ear.
- Avoid alcohol, caffeine, nicotine, and all fried foods.
- To subdue dizziness, sit in a chair with your feet flat on the floor and stare at a fixed object for a few minutes.
- If you begin to experience dizziness soon after taking new medication, the problem may be drug related. Discuss the problem with your physician or pharmacist.
- If vertigo is a recurring problem, consult your health care provider. It may be a sign of an underlying problem that requires treatment.

**Considerations**

- People who have vertigo sometimes experience a phenomenon called nystagmus, involuntary rapid or jerky eye movements. It may occur spontaneously or as a result of changing positions. Nystagmus, or any other unusual eye movement, always requires the attention of a physician.
- Dizziness can be caused by many different things, some of them serious. If you feel dizzy and find it difficult to speak, swallow, or think clearly, seek medical attention. These may be the symptoms of a stroke. Numbness and tingling or loss of vision accompanied by dizziness also can be signs of a stroke.
- If dizziness is accompanied by nausea, sweating, and paleness of complexion with a racing heartbeat, seek medical attention. This can be a sign of a number of different health problems, including a heart attack, or, if you have diabetes, a hypoglycemic (low blood sugar) episode. Hypotension, or a sudden drop in blood pressure, also can cause sudden dizziness, especially after meals.
- Air contains less oxygen at altitudes high above sea level. Lower oxygen levels can cause mild, temporary dizziness or light-headedness.
- Certain activities, such as taking amusement park rides, watching action movies, sailing, or playing video games, may bring on vertigo or dizziness. In such cases, symptoms diminish soon after the activity ceases.
- Treatment for benign paroxysmal positional vertigo usually entails special exercises and, sometimes, surgery.

See also ARTERIOSCLEROSIS/ATHEROSCLEROSIS; CARDIOVASCULAR DISEASE; and MENIÈRE'S DISEASE in Part Two.

## VITILIGO

Vitiligo, also called leukoderma, is a skin condition characterized by chalky white patches of skin surrounded by a dark border. The spots can be few or many; they may be tiny or cover the body. They usually appear on both sides of the body in approximately the same place (for example, you may have exactly the same white patches on the top of your left and right feet), and they do not hurt or itch. These spots occur because, for some reason, the cells that normally produce the skin pigment melanin are absent. If the affected area is on the scalp, the hair that grows from it is likely to be white as well.

Vitiligo itself is not a threat to health. However, it has been linked with other diseases in some cases, including Addison's disease, pernicious anemia, and alopecia areata (patches of hair loss). The exact cause of vitiligo is not known, but it can run in families and may be related to an autoimmune problem. A thyroid gland malfunction may be involved as well. Vitiligo can also occur after physical trauma to the skin. Chemical agents such as catechol (used for tanning and dyeing) and phenol (often found in disinfectants) may be involved in the development of this condition. Physical and emotional stress may aggravate the condition. The unpigmented spots are a concern primarily for cosmetic reasons and are highly vulnerable to sunburn.

Unless otherwise specified, the dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Vitamin B complex	50 mg and up of each major B vitamin, 3 times daily (amounts of individual vitamins in a complex will vary).	Needed for proper skin tone and texture. Helps to combat stress. A sublingual form is recommended.
plus extra vitamin B <sub>5</sub> (pantothenic acid) and para-aminobenzoic acid (PABA)	300 mg daily, in divided doses. 100 mg and up, 3 times daily.	The antistress vitamin. Important in skin pigmentation. A sublingual form is best. Aids in stopping discoloration of the hair. Consider injections (under a doctor's supervision).
<b>Important</b>		
Essential fatty acids (primrose oil or Ultimate Oil from Nature's Secret)	As directed on label.	Stimulates hormone function and contains all the needed essential fatty acids.

### Helpful

Ageless Beauty from Biotec Foods	As directed on label.	Protects the skin from free radical damage.
Calcium and magnesium	1,000 mg daily. 500 mg daily.	Deficiency contributes to fragility of the skin. Needed to balance with calcium.
Methylsulfonylmethane (MSM)	As directed on label.	Possesses remarkable therapeutic properties for the skin. Helps to detoxify the body on a cellular level.
Multivitamin and mineral complex	As directed on label.	To maintain a balance of all essential nutrients.
S-Adenosylmethionine (SAMe)	As directed on label.	Aids in relief of stress and depression, eases pain, and has antioxidant effects. <i>Caution:</i> Do not use if you have bipolar mood disorder or take prescription antidepressants. Do not give to a child under twelve.
Silica	As directed on label.	Important for developing skin's strength and elasticity; stimulates collagen formation.
Vitamin A plus carotenoid complex with beta-carotene	10,000 IU daily. As directed on label.	To promote healing and construction of new skin tissue.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Necessary for the formation of collagen, a protein that gives skin its flexibility. Also fights free radicals and strengthens the capillaries that feed the skin.
Vitamin E	200 IU daily.	Protects against free radicals that can damage the skin. Use d-alpha-tocopherol form.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	For tissue strength and repair. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed for collagen production and healthy skin. Also needed to balance with zinc.

### Herbs

The use of picrorrhiza (an Indian herb used in Ayurvedic medicine) has been shown to reduce the number and size of unpigmented skin patches.

St. John's wort can help reduce stress and anxiety.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs, including antidepressants, birth control pills, and anticoagulants.

Ginkgo biloba (40 milligrams, three times a day) was shown to arrest the progression of the condition. Ginkgo is a potent antioxidant and immune booster.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

## Recommendations

- Consult a nutritionally oriented physician for vitamin B complex plus PABA injections (*see under* Nutrients, above).
- Treat the affected area gently—cleanse gently, apply moisturizers liberally, and protect exposed areas from cleansing agents or other chemicals by wearing protective gloves or clothing.
- Expose patches of affected skin to the sun—this may promote repigmentation—but don't overdo it. Use adequate sun protection on the affected area, and always apply a sunscreen with a sun protection factor (SPF) of 15 or higher to any unpigmented areas. They have no natural protection against the sun's ultraviolet rays.

## Considerations

- Vitiligo sometimes responds to the use of PABA and magnesium. Small spots of pigment appear gradually, like freckles. The spots gradually merge until normal color is restored. Some people with vitiligo have prematurely gray or white hair. A small percentage of such people treated with PABA and magnesium have experienced a return of both skin and hair to the original color.
- Vitiligo lesions may be de-emphasized by the use of commercial cosmetics that cover the affected area with an opaque, waterproof layer. DermaBlend is one widely available product. (*See* Manufacturer and Distributor Information in the Appendix.)
- Creams and lotions that contain antioxidants such as ginkgo biloba, green tea, vitamin C, and carotenes may be helpful.
- Creams containing fluorinated steroids may be prescribed to stimulate repigmentation of the skin.
- For persons with widespread vitiligo, bleaching of the unaffected skin with hydroquinone (a weak but safe depigmenting agent) may be recommended. (A commonly used form is 20 percent monobenzyl ether.) This is done to minimize the difference in color between pigmented and depigmented areas. The process is irreversible, and it can take from several months to years to complete.
- Psoralen plus ultraviolet light A (PUVA) therapy is often used to treat vitiligo. This therapy combines ultraviolet light with an oral drug, and has proven to be effective, even for those with advanced symptoms. However, this treatment has many potential side effects for some individuals, including eye problems, liver damage, nausea, and skin blistering. Often hundreds of procedures are necessary. PUVA seems to work better when combined with a prescription vitamin D<sub>3</sub> cream. One study showed that light therapy was enhanced with L-phenylalanine and alpha-lipoic acid.
- B<sub>12</sub> and folic acid were shown to be ineffective at improving the treatment outcome of vitiligo with narrow-band UVB phototherapy.

- For mild forms of vitiligo, topical corticosteroids may be used to restore small patches of nonpigmented skin.
- Autologous melanocyte transplant is a procedure in which a sample of your normal pigmented skin is placed in a laboratory dish containing a special cell-culture solution to grow melanocytes. When the melanocytes in the culture solution have multiplied, the doctor transplants them to your depigmented skin patches. This procedure is currently experimental and is impractical for the routine care of people with vitiligo. It is also very expensive, and its side effects are not known.
- GH3 cream from Gero Vita International has given good results for many skin problems. This face cream is for adult use only.
- Hypnosis by a trained clinician may help with treatment in some patients. This alternative therapy was used in ancient times to treat all sorts of skin disorders.

## WARTS

Warts are small growths that are caused by human papillomaviruses (HPVs). There are at least forty known types of HPV. Warts may appear singly or in clusters. This section addresses three types of warts: common warts, plantar warts, and genital warts.

Common warts can be found anywhere on the body, but are most common on the hands, fingers, elbows, forearms, knees, face, and the skin around the nails. Most often, they occur on skin that is continually exposed to friction, trauma, or abrasion. They can also occur on the larynx (the voice box) and cause hoarseness. Common warts may be flat or raised, dry or moist, and have a rough and pitted surface that is either the same color as or slightly darker than the surrounding skin. They can be as small as a pinhead or as large as a small bean. Highly contagious, the virus that causes common warts is acquired through breaks in the skin. Common warts can spread if they are picked, trimmed, bitten, or touched. Warts on the face can spread as a result of shaving. Common warts typically do not cause pain or itching.

Plantar warts occur on the soles of the feet and the undersides of the toes. They are bumpy white growths that may resemble calluses, except that they can be tender to the touch and often bleed if the surface is trimmed. They also often have an identifiable hard center. Plantar warts do not tend to spread to other parts of the body.

Genital warts are soft, moist growths found in and around the vagina, anus, penis, groin, thigh, and/or scrotum. They are usually pink or red in color and resemble tiny heads of cauliflower. Genital warts most often occur in clusters, but they can appear singly as well; these are referred to as low-risk human papillomavirus (HPV) warts. They are transmitted through vaginal, oral, or anal sex, and are highly contagious. Because the warts do not usually appear until three months or more after an individual becomes infected with the HPV that causes them, the virus

can be spread before the carrier is even aware that he or she has it. Genital warts are not cancerous. If left untreated, they may go away or increase in size and number. An infant born to a mother with genital warts may contract the virus, although this is rare.

High-risk warts caused by HPV are cancerous, but no symptoms appear until the cancer is quite advanced. If the high-risk HPV infections are not cleared by the body's own immune system, the wart cells turn into cancer cells. About 10 percent of women with high-risk HPV infections are at risk for cervical cancer. High-risk HPV can also linger and infect the cells of the penis, anus, vulva, or vagina, where it can cause cancer. HPV affects 20 million Americans, and 6.2 million become infected each year. About 4,000 women die each year from cervical cancer caused by HPV. At least 50 percent of sexually active men and women contract HPV at some time in their lives. Cervical cancer affects 11,070 women each year.

Besides developing cervical cancer, women also need to worry about head and neck cancer later in life from HPV. Men with HPV do as well. Each year, more than 1,700 women and 5,700 men are diagnosed with head and neck cancer (in the oral cavity and oropharynx). This means that the virus may appear to lie dormant, but in fact is actively promoting cancer growth specifically in the mouth and neck area. No other parts of the body seem to develop cancer from HPV. Thus, it is important to get checked and treated for HPV as early as possible, and often, if engaged in repeated unprotected sex. Other cancers caused by HPV affect smaller numbers of patients per category but about the same total number.

A new vaccine called Gardasil can prevent women from getting HPV. It is the only vaccine that helps protect against four types of HPV: two that cause 70 percent of cervical cancers and two more that cause 90 percent of genital warts. The vaccine is for females aged nine to twenty-six years. The vaccine is less effective in preventing HPV-related diseases in young women who already have been exposed to one or more HPV types. It does not treat existing HPV; it can only prevent HPV before a person gets it. Thus, young girls need to get this vaccine before they become sexually active. The vaccine comes in three doses spread out over six months, and all need to be taken to assure maximal effect. Studies on thousands of girls around the world have found no serious side effects. Some girls reported fainting after the shots, so doctors were recommended to keep the patients in their offices for fifteen minutes afterward. Women still need to be screened for cervical cancer by regular PAP tests even if they have been vaccinated. The vaccine is not approved for males. Men who are concerned that they may have genital warts should be evaluated by their health care providers at routine physical exams. Genital warts affect about 1 percent of sexually active adults in the United States. Warts in both men and women can be removed by patient-applied medications or treated by a doctor.

Unless otherwise specified, the dosages recommended

here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Vitamin B complex	50 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary).	Important in normal cell multiplication.
Vitamin C with bioflavonoids	4,000–10,000 mg daily, in divided doses.	Has powerful antiviral capacity.
<i>Important</i>		
L-cysteine	500 mg twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Supplies sulfur, needed for prevention and treatment of warts. (See AMINO ACIDS in Part One.)
Methylsulfonylmethane (MSM)	As directed on label.	MSM and vitamin C are used by the body to build healthy new cells.
Vitamin A with mixed carotenoids including natural beta-carotene	100,000 IU daily for 1 month, then 50,000 IU daily for 1 month, then reduce to 25,000 IU daily for 1 month or until warts disappear. If you are pregnant, do not exceed 10,000 IU daily.	Needed for normalizing skin and epithelial membranes. Use emulsion form for easier assimilation and greater safety at higher doses.
Vitamin E	200 IU daily. Can be applied topically; cut open capsule to release oil. Apply to warts daily.	Improves circulation and promotes tissue repair and healing. Use d-alpha-tocopherol form.
Zinc	50–80 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Increases immunity against viruses. Use zinc gluconate lozenges or OptiZinc for best absorption.
<i>Helpful</i>		
Multivitamin and mineral complex	As directed on label.	Needed for normal cell division.
Reishi extract or shiitake extract	As directed on label.	Has antiviral properties.

## Herbs

☐ Aloe vera gel; myrrh; essential oils of clove, lemon-grass, peppermint, tea tree, or wintergreen; and tinctures of black walnut, chickweed, goldenseal, and pau d'arco have all been used externally to treat warts. Aloe vera gel has both antibacterial and antiviral properties. Place a

small dab of oil or extract on the wart two or three times daily until the wart is gone. If irritation occurs, dilute the oil or extract with distilled water or cold-pressed vegetable oil.

Astragalus protects the immune system, which is important in warding off warts.

*Caution:* Do not use astragalus in the presence of a fever.

Black walnut has healing properties. It is particularly useful for warts in the mouth and throat.

## Recommendations

To remove common warts, try one or more of the following remedies:

- Crush a garlic clove and apply the garlic directly on the wart, avoiding the surrounding skin. Cover it with a bandage and leave it in place for twenty-four hours. Blisters should then form, and the wart should fall off in about a week.
- Apply a paste made from castor oil and baking soda to the wart. Put the mixture on each night and cover it with a bandage. This may remove the wart in three to six weeks.
- The best treatment for plantar warts is to apply an appropriately sized strip of duct tape or adhesive tape over the wart for a maximum of two months (changing the tape periodically). This treatment has been proven as effective as using liquid nitrogen treatment, which is done in a doctor's office for up to six sessions two or three weeks apart. The treatment is called tape occlusion. Allergic reactions to the adhesive on the tape may make it unsuitable for use by certain sensitive individuals, however.

Increase the amount of sulfur-containing amino acids in your diet by eating more asparagus, citrus fruits, eggs, garlic, and onions. Desiccated liver tablets are also good.

If you suspect you may have genital warts, see your health care provider promptly. This is especially important for women, because genital warts have been linked to cervical cancer. An immediate Pap test is advised.

Keep genital warts dry. After bathing, use a hair dryer on a low setting to dry the area. Do not rub or irritate it. Wear only cotton underwear. Do not have sexual intercourse until the warts are completely healed.

Do not cut or burn a wart off yourself. These are procedures that must be done by a qualified health care provider.

## Considerations

Plantar warts may not require treatment. However, if a wart is painful and interferes with walking, treatment is warranted. Several treatment sessions may be necessary to

eliminate them, but doctors can usually eradicate even the most stubborn plantar warts.

Adequate daily vitamin C intake is most important in maintaining effective immunity against the viruses that cause warts. In one study, women who had diets rich in mixed tocopherols, vitamin E, and cryptoxanthin had a 30 percent decreased risk for cervical cancer. Oils and seeds contain mixed forms of vitamin E, and foods with cryptoxanthin include red bell peppers, papaya, cilantro, corn, oranges, avocados, and grapefruit.

People who take medications to suppress the immune system, such as those who have received organ transplants or who have certain autoimmune disorders, are more prone to develop warts.

Most common warts disappear within a year or two, even without treatment. Unless a common wart becomes bothersome, there is no need to do anything about it. Commonly used medical treatments for common and plantar warts include fulguration (using electric current to destroy wart tissue), freezing with liquid nitrogen, and topical applications of some chemicals, such as salicylic acid.

Cantharidin is another chemical your physician may apply to get rid of warts.

For larger genital warts, carbon dioxide (CO<sub>2</sub>) laser surgery may be recommended. Interferon injections may be used for genital warts that do not go away with other treatment.

Common warts can be treated with a mild acid solution such as salicylic acid or acetic acid (vinegar). It is thought that the acid weakens the walls of the wart enough to allow some of the virus to enter the bloodstream, causing the production of antibodies that eventually attack and destroy the warts. Removal does not allow the body to build up immunity to the virus.

There are a variety of treatments for genital warts, but none is a perfect cure and all have side effects. Treatment falls into three categories: prescription topical preparations that destroy wart tissue; surgical methods to remove wart tissue; and biological approaches that target the virus.

Women who have been diagnosed with genital warts should have a vaginal and uterine Pap smear every six months, as these warts are associated with an increased risk of cervical cancer.

## WEAKENED IMMUNE SYSTEM

Modern conventional medicine battles disease directly by means of drugs, surgery, radiation, and other therapies, but true health can be attained only by maintaining a healthy, properly functioning immune system. It is the immune system that fights off disease-causing microorganisms and that engineers the healing process. The immune system is the key to fighting every kind of insult to the

body, from that little shaving nick to the myriad of mutated viruses that seem to abound these days. Even the aging process may be more closely related to the functioning of the immune system than to the passage of time.

Weakening of the immune system results in increased susceptibility to virtually every type of illness. Some common signs of impaired immune function include fatigue, listlessness, repeated infections, inflammation, allergic reactions, slow wound healing, chronic diarrhea, and infections that represent an overgrowth of some normally present organism, such as oral thrush, or vaginal yeast infections. It is estimated that even healthy Americans collectively get one billion colds per year. People who have significantly more colds and infectious illnesses are likely to have some problem with immune function. By understanding some of the basic elements of the immune system and how they work, plus the overall role the immune system plays in your health, you can take responsibility for your own health.

In its simplest terms, the task of the immune system is to identify those things that naturally belong in the body and those that are foreign or otherwise harmful material, and then to neutralize or destroy the foreign material. The immune system is unlike other bodily systems in that it is not a group of physical structures but a system of complex interactions involving many different organs, structures, and substances, among them white blood cells, bone marrow, the lymphatic vessels and organs, specialized cells found in various body tissues, and specialized substances, called serum factors, that are present in the blood. Ideally, all of these components work together to protect the body against infection and disease.

The human immune system is functional at birth, but it does not yet function well. This is termed *innate immunity*—the immunity you are born with. Immune function develops and becomes more sophisticated as the system matures and the body learns to defend itself against different foreign invaders called antigens. This is termed *adaptive immunity*.

The immune system has the ability to learn to identify, and then to remember, specific antigens that have been encountered. It does this through two basic means, known as *cell-mediated immunity* and *humoral immunity*. In cell-mediated immunity, white blood cells called T lymphocytes identify and then destroy cancerous cells, viruses, and microorganisms like bacteria and fungi. The T lymphocytes, or T cells, mature in the thymus gland (hence the “T” designation). The thymus, a small gland located behind the top of the breastbone, is a major gland of the immune system. In the thymus, each T cell is programmed to identify one particular type of invading enemy. Not all prospective T cells make a successful passage through the thymus. Those whose programming is imperfect are eliminated. The ones that do make it are released into the bloodstream to search out and destroy antigens that correspond to their programming. They attack the antigens in part

through the secretion of proteins called cytokines. Interferon is one of the better-known cytokines.

Humoral immunity involves the production of antibodies. These are not cells, but special proteins whose chemical structures are formed to match the surfaces of specific antigens. When they encounter their specific antigens, antibodies either damage the invasive cells or alert the white blood cells to attack. The antibodies are produced by another group of white blood cells, the B lymphocytes, which are manufactured by and mature in the bone marrow. When a B lymphocyte is presented with a particular antigen, it engineers an antibody to match it and stores a blueprint of the invader so that it can initiate the production of antibodies in case of subsequent exposure, even if a long period of time elapses in between. For this system to work, each B cell must come into existence prepared to produce an almost infinite variety of different antibodies, so that it can match whatever antigen it is presented with. This is made possible by a mechanism known as “jumping genes.” Inside the B cells, the genes that determine the chemical structure of the protein to be produced can be shuffled around and linked up in an astronomical number of different combinations. As a result, any B cell is capable of producing an antibody molecule to match virtually any foreign invader. It is the phenomenon of humoral immunity that makes immunization possible.

Because of their crucial role in all aspects of immunity—both cell-mediated and humoral—white blood cells are considered the body’s first line of defense. White blood cells are larger than red blood cells. In addition, they can move independently in the bloodstream and are able to pass through the cell walls. This enables them to travel quickly to the site of an injury or infection. There are different categories of white blood cells, each of which performs a specific function. These include the following:

- *Granulocytes*. There are three types of granulocytes:
  1. *Neutrophils*, the most abundant type of white blood cell, whose function is to ingest and destroy microorganisms such as bacteria.
  2. *Eosinophils*, which ingest and destroy antigen-antibody combinations (formed when antibodies intercept antigens) and also moderate hypersensitive (allergic) reactions by secreting an enzyme that breaks down histamine. High levels of eosinophils in the blood are often present in individuals with allergic disorders, presumably because the body is attempting to tame the allergic reaction.
  3. *Basophils*, which secrete compounds such as heparin or histamine in response to contact with antigens.
- *Lymphocytes*. The lymphocytes are responsible for the development of specific immunities. Three important types of lymphocytes are T cells, B cells, and NK cells.
  1. *T cells* undergo maturation in the thymus gland and play a major role in cell-mediated immunity.

2. *B cells* mature in the bone marrow and are responsible for the production of antibodies.
  3. *NK (natural killer) cells* destroy body cells that have become infected or cancerous.
- *Monocytes*. The largest cells in the blood, monocytes act as the “garbage collectors” of the body. They engulf and digest foreign particles as well as damaged or aging cells, including tumor cells. After spending about twenty-four hours circulating in the bloodstream, most monocytes enter the tissues and perform similar functions there. At this point, they are known as macrophages.

Another important component of immunity is the lymphatic system. This is a system of organs (including the spleen, the thymus, the tonsils, and the lymph nodes) and fluid, called lymph, that circulates through the lymphatic vessels in the body and also bathes the body’s cells. The lymphatic system provides a kind of continuous cleansing that operates at the cellular level. It is through the lymphatic system that fluid from the spaces between cells is drained, taking with it waste products, toxins, and other debris from the tissues. The lymph flows through the lymph nodes, where the macrophages filter out the undesirables, and from there it returns to the venous circulation.

Other elements of the immune system include the spleen, the thymus, and the bone marrow. The spleen filters the blood and removes old red blood cells that need replacing. The spleen is populated by macrophages, dendritic cells (white blood cells that collect bits of antigens so that T cells can learn to recognize them), red blood cells, natural killer cells, and B and T cells. In the spleen, antigens are brought to the B cells, which use them to learn to manufacture the appropriate antigen response. People whose spleens have been removed tend to be more prone to illness because these important functions are no longer performed.

The T cells play a role in immunity by secreting interleukin-1, interleukin-2, and interferon, as well as activating B cells so that they produce antibodies. These secretions are known as cytokines. We need cytokines to survive, but sometimes too many are secreted and they create a highly immune-charged system. For example, obesity causes the excess release of cytokines and puts the body in an inflammatory state, which makes it more prone to heart disease and diabetes.

The bone marrow produces new white blood cells, platelets, B cells, natural killer cells, granulocytes, and thymocytes. All white blood cells are made from stem cells. Stem cells are embryonic cells that have the capacity to mature into virtually any type of cell. Some of the white blood cells made in the bone marrow leave the bone marrow and mature elsewhere in the body, while others mature where they are and support the immune system. All the cells of the immune system come originally from the bone marrow. Both the appendix and the tonsils also support the immune system.

Marvelous as it is, the immune system can work as it should only if it is cared for properly. This means getting

all the right nutrients and providing the right environment, plus avoiding those things that tend to depress immunity.

Many elements of the environment we live in today compromise our immune systems’ defensive abilities. The chemicals in the household cleaners we use; the overuse of antibiotics and other drugs; the antibiotics, pesticides, and myriad additives present in the foods we eat; and exposure to environmental pollutants all place a strain on the immune system. Another factor that adversely affects the immune system is stress. Stress results in a sequence of biochemical events that ultimately suppresses the normal activity of white blood cells and places undue demands on the endocrine system, as well as depleting the body of needed nutrients. The result is impaired healing ability and lowered defense against infection.

Proper immune function is an intricate balancing act. While inadequate immunity predisposes one to infectious illness of every type, it is also possible to become ill as a result of an immune response that is too strong or directed at an inappropriate target. Many different disorders, including allergies, lupus, pernicious anemia, rheumatic heart disease, rheumatoid arthritis, and type 1 diabetes have been linked to inappropriate immune system activity. Consequently, they are known as autoimmune, or “self-attacking-self,” disorders.

While much is known about the functioning of the immune system, much more remains to be learned. Only in the past ten to fifteen years have many facets of immune function begun to be studied and understood by physicians and researchers. The field of immunology (the study of the immune system) is one of the fastest-growing fields in medicine today.

The program of supplements outlined here is designed to strengthen the immune system, whether it is damaged as a result of disease, stress, inadequate nutrition, poor living habits, chemotherapy, or a combination of one or more of these factors. The dosages recommended are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

#### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Acetyl-L-carnitine	As directed on label.	An energy carrier, metabolic facilitator, and cell membrane protectant. Protects the heart.
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label. Take on an empty stomach.	Restores important bacteria to the intestinal tract. Use a nondairy formula.
Aerobic 07 from Aerobic Life Industries	9 drops twice daily, taken in water.	For tissue oxygenation.
Béres Drops Plus from Nupharma Nutraceuticals	As directed on label.	Contains minerals and trace elements that boost and nourish the immune system.

Beta-1,3-D-glucan	As directed on label.	Stimulates macrophages to remove cellular debris and, possibly, to recognize and kill tumor cells.	Pycnogenol	As directed on label 3 times daily, with meals.	A unique bioflavonoid that is a potent antioxidant and immune system enhancer.
Bovine colostrum	As directed on label.	Contains immunoglobulins and antibody-stimulating factors. Enhances immunity.	and/or grape seed extract	As directed on label.	One of the most potent antioxidants; protects the cells.
Coenzyme Q <sub>10</sub>	100 mg daily.	Supports the immune system. An oxygen enhancer to protect the cells and heart function.	Quercetin	As directed on label.	Helps to prevent reactions to certain foods, pollens, and other allergens. Increases immunity.
plus Coenzyme A from Coenzyme-A Technologies	As directed on label.	Works well with coenzyme Q <sub>10</sub> to support the immune system and increase energy.	plus bromelain	As directed on label.	Enhances the effectiveness of quercetin.
Essential fatty acids (Ultimate Oil from Nature's Secret)	As directed on label.	A most important element in the diet. Necessary for a healthy immune system.	Raw thymus glandular	As directed on label.	To enhance T cell production. Glandulars from lamb source are best.
Free form amino acid (Amino Balance from Anabol Naturals)	As directed on label, on an empty stomach.	Protein that is broken down into a form the body can use. Use a formula containing all the essential amino acids.	plus multiglandular complex with raw spleen glandular	As directed on label.	
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	Stimulates the immune system.	Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	Important free radical destroyer.
Glutathione	As directed on label.	Inhibits the formation of free radicals; aids in red blood cell integrity; reduces quantities of hydrogen peroxide; protects immune cells.	Squalene (shark liver oil)	As directed on label.	Aids in rebuilding and functioning of cells; has anticancer properties.
Kelp	2,000–3,000 mg daily.	Supplies a balance of minerals needed for immune system integrity.	Superoxide dismutase (SOD) plus dimethylglycine (DMG) (Aangamik DMG from Food- Science of Vermont)	As directed on label.  As directed on label.	To improve oxygenation of tissues.
Kyo-Green from Wakunaga	As directed on label.	Supplies nutrients and chlorophyll needed for tissue repair, and cleanses the blood. Important in immune response.	Taurine Plus from American Biologics	As directed on label.	An antioxidant and immune regulator necessary for white blood cell activation and neurological function.
L-arginine and L-ornithine	As directed on label, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	To enhance the immune system and retard the growth of tumors and cancer. Necessary for the immune system. (See AMINO ACIDS in Part One.)	Vitamin A plus natural carotenoid complex with beta-carotene	10,000 IU daily.  As directed on label.	Needed for proper immune function. Powerful antioxidants, free radical scavengers, and immune system enhancers. May protect against cancer and heart disease.
L-cysteine and L-methionine plus L-lysine	500 mg each twice daily, on an empty stomach.	To destroy free radicals and viruses and protect the glands, especially the liver. (See AMINO ACIDS in Part One.)	Vitamin B complex	100 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary).	Antistress vitamins, especially important for normal brain function. Consider injections (under a doctor's supervision). If injections are not available, use a sublingual form.
Lecithin granules or capsules	1 tbsp 3 times daily, with meals. 1,200 mg 3 times daily, with meals.	Aids in cellular protection.	plus extra vitamin B <sub>6</sub> (pyridoxine) and vitamin B <sub>12</sub>	50 mg 3 times daily.  1,000–2,000 mcg daily.	Vitamins B <sub>6</sub> and B <sub>12</sub> potentiate amino acids and are necessary for best absorption of amino acids and for proper functioning of enzymes in the body.
Maitake extract or reishi extract or shiitake extract	As directed on label. As directed on label. As directed on label.	Mushrooms that build immunity and fight viral infections and cancer.	plus raw liver extract	As directed on label.	A good source of B vitamins and iron. Consider injections (under a doctor's supervision).
Manganese	2 mg daily.	Necessary for proper immune function. Works with the B vitamins to provide a general feeling of well-being.	Vitamin C with bioflavonoids	5,000–20,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	An important antioxidant that decreases susceptibility to infection.
Multivitamin and mineral complex	As directed on label.	All vitamins and minerals are necessary in balance. Use a high-potency formula.	Vitamin E	200 IU daily.	An antioxidant that is an integral part of the body's defense system. Use d-alpha-tocopherol form. Use an emulsion form for easier assimilation.
Proteolytic enzymes or Inf-zyme Forte from American Biologics	As directed on label. 4 tablets 3 times daily, with meals.	To aid in proper breakdown of proteins, fats, and carbohydrates for better absorption of nutrients.	Zinc plus copper	50–80 mg daily. Do not exceed this amount. 3 mg daily.	Very important for the immune system. Use zinc chelate form. Needed to balance with zinc.

## Herbs

Astragalus boosts the immune system and generates anticancer cells in the body. It is also a powerful antioxidant and protects the liver from toxins.

*Caution:* Do not use astragalus in the presence of a fever.

Bayberry, fenugreek, hawthorn, horehound, licorice root, and red clover all enhance the immune response.

*Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

BioStrath, an herbal tonic produced by Nature's Answer, contains vitamins, minerals, and essential amino acids, plus adenosine triphosphate (ATP), a key cellular energy source. This supplement is good for fighting illness and for long-term vitality.

Black radish, dandelion, and milk thistle help to cleanse the liver and the bloodstream. The liver is *the* organ of detoxification and must function optimally.

Boxthorn seed, ginseng, suma, and wisteria contain germanium, a trace element that aids immune function and has anticancer properties.

*Caution:* Do not use ginseng if you have high blood pressure or are pregnant or nursing.

Echinacea boosts the immune system and enhances lymphatic function. The echinacea supplement Echinaforce from Bioforce USA has been studied regarding reduction of common cold symptoms. It was found to be 60 percent more effective than a placebo.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Esberitox from Enzymatic Therapy is a combination of different herbs designed to promote a healthy immune system. It is also effective against the common cold.

Ginkgo biloba is good for the brain cells, aids circulation, and is a powerful antioxidant.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Goldenseal strengthens the immune system, cleanses the body, and has antibacterial properties.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

ImmunoCare from Himalaya Herbal Healthcare is a combination formula containing Ayurvedic herbs that may protect white blood cells.

Ligustrum (known in Chinese herbology as *nu zhen zi*) inhibits tumor growth in a cancer cell line in a Petri dish, but not in humans.

Moducare from Essential Sterolin Products has proven effective in balancing T cell activity, which has the potential to increase immune system function. This supplement also improves symptoms of various autoimmune disorders. Moducare is a 100 to 1 mixture of sitosterol and sitosterolin derived from an original South African herbal traditional remedy. The usual dosage is three 20-milligram capsules daily.

Rather than taking shiitake, reishi, and other mushroom extracts separately, you can take them in combination formulas such as Mushroom Optimizer from Jarrow Formulas. This product combines reishi, turkeytail, maitake, cordyceps, blazei, shiitake, and white wood ear extracts to work on immune system problems.

Picrorrhiza, an Indian herb used in Ayurvedic medicine, is a powerful immunostimulant that boosts all aspects of immune function.

St. John's wort is a natural blood purifier and may fight viruses.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

## Recommendations

Take an inventory of the factors that may be compromising your immune system and take steps to correct them. Two of the most common immune suppressors include stress and an incorrect diet, especially a diet high in fat and refined processed foods. Obesity also dampens immune function.

Supply your immune system with adequate amounts of nutrients that promote proper immune function. Some of the most valuable include:

- Vitamin A is the anti-infection vitamin. If used properly and in moderate doses, vitamin A is rarely toxic and is very important in the body's defense system.
- Vitamin C may be the single most important vitamin for the immune system. It is essential for the formation of adrenal hormones and the production of lymphocytes. It also has a direct effect on bacteria and viruses. Vitamin C should be taken with bioflavonoids, natural plant substances that enhance absorption and reinforce the action of this vitamin.
- Vitamin E interacts with vitamins A and C and the mineral selenium, acting as a primary antioxidant and scavenger of toxic free radicals. Vitamin E activity is an integral part of the body's defense system.

- Zinc boosts the immune response and promotes the healing of wounds when used in appropriate doses (100 milligrams or less daily). It also helps to protect the liver. Doses over 100 milligrams per day may actually depress immune function, however.
  - Begin a diet of fresh fruits and vegetables (preferably raw) plus nuts, seeds, grains, and other foods that are high in fiber.
  - Include in your diet chlorella, garlic, and pearl barley. These foods contain germanium, a trace element beneficial for the immune system. Also add kelp to the diet, in the form of giant red kelp or brown kelp. Kelp contains iodine, calcium, iron, carotene, protein, riboflavin, and vitamin C, which are necessary for the immune system's functional integrity.
  - Consume "green drinks" daily. The best contain a wide variety of plants and are organic.
  - Avoid animal products, processed foods, sugar, and soda.
  - Follow a fasting program once a month to rid your body of toxins that can weaken the immune system. Children should not fast. (See FASTING in Part Three.)
  - Use spirulina, especially while fasting. Spirulina is a naturally digestible food that aids in protecting the immune system. It supplies many nutrients needed for cleansing and healing.
  - Be sure to get sufficient sleep. As much as possible, avoid stress.
  - Get regular moderate exercise (but don't overdo it). Exercise reduces stress and elevates mood, which has a positive effect on immune response. In addition, T lymphocyte production is stimulated by exercise.
- Caution:* If you are thirty-five or older and/or have been sedentary for some time, consult with your health care provider before beginning an exercise program.
- Avoid overeating.
  - Do not smoke or consume beverages containing alcohol or caffeine.
  - Do not take any recreational drugs.

### Considerations

- White blood cells are an indicator of health. Since the beginning of the AIDS epidemic, we have all become aware of the importance of a good immune system. White blood cell counts—and the implications of low numbers of white blood cells—are very important. The normal range of white blood cells in a person with a strong immune system is anywhere from 4,000 to 12,000 cells per microliter ( $\mu\text{L}$ , the equivalent of one-millionth liter) of blood.
- Marijuana use weakens the immune system. Delta-9 tetrahydrocannabinol (THC), the most active compound in

marijuana, alters the normal immune response, making the white blood cells less effective than normal.

- A person's mental state can suppress his or her immune system. A positive frame of mind is important in building up the immune system. (See ANXIETY DISORDER; DEPRESSION; and/or STRESS in Part Two.)
- An underactive thyroid results in immune deficiency. (See HYPOTHYROIDISM in Part Two.)
- Food allergies and adverse food reactions can place stress on the immune system. (See ALLERGIES in Part Two.)
- Research has shown that dehydroepiandrosterone (DHEA), a hormone, may enhance the functioning of the immune system. (See DHEA THERAPY in Part Three.)
- Human growth hormone (HGH) is another naturally occurring hormone that strengthens the immune system. Treatment with HGH requires the supervision of a physician, but it is not typically used to treat immune problems. (See GROWTH HORMONE THERAPY in Part Three.)
- See also AIDS (ACQUIRED IMMUNODEFICIENCY SYNDROME) in Part Two.

### WEIGHT PROBLEMS

See ANOREXIA NERVOSA; APPETITE, POOR; BULIMIA; OBESITY; and UNDERWEIGHT/WEIGHT LOSS.

### WILSON'S DISEASE

Wilson's disease, also called *hepatolenticular degeneration* or *inherited copper toxicosis*, is an uncommon inherited disorder that affects approximately 1 in 40,000 persons worldwide. In people with Wilson's disease, the body is unable to metabolize the trace element copper as it should, with the result that excess copper accumulates in the brain, kidneys, liver, and the corneas of the eyes. This causes organ damage and other complications, including neurological problems and psychotic behavior. Untreated, Wilson's disease leads to brain damage, cirrhosis of the liver, hepatitis, and, ultimately, death. Fortunately, early detection and treatment of the disease can minimize the symptoms and complications and possibly even prevent them altogether.

Symptoms of Wilson's disease may include bloody vomit; difficulty speaking, swallowing, and/or walking; drooling; an enlarged spleen; jaundice; loss of appetite; loss of coordination; progressive fatigue and/or weakness; progressive intellectual impairment; psychological deterioration manifested as personality changes and/or bizarre behavior; rigidity, spasms, or tremors of the muscles; swelling and/or fluid accumulation in the abdomen; and unexplained weight loss. Sometimes the first sign is the development of a pigmented ring, known as a Kayser-Fleischer ring, at the outer margin of the cornea, which may be detected during a routine eye examination. In the advanced stages of the disease, symptoms due to chronic active hepatitis or cirrhosis may appear, men-

strual cycles may cease, and an individual may experience chest pains, heart palpitations, light-headedness, pallor, and shortness of breath as a result of exertion.

Although people who have Wilson's disease are born with the disorder, symptoms are rarely seen before the age of six and most often do not appear until adolescence or even later. However, to prevent complications, treatment is required whether symptoms have appeared or not. Diagnosis is usually based on a study of individual and family medical history plus blood tests to determine levels of ceruloplasmin (a copper-carrying protein in the blood) and to check for anemia, plus a urine test to reveal elevated levels of copper in the urine. A liver biopsy to evaluate the amount of copper in liver tissue may be done to confirm the diagnosis.

The dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

**NUTRIENTS**

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Garlic (Kyolic from Wakunaga)	As directed on label.	A powerful antioxidant that protects liver and heart function. Promotes normal healing and prevents cell damage.
Iron	As directed by physician. Take with 100 mg vitamin C for better absorption.	To correct and protect against anemia. <i>Caution:</i> Do not take iron unless anemia is diagnosed.
Multivitamin and mineral complex with potassium and selenium	As directed on label. 99 mg daily. 200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A balance of all nutrients is essential for healing. Necessary for proper muscle contraction. Needed for proper adrenal gland function.
Vitamin A with mixed carotenoids including beta-carotene	10,000 IU daily.	Powerful antioxidants that also enhance immunity.
Vitamin B complex plus extra vitamin B <sub>6</sub> (pyridoxine)	75 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	Protects the liver and is needed for proper brain function. Helps to prevent damage to the nervous system and guard against anemia. Also combats fluid retention.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Protects against inflammation, anemia, and hepatitis, and reduces copper levels in the body. Use an esterified form.
Vitamin E	100 IU daily. Take separately from iron.	Promotes normal healing and prevents cell damage. Use d-alpha-tocopherol form.

Zinc 75 mg daily. Do not exceed this amount. Decreases copper levels and enhances immunity. Zinc balances copper in the body.

<i>Important</i>		
Acetyl-L-carnitine	As directed on label.	Protects liver and heart function.
Advanced Carotenoid Complex from Solgar	As directed on label.	Contains powerful free radical scavengers and immune system enhancers.
Calcium and magnesium	1,500–2,000 mg daily. 750–1,000 mg daily.	Minerals that work together to prevent muscle spasms.
Coenzyme Q <sub>10</sub> plus Coenzyme A from Coenzyme-A Technologies	As directed on label. As directed on label.	A powerful antioxidant that also increases circulation and energy. Works with coenzyme Q <sub>10</sub> .
Flaxseed oil	As directed on label.	To supply essential fatty acids, which are vital for brain and nerve function and enhance immunity.
Free form amino acid	As directed on label, on an empty stomach.	Necessary for protein synthesis. Use a formula containing all the essential amino acids.
Gamma-amino-butyric acid (GABA)	As directed on label, on an empty stomach.	Essential for proper brain function. Also has a tranquilizing effect. (See AMINO ACIDS in Part One.)
L-arginine and L-ornithine plus L-cysteine	As directed on label, on an empty stomach. Take at bedtime with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption. As directed on label, on an empty stomach.	To aid in liver and kidney detoxification. (See AMINO ACIDS in Part One.) Reduces the body's absorption of copper.
Methylsulfonylmethane (MSM)	As directed on label.	Contains sulfur, which aids in removing copper from the body.
Pycnogenol and/or grape seed extract	As directed on label. As directed on label.	Powerful antioxidants that lessen mental deterioration.

**Herbs**

☐ Alfalfa, ginkgo biloba, gotu kola, kava kava, lobelia, parsley, oat straw, periwinkle, and skullcap are good for overall good health and the functioning of the brain and nervous system.

*Caution:* Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs. Lobelia

is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

Astragalus, echinacea, and pau d'arco are helpful for fatigue.

*Cautions:* Do not use astragalus in the presence of a fever. Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Black radish and red clover strengthen the liver.

Burdock, dandelion, milk thistle, and suma cleanse and support the liver and help to fight fatigue.

Cat's claw is an anti-inflammatory, antioxidant, immune system enhancer, and internal cleanser. Cat's Claw Defense Complex from Source Naturals is a good source of this herb and also contains other beneficial ingredients.

*Caution:* Do not use cat's claw during pregnancy.

Cayenne (capsicum) eases blood pressure, fights fatigue, and helps support the nervous system.

Goldenseal is helpful if symptoms include difficulty swallowing, and it can ease fatigue as well. Licorice is also beneficial for swallowing difficulties, as is gargling with thyme tea.

*Cautions:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

St. John's wort is beneficial for the nervous system and also helps to overcome fatigue and difficulty swallowing.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

Siberian ginseng is a tonic herb that helps reduce fatigue and supports brain and nervous system function.

*Caution:* Do not use this herb if you have hypoglycemia, high blood pressure, or a heart disorder.

Valerian root is calming and is good for the brain and nervous system. It can also be beneficial for swallowing difficulties.

## Recommendations

Increase your consumption of onions. They contain sulfur, which helps to rid the body of copper.

Eat fresh (not canned) pineapple frequently. It contains bromelain, an enzyme that helps to keep down swelling and inflammation.

Have the copper level of your drinking water tested. Look in the yellow pages of your local telephone directory or consult your state's environmental agency for laboratories that can do this type of testing. If your tap water contains more than 1 part per million of copper, drink quality bottled water instead (steam-distilled is best) or check the pipes in your home; if you can determine that all or most of the copper in your water is coming from the pipes, it may be worthwhile to replace them with copper-free ones.

If you take a multivitamin and/or mineral supplement, be sure to choose a formula that does *not* contain copper.

Eliminate from the diet foods high in copper. These include barley, beets, blackstrap molasses, broccoli, chocolate, enriched cereals, garlic, lentils, liver, mushrooms, nuts, organ meats, salmon, and shellfish, as well as avocados, beans and other legumes, egg yolks, oats, oranges, pecans, raisins, soybeans, whole grains, and green leafy vegetables.

If you suffer from tremors, avoid caffeine.

Avoid alcohol consumption. Wilson's disease increases the risk of cirrhosis of the liver.

Do not use copper cookware or utensils.

## Considerations

Wilson's disease can be neither prevented nor cured. With appropriate management, however, the prognosis is excellent. Anyone with a family history of Wilson's disease should undergo diagnostic testing—the sooner the better, and whether or not symptoms are present—so that treatment, if necessary, may begin as soon as possible.

Treatment of Wilson's disease is a lifelong proposition. Most often, it involves taking penicillamine (Cuprimine, Depen), a drug that removes copper from the body by increasing its excretion in the urine. Possible side effects of this drug include deficiencies of vitamin B<sub>6</sub> (pyridoxine) and iron, and many people experience an allergic reaction to the drug within ten days of taking it. The most serious potential side effects of this medication include kidney disease, blood cell problems, and Goodpasture's syndrome (a potentially life-threatening syndrome characterized by bleeding of the lungs and kidney failure). Penicillamine has also been suspected of being linked to leukemia development in at least two cases. A person with a sensitivity to penicillamine may also be given a steroid such as prednisone (Deltasone and others) to decrease the reaction to the penicillamine, or the drug trientine (Syprine) may be prescribed instead. This medication also chelates copper so that it can be eliminated from the body.

Some doctors prescribe high doses of zinc in place of, or in conjunction with, conventional drugs to keep copper levels under control. Zinc naturally balances with copper

in the body. Zinc acetate (Galzin) is another medication that may be prescribed. It should be taken exactly as the doctor has prescribed.

- Regardless of the treatment regimen, regular checkups are required to monitor possible side effects from medication and to check the level of copper in the urine.
- If you develop any personality changes or problems linked to Wilson's disease, consulting a psychologist or other mental health professional may be helpful.
- Elevated copper levels in the body result in the depletion of vitamin C and zinc. Persons with Wilson's disease therefore always require a higher than normal intake of these nutrients.
- Wilson's disease is not the only cause of elevated levels of copper in the body. Toxic levels of copper can also accumulate in the body as a result of excessive exposure to the metal. If a person with elevated copper levels has normal liver function and no corneal abnormalities, it is likely that the toxicity is due to something other than Wilson's disease. In addition, copper toxicity as a result of excessive copper ingestion can be demonstrated by hair analysis, whereas persons with Wilson's disease do not exhibit elevated levels of copper in the hair.
- Tetrathiomolybdate is an experimental drug that shows promise in treating Wilson's disease.
- Without proper treatment Wilson's disease is usually fatal by age thirty. However, if treatment is begun early enough, symptomatic recovery is usually complete, and a life of normal length and quality can be expected.
- See also COPPER TOXICITY in Part Two. The Wilson's Disease Association offers aid and support to people with Wilson's and related diseases. (See Health and Medical Organizations in the Appendix.)

**WILSON'S SYNDROME**

See under HYPOTHYROIDISM.

**WORMS (PARASITES)**

Worms are parasites that live in the gastrointestinal tract. The most common types of worms are roundworms (including ascarids, hookworms, pinworms, and threadworms) and tapeworms. Roundworms are contagious intestinal parasites that are shaped like earthworms but are smaller in size. They can easily be seen with the naked eye. Pinworms are white, threadlike worms about one-third inch long. In the United States, pinworm infestation in young children is by far the most prevalent parasitic worm problem. Tapeworms vary in length from an inch up to thirty feet and can survive for up to twenty-five years in the body.

Depending on the type of worm involved and the severity of the infestation, there may be a variety of symptoms.

In some cases, there may be no perceptible symptoms at all. In other cases, worms may be seen in the stool.

Pinworms can cause severe anal itching (especially at night, as the worms tend to migrate outside the anus to lay their eggs), insomnia, and restlessness. Hookworms can cause itching on the soles of the feet, and in some cases, bloody sputum, fever, rash, and loss of appetite. Threadworms can cause coughing or bronchitis, abdominal pain, diarrhea, and gas, preceded by tiny red abrasions that sometimes itch. Small tapeworms can cause weight and appetite loss, abdominal pain, vomiting, and diarrhea. Large tapeworms can cause similar symptoms, but usually without weight loss. Ascariasis, caused by ascarids, is characterized by bloating, stomach pain, vomiting, and difficulty breathing. Trichinosis is a disease caused by a microscopic roundworm that, if left untreated, can lead to muscle damage and cardiac or neurological complications.

Worm infestations can range from mild to severe, even life-threatening, particularly in children. They result in poor absorption of essential nutrients, and in some cases, loss of blood from the gastrointestinal tract. They can therefore lead to such deficiency-related disorders as anemia and growth problems. Malabsorption resulting from parasitic infection makes one susceptible to many diseases because it results in diminished immune function.

Worms can be contracted through a variety of mechanisms, including improper disposal of human or animal waste, walking barefoot on contaminated soil, and ingestion of eggs or larvae from uncooked or partially cooked meat. In some cases, eggs may become airborne and be inhaled.

Parasites are more common than most people suppose, and they can be behind many illnesses, including colon disorders. They are more common in children than in adults. They are also common in people with AIDS, chronic fatigue syndrome, candidiasis, and many other disorders. Unfortunately, physicians often do not check for worm infestation.

The dosages recommended here are for adults. For children between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For children between six and twelve, use one-half of the recommended dose, and for children under the age of six, use one-quarter of the recommended amount.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Important</i>		
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label.	Restores normal intestinal flora. Use a nondairy formula.
Beta-carotene	50,000 IU daily until you are healed.	Acts as an anti-infective.
Essential fatty acids (Ultimate Oil from Nature's Secret)	As directed on label.	Helps to protect the gastrointestinal tract.

Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily, with meals.	Has antiparasitic properties. A fresh clove of garlic can also be put in the shoes to be absorbed through the skin.
Kyolic-EPA from Wakunaga	As directed on label.	Restores proper fatty acid balance. Repairs tissues and aids in healing.
Liquid Kyolic with B <sub>1</sub> and B <sub>12</sub>	As directed on label.	An excellent blood builder.
Multivitamin and mineral complex	As directed on label.	To promote overall health and proper nutrition. All nutrients are needed by persons with these disorders.
Parasitin from Växa International	As directed on label.	To cleanse and detoxify the body of parasites and worms.
Vitamin B complex plus extra vitamin B <sub>12</sub>	50 mg of each major B vitamin 3 times daily, with meals (amounts of individual vitamins in a complex will vary). 1,000–2,000 mcg twice daily.	To prevent anemia associated with parasitic infestation. Use sublingual forms to assure absorption.
Vitamin C with bioflavonoids	3,000 mg daily.	Protects against infection and enhances immune function.
Zinc	50 mg daily. Do not exceed a total of 100 mg daily from all supplements.	Promotes a healthy immune system and proper wound healing.

## Herbs

- Aloe vera juice, taken twice daily as directed on the product label, has an alkalinizing and anti-inflammatory effect.
  - Black walnut extract destroys many types of worms. Take black walnut extract on an empty stomach three times per day.
  - Butternut bark, fennel seed, flaxseed, licorice root, and senna leaf are good for bowel and colon cleansing.
- Caution:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.
- Calendula ointment or witch hazel can be used to help relieve anal itching and irritation.
  - Cascara sagrada, chamomile, ficus, gentian root, mugwort, mullein oil, parsley, pau d'arco, rhubarb root, slippery elm, thyme, valerian, and wormwood are effective against many types of worms.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not use wormwood in high doses or for extended periods because it contains the chemical compound thujone that can be poisonous. Do not use wormwood if you suffer from any type of seizure disorder or are pregnant.

Cayenne (capsicum), garlic, and turmeric help to strengthen the immune system and destroy many types of worms.

Grapefruit seed extract is very effective for destroying parasites. It can be taken internally and is also good for washing vegetables before eating (mix 10 drops of extract in 2 quarts of water) to remove any bacteria or parasites.

Pinkroot works well against roundworms.

Pumpkin extract contains zinc and aids in expelling worms.

## Recommendations

Eat a high-fiber diet consisting primarily of raw vegetables and whole grains.

Eat pumpkin seeds, sesame seeds, and figs (or drink fig juice) on an empty stomach three times per day. This can be combined with the black walnut extract mentioned under Herbs, above.

Drink only filtered or bottled steam-distilled water.

Monitor your intake and output of fluids, and replace fluids as needed.

Eliminate *all* sugar, refined carbohydrates, fruits (except figs and pineapples), and pork and pork products from the diet until the worms have been completely eradicated. Worms thrive on sugar.

For tapeworms, fast for three days on raw pineapple. (See FASTING in Part Three.) The bromelain in pineapple destroys tapeworms.

Drink plenty of papaya juice.

For pinworms, eat bitter melon, a cucumber-shaped vegetable found in Asian markets. This is effective against pinworms and is a good immune system strengthener. Eat one or two melons a day for seven to ten days. Do this again after two months to ensure that the infestation has not returned.

*Never* eat meat, fish, or poultry that is not fully cooked or that has been left out at room temperature for too long. Sushi is usually safe, but not always. (See **FOODBORNE/WATERBORNE ILLNESS** in Part Two.)

Take a warm bath using ½ cup of Epsom salts per gallon of water. Before getting into the water, apply zinc oxide to the opening of the anus. Repeat for three days in a row.

Have pet cats and dogs checked and, if appropriate, treated for parasites when you first get them, and in the spring and fall of each year thereafter.

Always wear shoes in soiled areas.

Maintain meticulous personal hygiene. Avoid scratching the anal area, and wash your hands frequently, preferably with antibacterial soap, scrubbing well under the

fingernails. If children are affected, teach them proper hygiene as well.

Wash all utensils and surfaces that come in contact with raw meat, pork, or fish with antibacterial soap.

Wash underwear, bed linens, and towels after each use in very hot water with chlorine bleach added, if possible. Change linens and towels daily.

For a severe infestation, use high colonics (also known as colonic irrigation). This procedure is usually performed in a professional office. If this treatment is not available, follow the procedure for colon cleansing described in this book. Speak to your child's pediatrician before using colonics. (See COLON CLEANSING and ENEMAS, both in Part Three.) A product called 10-Day Colon Cleanse from Aerobic Life Industries is also recommended.

### Considerations

Worm infestations can be persistent and stubborn. It may be necessary to treat all members of the household to finally eradicate the parasites. All family members should be examined for possible infection. In addition, it is a good idea to compile a list of people who have been in close contact with the affected individual and advise them to seek the evaluation and advice of a health care provider.

The following are the different types of worms and the routes through which they can enter the body:

- *Ascarids*: Through the soil, or in contaminated raw or undercooked food.
- *Hookworms and threadworms*: Through the feet or drinking water.
- *Pinworms*: Eggs can be transferred by touch from an infected individual who has eggs on the fingers from scratching the affected area.
- *Tapeworms*: In raw or undercooked beef, fish, or pork, or through inadvertently swallowing infested fleas or lice that live on pets.

Doctors treat most types of worms with prescription medications such as mebendazole (Vermox) or thiabendazole (Mintezol), or with pyrantel pamoate (Antiminth), which is available over the counter. Creams or ointments may be prescribed to relieve anal itching and irritation.

Some sushi has been found to be contaminated with a wormlike parasite called anisakis, which can cause illness similar to Crohn's disease if ingested. This parasite is a tightly coiled, clear worm, about one-half to three-quarters inch in length. It commonly embeds itself in herring and other fish. Fortunately, an experienced sushi chef can spot this parasite easily, so its presence in sushi is relatively rare.

The risk of parasitic infection is increased by travel to places with inadequate public sanitation, personal hygiene levels, and/or food-handling practices.

Because of the generalized nutritional deficiency associated with this disorder, good nutrition is vital. Foods high in protein and iron are particularly important.

### WRINKLES

Wrinkles form when the skin thins and loses its elasticity. As long as the skin is supple, any creasing of the skin disappears as soon as you stop making the expression that caused it. But skin that has lost its suppleness retains the lines formed by smiling or frowning, for instance, even after you have assumed a more neutral expression. Over time, these lines deepen into wrinkles.

Some amount of wrinkling is a result of aging and is probably inevitable; no matter what you do, you will develop some lines if you simply live long enough. With aging, all skin cells begin to produce excess amounts of free radicals—unstable atoms and molecules that are normally removed by naturally occurring antioxidants within the skin cells. In aging skin cells, antioxidants are in short supply. The free radicals generated are left unchecked to cause damage to cell membranes, proteins, and DNA. These free radicals eventually break down collagen, a protein substance in connective tissue, and release chemicals that cause skin inflammation. It is a combination of these cellular and molecular events that leads to skin aging and the formation of wrinkles.

The first signs of wrinkles usually appear in the delicate tissue around the eyes—smile lines or “crow's feet.” The cheeks and lips show damage next. As we age, our skin becomes thinner and dryer, both of which contribute to the formation of wrinkles. But other factors help to determine the rate and the extent of wrinkling, including diet and nutrition, muscle tone, habitual facial expressions, stress, proper skin care (or lack thereof), exposure to environmental pollutants, and lifestyle habits such as smoking. Heredity probably also plays a role.

The most important factor of all is sun exposure, which not only dries out the skin but also leads to the generation of free radicals that can damage skin cells. The sun is your skin's worst enemy. It is estimated that much of what we think of as signs of age are actually signs of overexposure to sunlight. Furthermore, overexposure does not necessarily mean sunbathing or sunburn; approximately 70 percent of sun damage is incurred during such everyday activities as driving and walking to and from your car. The ultraviolet-A (UVA) rays that do this damage are present all day long and in all seasons. These rays erode the elastic tissues in the skin, causing wrinkling. Worse, the effects of the sun are cumulative, although they may not be obvious for many years.

Unless otherwise specified, the dosages recommended here are for adults.

## NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Methylsulfonylmethane (MSM)	As directed on label.	Has been shown to help prevent wrinkling of the skin.
Primrose oil or black currant seed oil	1,000 mg 3 times daily. As directed on label.	Good healers for dermatitis, acne, and most other skin disorders. These oils contain linoleic acid, which is needed by the skin.
Vitamin A plus natural carotenoid complex (Betatene)	25,000 IU daily for 3 months, then reduce to 15,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	Necessary for healing and construction of new skin tissue. Antioxidants and vitamin A precursors.
Vitamin B complex plus extra vitamin B <sub>12</sub>	As directed on label. 1,000–2,000 mcg daily.	Antistress and antiaging vitamins. Sublingual forms are best.
<b>Important</b>		
Kelp	1,000–1,500 mg daily.	Supplies balanced minerals needed for good skin tone.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	An antioxidant that works with vitamin E.
Silica	As directed on label.	Important for skin strength and elasticity. Stimulates collagen formation.
Topical vitamin C (Hyper-C Serum from Jason Natural Cosmetics)	As directed on label. Apply topically to the face after washing and before applying moisturizer for best absorption.	Studies have shown that applying vitamin C topically promotes collagen production, improves skin tone, and can slightly reduce the appearance of fine wrinkles.
Vitamin C with bioflavonoids	3,000–5,000 mg daily, in divided doses.	Necessary for the formation of collagen, a protein that gives the skin its flexibility. Also fights free radicals and strengthens the capillaries that feed the skin.
Vitamin E	200 IU daily.	Protects against free radicals that can damage the skin and contribute to aging. Use d-alpha-tocopherol form.
Zinc plus copper	50 mg daily. Do not exceed a total of 100 mg daily from all supplements. 3 mg daily.	For tissue strength and repair. Use zinc gluconate lozenges or OptiZinc for best absorption. Needed for collagen production and healthy skin. Also needed to balance with zinc.
<b>Helpful</b>		
Ageless Beauty from Biotec Foods	As directed on label.	Protects the skin from free radical damage.
Calcium and magnesium	1,500 mg daily. 750 mg daily.	Deficiency contributes to fragility of the skin. Needed to balance with calcium.
Collagen cream	Apply topically as directed on label.	Good for very dry skin. A nourishing cream.

Elastin cream	Apply topically as directed on label.	Helps smooth existing wrinkles and prevent formation of new ones.
Flaxseed oil capsules or liquid or Ultimate Oil from Nature's Secret	1,000 mg daily. 1 tsp daily. As directed on label.	To supply needed essential fatty acids.
Glucosamine sulfate or N-Acetylglucosamine (N-A-G from Source Naturals)	As directed on label. As directed on label.	Important for the formation of healthy skin and connective tissue.
Grape seed extract	As directed on label.	An antioxidant that protects the skin from damage.
Herpanacine from Diamond-Herpanacine Associates	As directed on label.	Contains antioxidants, amino acids, and herbs that promote skin health.
Pycnogenol	As directed on label.	A free radical scavenger that also strengthens collagen.
Superoxide dismutase (SOD)	As directed on label.	A free radical destroyer. Also good for brown age spots.
Tretinoin (Retin-A)	As prescribed by physician.	Removes fine lines and smooths out wrinkles; also excellent for age spots, precancerous lesions, and sun-damaged skin. Available by prescription only. Takes around six months to show results.
Vitamin D	400 IU daily.	Deficiency can contribute to aging of the skin.

## Herbs

- Acerola hydrates the skin.
- Alfalfa, borage, burdock root, chamomile, oat straw, red raspberry, and thyme are all good for general nourishment of the hair, skin, and nails.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Aloe vera has soothing, healing, and moisturizing properties. Apply pure aloe vera gel to dry skin as directed on the product label.
- Comfrey is good for alleviating dry skin.

*Caution:* Comfrey is recommended for external use only.

- Witch hazel is very useful in skin care.
- Other herbs that are beneficial for skin tone include borage seed, cranberry, flaxseed, ginger root, lavender, lemon grass, parsley, and pumpkin seed.

## Recommendations

- Eat a well-balanced diet that includes many and varied fruits and vegetables, preferably raw, to provide your skin

with the nutrients it needs. Also eat whole grains, seeds, nuts, and legumes.

Drink at least 2 quarts of water every day, even if you do not feel thirsty. This helps to keep the skin hydrated and to flush away toxins, discouraging the formation of wrinkles.

Obtain fatty acids from cold-pressed vegetable oils. Avoid saturated and animal fats.

Do not smoke, and avoid alcohol and caffeine. All of these substances dry out the skin, making it more vulnerable to wrinkling. In addition, the smoking habit means pursing one's lips hundreds of times each day. The creases that form when you inhale from a cigarette often develop into wrinkles at a comparatively early age.

No matter what your age or skin type, protect yourself from the sun. Always apply a sunscreen with a sun protection factor (SPF) of at least 15 to all exposed areas of skin, especially your face, regardless of the season or the weather. Sun exposure is the single greatest source of skin damage.

Get regular exercise. Like other organs of the body, skin gets its nourishment from the bloodstream. Exercise increases the circulation of blood to the skin.

Exercise your face. Sit in a chair and extend your jaw in an exaggerated chewing motion. Stretch the muscles under your chin and the front of your neck. Lying on a slant board for fifteen minutes a day is also good.

Avoid alcohol-based toning products. Use witch hazel or an herbal/floral water instead.

Pay attention to your facial expressions. If you find yourself squinting, raising your eyebrows, or making some other potentially wrinkle-inducing expression over and over again, you can make a conscious effort to stop.

Practice good skin care and keep your skin well lubricated, especially if it is dry. (See DRY SKIN in Part Two.)

Avoid using harsh soaps or solid cleansing creams such as cold cream on your face. Use natural oils such as avocado oil instead to remove dirt and old makeup. Apply it gently to your face and rinse it off with warm water. E-Gem Skin Care Soap from Carlson Laboratories is also good. Use a facial sponge or loofah (also spelled loofa or luffa) several times a week to remove dead, dry skin cells and stimulate circulation.

Open a capsule of ACES + Zn from Carlson Labs and add the contents to your moisturizing cream before applying. This will help protect the skin from free radical damage. Do the same with your sunscreen.

Do not apply heavy oils around the eye area before going to bed. This may cause eyes to be puffy in the morning.

Limit your use of cosmetics, and choose the ones you do use carefully. Do not share your cosmetics, and replace them every three months.

## Considerations

Selecting good skin care products can be confusing. We recommend that you seek out products containing natural ingredients, and avoid those that contain petrolatum, mineral oil, or any hydrogenated oils. Some good ingredients to look for in skin care products include the following:

- *Allantoin*, a soothing agent derived from comfrey.
- *Aloe vera*, which is rich in nutrients and softens the skin.
- *Alpha-hydroxy acids*, natural fruit acids that encourage the shedding of dead surface skin cells and the formation of fresh, new skin cells.
- *Arnica*, an herb with both astringent and skin-soothing properties.
- *Burdock*, an herb that helps the body eliminate poisons from the skin.
- *Calendula*, an herb that promotes skin cell formation and stimulates tissue growth, and also soothes and softens sensitive skin.
- *Chamomile*, an anti-inflammatory, antibacterial herb that is good for sensitive skin.
- *Collagen*, a protein found in healthy young skin tissue.
- *Comfrey*, an herb that aids healing and soothes chapped, irritated, or blemished skin.

*Caution:* Comfrey is recommended for external use only.

- *Cucumber*, which contains amino and organic acids that cool and refresh the skin and tighten the pores.
- *Essential fatty acids* (including linoleic, linolenic, and arachidonic acids), which smooth rough skin, protect against moisture loss, and prevent invasion by free radicals.
- *Ginkgo biloba*, an antioxidant that helps skin stay younger looking.
- *Glycerine*, a soap by-product that attracts and holds moisture in the skin.
- *Ivy*, an herb that stimulates circulation and aids other ingredients in penetrating the skin.
- *Liposomes*, microscopic bubbles that deliver active ingredients deep into the skin.
- *Panthenol (provitamin B<sub>5</sub>)*, a nutrient that builds moisture and soothes irritation.
- *Retinoic acid*, a form of vitamin A that smooths skin, promotes cell renewal, and improves circulation to the skin.
- *Sage*, an herb with astringent properties that can help relieve dry, itchy skin.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

- *Witch hazel*, a natural astringent that tones the skin.

- *Yarrow*, an astringent herb that acts as an anti-inflammatory and tightens and firms saggy skin.
- There are many excellent home facial treatments that can help with specific skin problems. Some of the best include:
  - *To add color to sallow skin*, mash ½ cup or so of strawberries in a blender and apply them to your face. Leave them on for ten minutes, then rinse with tepid water.
  - *To alleviate puffiness in the eye area*, place cool cucumber slices over your eyes for ten minutes or more, as needed.
  - *To cleanse the pores*, rub mashed tomato over your face.
  - *To moisturize your skin*, mash together grapes (a natural source of collagen and alpha-hydroxy acids) with enough honey to make a paste, and apply the mixture to your face as a mask. Leave it in place for twenty to thirty minutes while you relax, then rinse it off.
  - *To remove dead surface skin cells and improve skin texture*, gently rub a small handful of dry short-grain rice against your face for a few minutes. This technique has been used by Japanese women for centuries.
  - *To soften and nourish the skin*, mash half of an avocado and apply it to your face. Leave it on until it dries, then rinse off with warm water. Avocado contains essential fatty acids and other nutrients that help prevent premature wrinkling.
  - *To tighten and refine pores*, whip up the white of an egg with a pinch of alum and apply it to your face as a mask. After fifteen to twenty minutes, rinse it off with lukewarm water.
- Wrinkle lines from the lips toward the nose may be due to a deficiency of vitamin B<sub>2</sub> (riboflavin).
- Researchers studying premature aging have found that vitamin E, carotenoids, and selenium may help prevent wrinkling.
- Antioxidant supplements improve skin integrity, making it appear younger looking longer.

- Chemical peels, used by many dermatologists and skin care professionals, trigger collagen production deep underneath the skin by destroying the upper layer of skin cells. The new collagen produced helps to improve elasticity and give the skin a more youthful look. Chemical peels can irritate the skin, and they can also cause sun sensitivity.
- Alpha-hydroxy acids (AHAs) are acids derived from various fruits that act in much the same way, but they are natural, less irritating to the skin, and do not produce sun sensitivity. Glycolic acid (the best for exfoliation), citric acid, and malic acid are all AHAs. While these are gentler than chemical peels, they still can irritate sensitive or fair skin.
- Ester-C Gel with E Skin Recovery Complex from Derma-E Skin Care is a good product that combines esterified vitamin C, vitamin E, borage oil, green tea extract, and herbs that help repair dull, aging, sun-damaged skin.
- Dermatologists are constantly searching for ways to prevent or treat wrinkles. Doctors perform a wide range of treatments for wrinkles, including facial peels; cosmetic skin surgery; laser resurfacing; local injections with purified botulinum toxin (Botox), collagen injections, or new soft-tissue fillers such as hyaluronic acid (Restylane); and fat transfers, to name a few. Many, if not all, of these treatments can cause unpleasant side effects. If you are considering medical treatment for this condition, do plenty of research and discuss your options with a qualified dermatologist.
- Surgical treatment is an expensive but effective option as well. If you are bothered by your wrinkles, speak to a board-certified plastic surgeon. Get a second opinion or ask around before committing to a procedure.

PART THREE

---

Remedies  
*and*  
Therapies

# Introduction

In Part Two, various treatment programs were recommended for each of the health problems discussed. Part Three explains how to implement some of the remedies and therapies discussed earlier, as well as providing information about some cutting-edge technologies that are showing promise in the treatment of various disorders. It covers when each treatment can be beneficial, and, when appropriate, offers instructions for effective use. You can learn about the more traditional treatments offered by homeopathic medicine and chiropractic; ancient techniques offered by Ayurvedic

medicine, fasting, juicing, and poultices; less well-known treatment approaches such as aromatherapy, hyperbaric oxygen therapy, and magnetic field therapy; and a potpourri of more innovative treatments that may be helpful depending on the condition you are trying to treat. These remedies should all be used in conjunction with a healthy diet and supplementation program.

After learning about what is available out there, you will be able to choose the options that are most suitable for you and your situation.

## AROMATHERAPY AND ESSENTIAL OILS

Aromatherapy is the use of pure essential oils to enhance physical and mental well-being. Essential oils are aromatic, highly concentrated distilled essences of plants. These oils can have many different applications in our lives. They can sometimes be used as a natural adjunct to, or substitute for, prescription or over-the-counter drugs. We can also use them simply to make ourselves feel better.

Aromatherapy uses the sense of smell to enrich our experience of the world. Smell plays a significant role in our daily perceptions and how we react physically, emotionally, and mentally to what is going on around us. Various scents help us orient ourselves to the season of the year, our location, and situations of danger. Essential oils not only affect the physical but also the mental and emotional aspects of our lives. The inhalation of certain essential oils has been associated with the release of brain chemicals that stimulate various emotions. For example, lavender oil has the ability to evoke and increase the release of serotonin, thus producing a calming effect on the body. Some essential oils also have healing properties when applied topically to the skin.

When purchasing essential oils, make sure they are 100 percent pure botanical extracts, not chemical reproductions of different fragrances. Chemical reproductions are not effective in aromatherapy because they do not evoke the same biochemical response as natural, pure essential oils.

Pure essential oils are extracted directly from various parts of different plants. The oils can be obtained by a variety of methods, including distillation, solvent extraction, carbon dioxide extraction, expression (pressing), and enfleurage (a process in which some type of odorless oil is used to extract essential oil from flower petals). The type and part of the plant being used determines which type of extraction process is appropriate.

The following are some helpful hints to keep in mind when shopping for essential oils:

- Buy in small quantities (the oxygen in partially filled bottles deteriorates the oil).
- Read the label carefully and make sure it says “pure essential oil.”
- Be aware that the availability of different plants and the extraction methods used affect prices, so there can be great variations in the costs of different oils. This is normal.

- Certain plant oils, such as apple blossom and peach blossom, cannot be extracted. If you find oils with such scents, they are not true essential oils.

Using essential oils is really very simple. Basically, you dilute a small amount of essential oil in a base of some kind (either water or another oil, termed a carrier oil, depending on the intended use), and apply or inhale it. For inhalation therapy, there are special devices available, including diffusers, simmer pots, aromatherapy lamps, and lightbulb rings. When using one of these devices, follow the manufacturer’s instructions. Or you can inhale an essential oil directly from the bottle. For topical applications, you can use any of the following to dilute essential oils:

- Almond oil.
- Apricot oil.
- Grape seed oil.
- Jojoba oil.
- Olive oil.
- Water.

The following are some suggested dilution ratios for topical applications:

- Baths. Add 8 drops essential oil to 1 cup water and add to the bath.
- Body lotion. Add 25 drops essential oil to 8 ounces of unscented lotion.
- Carpet freshener. Add 25 drops essential oil to 16 ounces of water.
- Cleaning. Add 25 drops essential oil to 2 gallons of water.
- Facial oil. Add 6 drops essential oil to 1 ounce of jojoba oil.
- Hair conditioner. Add 1 drop essential oil to 4 to 6 ounces of unscented conditioner.
- Hair rinse. Add 10 drops essential oil to 16 ounces water.
- Massage oil. Add 25 drops essential oil to 2 ounces almond, apricot, grape seed, jojoba, or olive oil.
- Perfume. Add 12 drops essential oil to ½ ounce water or jojoba oil.
- Room deodorizer. Add 25 drops essential oil to 16 ounces water.
- Shampoo. Add 12 drops essential oil to 16 ounces unscented shampoo.

When using essential oils, be aware that they are highly concentrated and very potent. Keep the following commonsense precautions in mind:

- Do not use oils full strength. Always dilute them first. Some essential oils can be toxic if used at full strength.
- Do not use oils near the eyes.

## Common Essential Oils

There are many different essential oils available, each with its own special properties. The table below lists some of the

more commonly used oils and their qualities. Use it to determine which essential oil or oils you might like to try.

Essential Oil	Uses
Bergamot	Contains statin-like compounds and may help with blood disorders.
Cedarwood	Has antibacterial properties.
Chamomile	An analgesic, anti-inflammatory, and anticonvulsive. Excellent for headaches (apply as a compress to head). Good in baths, hair rinse, and massage oil. <i>Caution:</i> Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.
Cinnamon bark	Useful for scent enhancement in the home or office. Makes a good air freshener and is also antifungal.
Clary sage	A very aromatic oil that is enjoyed by both men and women. An antioxidant, anti-inflammatory, and anti-microbial. Good when used in skin and hair care products. <i>Caution:</i> Should not be used in the first months of pregnancy.
Cypress	An antifungal and may promote hair growth.
Eucalyptus	Antifungal, antibacterial, and anti-inflammatory. May promote good dental health and reduce decay and cavities. Improves lung function. Used as an ointment for muscular aches and pains. Good for repelling insects, and for use on insect bites or stings. Has a normalizing, balancing effect.
Frankincense	An anti-inflammatory. Helpful for asthma and breathing. Reduces pain and improves physical function in arthritis. Controls diarrheal disease in patients with colitis.
Geranium	Immune system booster, blood-pressure-lowering agent, hormone balancer, and insect repellent. A normalizing and balancing, mildly sedating oil good for PMS, as a bath additive.
Grapefruit	Acts as an antioxidant and antiproliferation agent, which may reduce cancer risk. Useful in baths, skin care products, and colognes.
Hyssop	Helps reduce anxiety and stress; promotes alertness, calmness, and a feeling of contentedness. May reduce risk of dental decay and cavities. Helps induce sleep and prevent insomnia. Improves circulation. <i>Caution:</i> Do not use if you have epilepsy or other seizure disorders.
Jasmine	An antibacterial agent and antioxidant. Has been used for apathy, hysteria, uterine disorders, coughs, and as a muscle relaxant for childbirth because it is an antispasmodic.
Juniper	An antioxidant and antibacterial, and increases blood flow. <i>Caution:</i> Do not use during pregnancy. Do not use if you have kidney problems.
Lavender	Reduces pain related to postsurgical procedures, and neck and back pain. Can act as a sedative to aid in falling asleep and promoting deep sleep. May reduce situational stress.
Lemon	An antioxidant that reduces oxidative stress to the bad cholesterol (LDL). Retards tumor growth in a cancer cell line. Emulsifies and disperses grease and oil. Helpful in cleaning products and hair rinses and for wound cleansing.
Linden	A calming, sedating, and soothing tonic.
Mandarin	A sweet, light, and tangy fragrance. Helps decrease platelet clumping. Acts as an antioxidant and inhibits human cancer cell line growth. Is also used as a digestive aid and is commonly found in soaps, cosmetics, perfumes, and colognes.
Orange	Has antifungal properties. Useful in relieving short-term knee pain. <i>Caution:</i> This oil increases sensitivity to the sun. Do not use it if you will be spending considerable time outdoors.
Patchouli	An earthy scent used in personal fragrances, baths, and hair care products. Good for dry skin. Is effective against mosquito bites.
Peppermint	Helps digestion, which could help people who experience nausea. Reduces symptoms of irritable bowel syndrome such as diarrhea. Reduces fatigue and improves mood. Promotes better sleep. Good for use in baths and oral care products.

Pine	May reduce appetite by modulating satiety hormones.
Rosemary	An antioxidant and anti-inflammatory, and inhibits <i>H. pylori</i> in a Petri dish. Helps keep bones strong, and was shown to have anticancer effects on human cell lines. Used in hair care products as a conditioner and shine enhancer. <i>Caution:</i> If irritation occurs, discontinue use. Do not use directly on the skin without diluting. Use caution inhaling it if you have asthma or bronchitis. Do not use if you have epilepsy.
Sandalwood	Acts as an anticancer agent in cells and helps support the liver by increasing glutathione, which is a potent antioxidant. Good in skin care blends.
Tea tree	A potent antibacterial, antimicrobial, anti-inflammatory, antiviral, and fungicide. Good for athlete's foot, dandruff, and yeast infections. May reduce gingivitis and support healthy gums.
Thyme	An antibacterial, antioxidant, and antifungal. Helps support bone health.
Ylang ylang	Lifts mood, eases anxiety, relaxes, reduces stress, normalizes the heartbeat, and lowers blood pressure. Has a harmonizing effect. May be used on the skin or for aromatherapy.

- Do not touch your face, mucous membranes, or genitals if your hands have been in direct contact with the oils.
- Keep essential oils out of the reach of children.
- Be cautious about using essential oils for children, especially young children. If you do use essential oils on a child, reduce the concentration of the essential oil by half or more.
- Be cautious using essential oils during pregnancy.
- Avoid sun exposure when using bergamot and other citrus oils.

To help you determine which essential oil or oils may be suited to your particular needs, *see* Common Essential Oils on the previous page.

## ASCORBIC ACID FLUSH

Because vitamin C (ascorbic acid) promotes the healing of wounds and protects the body from bacterial infection, allergens, and other pollutants, it is often beneficial to flush the body with ascorbic acid. This therapy may help treat chemical allergies, influenza, and sprains, and it can help prevent other illnesses. Your intake will likely exceed the upper limit of safety, which is 2,000 milligrams for adults over age nineteen, 1,200 to 1,800 milligrams for children age nine to eighteen, and 400 to 650 milligrams for children age one to eight.

### Procedure for Adults

Place 1,000 milligrams of ascorbic acid in a cup of water or juice. To make this drink, use ascorbic acid in the form of either esterified vitamin C, such as Ester-C, or a buffered product, such as calcium ascorbate. Take every half hour, keeping track of how much has been taken, until diarrhea results. Count the number of teaspoons needed to produce diarrhea. Subtract 1 teaspoon from this amount, and take

the resulting ascorbic acid drink every four hours for one to two days. During therapy, make sure the stool retains a tapioca-like consistency. If it again becomes watery, decrease dosage as necessary. Repeat therapy once a month.

## AYURVEDIC REMEDIES

Ayurvedic medicine is one of the oldest forms of medicine in the world. It incorporates tools such as diet, exercise, breathing exercises, meditation (yoga), mental visualization, therapeutic massage, and herbs to treat illness and maintain health. This ancient healing method also uses color therapy, sound therapy, and aromatherapy to help create balance within the body.

In Ayurveda, the fundamental healing philosophy is the concept of the three *doshas*, or basic types of energy or functional principles. These are vata (from ether and air), pitta (from fire and water), and kapha (from water and earth), and according to the principles of Ayurveda, they are present in everyone and everything. Vata is the energy of movement. Pitta is the energy of digestion or metabolism. Kapha is the energy of lubrication and structure. All three doshas are present in everyone, but one is usually predominant in any given individual. Ayurvedic medicine sees disease as a result of excess or deficiency in vata, pitta, or kapha, and also the presence of toxins. Good health indicates a balance of these three energies in a body that is relatively toxin-free. Herbs are used to treat illness by restoring this balance. Herbs that deal with energy or movement are used to increase vata. Herbs that treat digestion, assimilation, absorption, and metabolism are pitta, and those involved with structure and the musculoskeletal system—the “glue” that holds the body together—are kapha.

Ayurvedic medicine regards the human body as a manifestation of cosmic energy that is transferred to all levels, both mental and physical. This can be difficult for people from Western cultures to grasp, but practitioners believe the two systems of energy are closer than we can conceive.

At Ayurveda's core is the belief that we are a totality of body and soul within the universe, and if we can live in harmony with nature and our inner beings, we will stay healthy.

## BIOFEEDBACK

See under PAIN CONTROL.

## BLOOD PURIFICATION

Blood is composed of four components: plasma; red blood cells; white blood cells; and platelets. Through these components, the blood performs several life-sustaining functions. The plasma is the watery, colorless liquid in which the other components float. The red blood cells transport oxygen to the cells. The white blood cells destroy bacteria and other disease-producing organisms. The platelets are needed for the blood-clotting process.

In addition, blood transports nutrients to the cells and carries away wastes; transports hormones from the endocrine glands to other parts of the body; helps regulate the amounts of acids, bases, salts, and water in the cells; and helps regulate body temperature. If any of these functions is impaired, the consequences can have a direct bearing on your health.

There are several ways in which the functions carried out by the blood may be hampered. First, hundreds of chemicals—ranging from gases such as carbon monoxide to toxic metals such as lead to natural substances such as fat—can find their way into the blood and impair its function. These foreign substances enter the body through the air we breathe, the water we drink, the food we eat, and the surfaces with which we come in contact through the skin. Because these substances act on the blood in different ways, the adverse effects they produce may vary widely.

Second, the performance of the blood may be hampered by a lack of specific nutrients. A classic example is an iron deficiency that results in anemia. However, there are many nutrients that the blood requires on a daily basis if it is to perform normally. Finally, genetics can play a role in creating blood disorders. Sickle-cell anemia and hemophilia are two common examples of such disorders.

Blood purification techniques can act in two ways. Some help draw foreign substances out of the body, while others provide important nutrients to help restore the blood's normal structure and maximize its performance.

### Procedure

Blood purification is achieved through the use of a special fast. (This is for healthy adults only. If you have a chronic condition, please check with your health care provider first. Pregnant and lactating women should only do this with a physician's consent.) Once you have decided to follow a blood purification program, it is vital to choose an

appropriate time for the fast. Consider that fasting requires the conservation of energy. Therefore, avoid fasting on a week when, for instance, you are moving your office or participating in a sports event. Also keep in mind that the cold-weather months are not an ideal time for a fast, as some of the heat you need to withstand the cold is created during the digestive process. Most important is the need to be mentally prepared. If you are "psyched up" for the fast, it is the right time to fast.

Once you have chosen the time for the fast and have prepared yourself mentally, you can begin to prepare yourself physically. For one week prior to the fast, follow a raw vegetable diet, including lots of "green drinks." Chlorophyll, obtained from tablets or fresh juice, "pre-cleanses" the body, making the fast less of a shock to your system.

While on the fast, consume only steam-distilled water; juices; and dandelion, milk thistle, licorice root, yellow dock root, burdock root, or red clover tea or extract. Drink at least 8 to 10 cups of distilled water daily to aid in cleansing and to help carry toxins out of the body. The best juices for blood purification are lemon juice, beet juice and its tops, carrot juice, and the juices of all leafy greens. Leafy green juices are particularly important because they supply chlorophyll, an essential part of any blood purification therapy. Chlorophyll not only cleanses the blood of impurities, but also builds up the blood with important nutrients, promotes regularity, and inhibits cellular damage from radiation. This makes chlorophyll helpful in the treatment of many disorders. Wheatgrass, barley, and alfalfa juices are all rich in chlorophyll. This fast provides very little salt. Most diets provide too much salt, but too little can make you lightheaded and dizzy. If you feel either of these, take some clear broth.

Stay on the fast for three days, or as directed by your health care provider. Once you have completed the fast, avoid white flour and all sugars—substances that are highly refined and hard to digest. The stress placed on your body by such foods can "undo" all of the good accomplished by the fast. Ideally, these foods should be avoided all of the time. At the very least, eliminate them—as well as heated fats and oils—for at least one month after your fast.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Chlorophyll tablets or liquid chlorophyll or fresh wheatgrass juice	As directed on label.  As directed on label. Take with juice. As directed on label.	Cleanses and refurbishes red blood cells. Aids immune system function.
<i>Important</i>		
Cell Guard from Biotec Foods	As directed on label.	A good antioxidant formula.

Helpful		
Kyo-Green from Wakunaga	As directed on label.	Good for the liver and the colon. Contains wheatgrass and barley grass.
Ultimate Cleanse from Nature's Secret	As directed on label.	A two-part system that helps to stimulate and detoxify the organs, blood, and channels of elimination.

## Herbs

Barberry, black radish, eyebright, lobelia, milk thistle, Oregon grape, pau d'arco, wild yam, and yellow dock cleanse and detoxify the liver and the endocrine system. You can use these herbs independently or in any combination.

*Cautions:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well. Do not use Oregon grape during pregnancy.

Borage seed, chamomile, dandelion, ginkgo biloba, and sarsaparilla help to restore the acid/alkaline balance to the bloodstream. Ginkgo biloba is also a powerful antioxidant and improves circulation.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure.

Burdock, dandelion, hawthorn, licorice, pau d'arco, red clover, rhubarb, sage, shiitake mushroom, and Siberian and other ginsengs detoxify and cleanse the blood. These herbs can be used independently or in any combination.

*Cautions:* Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing. Do not use Siberian ginseng if you have hypoglycemia or a heart disorder. Do not use ginseng if you have high blood pressure or are pregnant or nursing.

Echinacea cleanses the lymphatic glands.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

Goldenseal cleanses the mucous membranes.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of

cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

Green tea is a powerful antioxidant. Drink two or three cups daily.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

## Considerations

See also ENEMAS and FASTING in Part Three.

## CHELATION THERAPY

Chelation (pronounced *key-LAY-shun*) therapy is a safe, nonsurgical treatment used to rid the body of excess toxins, particularly metals. Chelating agents used in this therapy are available in over-the-counter formulas that can be taken orally at home, and in intravenous solutions that must be administered under the supervision of a physician. These chelators draw out toxic metals and other harmful substances that impair body function, and help the body eliminate these toxins via the kidneys. Oral chelating agents can often prevent problems from occurring by restoring circulation to the body's tissues. If serious health problems already exist, intravenous therapy is usually necessary.

Chelation therapy is used to treat a variety of health problems. First, chelating agents are used to bind with heavy toxic metals such as cadmium, lead, and mercury—substances that enter the body through food, water, and other means—and excrete these metals from the body. As certain minerals accumulate in the body, they interact with other minerals, promoting the actions of some and inhibiting the actions of others. Lead, for instance, has been shown to inhibit the actions of calcium, iron, and potassium, all of which are important nutrients. When chelating agents are used to eliminate toxic metals such as lead from the body, essential nutrients are better able to do their job.

Chelation therapy is also used in the treatment of atherosclerosis and other circulatory disorders, as well as in the treatment of gangrene, which often is the result of poor circulation. In atherosclerosis, deposits of cholesterol, fats, and other substances collect on the walls of large and medium-sized arteries in the form of hard plaque. It has been found that calcium acts as the "glue" that holds the atherosclerotic plaque together. Chelating agents bind with this calcium and carry it out of the body, potentially breaking up the plaque deposits, unclogging the arteries, and permitting more normal blood flow.

## ORAL CHELATION THERAPY

Oral chelating agents offer a safe, convenient alternative for persons who are at risk for circulatory problems or problems caused by toxic metal accumulation. Among the many disorders that may be helped by chelation therapy are multiple sclerosis, Parkinson's disease, Alzheimer's disease, and arthritis. This should be only an adjunct to the conventional treatment prescribed by your doctor. Some people have reported dramatic improvement in arterial circulation after chelation treatment. However, the medical literature cannot support its use. A review of all published medical research on the subject concluded that it is not effective for treating cardiovascular disease. The American Heart Association does not endorse it and the FDA has not approved this method for treating cardiovascular disease. It is always wise to consult a health care professional first if you have one of these chronic conditions.

### Procedure

The following chelating agents can be used to prevent many degenerative illnesses and can often alleviate the symptoms of existing conditions. These agents can be purchased in the combinations shown below in health food stores and drugstores. Follow package directions regarding dosage.

- Alfalfa, fiber, rutin, and selenium.
- Calcium and magnesium chelate with potassium.
- Chromium, garlic, pectin, and potassium.
- Coenzyme A.
- Coenzyme Q<sub>10</sub>.
- Copper chelate, iron, sea kelp, and zinc chelate.

In addition, the following supplements can act as oral chelating agents to rid the body of excess toxic metals and minerals. Mineral supplements can be used with intravenous chelation to replace lost minerals and to control free radical damage, which has been linked to heart disease.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Aangamik DMG from FoodScience of Vermont	200 mg daily.	Increases available oxygen and prevents cellular and tissue oxidation.
Alfalfa liquid or tablets	Double the amount directed on the label.	Detoxifies the liver and alkalizes the body. Chelates toxic substances from the body.
Apple pectin and rutin	As directed on label. As directed on label.	To bind with unwanted toxic metals and remove them from the body through the intestinal tract.
Calcium plus magnesium	1,500 mg daily. 700–1,000 mg daily.	Replaces calcium lost by using chelating substances. Use calcium citrate form. Displaces calcium within the cells of the artery walls.

Coenzyme Q <sub>10</sub>	60–90 mg daily.	Improves circulation, lowers blood pressure, and acts as a chelating agent.
Garlic (Kyolic from Wakunaga)	2 capsules twice daily, with meals.	A good chelating agent and detoxifier.
L-cysteine and L-methionine	500 mg each twice daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Two of the most important natural dietary chelators. Cysteine is effective for nickel toxicity.
L-lysine plus glutathione	500 mg each daily.	Aids in detoxifying harmful toxins and metals. Powerful free radical scavengers and antioxidants that remove unwanted substances from the body. <i>Caution:</i> Do not take lysine longer than six months at a time.
Selenium	200 mcg daily. If you are pregnant, do not exceed 40 mcg daily.	A powerful free radical scavenger.
Vitamin A with mixed carotenoids including natural beta-carotene or carotenoid complex	25,000 IU daily. If you are pregnant, do not exceed 10,000 IU daily. As directed on label.	To aid in excreting toxic substances. Use emulsion forms for easier assimilation.
Vitamin B complex plus extra vitamin B <sub>3</sub> (niacin) and vitamin B <sub>5</sub> (pantothenic acid) and vitamin B <sub>12</sub> and folic acid	100 mg of each major B vitamin 3 times daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily. 50 mg 3 times daily. 1,000 mcg 3 times daily. As directed on label.	B vitamins aid in protecting the body from harmful substances and are needed for all cellular functions. <i>Caution:</i> Do not take niacin if you have a liver disorder, gout, or high blood pressure.
Vitamin C with bioflavonoids	5,000–15,000 mg daily, in divided doses.	Powerful chelating agents and immunostimulants.
Vitamin E	200 IU daily.	Removes toxic substances and destroys free radicals. Use d-alpha-tocopherol form. Emulsion form is recommended for easier assimilation and greater safety at higher doses.

### Recommendations

Follow a diet designed to treat heart disease and/or high cholesterol. Avoid fried foods; dairy products; mayonnaise; red meat; processed and fast foods; salt; and gravies. Limit vegetable oils. Drink only steam-distilled water.

Eat as many fiber-rich foods as possible. Oats, brown rice, and wheat bran are all good sources of fiber. See **CARDIOVASCULAR DISEASE** and **HIGH CHOLESTEROL** in Part Two for more information.

Add a high-protein drink to your diet, or take the essential amino acids in supplement form. A deficiency of any one essential amino acid will reduce the effectiveness of all the others.

Increase your intake of manganese by eating Brazil nuts, pecans, barley, buckwheat, whole wheat, and dried split peas. Manganese is an important chelating agent when consumed in manganese-rich foods. It is a major factor in blocking calcium from entering the cells of the arterial lining.

*Caution:* Brazil nuts contain very high amounts of selenium, over 500 micrograms per ounce of nuts. If you are pregnant, do not consume Brazil nuts.

Incorporate onions into your daily meals. Onions produce a natural chelating effect in the body and tend to decrease the “clotting power” of blood.

When using chelation therapy, make sure to replace any essential minerals that might be displaced by chelating agents. Alfalfa, iron (with your doctor’s approval), kelp, and zinc supplements are recommended. Use a natural source of iron, such as blackstrap molasses or Floradix Iron + Herbs from Salus Haus.

If you take zinc supplements, eat sulfur-rich foods, like garlic, onions, and legumes. Zinc inhibits the action of sulfur.

### INTRAVENOUS CHELATION THERAPY

Intravenous chelation therapy is often used to remove calcified, hardened plaque from the arterial walls, improving circulation. When done under the care of a physician, this procedure can be a safe alternative to vascular surgery. This therapy is also used to remove heavy metals, such as lead, from the body. Most serious illnesses require repeated injections of the chelating agents.

The most common chelating agent now used in intravenous therapy is ethylenediaminetetraacetic acid (EDTA). A strong substance, EDTA attracts lead, strontium, and many other metals, as well as calcium. Although there is controversy surrounding the use of this agent, it has not been found to be toxic when used correctly.

Prior to beginning a course of EDTA chelation therapy, you must undergo a thorough physical examination. This includes a series of laboratory tests, including evaluations of cholesterol, blood, kidney function, liver function, glucose, and electrolytes. In addition, electrocardiogram and chest X-rays are routinely performed. Other studies often assess vitamin B<sub>12</sub> and mineral status. Typically, kidney function studies are repeated several times during the course of chelation therapy. Blood studies may have to be repeated, too, depending on the initial laboratory results.

The course of chelation therapy varies from person to person, but a typical course includes two treatments per week, each of three hours’ duration. In addition to EDTA, physicians frequently administer supplements—including

vitamin C, magnesium, and trace minerals—with the intravenous infusion, depending on the individual’s particular illness and the results of the laboratory studies.

### Recommendations

While undergoing EDTA chelation therapy, be sure to take supplemental vitamins and minerals, particularly zinc, chromium, and the B-complex vitamins. This is important, as chelation agents are known to bind with and remove certain vitamins and minerals from the body. Make sure that your physician knows you are doing this. During therapy, take these supplements as directed in NUTRITION, DIET, AND WELLNESS in Part One.

### Considerations

When supervised by a qualified physician, EDTA intravenous chelation therapy is safe and causes few side effects.

Hair analysis is an excellent means of determining the concentration of minerals in the body. (See HAIR ANALYSIS in Part Three.)

There are hundreds of doctors in the United States who are certified by the American Board of Clinical Metal Toxicology as approved chelation therapists. For information on the approved physicians in your area, you can contact them directly. (See Health and Medical Organizations in the Appendix.)

### CHINESE MEDICINE

Traditional Chinese medicine (TCM) is an ancient form of medicine. It is based mainly on the prevention of illness, although it has helped many people to find a cure for a wide variety of health problems.

Chinese medicine uses herbs, acupuncture, acupressure, massage, and diet to promote health. It especially emphasizes changing lifestyle habits. The key to understanding Chinese medicine is to understand the idea of *balance*. The goal in using any of the tools of Chinese medicine, including herbs, is to supply the body with what it requires to regulate the flow of *chi*, or vital energy, and to promote a state of equilibrium, or balance, and harmony. Once balance is attained, the person regains health.

For centuries, the Chinese have taught how to achieve balance in life using the concept of yin and yang, which are present in human beings and in all of nature. Yang is characterized as heat and light; yin as shadow and cold. Dryness and summer are yang; wetness and winter are yin. Chinese philosophy also classifies energy as yang and blood as yin. A person with an excess of yang might be overweight, have an angry temperament, and high blood pressure. Such an individual would benefit from such foods as asparagus, bananas, cucumbers, soy products (tofu), and watermelon.

A person with a quiet personality, who is listless or tires easily, may have an excess of cooling yin. Foods recommended for this type of person include beef, garlic, ginger, lamb, and pepper. Yin foods are cooling and have a cooling effect, whereas yang foods are warming. Neutral foods include black beans, cabbage, carrots, lemons, and rice and other whole-grain foods. These foods provide balance. To maintain health, one must consume the proper balance of yin, yang, and neutral foods.

Like foods, medicinal herbs are seen in terms of yin and yang. Chinese herbs are very powerful and should be used under the advice of a healer trained in traditional Chinese medicine. There are more than 5,000 herbs in the Chinese pharmacopoeia, many of them unknown to Western practitioners. Along with commonly known herbals, such as astragalus (which enhances immune function) and reishi (the mushroom of immortality), traditional Chinese remedies that have been becoming more widely available in the United States include cordyceps and velvet antler (also sometimes called antler velvet). Cordyceps (also called caterpillar fungus) is a plant that is found only in certain isolated places in southwest China and Tibet, at elevations of more than 12,000 feet above sea level. Chinese researchers have found more than two hundred species of wild cordyceps. Studies on this herb suggest that it can reduce the ill effects of radiation treatment, lower blood pressure, reduce symptoms of asthma and other respiratory problems, increase energy levels, improve memory, and improve male sexual ability. Velvet antler has been reported to increase energy, mental alertness, and sex drive; decrease blood pressure and cholesterol levels; and reduce PMS symptoms. Velvet antler also may be effective as an anti-inflammatory.

If you are interested in exploring traditional Chinese medicine, we suggest that you work with a qualified practitioner of Oriental medicine, certified by the National Certification Commission for Acupuncture and Oriental Medicine (NCCAOM) rather than simply buying Chinese remedies on your own. The NCCAOM can help you to locate a qualified practitioner in your area. (See Health and Medical Organizations in the Appendix.) Many of the over-the-counter remedies that are available are not actually traditional and/or may be adulterated.

## CHIROPRACTIC

See under PAIN CONTROL.

## COLON CLEANSING

Retained debris in the colon leads to the absorption of toxins, resulting in systemic intoxication (poisoning). Symptoms of this condition can include mental confusion, depression, irritability, fatigue, gastrointestinal irregularities, and even allergic reactions such as hives, sneezing, and coughing. Many nutritionists and researchers believe that this toxicity can eventually lead to more serious disorders.

Colon cleansing can rid the colon of debris, and help prevent and treat a variety of health problems. This is for adults, and it is wise to check with your health care professional first.

## Procedure

The best means of removing toxins and wastes from the body is a fast. This should be the first step in any colon-cleansing program. (See BLOOD PURIFICATION and FASTING in Part Three.) In addition to following a fast, use a wheatgrass, fresh lemon juice, garlic, or coffee enema. (See ENEMAS in Part Three.) If bowel problems or related symptoms are chronic, repeat this program once monthly.

The following supplements aid in cleansing the colon.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<b>Very Important</b>		
Fiber (ground flaxseeds, oat bran, or psyllium seed husks)	1 capsule or 1 teaspoon 4 times daily. Take separately from other supplements and medications.	Essential for a clean colon. Not habit forming.
<b>Important</b>		
Acidophilus or Kyo-Dophilus from Wakunaga	As directed on label. Take on an empty stomach.	Restores the normal "friendly" bacteria in the colon. If you are allergic to dairy products, use a nondairy formula.
Aloe vera juice	½ cup 3 times daily. Use a pure form.	Heals colon inflammation.
Bio-Bifidus from American Biologics	As directed on label. For fast results, also use as an enema. (do this only once).	Replaces the bowel flora.
<b>Helpful</b>		
Apple pectin	As directed on label.	A source of quality fiber. Helps to detoxify heavy metals.
Kyo-Green from Wakunaga or ProGreens from Nutricology	As directed on label.	To assist in keeping the colon clear of toxic debris and aid in healing of an inflamed colon.
wheatgrass juice or capsules	As directed on label.	
Sonne's #7 Detoxificant from Sonne Organic Foods	As directed on label.	An intestinal cleanser. Contains liquid bentonite, which absorbs and eliminates toxins.
Ultimate Cleanse from Nature's Secret	As directed on label.	An excellent detoxification program.
Vitamin C with bioflavonoids	6,000–10,000 mg daily, in divided doses. (See ASCORBIC ACID FLUSH in Part Three.)	Protects the body from pollutants. Use a buffered or esterified form.

## Herbs

- Aloe vera, calendula, and peppermint help to restore the acid/alkaline balance of the colon and promote healing.
- Burdock, echinacea, and licorice have detoxifying properties. Licorice also supports the organs.

*Cautions:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Barberry, butternut bark, cascara sagrada (a natural laxative made from the bark of *Rhamnus purshiana*), flaxseed, red raspberry, rhubarb, and senna can be used to flush the colon and release waste.

*Caution:* Do not use barberry during pregnancy.

- Boneset, elecampane, fenugreek, lobelia, and yarrow loosen and flush mucus from the intestines.

*Caution:* Do not use boneset on a daily basis for more than one week, as long-term use can lead to toxicity. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Burdock root, milk thistle, and red clover cleanse the blood and support the liver.
- Fennel restores the acid/alkaline balance of the colon, promotes healing, flushes the colon, and releases waste.
- Garlic eliminates certain parasites.
- Marshmallow restores the acid/alkaline balance of the colon, promotes healing, and loosens and flushes mucus from the intestines.
- Pau d'arco restores the acid/alkaline balance of the colon, promotes healing, and has detoxifying properties.
- Slippery elm bark soothes inflammation and cleanses excess waste from the colon. For quick relief, use slippery elm tea as an enema.

## Recommendations

- Eat only raw foods for two weeks, and then maintain a diet of 50 percent raw foods, including plenty of raw vegetables and non-citrus fruits such as apples, bananas, berries, grapes, and pears.
- Drink at least ten 8-ounce glasses of water each day, even if you are not thirsty. Insufficient liquid intake promotes hard stools, which can stay in the colon for weeks or even months, causing symptoms such as headache, fatigue, and depression, and resulting in a toxic bloodstream.
- Avoid saturated fats, sugar, and highly processed foods. Avoid oils and fried foods until the colon returns to normal

and the stools are normal. Use olive oil, canola oil, or essential fatty acids sparingly during this cleansing period. Dairy products should be avoided because they create excess mucus in the colon. The nutrients in dairy—calcium, magnesium, and vitamin D—should be obtained from other foods or supplements. This diet helps to maintain a clean colon.

- If you have a blood sugar problem, avoid sweet fruits.
- Upon arising and at bedtime, drink the juice of a fresh lemon squeezed into a cup of warm water to cleanse the bloodstream and detoxify and neutralize the system.
- Each morning, take a brisk walk and drink fresh carrot and apple juice, "green drinks," or fresh pineapple and papaya juice.
- Make a colon-cleansing drink by mixing 1 tablespoon of bentonite with 1 teaspoon of psyllium seed, ½ cup of apple juice, ½ cup of aloe vera juice, and ½ cup of steam-distilled water. Drink this mixture once daily until the colon is clean and not foul smelling.
- Use a fiber supplement such as psyllium seed on a daily basis. Mix the supplement with water or juice, and drink it immediately, as the mixture thickens quickly. Avoid fiber supplements in capsule and pill form.

## COLOR THERAPY (CHROMATHERAPY)

Scientists have studied the effects of color on our moods, health, and way of thinking for years. Even an individual's preference for one color over another may be related to the way that color makes the individual feel.

Color can be described as light—visible radiant energy—of certain wavelengths. Photoreceptors in the retina, called cones, translate this energy into colors. The retina contains three kinds of cones: one for blue, one for green, and one for red. We perceive other colors by combining these colors in the brain.

The colors you choose for your clothes and for your home, office, car, and other surroundings can have a profound effect on you. Colors have been known to ease stress, to fill you with energy, and even to alleviate pain and other physical problems. This idea, it should be noted, is far from new. In fact, the "color your world" concept is part of the ancient Chinese design technique *feng shui*.

When selecting a color to effect a change in mood or to relieve discomfort, it is vital to choose the color suited to your particular objective. For instance, blue has a relaxing, peaceful, and calming effect. Blue may slightly lower blood pressure, the heart rate, and respiration. In one study, children prone to aggressive behavior became calmer when placed in a blue classroom. Blue has also been found to make people feel cooler in hot and humid environments. To help relieve the pain of ulcers, back problems, insomnia, rheumatism, and inflammatory disorders, surround yourself with blue, and focus your mind on the body part you want to

heal while looking at the color. One good place to do this is in the countryside, where the blue of the sky and the water can impart a feeling of calming “oneness” with the universe.

As another of nature’s most abundant colors, green, like blue, has a soothing and relaxing effect on the body as well as on the mind. People who are depressed or anxious can benefit from green surroundings. Green also helps nervous disorders, exhaustion, heart problems, and cancer. When you are ill, try sitting on a hillside or by a green pasture, and focus on the body part you want to heal. Green may also be a good environmental color for the dieter.

Like blue and green, violet creates a peaceful environment. Violet also suppresses the appetite and is good for scalp and kidney problems and for migraine headaches.

The color red stimulates, excites, and warms the body. Red increases the heart rate, brain wave activity, and respiration. The color of passion and energy, red is also good for sexual dysfunction, as well as for anemia, bladder infections, and skin problems. Those who have poor coordination should avoid wearing the color red. In addition, people suffering from hypertension (high blood pressure) should avoid rooms with a red decor, as this can cause their blood pressure to rise. Conversely, red has a good effect on those with hypotension (low blood pressure).

Pink has a soothing effect on the body, relaxing the muscles. Because it has been found to have a tranquilizing effect on aggressive and violent people, pink is often used in prisons, hospitals, and juvenile and drug centers. Those suffering from anxiety or withdrawal symptoms can benefit from pink surroundings. Pink is also a good color for the bedroom, where it can help evoke feelings of romance.

Orange is the color of choice for stimulating the appetite and reducing fatigue. Use this color in place mats and tablecloths, for instance—to encourage a finicky eater or to pique the appetite of a person who is ill. This color should be avoided by those who are trying to lose weight. If you are feeling tired or run down, try wearing an orange garment to lift your energy level. General weakness, allergies, and constipation may also improve.

Yellow is the most memorable of all the colors. Whenever you want to remember something, jot it down on yellow paper. This color also raises the blood pressure and increases the pulse rate, but to a lesser degree than red does. As the color of sunshine, yellow has an energizing effect; it can help relieve depression. A chromotherapist may use this color to treat muscle cramps, hypoglycemia, overactive thyroid, and gallstones.

Black is a “power” color. Try wearing black clothes for a feeling of strength and self-confidence. Black also suppresses the appetite. If you want to lose weight, cover your dining table with a black tablecloth.

## CRYSTAL AND GEMSTONE THERAPY

Some people believe colorful crystals hold incredible powers. For example, Thomas Edison is said to have believed

that his success was due in part to a pocketful of quartz crystals he always carried with him. He felt that the stones allowed him the opportunity to take notice of his inner self and his creativity. Gemstone therapists believe that gems possess a specific healing energy that can be transferred to the body.

Certain gemstones are used for healing specific organs by contact with the body’s related energy centers, called *chakras*. Certain stones also direct energies toward emotional states. Quartz crystals are probably the most popular. Quartz can be a beautiful white, such as milk quartz, or colorless and shiny like rock crystal. The rock crystal’s therapeutic properties are aimed at soothing resentment and envy. It is also used to calm weak kidneys, cardiac pain, and upset stomachs.

In some cases, the healing properties of gems are used to stimulate energy flow to certain areas of the body. Amber (yellow to brown) is believed to aid in kidney and bladder function. Agate (gray, blue, and beige) promotes self-confidence and energy. Amethyst (purple) is used to unlock blocked energy, bring calm in times of grief, and promote positive thinking. Diamonds (many colors) protect energy fields and cleanse the blood. Emerald (green) improves memory and intellect. Jade (green or white) attracts loyal friends, brings good fortune, composure, peacefulness, and wisdom. Onyx (black) improves devotion and concentration. Ruby (red) increases energy, improves circulation, and promotes intuitive thinking. Sapphire (blue) gives the wearer self-esteem, purity of mind, and contentment. Turquoise is used to protect against harmful energy. Black onyx aids in changing bad habits. These are only a few examples of the powers ascribed to gemstones.

All crystals and gemstones should be “cleansed” periodically in running water to wash away the negative energies they may have picked up, particularly if they have been used for healing.

## DHEA THERAPY

The most abundant hormone found in the bloodstream, dehydroepiandrosterone (DHEA) is produced by the adrenal glands, which sit atop the kidneys. Much like human growth hormone (HGH) and melatonin—two other hormones now known to have antiaging properties—DHEA is produced abundantly during youth, with production peaking around age twenty-five. After this, though, production wanes. By the age of eighty, people are thought to have only 10 to 20 percent of the DHEA they had at twenty.

Research has shown that DHEA has many functions in the body pertaining to health and longevity. Among other things, it may help to generate the sex hormones estrogen and testosterone. If testosterone increases, then so does the percentage of muscle mass, and the percentage of body fat decreases. If estrogen is increased, new bone deposition can occur, thereby helping to prevent osteoporosis. As the production of DHEA declines with age, the structures and

systems of the body appear to decline with it. This leaves the body vulnerable to various cancers, including cancer of the breast, prostate, and bladder, as well as to atherosclerosis, high blood pressure, Parkinson's disease, diabetes, nerve degeneration, and other age-related conditions.

Some research suggests that DHEA replacement therapy can have a number of highly beneficial effects. In a 1986 study based on twelve years of research involving 242 middle-aged and elderly men, small doses of DHEA appeared to be linked with a 48 percent reduction in death from heart disease, and a 36 percent reduction in death from other causes. In one twenty-eight-day study, DHEA therapy enabled men to lose 31 percent of mean body fat without changing body weight. However, a 2006 randomized controlled study at the Mayo Clinic in Rochester, Minnesota, showed that elderly women taking DHEA had no changes in body composition, muscle strength, or how well they could handle glucose, and showed no improvement in quality of life. The authors concluded that DHEA has no physiological relevant benefit in aging.

DHEA comes both in nonprescription-strength pills and capsules, and in higher-dosage prescription-strength pills and capsules. Most of the DHEA that you can buy is made in laboratories from substances extracted from wild yams, the most common substance being *diosgenin*. Also available are extracts of the wild yams that have *not* been processed into DHEA, but that the body may convert into DHEA.

*DHEA therapy should be undertaken with caution.* Some physicians believe that high doses of DHEA suppress the body's natural ability to synthesize the hormone. Women should take no more than 10 milligrams daily. Sometimes changing estrogen levels and making them higher will stimulate the growth of breast and prostate cancers. Before using this therapy, check with your doctor, who knows your health risk and your family history. Animal studies have indicated that high doses can also lead to liver damage. For this reason, while undergoing DHEA replacement therapy, it is important to take supplements of the antioxidants vitamin C, vitamin E, and selenium to prevent oxidative damage to the liver. A better source of DHEA might be 7-Keto DHEA. This substance plays the same role as DHEA in the body, such as strengthening the immune system and enhancing memory, but, unlike ordinary DHEA, it is not converted into estrogens or testosterone.

## ENEMAS

Over time, toxic wastes can accumulate in the colon and liver, and then circulate throughout the body via the bloodstream. A clean and healthy colon and liver, then, are essential for the health of all the organs and tissues of the body.

There are two types of enemas—the retention enema and the cleansing enema. Retention enemas, also known as suppositories or implants, are held in the body for about fifteen minutes. Their primary action is to help rid the liver

and colon of impurities. Cleansing enemas, which are retained for only a few minutes, are used to flush and cleanse the colon.

When using any enema, keep in mind that enemas should never be used if there is rectal bleeding. In such a case, contact a physician immediately.

If you experience tension or spasms in the bowel while using an enema, proceed slowly and try using warmer water—99°F is a good temperature—to help relax the bowel. If the bowel is weak or flaccid, try using colder water—75°F to 80°F—to help strengthen it.

After using any enema, be sure to wash and sterilize the tip of the enema bag. Enemas are for adults, and it is always wise to check with a health care professional first.

## THE CATNIP TEA ENEMA

Catnip tea enemas are a good way to bring a high fever down quickly and keep it down. These also relieve constipation and congestion, which keep fever up. Repeat the procedure every four to six hours, and continue taking the enemas twice daily as long as fever persists. If the fever does not correct itself after twenty-four hours, seek medical attention. Catnip tea enemas should *not* be given to children.

### Procedure

To make the solution for the catnip tea enema, place about 8 tablespoons of fresh or dried catnip leaves in a glass or enameled pot. (If you are using bagged catnip tea, use the amount recommended on the package to make 1 quart of tea.) In a separate pot, bring 1 quart of steam-distilled water to a boil. Remove the water from the heat and pour it over the herbs. Cover the pot and let the tea steep for five to ten minutes. Then strain out the catnip and allow the tea to cool to a comfortable, slightly warm temperature.

Place all of the solution in an enema bag. Do not use petroleum jelly to lubricate the tip of the enema bag. Instead, use vitamin E oil (buy it in oil form or pierce the end of a vitamin E capsule and squeeze the liquid onto the tip). The liquid will both ease insertion and have a healing effect on the anus and the lining of the colon, if these areas are inflamed. Aloe vera may also be used for this purpose.

The best position to assume when receiving the enema is “head down and rear up.” If you experience any pain during insertion, stop the flow of the enema bag and, remaining in the same position, take deep breaths until the pain subsides. Then resume the enema flow. If you expel the liquid before all of it has been inserted, simply begin the process over again. If pain persists, discontinue the enema procedure.

After the liquid has been inserted, roll onto your back, and finally roll over and lie on your right side. As you are doing this, massage your colon to help loosen any fecal matter. Start on your right side and gradually move your

fingers up toward the bottom of your rib cage, then across your abdomen and down the left side. Hold the solution in your body for three or four minutes before expelling it.

### THE COFFEE OR WHEATGRASS RETENTION ENEMA

This type of enema is not hard to retain, since it is only a pint of liquid. When used as a retention enema—an enema that is held in the body for a specified period of time—coffee does not go through the digestive system and does not affect the body as a coffee beverage does.

A coffee retention enema is quite helpful during a serious illness, after hospitalization, and after exposure to toxic chemicals. This enema can also be used while fasting to relieve the headaches sometimes caused by the quick release of toxins. Ask your doctor before doing this if you are recovering from a major illness or have a chronic condition.

Some alternative clinics use fresh wheatgrass retention enemas for the treatment of cancer and other chronic illnesses, using 1 ounce of fresh wheatgrass juice in 1 cup of warm water. Wheatgrass contains nearly all the nutrients and enzymes the body needs for healing. If you cannot obtain fresh wheatgrass, Sweet Wheat from Sweet Wheat, Inc., a freeze-dried product, is a good alternative. Try using coffee and wheatgrass enemas on alternating days.

#### Procedure

To make the coffee enema solution, place 2 quarts of steam-distilled water in a pan, and add 6 heaping tablespoons of ground coffee (do not use instant or decaffeinated). Boil the mixture for fifteen minutes, cool to a comfortable temperature, and strain. Use only 1 pint of the strained coffee at a time, and refrigerate the remainder in a closed jar.

Place 1 pint of the enema solution in an enema bag. Do not use petroleum jelly to lubricate the tip of the enema bag. Instead, use vitamin E oil (buy it in oil form or pierce the end of a vitamin E capsule and squeeze the liquid onto the tip). The liquid will both ease insertion and have a healing effect on the anus and the lining of the colon, if these areas are inflamed. Aloe vera gel may also be used for this purpose.

The best position to assume when receiving the enema is “head down and rear up.” After the liquid has been inserted, roll onto your right side and hold the solution in your body for fifteen minutes before allowing the fluid to be expelled. Do not roll from side to side.

Do not be concerned if the liquid is not expelled after fifteen minutes. Simply stand up and move around as usual until you feel the urge to expel the liquid.

#### Recommendations

Use steam-distilled water, not tap water. This is especially important for retention enemas—you do not want to absorb any chemicals from the tap water.

To maximize the benefits of this or any other retention enema, use a cleansing enema first.

Do not abuse coffee enemas by using them too often. Use them only once daily while following a program for a specific disorder, unless you are being treated for cancer. People with cancer may need up to three enemas a day. You may also use coffee and wheatgrass enemas occasionally as needed.

Remember that excessive use of coffee enemas over six months or more may deplete the body’s stores of iron, as well as other minerals and vitamins, causing anemia. Do not use coffee enemas for longer than four to six weeks at a time. If you develop anemia during treatment—or whenever you use this enema daily for a long period of time—be sure to take desiccated liver tablets as directed on the label.

*Caution:* Only a doctor can diagnose anemia by a blood test, so seek medical attention if you are feeling sluggish. Do not take iron or products with iron until anemia is diagnosed.

If you have cancer, AIDS, or another serious illness, or if you have a malabsorption problem, add 1 cc of B-complex vitamins or 2 cc of injectable liver extract, plus an eyedropperful of liquid kelp or sea water concentrate (found in health food stores) to the enema solution. If you are unable to locate injectable forms of these supplements, open 2 capsules of a B-complex supplement and add the contents to the enema solution, making sure it dissolves before use. You can open up a capsule of probiotics and add the contents to the solution. Used daily, these supplements replace any lost B vitamins, help rebuild the liver, and provide an extra boost of energy. You can also add burdock root and milk thistle extract to the enema. Use only alcohol-free liquid extract and 5 drops of each to the enema solution. This will help to cleanse the blood and the liver. Consult your doctor before doing this.

To kill unwanted bacteria in the colon—or for any type of colon disorder, including diarrhea and constipation—add 5 drops of Aerobic 07 from Aerobic Life Industries to the enema solution.

### THE LEMON JUICE CLEANSING ENEMA

The lemon juice enema is an excellent means of cleansing the colon of fecal matter and other impurities and of detoxifying the system. This enema also balances the pH of the colon and is useful whenever cleansing of the colon is desired, as well as for colon disorders, such as constipation.

#### Procedure

To make the solution for the lemon enema, add the juice of 3 lemons to 2 quarts of lukewarm steam-distilled water. (Be sure to avoid using either very cold or very warm water.) If desired, add 2 eyedroppers of liquid kelp to boost the mineral content of the solution.

Place all of the solution in an enema bag. Do not use petroleum jelly to lubricate the tip of the enema bag. Instead, use vitamin E oil (buy it in oil form or pierce the end of a vitamin E capsule and squeeze the liquid onto the tip). The liquid will both ease insertion and have a healing effect on the anus and the lining of the colon, if these areas are inflamed. Aloe vera gel may also be used for this purpose.

The best position to assume when receiving the enema is “head down and rear up.” After the liquid has been inserted, roll onto your back, and finally roll over and lie on your left side. As you are doing this, massage your colon to help loosen any fecal matter. Start on your right side and gradually move your fingers up toward the bottom of your rib cage, then across your abdomen and down the left side.

Note that 2 quarts is a lot of liquid. If you experience any pain during insertion, stop the flow of the enema bag and, remaining in the same position, take deep breaths until the pain subsides. Then resume the enema flow. If you expel the liquid before all of it has been inserted, simply begin the process over again. If pain persists, discontinue the enema procedure.

Hold the solution in your body for three or four minutes before allowing it to be expelled. After two or three such sessions, you will find it easier to insert and hold the liquid.

## Recommendations

☐ If you have trouble with constipation, use the lemon juice enema once a week, and the coffee retention enema once a week. The bowels will soon move, the colon will be clean, and the stool will not be foul-smelling. Constipation is also treated with fiber-rich foods like fruits, vegetables, and whole grains, and plenty of water.

☐ If you suffer from colitis, use the lemon juice enema once a week. Any time pain from colitis is experienced, this enema will quickly relieve the discomfort. But check with your health care professional first, if you have been diagnosed with colitis.

☐ If you are allergic to lemons, prepare the enema solution with 1 to 2 ounces of wheatgrass juice or 1 ounce of liquid aged garlic extract (Kyolic) in 2 quarts of steam-distilled water. Or fill the enema bag with plain steam-distilled water.

## THE PROFLORA WHEY ENEMA

This remedy may be beneficial if you have used high colonics or taken antibiotics over a long period of time—practices that can kill the body’s “friendly” bacteria. The whey enema may help the body fight yeast infections and improves digestion and the assimilation of nutrients.

## Procedure

To make the enema solution, mix 2 quarts of lukewarm steam-distilled water and 5 tablespoons of ProFlora whey.

Pour the mixture into the enema bag. Release any air from the enema tube before insertion, and lubricate the tip with vitamin E oil (buy it in oil form or pierce the end of a vitamin E capsule and squeeze the liquid onto the tip). Do not use petroleum jelly to lubricate the tip of the bag.

For best results, use a plain water enema before using the ProFlora whey enema, as this makes it easier to retain the solution for the necessary period of time. Do not use this type of enema on a daily basis. Limit it to three times a year.

To replace the friendly bacteria in the colon, do a probiotic retention enema after the ProFlora whey enema. Open up 8 capsules of Kyo-Dophilus from Wakunaga and add the contents to 1 cup of lukewarm (body-temperature) water. The best position to assume when receiving the enema is “head down and rear up.” This enema will normalize the pH of the colon and restore healthy bacteria so that constipation will be eliminated. After the liquid has been inserted, roll onto your right side and hold the solution in your body for fifteen minutes before allowing the fluid to be expelled. Do not roll from side to side.

Do not be concerned if the liquid is not expelled after fifteen minutes. Simply stand up and move around as usual until you feel the urge to expel the liquid. Do not use this type of enema on a daily basis. Limit it to three times a year.

## EXERCISE

The closest thing to a “magic bullet” for maintaining youth and optimal health is a well-balanced combination of exercise and proper nutrition. The entire body benefits from this formula, both physically and psychologically.

Regular exercise improves digestion and elimination, increases endurance and energy levels, promotes lean body mass while burning fat, and lowers overall blood cholesterol while increasing the proportion of “good” cholesterol (HDL) to “bad” cholesterol (LDL). Exercise also reduces stress and anxiety, which are contributing factors to many illnesses and conditions. In addition to the physical benefits, studies have shown that regular exercise elevates mood, increases feelings of well-being, and reduces anxiety and depression.

The power of exercise in maintaining health was underscored by the continuing Aerobics Center Longitudinal Study, which was designed to examine the effects of different fitness levels. According to a report on the study published in the *Journal of the American Medical Association*, low fitness may pose as great a risk to health as smoking, and a greater risk than high cholesterol, high blood pressure, or obesity. It was reported that smokers who are moderately physically fit, but have high blood pressure and high cholesterol, live longer than nonsmokers who are healthy but sedentary. Moderate fitness, it was stated, can be achieved in ten weeks through many different forms of exercise, including daily sessions of walking, bicycling, or even gardening.

Exercise includes a variety of movements and different activities. *Recreational* exercise is meant for enjoyment and relaxation, while *therapeutic* exercise is intended to alleviate or prevent a particular problem. Sometimes an exercise can be both recreational and therapeutic. Take swimming, for example. With careful attention to arm and shoulder movements, swimming can meet both the recreational and therapeutic needs of someone who has arthritis of the shoulder.

There are a number of exercise types, each of which has a specific purpose:

- *Aerobic or endurance exercise* improves the body's capacity to use fuel and oxygen. Swimming, bicycle riding, jogging, and power walking are examples of this type of exercise. The body's cardiovascular system benefits through increased blood supply to the muscles and enhanced oxygen delivery throughout the body. Just thirty minutes a day of sustained aerobic activity can lower blood pressure and strengthen heart function.
- *Range-of-motion exercise* helps maintain a joint's complete movement by putting a body part through its maximum available range of motion. Extending and moving one's arms in wide circular motions is an example of this. Some degree of flexibility is required to perform range-of-motion exercises, so stretching beforehand is recommended.
- *Strengthening exercise* helps a muscle's ability to contract and do work. Doing sit-ups, for example, is a way of strengthening abdominal muscles.

One exercise rarely achieves two goals. For instance, a strengthening exercise will not significantly affect endurance, and range-of-motion exercises will not necessarily improve strength. A total exercise program must consider the individual's goals and include activities designed to achieve those goals. (See PAIN CONTROL in Part Three for other types of exercises that can be used for relaxation, meditation, and healing.)

Exercise should not be looked at as a chore. Try to select activities that you enjoy and look forward to doing. Whatever you choose, start out slowly, listen to your body, and gradually increase the intensity and duration of your workout.

A word of caution: If you are over thirty-five and/or have been sedentary for some time, consult with your health care provider before beginning any new exercise program.

## FASTING

Over time, toxins build up in the body as the result of the pollutants in the air we breathe, the chemicals in the food and water we consume, and other means. Periodically, the body seeks to rid itself of these toxins and releases them from the tissues. The toxins then enter the bloodstream, causing the body to experience a "low" or "down" cycle.

During such a cycle, you may suffer from headaches, diarrhea, or depression. Fasting is an effective and safe method of helping the body detoxify itself and move through this low cycle with greater speed and fewer symptoms. In fact, fasting is recommended for any illness, as it gives the body the rest it needs to recover. Acute illnesses, colon disorders, allergies, and respiratory diseases are most responsive to fasting, while chronic degenerative diseases are the least responsive. By relieving the body of the work of digesting foods, fasting permits the system to rid itself of toxins while facilitating healing.

But fasting is helpful not just in times of poor health or during the body's low cycles. By fasting regularly, you give all of your organs a rest, and thus help reverse the aging process and live a longer and healthier life. During a fast, the following happens:

- The natural process of toxin excretion continues, while the influx of new toxins is reduced. This results in a reduction of total body toxicity.
- The immune system's workload is greatly reduced, and the digestive tract is spared any inflammation due to allergic reactions to food.
- Due to a lowering of serum fats that thins the blood, tissue oxygenation is increased and white blood cells are moved more efficiently.
- Fat-stored chemicals, such as pesticides and drugs, are released.
- Physical awareness and sensitivity to diet and surroundings are increased.

Due to these effects of fasting, a fast can help you heal with greater speed; cleanse your liver, kidneys, and colon; purify your blood; help you lose excess weight and water; flush out toxins; clear the eyes and tongue; and cleanse the breath. It is recommended that you fast at least three days a month, and follow a ten-day fast at least twice a year. Fasting is for healthy adults; those with chronic conditions should ask their physician first. Children cannot afford this much time without nourishment and should not be put on a fast.

Depending on the length of the fast, it accomplishes different things. A three-day fast helps the body rid itself of toxins and cleanses the blood. A five-day fast begins the process of healing and rebuilding the immune system. A ten-day fast can take care of many problems before they arise, and may help to fight off illness, including the degenerative diseases that have become so common in our chemically polluted environment.

Certain precautions should be taken during fasts. First, *do not* fast on water alone. An all-water fast releases toxins too quickly, causing headaches and worse. Instead, follow the live-juice diet detailed below, as this both removes toxins and promotes healing by supplying the body with vitamins, minerals, and enzymes. Such a fast is also more likely

to lead to a continued healthy diet once the fast is over, as it will accustom you to the taste of raw vegetables and the vitality that this diet promotes. Second, whenever you fast for more than three days, do so only under the supervision of a qualified health care professional. If you have diabetes, hypoglycemia, or another chronic health problem, even short fasts should be supervised by a doctor. Pregnant and lactating women should *never* fast.

A final word of advice: It took years to wear your body down, and it will take time to build it back up to its peak condition. But believe that it can be done. Then, whenever you start to feel unwell, fast and feel better. Although a typical diet usually provides too much salt, when you fast your body gets very little salt (sodium)—a necessary nutrient. If you feel lightheaded or dizzy, include some broth in your diet.

### Procedure

To prepare for the fast, eat only raw vegetables and fruits for two days. This will make the fast less of a shock to the system.

While on the fast, consume at least ten 8-ounce glasses of steam-distilled water a day, plus pure juices and up to 2 cups of herbal tea a day. Dilute all juices with the water, adding about 1 part water to 3 parts juice. Do not drink orange or tomato juice, and avoid all juices made with sweeteners or other additives.

The best juice to use during your fast is fresh lemon juice made by adding the juice of one lemon to a cup of warm water. Fresh apple, beet, cabbage, carrot, celery, and grape juices are also good, as are “green drinks,” which are made from green leafy vegetables. These green drinks are excellent detoxifiers. Raw cabbage juice is particularly good for ulcers, cancer, and all colon problems. Just be sure to drink the cabbage juice as soon as it is prepared. As this juice sits, it loses its vitamin content.

As a general rule, you should not combine fruit and vegetable juices. Apples are the only fruit that should be added to vegetable juices.

Follow the juice-water-and-tea fast with a two-day diet of raw fruits and vegetables. The desired effects of the fast can be ruined by eating cooked foods immediately afterward. Because both the size of the stomach and the amount of secreted digestive juices may decrease during fasting, the first meals after a fast should be frequent and small.

### Herbs

Herbal teas may be consumed throughout the fast, once or twice per day or more if you wish. Try the following teas:

- Use alfalfa, burdock, chamomile, dandelion, milk thistle, red clover, and rose hips tea to rejuvenate the liver and cleanse the bloodstream.

*Caution:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it.

- Drink 2 parts echinacea and pau d’arco tea mixed with 1 part unsweetened cranberry juice. Used four times a day, this will rebuild the immune system, aid in bladder function, and rid the colon of unwanted bacteria.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- Use peppermint tea for its calming and strengthening effect on the nerves, and for indigestion, nausea, and flatulence.
- Use slippery elm tea for inflammation of the colon. This tea also is beneficial when used as an enema solution.

Take 2 capsules of garlic twice a day. If you prefer a liquid supplement, add 1 tablespoon of liquid aged garlic extract (Kyolic) to a cup of water. Garlic supplements may be taken on a daily basis before, during, and after a fast to promote overall health, aid in the healing process, and rid the colon of many types of parasites.

### Recommendations

When fasting, you may not be getting enough salt. If you feel lightheaded or dizzy, take some broth with sodium and/or add salt to your food.

If you must have something to eat during the fast, eat a piece of watermelon. Always eat watermelon by itself, with no additional foods. You can also try applesauce—fresh, not canned—made in a blender or food processor. Leave the skin on the apples, and do not cook them.

Take a fiber supplement on a daily basis before and after your fast, but not during the fast. To promote cleansing of the colon before and after your fast, be sure to make extra fiber a part of your daily diet. Bran, especially oat bran, is an excellent source of fiber. Try to avoid supplements containing wheat bran, as they may be irritating to the colon wall. Another good fiber source is ABC Aerobic Bulk Cleanse from Aerobic Life Industries. To use this colon cleanser, mix it with half aloe vera juice and half natural cranberry juice. This mixture adds fiber and has a healing and cleansing effect also. Psyllium seed husks and ground flaxseed are other good-quality fiber products. Be certain to accompany any fiber capsule with a large glass of water, because the capsules expand and soak up a good deal of water.

Do not chew gum while on the fast. The digestive process starts when chewing prompts the body to secrete enzymes into the gastrointestinal tract. If there is no food in the stomach for the enzymes to digest, trouble occurs.

If desired, take spirulina during the fast. Spirulina is high in protein and contains a wide range of vitamins and

minerals, plus chlorophyll for cleansing. If you are using tablets, take 5 tablets three times daily. If you are using powder, take 1 teaspoon three times daily, mixing the powder with a cup of unsweetened juice.

If you have hypoglycemia, consult a qualified health care professional before starting any fast.

If you are over sixty-five, or if you need daily supplements for another reason, continue taking your vitamin and mineral supplements during the fast. Older people need certain vitamins and minerals daily. When you are drinking fresh juices, reduce the dosage of supplements that you take.

If desired, before, during, and after your fast, use Kyo-Green from Wakunaga of America and ProGreens from Nutricology. These products contain all the nutrients needed to aid in the healing process. If used during the fast, these products should replace a cup of “green drink.”

During a fast, as toxins are released from your body, you may experience fatigue; body odor; dry, scaly skin; skin eruptions; headaches; dizziness; irritability; anxiety; confusion; nausea; coughing; diarrhea; dark urine; dark, foul-smelling stools; body aches; insomnia; sinus and bronchial mucus discharge; and/or visual or hearing problems. These symptoms are not serious and should pass quickly. To alleviate any of these symptoms, use a daily lemon juice enema to cleanse the colon, and a daily coffee enema to rid the liver of impurities. Also, you may be lacking in salt; use salted broth. (See ENEMAS in Part Three.)

During your fast, be sure to get adequate rest. If necessary, try napping during the day to recharge your batteries.

If desired, before, during, and after your fast, use Desert Delight from Aerobic Life Industries. This product, which contains crabapple, papaya, and aloe vera juice, helps keep the colon clean, and also supports kidney and bladder function, aids digestion, and has a healing effect on ulcers. If used during the fast, substitute this product for a cup of juice.

To make an excellent juice for healing many illnesses, juice together 3 carrots, 3 kale leaves, 2 stalks celery, 2 beets, 1 turnip, ¼ pound spinach, ½ head of cabbage, ¼ bunch of parsley, ¼ of an onion, and ½ clove of garlic. If you don't have a juicer, place the vegetables in pure water and gently boil them, adding no seasonings. A cup of this juice may be substituted for any other juice while fasting. Save the vegetables from the broth to eat after your fast. Remember that no solid food is allowed during the fast.

During a fast, as toxins are released from your body, you will probably experience a coated tongue and an unpleasant taste in your mouth. To relieve this problem, try rinsing your mouth with fresh lemon juice.

If you are a denture wearer, keep your dentures in your mouth throughout the fast to prevent shrinkage of the gums.

While fasting, continue your normal daily routine, including moderate exercise. Avoid any strenuous exercise.

Be aware that when you fast during a low phase, you help your body experience the “up” phase of the cycle—a period during which you feel great. This occurs because the body has been cleansed of impurities. However, when you start to pollute your body again, the toxins once again begin to build up, and, in time, you will again have a low phase. When this occurs, the fast should be repeated.

Before, during, and after your fast, use dry-brush massages to help rid the skin of toxins and dead cells. Perform the massage with a *natural* bristle brush that has a long handle, so that you can reach your back. Always brush toward the heart—from wrist to elbow, elbow to shoulder, ankles to knees, knees to hips, and so on. This massage will flake away large amounts of dead skin, freeing the pores of impediments, and, in turn, helping the skin to excrete poisons. It will also greatly improve circulation. *Do not* use this technique on areas of the body affected by acne, eczema, or psoriasis. Also avoid brushing areas that are broken or recently scarred, or that have protruding varicose veins.

## GLANDULAR THERAPY

The glandular system is both important and complex. Virtually all body functions—from digestion to reproduction to growth—depend on a healthy glandular system.

To a large degree, the health of the glands, like the health of any organ of the body, can be greatly improved by adequate vitamin and mineral supplementation. Glandular therapy, the use of concentrated forms of various raw animal glands, can also improve the health of specific glands. If you have a chronic condition that affects one of your glands, ask your doctor before using any glandular supplements. Most have not been tested in children, so ask your child's pediatrician before using them.

Early endocrinologists hypothesized that glandulars worked by providing nutrients the body lacked. Once supplied with the missing nutrients, the malfunctioning organ was able to repair itself and function properly.

Some of the most important glandulars are the following:

- Raw adrenal glandular.
- Raw brain glandular.
- Raw heart glandular.
- Raw kidney glandular.
- Raw liver glandular.
- Raw lung glandular.
- Raw mammary glandular.
- Raw ovary glandular.
- Raw pancreas glandular.
- Raw pituitary glandular.

- Raw spleen glandular.
- Raw thymus glandular.
- Raw thyroid glandular.

Care should be taken in the purchase of glandulars. Many glandular products are by-products of the meat-processing industry and are taken from adult animals that show the effects of aging and exposure to toxins. This impairs the quality of the glandular. For best results, make sure that the glandulars you buy come from young, organically raised free-range animals that have not received hormones.

## MAINTAINING A HEALTHY GLANDULAR SYSTEM

A gland is an organ that manufactures and releases fluids and other substances into the body for the body's use. The function of these fluids is so wide-ranging that virtually all body processes depend on a healthy glandular system. An imbalance or malfunction of any one glandular substance or gland can create tremendous problems throughout the body.

Glands fall into two categories: the exocrine glands and the endocrine glands. The exocrine glands, each of which secretes a specialized substance, open onto a surface of an organ or other structure through a duct. Examples of such glands are the salivary glands of the mouth, and the sweat and oil glands of the skin. Other exocrine glands can be found in the kidneys, the mammary glands, and the digestive tract. These glands perform a variety of functions. The salivary glands, for instance, secrete saliva, which aids in the digestion of food, while the sweat glands help rid the body of waste products.

Unlike the exocrine glands, the endocrine glands are ductless, and thus secrete the substances they produce—specifically, hormones—directly into the bloodstream. Examples of these glands include the adrenal glands, found atop the kidneys; the gonads, found in the reproductive organs; the pancreas, found behind the stomach; the pituitary gland, found at the base of the brain; the thyroid and parathyroid glands, found in the neck; and the thymus gland, found below the thyroid. The pineal gland, which is attached to the brain, is also thought to be an endocrine gland.

By secreting hormones—chemicals that start or control the activity of an organ or group of cells—the endocrine glands help regulate practically all body functions. For instance, the pancreas secretes insulin, an important regulator of sugar metabolism. The female gonads, called the ovaries, produce hormones like estrogen, which aids the development of secondary sex characteristics, prepares the walls of the uterus to receive a fertilized egg, and performs many other important functions. The thymus secretes thymosin, a hormone that is critical to proper immune system function. The pituitary gland, which is often called the “master gland,” regulates the functions of the other glands, and also produces a hormone that stimu-

lates body growth. It should be noted that the pituitary gland, like many of the other endocrine glands, produces more than one hormone. Similarly, some hormones, such as estrogen, are secreted by more than one gland.

Like all organs, the glands need nutritional support, especially when stress depletes the body's stores of nutrients. Glandulars—concentrated forms of various organic animal glands—are one means of improving the health of the glands. In addition, nutritional supplements can help maintain the health of these glands, and thereby ensure proper functioning of the glandular system.

NUTRIENTS		
SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
<i>Very Important</i>		
Kelp	Up to 200 mg daily.	Rich in minerals and the element iodine, which are necessary for thyroid function.
L-arginine plus L-lysine	500 mg daily.	Increases the size and activity of the thymus gland. Add this supplement if you are prone to herpes outbreaks.
L-glycine	500 mg daily.	Essential for the health of the thymus gland, spleen, and bone marrow.
L-tyrosine	500 mg daily.	Important to the health and function of the adrenal, thyroid, and pituitary glands.
Manganese	As directed on label. Take separately from calcium.	Crucial to the production of thyroxine, the hormone that regulates the metabolic process. This nutrient is stored in and used by the liver, kidneys, pancreas, lungs, prostate gland, and brain.
Vitamin A plus natural beta-carotene and other carotenoids	As directed on label.	Nutrients that nourish the thymus gland and increase antibody production. All organs with duct systems require these nutrients.
Vitamin B complex plus extra vitamin B <sub>2</sub> (riboflavin)	100 mg of each major B vitamin twice daily (amounts of individual vitamins in a complex will vary). 50 mg 3 times daily.	B vitamins work best when all are taken together. Especially important if you are under stress.
and vitamin B <sub>5</sub> (pantothenic acid)	50 mg 3 times daily.	Vital to the health of the entire glandular system, especially the adrenal glands. The antistress vitamin.
Vitamin C with bioflavonoids	1,500 mg daily.	Important for adrenal function, and should be taken when using L-cysteine to prevent formation of cystine kidney stones.
Zinc plus copper	50 mg daily. Do not exceed 100 mg daily from all supplements. 3 mg daily.	Needed by the immune system, and for thymus and pancreas health. Especially important for the gonads (sex glands). Needed to balance with zinc.

Important		
Lecithin granules or capsules	1 tsp 3 times daily, before meals. 1,200 mg 3 times daily, before meals.	All cells and organs have lecithin surrounding them for protection. Also helps cleanse the liver.
Raw thymus glandular plus multiglandular complex	As directed on label.	To stimulate immune function and aid glandular function. Sublingual forms are best.
Helpful		
Essential fatty acids (flaxseed oil, primrose oil, or salmon oil)	As directed on label.	Needed to nourish the glands.
L-cysteine and L-methionine plus glutathione	500 mg each daily, on an empty stomach. Take with water or juice. Do not take with milk. Take with 50 mg vitamin B <sub>6</sub> and 100 mg vitamin C for better absorption.	Aid in detoxifying glands of harmful pollutants. Also necessary for insulin production, and act as powerful antioxidants.
Selenium	As directed on label. If you are pregnant, do not exceed 40 mcg daily.	Nourishes the liver and pancreas.
Silica or oat straw	500 mg twice daily.	To supply silicon, a trace mineral that aids in healing the glands and tissues. See under Herbs, below.
Superoxide dismutase (SOD) or Cell Guard from Biotec Foods	As directed on label, on an empty stomach. Take with a large glass of water.	A potent detoxifier that also transports oxygen for healing in the glandular system. An antioxidant complex that contains SOD.
Vitamin E	200 IU daily.	Rids the body of toxic substances when combined with vitamin C and selenium. Use d-alpha-tocopherol form.

## Herbs

Black cohosh, black radish extract, goldenseal, licorice, lobelia, mullein, and red clover, taken in tea form, help strengthen and rebuild the liver, and restore glandular balance.

**Cautions:** Do not use black cohosh if you are pregnant or have any type of chronic disease. Black cohosh should not be used by those with liver problems. Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breastfeeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Lobelia is only to be taken under supervision of a health

care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Burdock root and red clover aid in cleansing the lymphatic glands and ridding the body of toxins.
- Cedar stimulates pancreatic function.
- Celery seed and hydrangea are diuretics that can be used to stimulate the kidneys.
- Chicory, milk thistle, and stillingia root stimulate and cleanse the liver.
- Cordyceps exerts its primary effects on the kidneys and increases lung capacity.
- Dandelion stimulates and cleanses the liver. It also stimulates bile production, thereby benefiting the spleen and improving the health of the pancreas.
- Echinacea cleanses and strengthens the kidneys, liver, pancreas, and spleen.
- Caution:** Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.
- Gentian contains elements that are known to normalize the functions of the thyroid gland.
- Oat straw is a good source of silicon, which aids in healing, and is also high in calcium. It can be taken in tea or capsule form.
- Parsley is a diuretic that stimulates kidney function. It also helps strengthen and rebuild the liver, and maintain glandular balance.
- Uva ursi is a diuretic that stimulates kidney function. It also has a germicidal effect, and thereby destroys any bacteria that may be present. It is a tonic for a weakened liver, kidneys, and other glands.

## Recommendations

- See BLOOD PURIFICATION in Part Three and follow the instructions.
- Use alfalfa, beet, black radish, and dandelion juice for cleansing the liver. (See JUICING in Part Three.)
- Use olive oil and lemon juice (3 tablespoons of olive oil mixed with the juice of a fresh lemon), plus plenty of pure apple juice, to stimulate the gallbladder and help excrete bile and even small gallstones. (See GALLBLADDER DISORDERS in Part Two.)
- See FASTING in Part Three and follow the program once monthly to allow glands time to heal and rest.
- See HYPOTHYROIDISM in Part Two and follow the temperature self-test to determine how well your thyroid gland is functioning.

## Considerations

When toxic substances circulate through the bloodstream due to poor eating habits, the use of drugs, or other factors, the presence of these substances is reflected in the lymphatic system. The lymph glands act as a filter, removing poisons from the body.

## GROWTH HORMONE THERAPY

Human growth hormone (HGH) is secreted by the pituitary gland in the brain. Like all hormones, HGH works to regulate the activities of vital organs, and thus helps maintain health throughout the body. HGH was originally called a growth hormone because it is produced in greatest amounts during adolescence, when growth is most rapid. HGH does indeed help to regulate growth. Because of the link between this hormone and the growth process, HGH therapy was first used to treat children who were failing to grow normally because of a deficiency of this hormone. Without HGH therapy, these children would have become dwarfs; with it, their growth was normal.

However, it has been found that HGH controls more than just growth. It is probably the most complex hormone the body uses. Tissue repair, healing, cell replacement, organ health, bone strength, brain function, enzyme production, and the health of nails, hair, and skin all require adequate amounts of HGH. In addition, this hormone strengthens the immune system and helps the body resist oxidative damage.

After adolescence, levels of HGH begin to decline at a rate of about 14 percent per decade. As production of the hormone decreases, so does the function of all vital organs. Because of this correlation between declining HGH production and aging, another application of HGH therapy has developed—the use of the hormone to reverse or retard age-related symptoms of physical and mental decline, and to treat some non-age-related disorders as well.

According to reports in scientific literature, benefits from HGH replacement therapy include a reversal of declining pulmonary function, decreased body fat, increased capacity to exercise, increased bone mass in people with osteoporosis, and the improvement or reversal of many other age-related symptoms and disorders. HGH has also been shown to strengthen the immune system and to improve the quality of life for people with AIDS by treating “wasting syndrome”—severe weight and muscle loss. People receiving HGH have reported a general enhancement of health and well-being, including a more positive outlook.

Although HGH injections may be self-administered, therapy must be prescribed and supervised by a physician. This is particularly important in light of the fact that as the therapy promotes tissue repair and other processes, the need for many nutrients increases. Therefore, treatment should include the supplementation of various vitamins, minerals, and, in some cases, other hormones.

As long as the dosage remains low—4 to 8 international units of the hormone per week—HGH therapy appears to be free of significant side effects. Those side effects that do occur usually pass as the body adjusts to the therapy.

HGH is extremely expensive, and a program of HGH therapy can cost upwards of \$20,000 a year. Many people turn to the Internet in an attempt to buy HGH at savings. Unfortunately, supplements sold online that purport to contain pure HGH are probably not worth the money. Any amount of HGH they contain is quite small—too small to have much of an effect. We recommend proper injections, or failing that, use of supplements that might stimulate the body to produce more HGH. Do not give HGH to children without consulting a pediatrician.

## Recommendations

Avoid the consumption of excessively sweet foods, as it results in a blood sugar level that is counterproductive to the release and utilization of HGH. High-sugar foods should especially be avoided before going to bed, as the primary supply of HGH is released during sleep.

Avoid eating immediately before exercising. Although vigorous exercise usually stimulates the production of HGH, blood sugar levels must be stable during exercise for HGH release to take place. Drinking a protein-rich shake an hour before a workout is fine.

To stimulate the body’s production of HGH, take the amino acid arginine, which has been shown to encourage HGH production. This amino acid is best taken in supplement form (500 milligrams daily), as foods that are high in arginine also contain amino acids that inhibit its ability to reach the pituitary gland, the site of HGH release.

## Considerations

Doctor’s Growth Hormone Triple Strength from Fountain of Youth Technologies is an Ayurvedic herbal formula whose ingredients include naturally occurring levodopa (L-dopa) and Ayurvedic herbs to stimulate the pituitary gland to release human growth hormone (HGH).

The use of some brands of HGH has resulted in the production of antibodies to growth hormone.

For information about other antiaging hormones, see MELATONIN *under* NATURAL FOOD SUPPLEMENTS in Part One, and DHEA THERAPY in Part Three.

## GUIDED IMAGERY

See *under* PAIN CONTROL.

## HAIR ANALYSIS

Hair analysis offers an accurate assessment of the concentration of minerals in the body—those that are toxic in any

amount, those that are essential, and those that are needed in small amounts, but toxic in larger amounts. By allowing early detection of toxic substances such as mercury, lead, cadmium, and aluminum, hair analysis makes it possible to identify and treat toxicity before overt symptoms appear. By showing levels of minerals such as calcium, it makes it possible to identify and treat a range of nutritional deficiencies well before health problems become serious.

Before the technique of hair analysis was developed, medical practitioners who were interested in the concentration of trace elements in the body had to rely on urine and serum sampling. Unfortunately, these tests do not reflect the concentration of minerals in the cells and organs, but instead show the level of *circulating minerals*. The correlation between mineral concentrations in the internal organs of the body and concentrations in hair has been found to be much more reliable. In fact, hair analysis has been found to be such an accurate measure of substance exposure that it is often used to detect drug use.

Hair analysis begins with the removal of a small amount of hair, usually from the nape of the neck. Because harsh chemical treatment of the hair through coloring, bleaching, and permanent-waving can result in inaccuracies, a pubic hair specimen may be used instead. The hair sample is chemically washed and stripped of all substances found on it. A specific amount (by weight) of the resulting sample is then dissolved in a known volume of acid. Finally, using a method of chemical analysis called atomic absorption photometry, each mineral is isolated and measured on a parts-per-million (ppm) basis.

Hair analysis also provides a relatively permanent record of mineral concentrations, which can be analyzed by computer to determine the correlation between various elements in the hair. Treatment of any identified problems, using chelation therapy and/or other programs, can then be designed and implemented before the condition becomes irreversible. (See CHELATION THERAPY in Part Three.) Later, follow-up hair analyses can be compared with the initial results to learn the effectiveness of the treatment. Your health care provider should be able to help you obtain an analysis of your hair from a reputable laboratory.

## HEAT AND COLD THERAPY

See under PAIN CONTROL.

## HOMEOPATHY

The practice of homeopathic medicine was started two hundred years ago by Samuel Hahnemann, a German physician. The basic principles of homeopathy are that the natural state of the human body is one of health and that we possess the natural ability to heal ourselves. What we describe as symptoms are actually the body's efforts to protect itself against disease. Therefore, to effect a cure, we

should not suppress the symptoms, but seek to stimulate the body's own natural healing processes.

Conventional Western medicine often seeks a cure by administering large doses of suppressant drugs. This can be a harmful approach for three reasons. First, suppressing symptoms can hamper the body's ability to cure itself. Second, the use of some drugs can have serious side effects. Third, this can rob the body of the opportunity to develop its own natural immunity.

It is possible to increase the healing power of a medicine and reduce its toxicity while at the same time proportionately and progressively diluting the medicine. In homeopathy, the more a remedy is diluted, the greater its potency. This allows homeopathic physicians to administer extremely powerful but minute therapeutic doses with no unpleasant side effects and no danger of toxic reactions. The reverse is often true in conventional medicine.

The individual and not the illness is the focal point in homeopathic medicine. Homeopathy considers the state of the whole individual—physical, mental, and emotional—whereas conventional physicians are often concerned only with the physical aspects of illness. Of course, no system of healing can cure all diseases. One can follow homeopathy as the general rule, backing it up with conventional medicine as required.

Homeopathic medicines are among the safest preparations known to medical science. Most of them (about 80 percent) are derived from plants. Some examples of plant-derived homeopathic remedies are *Bryonia* (wild hops), *Calendula* (marigold), and *Rhus toxicodendron* (poison ivy). Other remedies are derived from animals or animal products. These include *Apis mellifica* (honeybee) and *Sepia* (inky fluid from the cuttlefish). Still other remedies are prepared from minerals or mineral ores. Examples include *Natrum muriaticum* (sodium chloride), *Silicea* (flint), and *Sulfur*.

Homeopathic remedies are prepared by grinding the active ingredient and mixing it with alcohol and water, then allowing it to soften and steep. Finally, the liquid is filtered to produce a tincture. The medicines are then made more potent by progressive dilutions, which increase the healing power while decreasing the concentration. There are various potency ranges. The base, or mother tincture, has a potency of 1x. To make a 2x potency, one part of the base tincture is attenuated (mixed) with 9 parts of alcohol and shaken ten times. To make a 3x potency, one part of the 2x potency is mixed with 9 parts of alcohol and shaken again. This process is continued until the desired potency is attained.

Other mixing agents that can be used in addition to alcohol are glycerin, water, and lactose. In addition to x potencies, there are *c potencies*. These are prepared in the same way as the x potencies, except they are mixed at a ratio of 99 to 1, instead of 9 to 1. There are also *k potencies*. The 1,000k potency is labeled as 1m, a 10,000k potency as 10m, and so on.

Homeopathic remedies come in pellets, tablets, and di-

lutions (liquids). The strength of the medicine affects the way it works. Generally speaking, the lower potencies, such as 3x or 6x, have a greater effect on the organs and are suited to acute illness. Medium potencies, such as 12x and 30x, affect the senses and nervous system. High potencies, 60x and above, affect mental condition.

The following is a rough guide to the various potencies, their effects, and uses:

Potency	What It Affects	Frequency of Dosage
6x, 12x, 6c, 12c	Body organs. Used for symptoms of acute conditions.	One dose every ¼ hour to every 4 hours.
30x, 30c	Body organs plus the senses and nervous system. Used for symptoms of chronic conditions.	Once a day to 3 times a day.
200x, 1m, 10m, LM	Body organs, senses, nervous system, mind, and emotions.	Once a month to once a year.

A typical dose of a homeopathic remedy is 3 tablets or 10 pellets for adults, 2 tablets or 5 pellets for children. Remedies should be taken on an empty stomach. The tablets should be placed under the tongue and held there for as long as possible while they dissolve. If possible, you should not swallow the tablets. Most homeopathic remedies carry claims about what they are designed to treat, which have been reviewed by the FDA. This makes it easy to find what you are looking for.

## HYDROTHERAPY

Hydrotherapy—the therapeutic use of water, steam, and ice—has been used for centuries to effectively treat injuries and a wide range of illnesses. Treatment techniques include baths (full body and specific body parts), compresses, showers, sitz baths, steam baths, and whirlpools. Hospitals, clinics, and spas worldwide use forms of hydrotherapy as safe and effective methods for managing such conditions as back pain, bronchitis and other respiratory problems, cancer, hypertension, muscle pain and inflammation, and rheumatoid arthritis. Hydrotherapy is also useful in treating the discomfort caused by spinal trauma.

There are three categories of external hydrotherapy: hot water, cold water, and alternating hot and cold water. *Hot water* stimulates the immune system and increases circulation, helping to relieve the body of toxins. By soothing nerves, hot water calms and relaxes the body. *Cold water*, which constricts blood vessels, is effective in reducing inflammation. Cold-water treatments are also used to reduce fever. *Alternating hot- and cold-water treatments* have been

found to alleviate upper respiratory congestion and stimulate organ function through improved circulation.

Many hydrotherapy techniques for a range of conditions can be effectively performed at home. For instance, muscular pain and swelling caused by a sprain or strain respond favorably to an immediate application of cold. An ice pack, applied continually (up to twenty minutes on, followed by twenty minutes off) during the initial twenty-four hours following a trauma, can reduce swelling and provide relief.

Sitz baths, in which the pelvis is immersed in water, increase blood flow in the pelvic region and help to relieve problems in that area. Hot-water sitz baths are commonly used for the treatment of inflamed hemorrhoids, painful ovaries and testicles, muscular disorders, prostate disorders, and uterine cramps. They are often prescribed to a woman who has just delivered a child vaginally. Cold-water sitz baths are used to treat constipation, sexual dysfunction, inflammation, sore muscles, and vaginal discharge. Alternating hot- and cold-water sitz baths are helpful in relieving abdominal disorders, blood poisoning, congestion, foot infection, headaches, muscle disorders, neuralgia, and swollen ankles. (See SITZ BATH in Part Three.)

Other effective hydrotherapy methods include simple, soothing baths and showers, body wraps, foot and hand baths, steam inhalation, and hot and/or cold compresses.

Although many hydrotherapy methods can be performed at home, certain treatments such as hyperthermia, neutral baths, and whirlpool baths are available only in clinics or hospitals. These treatments must be performed under the careful supervision of a licensed therapist or other health care provider:

- *Hyperthermia.* Fever stimulates the body's immune system to produce the antibodies necessary for fighting certain illnesses. Hyperthermia is a hot-immersion bath used to induce fever in those who cannot achieve one naturally.
- *Neutral bath.* This therapy, in which the body is submerged to the neck in warm water (92°F to 98°F), helps to soothe the body. Neutral baths are effective in calming nervousness and emotional upsets, reducing joint swelling, and helping the body rid itself of toxins.
- *Whirlpool bath.* Used effectively in treating muscle and joint injuries, whirlpool baths are also used to soothe burns and to stimulate circulation in patients with paralysis.

If you are interested in locating a hydrotherapy facility in your area, check with your local hospital. You can also look in the yellow pages of your local telephone directory under "Health Resorts" or "Physical Therapists."

*A word of caution:* If you have any health-related problems or conditions, be sure to consult with your health care provider before beginning *any* hydrotherapy treatment. All of the treatments presented in this section are recommended for those who are in generally good health.

## HYPERBARIC OXYGEN THERAPY

All human tissues and organs need oxygen in order to function. Hyperbaric oxygen therapy (HBOT) is the administration of oxygen at high atmospheric pressure. This saturates the body with oxygen, increasing the total available amount. HBOT is useful in the treatment of a variety of conditions that are associated with an insufficient amount of oxygen in part or all of the body.

HBOT is administered by placing the individual being treated in a special chamber that delivers pure oxygen at three times the normal atmospheric pressure. In most cases, the entire chamber is pressurized for treatment, and then depressurized before the person is removed. In some cases, oxygen is delivered by mask, making pressurization and depressurization unnecessary.

In the United States, HBOT is most commonly used in cases of trauma, including burns, wounds, injuries from motor vehicle accidents, carbon monoxide poisoning, acute cyanide poisoning, smoke inhalation, and the death of tissues from radiation therapy. HBOT is also used to treat skin grafts that are failing to take, gangrene, decompression sickness, and certain cases of blood loss and anemia. HBOT is now being used by both conventional and alternative physicians, and continues to gain acceptance for new applications.

Although HBOT is strictly controlled for safety, it may not be appropriate for all individuals. People with a history of emphysema, middle ear infection, or spontaneous pneumothorax (accumulation of air in the chest cavity) may encounter problems with this therapy.

## HYPNOTHERAPY

*See under* PAIN CONTROL.

## JUICING

Fruits and vegetables are excellent sources of a wide range of vitamins, minerals, enzymes, and other nutrients, including phytochemicals—compounds that have been shown to combat cancer in a petri dish. Since more of the healthful substances found in fruits and vegetables are being discovered all the time, no supplement pill can contain all of these compounds. Also, because each plant appears to produce particular phytochemicals that work against cancer in particular ways, it is suggested that a rich assortment of fruits and vegetables be included in the diet. It is also recommended that you consume two glasses of live juices a day for health maintenance. Four glasses a day is recommended if you want to speed healing and recovery from illness.

Juicing is an excellent means of adding fruits and vegetables to your diet. Since juice contains the whole fruit or vegetable—except for the fiber, which is the indigestible part of the plant—it contains virtually all of the plants'

health-promoting components. Because fresh juices are made from *raw* fruits and vegetables, all of the components remain intact. Vitamin C and other water-soluble vitamins can be damaged by overprocessing or overcooking. Fresh juice, however, provides all of the plants' healthful ingredients in a form that is easy to digest and absorb. In fact, it has been estimated that fruit and vegetable juices can be assimilated in twenty to thirty minutes.

Ideally, the juices recommended in this book should be made fresh in your kitchen and consumed immediately. Many commercial juices are heat-treated to lengthen shelf life. As just discussed, this process can destroy important nutrients. In addition, preservatives may have been added. Even pure, freshly made juices can lose some of their nutrients by being allowed to sit for long periods of time. By buying the best produce available, properly preparing it for juicing, and processing it in your own juicer, you will produce the most healthful, nutrient-rich drinks possible.

The individual entries in Parts Two and Three recommend the use of specific juices for the treatment of specific disorders. It is helpful, though, to be familiar with the three categories into which juices generally fall: green juices, vegetable juices, and fruit juices.

### Green Juices or "Green Drinks"

Green juices cleanse the body of pollutants and have a rejuvenating effect. Made from a variety of green vegetables, green juices are rich in chlorophyll, which helps to purify the blood, build red blood cells, detoxify and heal the body, and provide the body with fast energy.

Green juices can be made with alfalfa sprouts, barley grass, cabbage, kale, dandelion greens, spinach, and other green vegetables, including wheatgrass. To sweeten and dilute your green juices, try adding fresh carrot and apple juice. (No other fruit juices should be added.) Steam-distilled water is another good addition.

Although green juices have great health benefits, they should be consumed in moderation. Try drinking about 8 to 10 ounces a day. The following is an excellent "green drink":

---

#### Ageless Cocktail

---

*4–5 carrots*

*3 sprigs fresh parsley*

*1 large handful spinach*

*1 large handful kale*

*1 beet, including tops*

*1 clove garlic, peeled*

*¼ head cabbage*

1. Thoroughly wash all vegetables, peeling the carrots and beet. Cut the vegetables into pieces small enough to fit into the juicer.
2. Process the vegetables in the juicer and drink immediately.

## Safer Juice Processing

Juice products are enjoyed by many for their flavor and nutritional advantages. However, as evidenced by outbreaks, unpasteurized juice can also serve as a vehicle for foodborne illnesses. The California Department of Health Services, Food and Drug Branch developed a video in cooperation with the U.S. Food and Drug Administration (FDA), Centers for Disease Control and Prevention, university researchers, and industry representatives to assist the industry in producing a safer product.

Topics covered in the video:

- |  |   |
|--|---|
| Introduction to food safety, juice products as a special case. | Agricultural Practices and Raw Materials. |
| Regulation, Requirements, and Guidance.                        | Processing, Design, and Packaging.        |
| Personnel Practices.   | Performance Standards and Intervention.   |
| Cleaning and Sanitizing.                                       |   |

To order the *Safer Processing of Juice* video, call the California Department of Health Services, Food and Drug Branch at 916-650-6500.

### Vegetable Juices

Fresh vegetable juices are restorers. They boost the immune system, remove acid wastes, and alkalize the blood.

Among the most healthful and delicious of the vegetable juices are beet, cabbage, carrot, celery, cucumber, kale, parsley, turnip, spinach, watercress, and wheatgrass juice. Carrot juice is probably the most popular of the juices and is packed with carotenoids, including beta-carotene, the vitamin A precursor that helps fight cancer. Because carrots are the sweetest of the vegetables, their juice is not just delicious on its own, but is also great for mixing with other vegetables to increase their appeal. On the other hand, strong-flavored vegetables—broccoli, celery, onions, parsley, radishes, rutabaga, and turnips, for instance—should be used in small amounts only.

Garlic is a great addition to vegetable drinks. Before juicing, drop the garlic into vinegar for 1 minute to destroy any bacteria and mold on its surface. To avoid irritating the lining of the intestinal tract, use only 1 fresh garlic clove in 2 glasses of juice.

For the greatest health benefits, use many different vegetables when making your juices. That way, you will provide your body with a variety of important nutrients. The recipes that follow are just two of the many healthful vegetable juice drinks that you might want to try.

---

#### Potassium/Raw Potato Juice

---

*1 pound potatoes (3 medium potatoes)  
1 carrot or 1 stalk celery (optional)  
6–8 ounces steam-distilled water*

1. Scrub the potatoes well and cut out any eyes. Do not use potatoes that are part green.
2. Cut each potato in half. Cut the peel from the potato, making

sure to keep about ½ inch of potato on the peel. Set aside the potato center for another use.

3. Cut the potato skins into small enough pieces to fit into the juicer. Wash the carrot or celery, peeling the carrot if it was not grown organically. Cut into pieces.
4. Process the vegetables in the juicer. Add the water and drink immediately. Do not allow to stand.

---

#### Cabbage Juice for Ulcers

---

*¼–½ head cabbage  
1 apple or 2 carrots  
¼ cup steam-distilled water*

1. Thoroughly wash the vegetables and fruit, peeling the apple or carrots. Cut the produce into small enough pieces to fit into the juicer.
2. Process the vegetables and fruit in the juicer. Add the water and drink immediately. Do not allow it to stand, so as not to lose its benefits.

### Fruit Juices

Fruit juices help cleanse the body and nourish it with important nutrients, including cancer-fighting antioxidants.

Although any fruit can be juiced, certain juices are particularly healthful and delicious. One favorite cleansing juice is watermelon. To make this refreshing drink, place a whole piece of watermelon—with the rind intact—in the juicer. Other delicious juices can be made with apples, apricots, bananas, berries, citrus fruits, kiwi, melons, pears—with just about any fruit that you want to use.

You can enjoy fruit juices at any time of the day. About 10 to 12 ounces per day is recommended. The following is just one of the delicious fruit juice drinks you can make at home.

## Preparing Produce for Juicing

Juicing is an easy way to make delicious drinks that can boost your health and help you treat a number of disorders. By following these guidelines, you will ensure that your juices are as pure, nutrient-rich, and appetizing as possible:

- Whenever possible, buy and use organically grown produce—produce that is grown without the use of pesticides and other harmful chemicals. This prevents chemical residues from ending up in your juice.
- If you are unable to obtain organically grown fruits and vegetables, peel or thoroughly wash the produce, using a vegetable brush to remove chemical residues and waxes. Most health food stores carry vegetable washes that will help remove any residues.
- When purchasing potatoes for juicing, avoid those with a green tint, and be sure to remove any sprouts or eyes. The chemical solanine, which gives the potato its green cast, can cause diarrhea, vomiting, and abdominal pain.
- When using organically grown produce, feel free to leave the skin on in most cases. Do remove the skin, though, before juicing apricots, grapefruits, kiwis, oranges, papayas, peaches, and pineapples. The skins of oranges and grapefruits are quite bitter, and also contain a toxic substance that should not be consumed in large amounts. Because kiwis and papayas are tropical fruits, their skins are likely to contain residues of the harmful sprays often used in foreign countries, where some chemicals outlawed in the United States may still be legal. (The FDA is doing its best to inspect foreign growers.) The skins of pineapples are too thick to be processed by most juicers.
- When juicing fruits, leave in small seeds, except when using apples. Apple seeds actually contain cyanide, a toxic substance. Because of their size and hardness, all pits *must* be removed.
- Juice most produce with stems and leaves intact. However, remove carrot and rhubarb greens, as they contain toxic substances.
- When using soft fruits that contain very little water—avocados, bananas, and papayas, for instance—purée the fruits in a blender rather than using a juicer. Then stir the purée into other juices.
- Remember to rotate vegetables and fruits so you get a variety of nutrients.

### Kiwi Deluxe

1 firm kiwi, peeled  
1 small bunch red grapes  
1 green apple  
½ cup berries (blueberries, blackberries,  
and raspberries are good choices)

1. Wash all of the fruit thoroughly, peeling the apple. Cut the fruit into small enough pieces to fit into the juicer.
2. Process the fruit in the juicer. Pour over ice and drink.

*Variation:* Frozen fruit mixes can take the place of ice. This will make the drink taste like a shake. Add a cup of frozen fruit mix to the recipe above. You can also add rice milk or soymilk and a banana if desired.

### LIGHT THERAPY

The body's circadian rhythm—its inner clock—is regulated by the pineal gland. Affected by the absence or presence of light, the pineal gland is responsible for controlling such bodily functions as hormone production, body temperature, and the timing of sleep. Disturbances in the circadian rhythm can lead to depression as well as insomnia and other sleep disorders. The use of natural sunlight and various forms of light therapy has been effective in reestablishing the body's natural rhythm.

Natural sunlight contains the full wavelength spectrum needed for maintaining health. It triggers the impulses

that regulate most bodily functions. Artificial lighting—incandescent and fluorescent—lacks the complete balanced spectrum found in sunlight. Without certain wavelengths, the body cannot absorb some nutrients. Inadequate exposure to proper light can contribute to or worsen such illnesses and conditions as fatigue, depression, stroke, hair loss, suppressed immune function, cancer, hyperactivity, osteoporosis, and Alzheimer's disease.

A variety of light therapies have been used effectively in the treatment of a number of disorders. Some of the most common therapies are:

- *Bright light therapy.* This therapy involves the use of bright white light that ranges in intensity from 2,000 to 5,000 lux. (A lux is equal to the light of one candle; the average indoor light ranges from 50 to 500 lux.) Bright light therapy has proven helpful in treating cases of bulimia, sleep phase syndrome (a condition in which the person cannot fall asleep until the middle of the night), and irregular menstrual cycles.
- *Cold laser therapy.* Utilizing a low-intensity beam of laser light that stimulates the natural healing process at a cellular level, cold laser therapy is used in the treatment of pain, mild trauma, and orthopedic myofascial syndrome. It has also been used in dentistry, dermatology, and neurology.
- *Full-spectrum light therapy.* Exposure to natural sunlight and other forms of full-spectrum light is effective in re-

lieving a number of disorders, including depression, hyperactivity, hypertension, insomnia, migraines, and premenstrual syndrome. Sunlight has long been used to treat babies with jaundice; however, do not put your baby in the sun for treatment—hospitals have special lamps. Full-spectrum light, as well as bright white light, is effective in the treatment of seasonal affective disorder (SAD). Common symptoms of SAD, which is also called the “winter blues,” are depression, fatigue, overeating, and lowered libido.

- *Photodynamic light therapy (PDT)*. This therapy uses drugs, called *photosensitizing agents*, along with light to kill cancer cells. Depending on the part of the body being treated, the photosensitizing agent is either injected into the bloodstream or put on the skin. Over a certain amount of time the drug is absorbed by the cancer cells. Then light is applied to the area to be treated. The light causes the drug to react with oxygen, which forms a chemical that kills the cancer cells. PDT may also work by destroying the blood vessels that feed the cancer cells and by alerting the immune system to attack the cancer.
- *Ultraviolet light therapy*. Ultraviolet light therapies are used to treat illnesses such as cancer, as well as conditions like high cholesterol and premenstrual syndrome.
- The sun’s ultraviolet-A (UVA) rays, which have longer wavelengths than ultraviolet-B (UVB) and ultraviolet-C (UVC) rays, are considered the least harmful. There are a variety of ultraviolet light therapies.
- *UVA-1 therapy* isolates a portion of the UVA wavelength. It has been shown to be effective in the treatment of patients with atopic dermatitis. It is also used in the treatment of various connective tissues disorders including systemic lupus erythematosus (SLE) and systemic sclerosis (SS).

## MAGNET THERAPY

See under PAIN CONTROL.

## MASSAGE

See under PAIN CONTROL.

## MEDITATION

See under PAIN CONTROL.

## MUSIC AND SOUND THERAPY

Music therapy is the controlled use of music in the treatment of physical, mental, or emotional disorders. A variety of problems—including depression, high blood pressure, asthma, migraines, ulcers, and a range of physical disabilities—are currently managed using music.

In general, the nature of the problem dictates the precise form of the therapy. For some problems, specific musical pieces are played for the person being treated. In other instances, individuals actively participate in rhythm bands, group singing, individual or group music lessons, or music-accompanied physical activities.

Music has been shown to have various therapeutic capabilities. When played for individuals or groups with mental or emotional problems or with stress-related ailments, music can reduce anxiety and lessen irritability. In work with blind people, music has facilitated the development of better auditory perception. As a part of physical therapy, music has been used to stimulate or regulate movement. Also as a means of physical therapy, the playing of instruments has been employed both for its psychological benefits, such as greater self-confidence, and for its physical benefits, such as the strengthening of weak mouth and lip muscles.

Music is not the only type of sound that has been found to have therapeutic value. For many years, environmental sounds—the sound of a running stream, a waterfall, or bird songs—have been used by therapists and psychologists as a means of treatment. These sounds, it appears, can do much to relieve stress and lift depression.

Anyone can take advantage of the ability of music and other sounds to induce relaxation, with or without professional guidance. Soft music and soothing sounds, used alone or with relaxation techniques, can effectively alleviate stress, relax muscles, and evoke a positive mood. Researchers suggest that these sounds promote the production of endorphins, the body’s own painkillers, and can thereby also help in the control of pain. In some cases—as when music is to be applied to physical therapy—an experienced practitioner should be consulted.

## PAIN CONTROL

Pain is a message sent by the body to the brain, signaling that disease, injury, or strenuous activity has caused trouble in some area. Without pain, you would remain unaware of many problems—from torn ligaments to appendicitis—until the disorders became serious. At low levels, pain can motivate you to rest the injured area so that tissues can be repaired and additional damage can be prevented. When severe, pain can motivate you to seek treatment as well.

Not all pain appears to serve a useful function, though. While *acute pain*, the pain described above, can alert us to a problem that needs immediate attention, in some cases pain lasts long after an injured area has healed. In other instances, pain may be caused by recurring backache, migraines and other headaches, arthritis, and other disorders. Referred to as *chronic pain*—which may be defined as pain that occurs, continually or intermittently, for more than six months—this pain may signal an ongoing problem that cannot be eliminated through treatment. In such a case, pain management often becomes the treatment goal.

For some people, pain is cyclical. Pain produces anxiety,

and this anxiety intensifies the pain. Fear and anticipation of the physical problem can also heighten the pain, leading to feelings of depression and helplessness. When experiencing such pain, it is natural to limit one's activities. This can lead to a "chronic pain cycle," which can adversely affect one's confidence and self-esteem.

Being aware of the chronic pain cycle as well as understanding its psychological effects can help you avoid being drawn into it:

1. The cycle generally begins with prolonged periods of rest and inactivity, causing a loss in physical strength, endurance, and flexibility. As a result, you may begin to lose confidence in your ability to do things, causing a lowering of personal goals.
2. Inability to perform usual activities at home or work is likely to promote feelings of frustration, and you may begin perceiving yourself as unproductive. This sense of lowered self-esteem may further lead to depression.
3. During times when the pain subsides or is more tolerable than usual, you may overexert yourself in an effort to prove to yourself and others that you can still do the things you did before the chronic pain began.
4. As a result of the overexertion, the pain often returns and may be more severe than before. You may find yourself unable to finish tasks or accomplish goals. Discouraged and in pain, you begin limiting your activities, and the cycle begins again.

One way to keep from getting caught up in the chronic pain cycle is through pain management. Often, the reduction of physical pain can prevent the cycle from starting.

There are a variety of treatments that can help alleviate pain. Some do so on a purely physical level, perhaps by interrupting the pain process or desensitizing nerve endings. Others approach pain control on a psychological level, by affecting the mind's perception of the pain. When treating pain, the physical and psychological can be intertwined. Just as a physical reduction of pain may decrease anxiety and improve outlook, so can the mind be used to relax muscles and effect other physical changes that then reduce symptoms.

The discussions in this section are meant to introduce you to some of the many pain-control techniques now available. Depending on the cause of your pain, the level of your pain, and your own treatment preferences, you may want to try one or more of these techniques. While some of these approaches—like the use of hot and cold packs—can easily be used on your own, other techniques—such as biofeedback—require at least initial training by a qualified practitioner. Some, like chiropractic, must be performed by a professional. When possible, get referrals from your health care provider or from friends. If a reputable pain clinic is available to you, this can be a wonderful resource—one that offers a range of practitioners experienced in using a variety of pain-control techniques. Make sure that the pro-

fessional you consult has successfully treated a condition such as yours.

## ACUPRESSURE

Based on the same beliefs that are the foundation of acupuncture (see the discussion below), acupressure—also known as "contact healing"—is actually the older of the two methods. Acupressure and the healing art of *shiatsu* (a massage technique) are commonly referred to as "acupuncture without needles." Like acupuncture, acupressure seeks to restore health by restoring the normal flow of *chi*, the life energy that flows through the body along pathways called meridians. While acupuncture uses the insertion of needles to promote energy flow, acupressure uses finger and hand pressure. During pressure stimulation, neurotransmitters, which help to inhibit the reception and transmission of pain, are released.

Acupressure is a safe, simple, and inexpensive treatment. Although it may be performed by a skilled practitioner, because of the treatment's noninvasive nature, acupressure may also be performed by the individual for the immediate relief of pain. In fact, a number of self-acupressure techniques, including *Acu-Yoga*, *Do-In*, and *Tui Na*, can help you control pain through finger pressure, massage, body positioning, and a variety of other means.

More information on acupressure is available from the Acupressure Institute. (See Health and Medical Organizations in the Appendix.)

## ACUPUNCTURE

This ancient Chinese practice is based on the belief that health is determined by *chi*, the vital life energy that flows through every living thing. This energy is thought to move through the body along pathways called meridians, each of which is linked to a specific organ. If the flow of energy is balanced, the individual enjoys good health. If something interrupts this flow, however, various problems, including pain, can result. Acupuncture is used to restore proper energy flow, and, as a result, good health.

In acupuncture treatment, the acupuncturist inserts thin needles at specific points in the body. Although slight discomfort may occasionally be felt upon insertion of the needle, the treatment is virtually painless. The needles may be left in place for anywhere from a few minutes to a half hour. To support the acupuncture therapy, the practitioner may recommend taking herbs in the form of teas and capsules, and may also suggest specific lifestyle changes and exercises. Relief may be experienced after only one treatment or after a series of treatments.

Although used for a variety of health problems, including addictions and mental disorders, in the United States, acupuncture is perhaps most commonly used to relieve pain, including backache and migraine headaches. Studies have indicated that acupuncture may stimulate the pro-

duction of endorphins, the body's own painkillers. Completely safe, acupuncture has no known side effects.

For more information on acupuncture and a list of practitioners in your area, you can contact the American Association of Acupuncture and Oriental Medicine. (See Health and Medical Organizations in the Appendix.)

### AURICULAR THERAPY (AURICULOTHERAPY)

Auricular therapy (or auriculotherapy) involves stimulating the external surface of the ear, or auricle, to alleviate pathological conditions in other parts of the body. Various techniques are used, including electrical stimulation and the use of acupuncture needles.

The use of the auricle in diagnosis was first described in the early 1950s by the French neurologist Dr. Paul Nogier. Nogier first published his comprehensive systems of diagnosis and treatment in 1957, after years of observation demonstrated to him that points on the ears that had reduced electrical resistance corresponded to specific areas of the body. Since 1982, the World Health Organization (WHO) has been sponsoring working groups in an attempt to establish international consensus on the terminology and the auricular location points. WHO used research conducted by Terry Oleson, Ph.D., and Richard Kroening, M.D., at UCLA Pain Management Center, along with a Chinese ear acupuncture text by Helen Huang, as a guide to standardization.

There are two main schools of thought regarding the auricular points, one European and the other Oriental. While there is no complete agreement on auricular points between the two schools, forty-three points were adopted by the WHO in 1987. The use of auricular therapy for pain management and in the treatment of addiction is in widespread use in Europe and has been increasing steadily in the United States since the early 1970s. Its main use has been to enhance treatment of addiction, particularly nicotine addiction. Auriculotherapy seeks to restore a sense of well-being, reduce anxiety, and promote detoxification.

According to theory, there are meridians that run through the body. Along these meridians are pressure points—the same points used in acupressure. There are literally hundreds of these points located in the lobe of the ear. It has long been believed in Asia that when the meridians become unbalanced, illness results. Using a tiny battery-operated machine, a small charge of direct current can be applied, eliminating the need for acupuncture needles. Very brief stimulation—ten seconds at about 100 microamperes or less—on auricular points can often produce profound and immediate results. The key is to treat at the exact point on the front of the ear and the one directly behind it on the back associated with the regional area of pathology. These areas are called *corresponding points*. They are highly conductive and sensitive to pressure, sometimes long after the health problem is considered healed. This form of therapy has led to dramatic improvements in long-standing problems that were unresponsive to conventional medical therapy.

For more information, you can contact the Auriculotherapy Certification Institute. (See Health and Medical Organizations in the Appendix.)

### BIOFEEDBACK

Biofeedback combines a variety of relaxation methods such as guided imagery and meditation with the use of instruments that monitor the individual's responses. Over time, this teaches you to consciously regulate a number of your own *autonomic functions*—heart rate, blood pressure, and other processes previously believed to be involuntary. By consciously regulating these functions, you can control a number of problems, including pain.

During a biofeedback session, electrodes connected to a monitoring unit are taped or otherwise painlessly attached to the skin. The machine may measure any one of a number of things, including skin temperature, pulse, blood pressure, muscle tension, and brain wave activity. As you use various techniques, such as relaxation, to create the desired response—lower blood pressure, for instance—the machine, through sound or images, provides moment-by-moment feedback on your progress. Eventually, with the practitioner's help, you should become able to create the desired response without the use of the machine.

Although biofeedback has been successfully used to help control a wide range of health problems, it is perhaps best known for its use in the treatment of headaches and migraines. In a large number of cases, biofeedback has been successfully used to avert the onset of migraines. It has also been used to treat injuries, as well as to relieve the pain of TMJ syndrome.

It should be noted that biofeedback only measures stress; it does not cure it. Sessions should be conducted in conjunction with other therapies under the watchful eye of a qualified health care practitioner.

If you are considering biofeedback training, you can consult the Association for Applied Psychophysiology and Biofeedback. (See Health and Medical Organizations in the Appendix.)

### BREATHING EXERCISES

Shallow or poor breathing can contribute to many disorders. We need to learn to breathe deeply, and from the abdomen rather than from the chest, which produces short and shallow breathing. Learning this technique helps one to breathe in more oxygen, which then passes through the lungs and is absorbed into the bloodstream and into our bodies. Oxygen is needed for cellular respiration, cell metabolism, and proper brain function. If you breathe too shallowly, the body may not be able eliminate sufficient carbon dioxide for good health. Proper breathing technique increases lung capacity, increases energy levels, speeds the healing process of many disorders, and helps to relieve anxiety, asthma symptoms, insomnia, and stress.

To practice deep breathing, do the following:

1. Slowly breathe in through your nose and from your abdomen as deeply as you can and hold the breath for a count of ten.
2. Place your tongue between your front teeth and the roof of your mouth. Slowly breathe out through your mouth.

Do this for five minutes three times daily. Choose an environment with fresh air when doing this exercise, not a place with a lot of traffic or pollution.

If you want to relax quickly—say, if you are under tension or stress, or are having an anxiety attack—place your arms down along the sides of your body. As you are inhaling deeply, stretch your arms up and out as if to form a V-shape. Then exhale slowly through your mouth and bring your arms back down to your side. This is a stretching and breathing exercise at the same time. Repeat this as many times as is comfortable every hour until you find relief.

## CHIROPRACTIC

Chiropractic is a form of treatment that seeks to eliminate pain—and, in some cases, other problems—through the manipulation of the spinal column. Chiropractors believe that if the spinal vertebrae are properly aligned, impulses from the brain are able to travel freely along the spinal cord to the various organs, maintaining healthy function throughout the body. If a misalignment of the spine occurs, however, the normal flow of impulses is disrupted, resulting in pain as well as other physical disorders. Chiropractors seek to return the spine's alignment to its normal, healthy state. This permits the nervous system to regain normal function, allowing the body to heal itself and eliminate the pain.

After the chiropractor locates any spinal misalignments, chiropractic adjustment is used to reestablish normal function. This adjustment may involve touch; active motion, in which the patient bends and stretches in specific ways; and passive movement, in which the doctor assists the patient's movements. A hand-held rubber-tipped instrument may be used to gently manipulate the vertebrae. Some chiropractors support adjustment therapy with applications of heat and cold, electrical stimulation, nutrition, and other natural therapies. Chiropractic does not use drugs or surgery.

After physicians and dentists, chiropractors are the third largest group of health care professionals in our nation. They are licensed in all fifty states, and most health insurance plans cover some part of the treatment they provide. Chiropractors are the most widely used practitioners in the alternative health care field. The U.S. Department of Health and Human Services lists spinal manipulation as a proven treatment for acute lower back pain. Chiropractic therapy is also used to treat arthritis, bursitis, and a variety of other disorders, including many nonpainful ailments. To locate a qualified chiropractor in your area, you can consult [TheRightChiropractor.com](http://TheRightChiropractor.com). (See Health and Medical Organizations in the Appendix.)

## GUIDED IMAGERY

Much research has indicated that bodily functions previously thought to be totally beyond conscious control can be modified using psychological techniques. Guided imagery, a technique that has grown in popularity in the last several years, uses this mind-body connection to help people cope with a variety of disorders, including pain.

Researchers have established a link between negative emotions and lowered immune function. Conversely, they have found a connection between positive emotions and a healthy immune response. Guided imagery—the mind thinking in pictures—is an effective tool for eliminating negative thoughts and replacing them with positive ones.

Through guided imagery, the mind conjures up mental pictures or scenes in order to better direct the body's energy. You can, for instance, close your eyes and visualize the pain as a sharp knife in the affected body area. Then you can imagine that the knife is being withdrawn, and that a cooling, soothing cream is being applied to the area. Through imagery, people with cancer commonly visualize the cancer cells in their bodies as weak and their white “fighter” cells as strong and destructive. In other instances, people have found that, rather than visualizing the pain, focusing on a pleasant scene, such as a beautiful day at the beach, promotes relaxation and substantially controls pain.

Used with some success in the treatment of rheumatoid arthritis and other illnesses, guided imagery has also been shown to reduce stress, slow the heart rate, and stimulate the immune system. Taught properly, guided imagery can be an effective form of self-care; however, it is not meant to replace your doctor's care or prescribed medication. Rather, it can be used to enhance your prescribed course of treatment.

## HEAT AND COLD THERAPY

Hot and cold packs are simple-to-use pain-control tools that have been widely employed for many years. When applied singly or in combination, these techniques often provide relief not only from the pain itself, but, in some cases, from any accompanying swelling.

### Heat

Pain from backaches, arthritis, and similar disorders often responds well to heat therapy. By increasing the temperature in selected areas of the body, this treatment enhances blood circulation and helps muscles to relax, reducing stiffness and increasing mobility.

Heat can be applied to the affected area through a number of means, including hot water bottles and electric heating pads. Often, moist heat works better than dry heat. Some electric heating pads are capable of producing moist heat, as are some gel packs. Hot showers and wet towels are other means of concentrating moist heat on a painful

area. Poultices can also be effective and, for certain disorders, sitz baths are helpful. (See USING A POULTICE and SITZ BATH in Part Three.)

Use all forms of heat therapy with caution. Monitor the intensity of the heat and the duration and frequency of the treatment. Do not allow yourself to fall asleep while using an electric heating pad. Regardless of the heat source, a good rule of thumb is twenty minutes on, twenty minutes off. After removing the heat, firmly rub or massage the affected area. This will both dissipate the heat and help relieve tension. Do not massage the area if it is inflamed or has just sustained a serious injury. Never massage the area if you have phlebitis or other vascular problems.

## Cold

Because of its ability to prevent swelling, cold packs are often the treatment of choice directly following a strain, sprain, or other injury. In such cases, cold packs alone should be used during the first twenty-four to thirty-six hours. Cold packs can also help relieve certain types of chronic pain.

Ice packs are probably the most common means of applying cold. These packs can simply be applied to the painful area, or they can be rubbed on the area using a circular motion for five to seven minutes. Lower back pain seems to be particularly responsive to ice rubs. Cold gel packs, which are kept in the freezer between uses, are also effective, and, because of their pliable consistency, are often more comfortable than ice packs. If none are available, a pack of frozen peas works just as well and can mold to the area. When you are done with it, mark the bag so it can be used over again for this purpose (do not eat them) and place it back in the freezer.

Like heat therapy, cold therapy should be used with caution. Wrap ice packs, gel packs, or frozen peas in a towel before applying them to the affected area. Then apply the packs for no more than twenty minutes at a time.

## Heat and Cold

In some cases, alternating hot and cold treatments work best. For a painful and stiff neck, for instance, try using a warm shower to relieve tension. After the shower, use a five- to seven-minute ice massage to reduce swelling and further relieve pain.

Experimentation is the best way to discover whether heat, cold, or alternating heat and cold best relieves your discomfort. If several applications of one type of treatment—say, heat—do not provide any relief, try the opposite treatment. If your pain persists, and especially if you are not sure of its cause, consult your health care provider.

## Counterirritants

A variety of over-the-counter topical products, such as capsaicin cream, Ben-Gay, and Icy Hot, can be used in lieu of a

heat pack to treat localized pain. As counterirritants, these products stimulate blood flow to the affected area, acting much like heat. Glucosamine/Chondroitin MSM Ultra Rx-Joint Cream from Nature's Plus, Traumeel from Heel Inc., and many other natural products found in health food stores are good for arthritis, inflammation, bruising, and sprains. While such products may be relatively convenient and easy to use, they should be used with discretion. Do not apply anything but ordinary clothing to an area that has been treated with a counterirritant. Heating pads placed over treated areas can increase the medication's rate of absorption into the skin, thus causing serious damage.

## HERBS

Many herbs have been used for centuries for their pain-relieving properties. Some of the best include:

- Angelica, black haw, cramp bark, kava kava, rosemary, and valerian root are good for pain related to cramps and muscle spasms.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

- A tea made of blue violet, catnip, chamomile, gotu kola, licorice, rosemary, white willow, or wood betony is effective in relieving tension and nerve pain.

*Cautions:* Do not use chamomile if you are allergic to ragweed. Do not use during pregnancy or nursing. It may interact with warfarin or cyclosporine, so patients using these drugs should avoid it. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke.

- Capsaicin, an ingredient in cayenne (capsicum), can provide pain relief when regularly applied to the affected area. Now available in Zostrix, an over-the-counter topical cream, capsaicin is thought to relieve pain by limiting the production of a neural pain transmitter called substance P. Although the application of capsaicin may cause a burning sensation at first, repeated use keeps nerves from replenishing their supply of substance P, so that pain is not transmitted to the brain. In studies, capsaicin has been used to control the pain of neuralgia, diabetic neuropathy, rheumatoid arthritis, osteoarthritis, and cluster headaches. Cayenne may also help to alleviate pain if taken orally in capsule form.
- Hops, kava kava, passionflower, valerian root, wild lettuce, and wood betony have muscle-relaxing properties and may help to relieve lower back pain.

*Caution:* Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and

it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

- Essential oils of jasmine, juniper, lavender, peppermint, rose, rosemary, and thyme have been effective in the treatment of a variety of types of pain.
- Migraine Relief from Natural Care is an herbal blend that has been effective in relieving migraines.
- Fresh papaya juice and/or fresh pineapple is highly recommended for the treatment of inflammation, heartburn, ulcers, back pain, and digestive disorders.
- Saffron has been found to be effective in treating abdominal pain after childbirth.

### HYPNOTHERAPY

Like meditation and visualization, hypnotherapy is a method by which a qualified physician or therapist can induce a positive mental state in an individual. The therapist attempts to quiet the person's conscious mind to make the unconscious mind more accessible. Hypnosis is designed to generate a state of deep relaxation in which there is a heightened receptivity to suggestion through the calm repetition of words and statements. Once an individual is in this state, the practitioner provides simple verbal suggestions that help the mind block the awareness of pain and replace it with a more positive feeling, such as a feeling of warmth. If the pain is the result of an earlier injury, the practitioner may also help the individual more clearly remember the incident—a practice that often helps alleviate anxiety and thus reduce pain.

Hypnotherapy enhances positive imagery, helps to reduce anxiety, and induces a deep level of relaxation. During a hypnotic state, the mind is highly focused and fully aware of the situation, enabling the person to concentrate without being distracted. During hypnosis, breathing and pulse rate slow down, and blood pressure may drop.

No one can be forced into hypnosis. You must be a willing participant in the process. Good rapport between therapist and client is important.

Hypnosis has been used successfully to control back pain, joint pain, burn pain, and the pain of migraines and other headaches. This technique can be a valuable self-help tool, as you can learn to hypnotize yourself whenever you need it. However, self-hypnosis must first be learned from a licensed psychologist, a certified hypnotherapist, or another professional with experience in hypnotherapy.

### MAGNET THERAPY

Magnet therapy has been used in the Far East and Europe for some time and is becoming popular in the United States. It is said that magnets can be used to provide relief from pain and to hasten healing. Double-blind studies on the ef-

fectiveness of magnet therapy have shown that there is no scientific basis to conclude that small magnets of the type sold for the purpose can relieve pain or influence the course of disease. Many of today's products actually produce no significant magnetic field at the skin's surface, and none beneath. The initial study that is cited by magnet marketers is the pilot study done at the Baylor College of Medicine in Houston, where researchers found that magnets could provide significant relief for the pain of post-polio syndrome. However, other subsequent studies, such as one done at the New York College of Podiatric Medicine, reported no effect on patients suffering from heel pain. Researchers at the Veterans Administration Medical Center in Prescott, Arizona, conducted an elaborate study on back pain and found no evidence to support the claims of the magnet manufacturers.

Magnets are believed to work by increasing circulation and blood flow to affected areas, which in turn reduces swelling and inflammation. Arthritis, asthma, carpal tunnel syndrome, fibromyalgia, infections, migraines, osteoporosis, ruptured disks, sports injuries, and tennis elbow are a few of the conditions that are said to be helped by magnet therapy. So far, studies have shown that blood circulation is not affected by magnets.

Despite the decidedly mixed results of scientific research, the decision to try magnet therapy is one that each individual must make for him- or herself. If you are using magnets for pain relief and they seem to be working, by all means do not discontinue their use. However, if you do choose to use magnets, understand that they should not be used during pregnancy or in the presence of pacemakers, insulin pumps, and automatic defibrillators. People who take anticoagulants or use drug patches also should not use magnets. And on a practical note, keep your magnets away from your computer's hard drive and storage disks.

### MASSAGE

Massage involves the manipulation of muscles and other soft tissues. It is beneficial in treating a wide range of conditions, including muscle spasms and pain, soreness from injury, and headaches. Massage works to relieve pain in a number of ways: by promoting muscle relaxation; by increasing lymphatic circulation and thereby possibly reducing inflammation; by breaking up scar tissue and adhesions; by promoting blood flow through the muscles; and by promoting drainage of the sinus fluids.

Massage is not advisable for everyone. Those with a history of phlebitis, high blood pressure, or any other vascular disorder should not receive any type of deep muscle massage performed with strong pressure. Always check with a physician before receiving deep muscle massage. Massage should not be performed on inflamed areas or on individuals with malignant or infectious conditions.

A variety of massage therapies are currently in use. Each

is based on a different theory and utilizes specific techniques. The following bodywork systems represent some of those most widely used:

- *Deep tissue massage.* Used to release chronic muscular tension, deep tissue massage is applied with greater pressure and on deeper muscles than classic Swedish massage. It generally focuses on a specific problem area.
- *Esalen massage.* This massage technique attempts to bring about a sense of well-being through deep and beneficial states of consciousness. Esalen massage focuses on the mind and body as a whole. It is a hypnotic method that uses slow, rhythmic movements to bring about a general state of relaxation.
- *The Feldenkrais method.* The idea of “self-image” is central to the theory and technique of this method. Through exercise and “touch,” the therapist helps eliminate negative muscle patterns and the feelings and thoughts associated with them. This method uses two approaches: *Awareness through Movement* and *Functional Integration*. Awareness through Movement employs a group approach in which the participants are guided through a slow, gentle sequence designed to replace old movement patterns with new ones. Functional Integration is an individualized approach that uses hands-on touch and movement. The Feldenkrais method differs from most other types of massage in that there is no attempt to alter the body’s structure. Rather, it is through touch that the practitioner attempts to communicate a sense of improved self-image and movement.
- *Neuromuscular massage.* This form of deep tissue massage concentrates on a specific muscle. Through the use of concentrated finger pressure, sensitive “trigger points” are released and blood flow is increased.
- *Reflexology.* Reflexology originated thousands of years ago in China. It was taken up in the United States in the 1950s. Reflexologists apply pressure to different spots on the feet, hands, and ears that correlate with the body’s organs. This opens a channel for energy to flow to the affected part of the body. There may be pain when pressure is applied to some spots, and in some cases it is necessary to use prolonged pressure. The reflexologist should inform you about which body part any pressure point represents so that if you feel pain, you can apply pressure and massage the spot yourself to reduce the pain.
- *Reiki.* In Japanese, *reiki* (ray-key) means “universal life energy.” The practice of reiki promotes a return to health through “wholeness.” The treatment consists of the health professional gently placing his or her hands on a relaxed body. You keep your clothes on for a reiki session. The practitioner’s hands touch a variety of places, such as the head, chest, abdomen, and back, to promote energy to flow through the body. For some people, this treat-

ment promotes deep relaxation, while to others it may be invigorating. Reiki originated many thousands of years ago and is easy to learn, but powerful. It is used to relieve stress, empower goals, overcome obstacles, and heal illness. It can also be a tool for spiritual growth.

- *Rolfing or structural integration.* This method is based on the belief that function is improved when body parts are properly aligned. Through manipulation of connective tissue linking muscles to bones, the therapist attempts to restore fuller movement, resulting in a more balanced body. The Rolfer applies deep tissue pressure to the muscles of the neck, head, back, pelvis, legs, and arms. This pressure stretches and guides the connective tissues, allowing for more flexible movement. Rolfing is also effective for muscle pain, neck tension, back pain, headaches, and increasing the range of motion. Before treating you, a Rolfer will evaluate your motion as you walk, bend, and turn.
- *Shiatsu.* Literally meaning “finger pressure” in Japanese, this Oriental massage technique focuses on acupressure points to restore and maintain health. Through firm, rhythmic pressure applied to specific points for three to ten seconds each, the shiatsu therapist attempts to unblock the energy that flows through the acupuncture meridians. The pressure used depends on the person’s needs. Other techniques used include kneading, stroking, tapping, and stretching done by a shiatsu therapist.
- *Sports massage.* A combination of kneading, passive stretching, and range of deep-tissue motions, sports massage is designed to ease muscle strain and promote flexibility. It is most effective when applied before or after exercising.
- *Swedish massage.* The development of this technique is credited to Per Hendricks Ling, who in the early 1800s used kneading, stroking, tapping, and shaking to induce the body to relax. Swedish massage can also relieve soreness and swelling, as well as promote rehabilitation after an injury.

For organizations that can provide further information about massage therapy, see Health and Medical Organizations in the Appendix.

## MEDICATION

Numerous over-the-counter medications are available to help control pain. Two of the simplest nonnarcotic pain relievers are acetylsalicylic acid (aspirin) and acetaminophen (found in Tylenol, Datril, and many other products). Both of these medications can help relieve mild to moderate pain. Aspirin can also reduce swelling and inflammation. If you take aspirin for pain relief, you should also take supplements of vitamin C, as this nutrient has been shown to make the effects of the analgesic last longer.

Nonsteroidal anti-inflammatory drugs (NSAIDs), an-

other type of nonnarcotic analgesic, may also be helpful in the relief of aches and pains. These products include ibuprofen (Advil, Nuprin, and others), ketoprofen (Orudis), and naproxen (Aleve).

Although over-the-counter analgesics are generally regarded as safe, discretion should be exercised in their use. For instance, aspirin has been related to gastrointestinal bleeding. If you take acetaminophen, be sure to avoid consuming alcohol, as this can both decrease the effectiveness of the drug and cause damage to the liver. If you take aspirin, be aware that it may affect the stomach. More important, you should *never* give aspirin to a child, especially a child with a cold or flulike symptoms. If you do, you run the risk of having the child get a life-threatening condition called Reye's syndrome.

Regardless of the pain reliever being used, you should never take more than the dosage directed on the label without first consulting your health care provider. Virtually any medication can cause problems when used inappropriately.

## MEDITATION

Meditation, which has been practiced for thousands of years, is an effective means of treating stress and managing pain. Broadly defined, meditation is an activity that calms the mind and keeps it focused on the present. In the meditative state, the mind is not cluttered with thoughts or memories of the past, nor is it concerned with future events.

There are hundreds of meditation techniques, most of which fall into one of two categories: *concentrative* and *mindfulness*. During concentrative meditation, attention is focused on a single sound, an object, or one's breath, to bring about a calm, tranquil mind. One simple, common technique involves sitting or lying comfortably in a quiet environment, closing your eyes, and focusing attention on your breath as you inhale through your nose for a count of three, then exhale through your mouth for a count of five. This focus on your breathing rhythm—slow, deep, regular breaths—allows your mind to become tranquil and aware.

During mindfulness meditation, the mind becomes aware of but does not react to the wide variety of sensations, feelings, and images tied in with a current activity. By sitting quietly and allowing the images of your surroundings to pass through your mind without reacting to or becoming involved with them, you can attain a calm state of mind.

Much research has been done on transcendental meditation (TM). TM brings about a state of deep relaxation in which the body is totally at rest, but the mind is highly alert. Studies show that meditation, especially TM, is effective in controlling anxiety, enhancing the immune system, and reducing conditions such as high blood pressure. Meditation has also been used successfully to treat chronic pain and to control substance abuse.

Meditation is an effective self-care technique that can be a useful part of your health care program. However, it is not an alternative to recommended medical treatment.

## QI GONG

Qi gong (pronounced cheie-gong) is a slow-motion exercise that is older than tai chi. Both concentrate on movement and breath meditation. *Qi* means "life force, energy," and *gong* means "work, a skill of practice." Qi gong increases vital energy for emotional and physical health.

According to traditional Chinese medicine, this type of exercise wards off illness. It has been linked to reduced blood pressure and increased levels of endorphins, natural body chemicals that relieve pain and maintain mental health. Work with a trained professional to begin with, and in a half-hour you will be able to practice qi gong on your own. You will not find the exercises too strenuous. They are done as if in slow motion.

This particular discipline not only improves your mind, but also tones the muscles and joints, and improves your balance. Remember to move your body slowly, with concentration, and remove all other thoughts from your mind. Proper breathing also is a part of qi gong. You want to enable your physical and mental processes to operate in balance for healing, relaxation, and internal energy.

## RELAXATION TECHNIQUES

Once pain occurs—whether from injury or another source—your psychological reaction to it can have a profound effect on the duration and intensity of the pain. In some people, pain is cyclical; pain produces anxiety and tension, and tension intensifies pain. In the case of disorders such as migraines, tension can be a significant cause of the initial pain. By releasing tension, relaxation techniques can greatly reduce certain types of pain and actually prevent some pain from occurring.

A variety of relaxation techniques are available, including biofeedback, deep breathing, guided imagery, meditation, progressive relaxation, and yoga. These techniques facilitate deep relaxation and reduce stress. The advantage of relaxation therapy is that you can easily master these methods, either on your own or with the help of a professional, and then use them whenever they are needed.

## TAI CHI

Tai chi, known as "meditation in motion," is similar to qi gong. It is used for meditation and complete relaxation. Both techniques are characterized by slow, soft, flowing movements that emphasize energy forces. These arts are very unlike the "strong" martial arts, such as karate and kung fu (wushu). Tai chi releases the flow of energy throughout the body. When this energy becomes blocked, one becomes ill.

## TENS UNIT THERAPY

Transcutaneous electrical nerve stimulation (TENS) units can be helpful in dealing with localized pain, and are widely used both in doctors' offices and physiotherapy clinics.

TENS therapy can also be performed at home. With this technique, electrodes are placed on the skin and joined to the TENS unit with wires. Electric signals are then sent to the nerve endings, blocking pain signals before they reach the brain. It is believed that these signals may also stimulate the production of endorphins, the body's natural painkillers. TENS therapy is not considered painful, although some people report feelings of mild discomfort.

Pain relief from TENS therapy can be long- or short-term in nature. Because the treatments are safe and have no known side effects, they can be repeated as necessary.

## USING A POULTICE

A poultice is made of a soft, moist substance that is mixed to the consistency of a paste, and then spread on or between layers of cloth. The cloth is then placed on a body surface.

Poultices act by increasing blood flow, relaxing tense muscles, soothing inflamed tissues, or drawing toxins from an infected area. Thus, they can be used to relieve the pain and inflammation associated with abscesses; boils; bruises; carbuncles; fibrocystic disease; fractures; enlarged glands in the neck, breast, or prostate; leg ulcers; sprains; sunburn; tumors; and ulcerated eyelids. They are also used to break up congestion, draw out pus, and remove embedded particles from the skin. Check with your health care provider first if you have any of these conditions to determine their severity.

### Procedure

An herbal poultice may be made with dried or fresh herbs. The two types of poultices are prepared in slightly different ways. For information on choosing the best herbal poultice for your condition, as well as cautions regarding the use of specific herbs, *see* Types of Poultices in this section.

### Preparing a Dried Herb Poultice

If you are using dried herbs, use a mortar and pestle to grind the herbs to a powder. Place the herbs in a bowl, and add enough warm water to make a thick paste that can be easily applied. Make a quantity sufficient to cover the affected area. The ratio of ground herbs to water will vary according to the herb being used. Add the water in small increments, just until the mixture is thick but not stiff.

Arrange a clean piece of gauze, muslin, linen, or white cotton sheeting on a clean, flat surface. The material should be large enough to cover the affected area completely. Spread the herbal paste over the cloth. Cleanse the affected area with hydrogen peroxide, and place the poultice over the area. Wrap a towel or plastic wrap around the poultice to

prevent the soiling of clothes or sheets. Use a pin or other fastener to secure the poultice in place.

### Preparing a Fresh Herb Poultice

If using fresh herbs for your poultice, place 2 ounces of the whole herb—about  $\frac{1}{2}$  cup—and 1 cup of water in a small saucepan. Simmer for 2 minutes. Do not drain.

Arrange a clean piece of gauze, muslin, linen, or white cotton sheeting on a clean, flat surface. The material should be large enough to cover the affected area completely. Pour the herbal solution over the cloth. Cleanse the affected body part with hydrogen peroxide, and place the poultice over the area. Wrap a towel or plastic wrap around the poultice to prevent the soiling of clothes or sheets. Hydrogen peroxide changes hair color so be careful when using it on the head. Use a pin or other fastener to secure the poultice in place.

### Treatment Duration

Herbal poultices should be kept in place for one to twenty-four hours, as needed. During this period, you may experience a throbbing pain. When the pain subsides, you will know that the poultice has accomplished its task and should be removed. Apply fresh poultices as needed until the desired level of healing has been reached. Wash the skin thoroughly after each poultice is removed.

### Types of Poultices

By making your poultice with the appropriate herbs or other substances, you will help ensure that the treatment is effective. Note that when the mixture used to make the poultice contains an irritant, such as mustard, it should not come into direct contact with the skin, but should be placed between pieces of cloth.

Herbs commonly used in poultices are listed below, along with the conditions for which they are appropriate.

- Dandelion, and yellow dock can be used to treat skin disorders such as acne, eczema, itchy or dry skin, psoriasis, and rashes. You can use one herb or combine two or three. The greatest benefit will be obtained from using all three.
- Elderberry can relieve pain associated with hemorrhoids.
- Fenugreek, flaxseed, and slippery elm can be combined to treat inflammation. Slippery elm can also be used alone for the inflamed gangrenous sores often associated with diabetes, and for leg ulcers. The use of a slippery elm poultice upon the appearance of sores and ulcers can help prevent gangrene. Slippery elm can also be combined with lobelia to treat abscesses, blood poisoning, and rheumatism.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver

disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Goldenseal is good for inflammations of all kinds.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Lobelia and charcoal (available in health food stores) can be combined and used to treat insect bites, bee stings, and almost all wounds. Lobelia can be combined with slippery elm to treat abscesses, blood poisoning, and rheumatism.

*Caution:* Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

- Mullein is used for inflamed hemorrhoids, lung disorders, mumps, tonsillitis, and sore throat. To make the poultice, mix 4 parts mullein with 1 part hot vinegar and 1 part water.
- Mustard is beneficial for inflammation, lung congestion, and swelling, and can help relax tense muscles. Because mustard is an irritant, place the mixture between two pieces of cloth, rather than placing it in direct contact with the skin.
- Onion is good for ear infections and for boils and sores that have difficulty healing. To make this poultice, place finely chopped onion between two pieces of cloth, rather than placing it in direct contact with the skin.
- Pau d'arco, ragwort, and wood sage can be combined and used to treat tumors and external cancers.
- Poke root is good for an inflamed or sore breast.
- Sage, like poke root, can help relieve breast inflammation and soreness.

*Caution:* Do not use sage if you suffer from any type of seizure disorder, or are pregnant or nursing.

## SITZ BATH

As a form of hydrotherapy—the use of hot and cold water, steam, and ice to restore and maintain health—the sitz bath increases blood flow to the pelvic and abdominal areas, and thus can help reduce inflammation and otherwise alleviate a variety of problems. Sitz baths (from the German *sitzen*, meaning “to sit”) can use hot or cold water only, or can alternate heat and cold. Hot sitz baths are particularly

helpful for such disorders as hemorrhoids, muscular disorders, painful ovaries and testicles, prostate problems, and uterine cramps. Cold sitz baths may be helpful in the treatment of constipation, impotence, inflammation, muscle disorders, and vaginal discharge. Alternating hot and cold sitz baths can help relieve abdominal disorders, blood poisoning, congestion, foot infection, headaches, muscle disorders, neuralgia, and swollen ankles. If your condition is severe, seek medical attention.

## Procedure

To prepare a sitz bath, fill a tub or basin so that the water covers the hips and reaches the middle of the abdomen. If possible, place the water in a basin that will allow you to immerse just the pelvic and abdominal regions. Special sitz bath basins are available on the Internet or at local home health care retailers, the same ones who supply wheelchairs and other medical appliances. You can fill another basin with water that is a few degrees warmer, and immerse your feet in it while sitting in the sitz bath. If no suitable basins are available, place the sitz bathwater in a bathtub. You may wish to cover your body with a sheet or blanket to increase your comfort.

As discussed above, the temperature of the water should vary according to the type of illness you are treating. When using a hot sitz bath, the bathtub or basin should be filled with water of about 104°F to 106°F. *Make sure that the temperature of the water does not exceed 110°F.* This is often given as the recommended temperature, but we think it is a bit too hot. You might want to make the water 90°F to 100°F at the beginning of the bath and then gradually increase the temperature to about 106°F. As already mentioned, your feet can be immersed in slightly hotter water. You might also wish to apply a cold compress to your forehead, as the compress will make it easier for you to withstand the heat of the bath. (Make sure that the sitz bath, foot bath, and cold compress are all prepared ahead of time.)

Stay in the bath for twenty to forty minutes. After the moist heat of the bath has soothed the area being treated, you can further stimulate the body by taking a quick cold shower or simply splashing your body with cool water. Then towel yourself dry.

When using a cold sitz bath, fill the bathtub or basin with ice water. Stay in the cold bath for thirty to sixty seconds only. By no means should you stay in the water for more than sixty seconds, as this added time will provide no additional benefits, and may even be harmful. Then towel yourself dry.

When using alternating hot and cold baths, fill one basin with water of about 106°F, and a second basin with ice water. Immerse yourself first in the hot sitz bath, and remain there for three to four minutes. Then move to the cold sitz bath, and remain there for thirty to sixty seconds. Repeat this two to four times, and towel yourself dry.

*A final word of caution:* If you have any health-related problems or conditions, be sure to consult with your health

care provider before using any type of sitz bath. Sitz baths are not appropriate for children.

## STEAM INHALATION

Steam inhalation therapy is helpful for relieving the congestion of bronchitis, the common cold, and a variety of other respiratory and sinus conditions. Steam inhalation opens up congested sinuses and lung passages, allowing you to discharge mucus, breathe more easily, and heal faster. To make the steam, you may use water only, or you may add dried or fresh herbs or herbal oils to enhance the effects of the treatment.

### Procedure

To provide the steam for the inhalation treatment, you may place the hot water in either a sink or a pot. In most cases, you can choose whichever method you find most convenient and comfortable. But if you are using fresh or dried herbs, you should use a glass or enameled pot, rather than the sink, to hold the water.

### Using a Sink

If using your bathroom sink to hold the water, fill the sink with very hot water. If desired, add 2 to 5 drops of herbal oil. Keep the water hot and steaming during the treatment by allowing a small, continuous trickle of hot water to flow into the basin. (The overflow outlet of your sink should prevent the water from spilling over.) As the water becomes diluted, add a few more drops of the herbal oil as needed.

Hold your head over the sink, and breathe in the steam. Usually, five to ten minutes of steam should be sufficient to clear your congestion. In some cases, you may choose to extend the session. Keep your face far enough from the water so that the steam does not irritate or burn your skin. This is particularly important when a child is being treated, as a child's skin is more sensitive to heat.

### Using a Pot

If you choose to use a pot to hold the water, and you are using fresh or dried herbs, be sure to select glass or enameled cookware only. This is important, as a metal pot can cause herbs to lose some of their medicinal properties. If you are using water only, any type of pot is appropriate.

Fill a wide pot with water, and bring it to a boil. Then remove the pot from the heat source, and place it on a heat-proof pad or cutting board at a convenient height for the inhalation treatment.

Once the water stops bubbling, if desired, add fresh or dried herbs or several drops of essential oil to the water. Allow the water to cool slightly. Then hold your head over the pot, and breathe in the steam. Capture the steam by

draping a towel over your head and the pot, creating a "tent." Usually, five to ten minutes of steam should be sufficient to clear your congestion. In some cases, you may choose to extend the session. Keep your face far enough from the water so that the steam does not irritate or burn your skin. This is particularly important when a child is being treated, as a child's skin is more sensitive to heat.

Whichever method you use, after each steam inhalation treatment, take several deep, full breaths to clear lung congestion.

Repeat the therapy as needed.

### Herbs

❑ Coltsfoot, comfrey, elecampane, eucalyptus, fennel, fenugreek, horseradish, licorice, lobelia, lungwort, mullein, pleurisy root, thyme, vervain, and yerba santa are expectorants that facilitate the excretion of mucus from the throat, lungs, and sinuses. These herbs may be used singly, in combination with one another, or in combination with the demulcent herbs listed below.

*Cautions:* Comfrey is recommended for external use only. Licorice root should not be used during pregnancy or nursing. It should not be used by persons with diabetes, glaucoma, heart disease, high blood pressure, or a history of stroke. Lobelia is only to be taken under supervision of a health care professional as it is potentially toxic. People with high blood pressure, heart disease, liver disease, kidney disease, seizure disorders, or shortness of breath should not take lobelia. Pregnant and lactating women should avoid lobelia as well.

❑ Burdock, chickweed, coltsfoot, Irish moss, lungwort, marshmallow, mullein, peach bark, and slippery elm are demulcents—substances that soften and relieve irritation of the mucous membranes. These herbs may be used singly, in combination with one another, or in combination with the expectorant herbs listed above.

## SURGERY: PREPARING FOR AND RECOVERING FROM

Although few people enjoy the prospect of surgery, sometimes surgery is the best available means of improving the quality of life or extending life. Thousands of Americans face surgery each year, often with fear and doubt. Not knowing what is involved can mean putting yourself through far more discomfort than is necessary. Whether you are undergoing surgery for the first time or the tenth, understanding why you need it and knowing about the risks involved, available alternative treatments, and the aftereffects will help you make the right decision. Being educated about your illness will enable you to deal more effectively with the outcome.

After you have been informed of all your options and have decided that surgery is the only viable alternative, use the nutritional guidelines provided in the table below

to prepare for the surgery. (For more information on making the decision to have surgery, *see* Recommendations in this section.) By taking these nutrients both before and after surgery, you will support the healing process and lessen postsurgical discomfort and pain. Make sure that your diet is well balanced and healthy. Remember that your general health *after* surgery partly depends on your general health *before* surgery. Do not take any supplements or drugs, even aspirin, that thin the blood. Fish oil containing eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), feverfew, garlic, ginger, ginkgo biloba, kava kava, and vitamin E are among the supplements that should not be used prior to surgery.

**Cautions:** Do not use feverfew when pregnant or nursing. People who take prescription blood-thinning medications should consult a health care provider before using feverfew, as the combination can result in internal bleeding. Do not take ginkgo biloba if you have a bleeding disorder, or are scheduled for surgery or a dental procedure. Kava kava can cause drowsiness. It is not recommended for pregnant women or nursing mothers, and it should not be taken together with other substances that act on the central nervous system, such as alcohol, barbiturates, antidepressants, and antipsychotic drugs.

Unless otherwise stated, the dosages recommended here are for adults. For a child between the ages of twelve and seventeen, reduce the dose to three-quarters of the recommended amount. For a child between the ages of six and twelve, use one-half the recommended dose, and for a child under six, use one-quarter of the recommended amount. Be sure to discuss any supplements you are taking with your surgeon prior to surgery.

### NUTRIENTS

SUPPLEMENT	SUGGESTED DOSAGE	COMMENTS
Acidophilus (Kyo-Dophilus from Wakunaga)	As directed on label 3 times daily.	To stabilize the intestinal bacterial flora if antibiotics are used. Use a high-potency powdered form.
Coenzyme Q <sub>10</sub>	60 mg daily.	A free radical destroyer that improves tissue oxygenation.
Essential fatty acids (salmon oil or Ultimate Oil from Nature's Secret)	As directed on label.	Important for proper cell growth and healing of all tissues. <i>Caution:</i> Do not take for three weeks prior to surgery. Take this supplement after the surgery.
Free form amino acid	As directed on label.	Aids in collagen synthesis and wound healing. Is a readily available form of protein, easily absorbed by the body.
Garlic (Kyolic from Wakunaga)	2 capsules 3 times daily.	A natural antibiotic that enhances immune function.
L-cystine	500 mg twice daily.	Speeds healing of wounds.
L-glutamine	500 mg 3 times daily and at bedtime.	Speeds healing of wounds.

L-lysine	500 mg daily.	Speeds healing of wounds and aids collagen formation. <i>Caution:</i> Do not take lysine for longer than six months at a time.
Methylsulfonylmethane (MSM)	As directed on label.	Good for pain and healing of tissues.
Multivitamin complex with vitamin A and mixed carotenoids including natural beta-carotene	As directed on label.	Provides necessary vitamins and minerals. Vitamin A is needed for protein utilization in tissue repair and is a free radical scavenger.
Pycnogenol or grape seed extract	As directed on label.	Surgery depletes the body of antioxidants. These are powerful antioxidants.
Vitamin C with bioflavonoids	6,000–10,000 mg daily, in divided doses.	Aids in tissue repair and healing of wounds. Vital in immune function. Use a buffered form.
Vitamin E	Beginning the day after surgery, take 200 IU daily. Do not take any vitamin E during the 2 weeks before surgery, as it thins the blood.	Improves circulation and repairs tissues. Use d-alpha-tocopherol form.
Vitamin E oil	After the stitches are removed and healing has begun, apply topically to the area of the incision 3 times daily.	Promotes healing and reduces scar formation. Purchase in oil form or cut open a capsule to release the oil.
Zinc plus calcium and magnesium and silica and vitamin D	50 mg daily. 1,500 mg daily. As directed on label. As directed on label. 400 IU daily.	Important for tissue repair. Look for a supplement that contains all of these nutrients.

### Herbs

Herbal teas are highly recommended before and after surgery. Try the following teas:

- Alfalfa, dandelion, and nettle are high in vitamins and minerals, and can also increase the appetite. Alfalfa is also a good source of iron.
- Bromelain and turmeric (curcumin) have potent anti-inflammatory properties.
- Burdock root and red clover aid in cleansing the blood and the liver.
- Echinacea enhances immune system function.

*Caution:* Do not take echinacea for longer than three months. It should not be used by people who are allergic to ragweed.

- Goldenseal is a natural antibiotic and helps to prevent infection.

*Caution:* Do not take goldenseal internally on a daily basis for more than one week at a time. Do not use it during pregnancy or if you are breast-feeding, and use with caution if you are allergic to ragweed. If you have a history of cardiovascular disease, diabetes, or glaucoma, use it only under a doctor's supervision.

- Green tea contains powerful antioxidants that aid in the healing process.

*Caution:* Green tea contains vitamin K, which can make anticoagulant medications less effective. Consult your health care professional if you are using them. The caffeine in green tea could cause insomnia, anxiety, upset stomach, nausea, or diarrhea.

- Kelp, reishi, and St. John's wort may help protect against the adverse effects of X-ray radiation.

*Caution:* St. John's wort may cause increased sensitivity to sunlight. It may also produce anxiety, gastrointestinal symptoms, and headaches. It can interact with some drugs including antidepressants, birth control pills, and anticoagulants.

- Milk thistle protects the liver from the toxic buildup of drugs and chemicals resulting from surgical procedures.
- Pau d'arco is a natural antibacterial herb. It enhances healing and cleanses the blood.
- Rose hips are a good source of vitamin C and enhance healing.

## Recommendations

Consult with your physician about minimally invasive surgery, also called laparoscopic, "keyhole," and "Band-Aid" surgery. This type of procedure—involving one or more small incisions rather than a large one—does less damage to the skin, muscles, and nerves than does conventional "open" surgery. It also involves a shorter hospital stay and less recovery time. Be aware that such procedures can be used for certain surgeries only. It is more difficult to perform these on overweight people, so if you are overweight, you may not have this option.

If you are overweight and have sufficient time to diet before surgery, try to gradually lose the extra weight. Studies show that excess weight can increase both the difficulty of performing surgery and the length of the recovery time. It has also been linked to an increased likelihood of postoperative infection.

If you smoke, stop. Smoking delays healing and interferes with the actions of certain drugs.

Make sure your doctor and those who will care for you are aware of any allergies you have to drugs, chemicals, or foods.

Ask your surgeon if there is anything that you can do to prepare for the surgery. In addition to the surgeon's recommendations, avoid taking vitamin E supplements, aspirin, all compounds containing aspirin, and fish oil for two weeks prior to surgery. These substances thin the blood.

Make sure your doctor and those who will care for you are aware of any supplements and medications—including natural medicines—you take regularly.

Because blood transfusions are sometimes required during surgery, explore the possibility of storing your own blood for use during the operation. By using your own blood, you will avoid the risk of contracting hepatitis or another bloodborne disease.

Many operations require that you be shaved. The infection rate is lower for patients who are shaved the day of surgery when compared with those who are shaved the night before.

Add fiber to your diet. It ensures better intestinal tract function.

Keep a positive attitude about your surgery, and look forward to getting out of bed and back to normal as soon as possible. The sooner you get out of bed, the better your chances of avoiding postoperative infection.

The practice of ordering routine laboratory tests before admission to surgery is commonplace in most hospitals. Many doctors believe that urinalysis, chest X-rays, or complete blood counts, for example, can identify potential problems that might complicate the surgery if not detected and treated early. Discuss with your doctor the necessity of having certain tests performed prior to surgery.

Before deciding to have surgery, ask your physician the following types of questions:

- Why do I need the operation?
- Are there alternatives to surgery?
- What are the benefits of having the operation?
- What are the risks of having the operation?
- What if I do not have this operation?
- What is your experience in performing this surgery?
- What has been your complication rate?
- What kind of anesthesia will I need?
- How will the surgery improve my quality of life and/or my chances for survival?
- Are there other forms of treatment that might be used instead of surgery?
- What percentage of the operations performed of this type are successful?
- What physical changes will result from this operation, and what improvements can I expect?

- How long is the recovery period?
- What is the cost of the operation?

Ask about the potential risks and side effects of having anesthesia. Be sure to mention any medical problems you have, including allergies, and any medications you have been taking, since they may affect your response to the anesthesia. Be sure to tell your anesthesiologist if you smoke.

After surgery, try to consume at least ten cups of liquids each day, including distilled water, herbal teas, juices, and protein drinks. The appetite is often poor after surgery, and large meals can be overwhelming. Try eating five to seven small, light, nutritious meals a day. Some people prefer liquids after surgery. You can make a healthy whey protein shake with milk or soymilk, or if you don't feel up to it, buy some prepared drinks at the drugstore.

After surgery, exercise caution when engaging in strenuous activity such as lifting. Most doctors advise patients to avoid lifting anything in excess of ten pounds for two weeks after surgery. Ask your doctor when you can begin light exercise, which has been shown to aid circulation and speed physical recovery. Also ask if there are any specific exercises that can aid your recovery.

After surgery, the homeopathic remedy *Arnica montana* is good for reducing swelling and promoting healing.

### Considerations

After major surgery, people generally experience a rapid breakdown of skeletal muscle, which increases any feelings of weakness. When you get home, the best way to restore the muscles and regain strength is eating adequate protein and, later, engaging in activities and exercise. In studies in which the amino acid glutamine was added to postsurgical intravenous solutions, muscle breakdown rates were greatly diminished.

Some foods interfere with the actions of certain medications. Milk, dairy products, and iron supplements may interfere with some forms of antibiotics. Acidic fruits, such as oranges, pineapples, and grapefruits, could inhibit the action of penicillin and aspirin. See *Substances That Rob the Body of Nutrients* on page 391 for a list of the nutrients that are lost with the use of different drugs.

Postsurgical depression is not uncommon. A healthy dietary program can help fight depression.

It takes the body a few weeks to recover from the trauma of surgery. During this period, hormonal imbalances are corrected, and the rate of metabolism is adjusted. Many incisions close within two days and heal within a week to the point that the skin will hold together under normal stress and body movement. However, you should obtain your doctor's approval before engaging in any exercise or lifting anything over ten pounds in weight.

## THERAPEUTIC LIQUIDS

The benefits of vegetables and grains are discussed throughout this book. This section offers two recipes that provide these benefits in broths that have healing properties.

The first of the broths derives its healthful properties—including its high potassium content—from potatoes and other vegetables. When purchasing potatoes, choose ones that do not have a green tint. The chemical solanine, which gives the potato its green cast, can interfere with nerve impulses and cause diarrhea, vomiting, and abdominal pain. Use Potato Peeling Broth as a nutritious drink when fasting. This broth is also good for heart disorders.

The second broth—barley water—has healing and fortifying properties, and is useful during convalescence from many different illnesses. You can also add powdered slippery elm bark to the water to make a drink that is not only nourishing, but also soothing to the throat and digestive tract.

Many other therapeutic liquids can also be made from vegetables and grains, as well as from fruits. (To learn about nutritious juices, see *JUICING* in Part Three.) These broths should not be your only source of nutrition, but a supplement to a healthy diet.

---

### Potato Peeling Broth

---

3 potatoes  
1 carrot, sliced  
1 celery stalk, sliced  
2 quarts steam-distilled water  
1 onion, sliced, and/or 3 cloves garlic, peeled

1. Scrub the potatoes well and cut out any eyes.
2. Cut the potatoes in half. Cut the peel from the potatoes, making sure to keep about ½ inch of potato with the peel. Set aside the potato centers for another use.
3. Place the potato peelings, carrot, and celery in a large pot. Cover with the water. Add the onion and/or garlic to taste and boil for about 30 minutes.
4. Cool the broth. Strain out and discard the vegetables and serve the broth as desired.

---

### Barley Water

---

1 cup barley  
3 quarts steam-distilled water

1. Place the barley and the water in a large pot and boil for about 3 hours.
2. Cool the broth. Strain out and discard the barley and serve the broth as desired.

## TRANSCUTANEOUS ELECTRICAL NERVE STIMULATION (TENS)

See under TENS UNIT THERAPY in PAIN CONTROL

## YOGA

Yoga is not new; it was developed in India more than 5,000 years ago, and was used to unite the body, mind, and spirit. Often, people think of yoga as physical exercise. However, the progress of learning to still the mind and unify consciousness is also important in yoga exercises. It can be difficult to turn off the voices in your head, especially when your body is motionless.

*Hatha* is a Sanskrit word meaning “willful” and *yoga* is translated as “union” or “communion.” This is understood as meditation in action. *Hatha yoga* is a term familiar to many who practice yoga, but it is not actually a particular style of yoga.

There are many different styles of yoga to choose from. Some are softer and easier to do, and some are strenuous and hard to do. If you are a beginner, it is probably best to try the easier forms, and it is necessary to work with a teacher. The following are a few approaches to choose from:

- *Ananda yoga* will appeal to the beginner who desires to cultivate spirituality and learn how to meditate. *Ananda* is a slower-paced style.
- *Ashtanga yoga* becomes more strenuous as the student progresses. The postures are linked together in a continuous flow, performed while practicing *ujjayi* breathing (a breath technique employed in a variety of Hindu and Taoist yoga practices). This builds stamina, strength, and flexibility. It is challenging, and not for the beginner.

- *Bikram yoga* is also not for the beginner. It requires a great deal of work. It is a sequential series of twenty-six postures done in a continuous flow. The room this practice is done in is heated to 100 degrees or more to promote sweating that helps cleanse the body of toxins.
- *Kundalini* and *tantra yoga* focus on activating the energy centers in the body called *chakras*. The *chakras* are seven cores of energy in the body. This type of yoga involves exploring the core of the body rather than the limbs—moving to the center and seeing the body as rivers of energy.
- *Raja yoga* concentrates more on meditation and less on strength and is good for the beginner.
- *Sivananda yoga* is a holistic approach. There are five basic principles that unite the body, mind (intellect), spirit, and heart. They include proper breathing (*pranayama*), a vegetarian diet, proper relaxation (*savasana*), study of the Vedic scriptures, and meditation.
- *Tivamukti yoga* focuses on spiritual teachings, postures, chanting, meditation, music, and readings, and are all incorporated into the class.
- There are many other types of yoga, including *kripalu* yoga, *integral* yoga, and *phoenix rising* yoga therapy. There are many unique techniques and teaching methods. The goals, however, are the same: to teach a greater understanding and awareness of the body; to free oneself from negative thoughts that drain one’s energies; and to strengthen mental and spiritual balance. Yoga postures remove obstructions from the body to enhance energy and well-being and achieve inner peace.

# Appendix

# Introduction

As we know, many of our favorite foods contain incredible health benefits, and the scientific community continues to reinforce this fact. With a plethora of recent research, the specific healing properties of acai, pecans, almonds, grapes, cranberries, blueberries, kiwi, pomegranates, mushrooms, broccoli, cabbage, cinnamon, and a whole host of other popular foods have been revealed not just as anecdotal chatter but rather as documented medical facts.

According to a 2001 study published in the *Journal of Nutrition*, eating a handful of pecans daily reduces cholesterol and may be a viable alternative to using cholesterol-reducing drugs. In another study, doctors learned that niacin, or vitamin B<sub>3</sub>, may boost levels of “good” cholesterol (HDL) when used in conjunction with a statin drug called simvastatin, which lowers levels of “bad” cholesterol (LDL). Some antioxidants also taken with vitamin B<sub>3</sub> in this study were found to have blunted niacin’s effect, so discuss any supplementation you may be taking with your doctor before adding niacin to your medication regimen.

Among the more notable discoveries is the link between omega-3 fatty acids and cardiovascular health. Long thought to protect against heart disease, foods containing eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) were shown to reduce the risk of dying from a heart attack or dying from anything else. These nutrients are essential for life and are often lacking in the diet. The American Heart Association recommends eating fish at least twice a week. In addition, taking 1 gram of fish oil a day is a good idea. Fish and fish oil supplements help maintain proper blood flow and blood pressure, which is why it is particularly important for persons who are overweight or who have diabetes to include both in their diet because their blood tends to be too thick. However, don’t overdo it—taking too many fish oil capsules could potentially lead to blood clotting problems.

Research has also led doctors to advise patients to drink cranberry juice to prevent and treat minor urinary tract infections. Of course, the antioxidants and other phytonutrients in cranberries may also help protect against heart disease, cancer, and other diseases. And the studies keep on coming. Blueberries have been shown to help improve memory, unclog arteries, enhance vision, strengthen blood vessels, stop urinary tract infections, promote weight control, and may reverse symptoms of aging.

Vegetables get in on the act as well. Broccoli contains high levels of vitamin C and beta-carotene—powerful anti-

oxidants that fight age- and disease-causing free radicals. Broccoli is also high in fiber, which is important for bowel health and blood sugar control. This one vegetable contains as much calcium as dairy products and a high level of sulforaphane, which has been found (in laboratory studies) to reduce the number, size, and reproduction of malignant tumors, as well as delay their onset.

As science continues to confirm the health benefits of a fresh, natural diet, we’ve also learned that the way we eat these foods affects their benefits. The idea of food synergy is one that is not always talked about but is an important concept. For example, natural flavonoids found in certain foods can allow greater protection against cancer when ingested together than when taken individually. One specific instance occurs when you take the compound sulforaphane and the flavonoid polyphenol apigenin at the same time. When taken together, they are twelve times stronger than when ingested alone. Polyphenol apigenin can be found in fruits and vegetables such as apples, cherries, grapes, tomatoes, beans, broccoli sprouts, celery, leeks, onions, and parsley. Tea and wine also contain this antioxidant. You’ll find sulforaphane in brassica vegetables such as broccoli, spinach, cabbage, cauliflower, Brussels sprouts, kale, collard greens, bok choy, and kohlrabi. Sulforaphane also positively interacts with selenium, a mineral that vegetables absorb through the soil. Because it can be hard to know how much selenium is present in store-bought vegetables, taking a supplement along with foods high in sulforaphane may be the best way to use this synergy to your advantage. Be sure not to exceed the upper limit of safety for selenium, which is 400 micrograms for those over fourteen years of age. Too much selenium can be harmful.

Many supplements are now available in liquid form. This delivery system has its advantages and disadvantages. Liquids are easy to swallow and offer quick absorption. However, they must be formulated properly so that they will remain stable in liquid form. Liquid concentrates require careful skill when manufactured, and may have preservatives added to keep them fresh. They should be refrigerated after opening. Liquid extracts are often very powerful, and small dosages are typically indicated.

You can learn more about liquid supplements, as well as about food synergy, nutritional practices, and so much more in the glossary, resources, and suggested reading that follow.

# GLOSSARY

- absorption.** Nutritionally, the process by which nutrients are absorbed through the intestinal tract into the bloodstream to be used by the body. If nutrients are not properly absorbed, nutritional deficiencies can result.
- acetic acid.** A weak inorganic acid that is the active ingredient in vinegar; a 4 to 5 percent solution of acetic acid in water makes vinegar.
- acid.** Any of a class of compounds that share certain basic chemical characteristics. Acids have low pH (below 7), are usually sour to the taste, and, in their pure form, are often corrosive. They can be either organic or inorganic compounds. Some foods produce acids in the body (meat, dairy, grains) and some reduce acid (fruits, vegetables). Eating both assures a balance in the blood.
- acidosis.** A condition characterized by excessive acidity of bodily fluids.
- acute illness.** An illness that comes on quickly and may cause relatively severe symptoms, but is of limited duration.
- adaptogen.** A term for a substance, usually an herb, that produces suitable adjustments in the body. Adaptogens tend to normalize body functions, and when the job is completed, they are eliminated or incorporated into the body without side effects. Some beneficial adaptogens include garlic, ginseng, echinacea, ginkgo, goldenseal, and pau d'arco.
- adrenal gland.** One of a pair of glands situated atop the kidneys. The adrenal glands are the source of the stress hormones epinephrine (adrenaline) and cortisol, among others.
- allergen.** A substance that provokes an allergic response.
- allergy.** An inappropriate response by the immune system to a normally harmless substance. Allergies can affect any of the body's tissues. Hay fever is a common type of allergy.
- allyl sulfides.** Phytochemicals found in leeks, onions, garlic, and chives that act to detoxify the body.
- alternative therapy.** The treatment of disease by means other than conventional medical, pharmacological, and surgical techniques.
- amino acid.** Any of twenty-two nitrogen-containing organic acids from which proteins are made.
- anabolic compound.** A substance that allows the conversion of simple nutritive materials into complex materials that are part of living tissue during the constructive phase of metabolism.
- analgesic.** Tending to relieve pain, or a substance that relieves pain.
- anemia.** A deficiency in the blood's ability to carry oxygen to the body tissues.
- anesthetic.** Causing loss of sensation, or a substance that causes the loss of sensation, especially the ability to feel pain.
- angina pectoris.** A syndrome of chest pain from heart disease with sensations of suffocation, typically brought on by exertion, and may be relieved by rest. In some cases medical attention is needed.
- antacid.** A substance that neutralizes acid in the stomach, esophagus, or the first part of the duodenum.
- antibiotic.** Tending to destroy or inhibit the growth of microorganisms, especially bacteria.
- antibody.** A protein molecule made by the immune system that is designed to intercept and neutralize a specific invading organism or other foreign substance.
- antigen.** A substance that can elicit the formation of an antibody when introduced into the body.
- antihistamine.** A substance that interferes with the action of histamines by binding to histamine receptors in various body tissues (*see* histamine).
- antioxidant.** A substance that blocks or inhibits destructive oxidation reactions. Examples include vitamins C and E, the minerals selenium and germanium, the enzymes catalase and superoxide dismutase (SOD), coenzyme Q<sub>10</sub>, and some amino acids.
- antivenin.** A serum that contains antitoxin specific for an animal or insect venom.
- arrhythmia.** *See* cardiac arrhythmia.
- arteriosclerosis.** A circulatory disorder characterized by a thickening and stiffening of the walls of large and medium-sized arteries, which impedes circulation.
- artery.** A blood vessel through which blood is pumped from the heart to all the organs, glands, and other tissues of the body.
- ascorbate.** A mineral salt of vitamin C. Taken as nutritional supplements, ascorbates are less acidic (and therefore less irritating) than pure ascorbic acid and also provide for better absorption of both the vitamin C and the mineral.
- ascorbic acid.** The organic acid more commonly known as vitamin C.
- atherosclerosis.** The most common type of arteriosclerosis, caused by the accumulation of fatty deposits in the inner linings of the arteries.
- aura.** A subjective sensation that precedes an attack of migraine or epilepsy. With epilepsy, it may precede the actual attack by hours or seconds, and may be of a psychic nature or sensory with olfactory, visual, auditory, or taste hallucinations. In a migraine attack, the aura immediately

- precedes the attack and primarily consists of visual sensory phenomena.
- autoimmune disorder.** Any condition in which the immune system reacts inappropriately to the body's own tissues and attacks them, causing damage and/or interfering with normal functioning. Examples include Bright's disease, type 1 diabetes, multiple sclerosis, rheumatoid arthritis, and systemic lupus erythematosus.
- autologous transfusion.** A transfusion of one's own blood that has been collected and kept for later use.
- automatism.** Automatic behavior or actions without conscious knowledge or control. Certain types of epileptic seizure may include automatisms. These may be complicated actions completed totally without the subject's control, and afterwards there will be no memory of having done them.
- bacteria.** Single-celled microorganisms. Some bacteria can cause disease; other ("friendly") bacteria are normally present in the body and perform such useful functions as aiding digestion and protecting the body from harmful invading organisms.
- benign.** Literally, "harmless." Used to refer to cells, especially cells growing in inappropriate locations that are not malignant (cancerous).
- beta-carotene.** A substance the body uses to make vitamin A.
- biliary.** Pertaining to bile or the bile duct.
- bile.** A bitter, yellowish substance that is released by the liver into the intestines for the digestion of fats.
- biofeedback.** A technique for helping an individual to become conscious of usually unconscious body processes, such as heartbeat or body temperature, so that he or she can gain some measure of control over them, and thereby learn to manage the effects of various disorders, including acute back pain, migraines, and Raynaud's disease.
- bioflavonoid.** Any of a group of biologically active flavonoids. They are essential for the stability and absorption of vitamin C. Although they are not technically vitamins, they are sometimes referred to as vitamin P.
- bioidentical hormones.** Custom-mixed female formulas containing various hormones that are chemically identical to those made naturally by the body.
- biopsy.** Excision of tissue from a living being for diagnosis.
- biotin.** A component of the B-vitamin complex formerly designated vitamin H. This is a water-soluble substance important in the metabolism of fats and carbohydrates. Present in many foods, it is particularly found in liver, kidney, milk, egg yolks, and yeast.
- blood count.** A basic diagnostic test in which a sample of blood is examined and the number of red blood cells, white blood cells, and platelets determined; or the results of such a test. It is sometimes referred to as CBC (complete blood count).
- blood sugar.** The glucose (a form of sugar) present in the blood.
- blood-brain barrier.** A mechanism involving the capillaries and certain other cells of the brain that keeps many substances, especially water-based substances, from passing out of the blood vessels to be absorbed by the brain tissue.
- body mass index (BMI).** A figure that represents the percentage of your body weight that is due to fat. It is determined from a calculation using body weight and height.
- bowel tolerance.** The amount of any substance the body can tolerate before it results in diarrhea.
- BRCA1 and BRCA2 genes.** Human genes that belong to a class of genes known as tumor suppressors. In normal cells they help ensure the stability of the cell's genetic material (DNA) and help prevent uncontrolled cell growth. Mutation of these genes has been linked to the development of hereditary breast and ovarian cancer.
- bronchi.** The two main branches of the trachea (windpipe) that lead to the lungs.
- Candida albicans.*** A type of fungus normally present at some level in the body. If it is present in overabundance, it causes yeast infection. Known as candida.
- capillaries.** Tiny blood vessels (their walls are about one cell thick) that allow the exchange of nutrients and wastes between the bloodstream and the body's cells.
- carbohydrate.** Any one of many organic substances, almost all of them of plant origin, that are composed of carbon, hydrogen, and oxygen, and serve as one of the major sources of energy in the diet along with fats.
- carcinogen.** An agent that is capable of inducing cancerous changes in cells and/or tissues.
- cardiac.** Pertaining to the heart.
- cardiac arrhythmia.** An abnormal heart rate or rhythm.
- carotene.** A yellow to orange pigment that is converted into vitamin A in the body. There are several different forms, including alpha-, beta-, and gamma-carotene.
- carotenoids.** A group of phytochemicals that act as antioxidants and includes the carotenes as well as some other substances.
- CAT scan.** Computerized axial tomography scan. A computerized X-ray scanning procedure used to create a three-dimensional picture of the body, or part of the body, for the purpose of detecting abnormalities.
- catatonia.** A state in which an individual becomes unresponsive; a stupor.
- cauterization.** A technique used to stop bleeding that involves applying electrical current, a laser beam, or a chemical such as silver nitrate directly to a broken blood vessel.
- cell.** A very small but complex organic unit consisting of a nucleus, cytoplasm, and a cell membrane. All living tissues are composed of cells.
- cellulose.** An indigestible carbohydrate found in the outer layers of fruits and vegetables.
- cerebral.** Pertaining to the brain.
- chancroid.** A highly infectious sexually transmitted disease characterized by the presence of genital ulcers.

- chelation.** A chemical process by which a larger molecule or group of molecules surrounds or encloses a mineral atom.
- chelation therapy.** The introduction of certain substances into the body so that they will chelate, and then remove, foreign substances such as lead, cadmium, arsenic, and other heavy metals. Chelation therapy can also be used to reduce or remove calcium-based plaque from the linings of the blood vessels, easing the flow of blood to vital organs and tissues.
- chemotherapy.** Treatment of disease by the use of chemicals (such as drugs), especially the use of chemical treatments to combat cancer.
- chiropractic.** A system of healing based on the belief that many disorders result from misalignments (called subluxations) of the spinal vertebrae and other joints. Chiropractors primarily treat illness by using physical manipulation techniques to bring the body into proper alignment and thus restore normal health and functioning.
- chlorophyll.** The pigment responsible for the green color of plant tissues. It can be taken in supplement form as a limited source of magnesium and some trace elements.
- cholesterol.** A crystalline substance that is soluble in fats and that is produced by all vertebrates. It is a necessary constituent of cell membranes and facilitates the transport and absorption of fatty acids. Excess cholesterol, however, is a potential threat to health.
- chromosome.** Any of the threadlike strands of DNA in the nuclei of all living cells that carry genetic information. There are normally forty-six chromosomes (twenty-three pairs) in all human cells, with the exception of egg and sperm cells.
- chronic illness.** A disorder that persists or recurs over an extended period, often for life. Chronic illnesses can be as relatively benign as hay fever or as serious as multiple sclerosis.
- citric acid.** An organic acid found in citrus fruits. Often used to lower the pH of cosmetic products to bring them closer to the natural pH of the skin.
- clotting factor.** One of several substances, especially vitamin K, that are present in the bloodstream and are important in the process of blood clotting.
- cocarcinogen.** An agent that acts with another agent to cause cancer.
- coenzyme.** A molecule that works with an enzyme to enable the enzyme to perform its function in the body. Coenzymes are necessary in the utilization of vitamins and minerals.
- cold-pressed.** A term used to describe food oils that are extracted without the use of heat in order to preserve nutrients and flavor.
- colic.** Sharp abdominal pains that result from spasm or obstruction of certain organs or structures, especially the intestines, uterus, or bile ducts.
- colonoscope.** An instrument for examining the colon.
- colonoscopy.** A procedure in which a long flexible tube (a colonoscope) is threaded up through the rectum for the purpose of examining the entire colon and rectum and, if there is an abnormality, taking a biopsy or removing it. The procedure requires a thorough bowel cleansing. In some cases, surgery is required if the mass is too big.
- complete protein.** A source of dietary protein that contains a full complement of the eight essential amino acids and in the right ratios.
- complex carbohydrate.** A type of carbohydrate that, owing to its chemical structure, releases its sugar into the body relatively slowly and also provides fiber. The carbohydrates in starches and fiber are complex carbohydrates. Also called *polysaccharides*.
- complication.** A secondary infection, reaction, or other negative event that makes recovery from illness more difficult and/or longer.
- congenital.** Present from birth, but not necessarily inherited.
- contraceptive.** Tending to prevent conception, or a device, substance, or method used to prevent pregnancy.
- contracture.** Fibrosis of connective tissue in skin, fascia, muscle, or joint that prevents normal mobility.
- contusion.** A bruise; an injury in which the skin is not broken.
- convulsion.** A seizure characterized by intense, uncontrollable contraction of the voluntary muscles that results from abnormal cerebral stimulation.
- coryza.** The nasal symptoms of the common cold.
- cradle cap.** A type of seborrheic dermatitis found on infants, usually appearing on the scalp, face, and head, and consisting of thick, yellowish, crusted lesions. Scaling or fissuring often appears behind the ears and on the face.
- cruciferous.** Literally, "cross-shaped." A term used to refer to a group of vegetables—including broccoli, Brussels sprouts, cabbage, cauliflower, turnips, and rutabagas—that have characteristic cross-shaped blossoms and that contain substances that may help to prevent colon cancer.
- cytokines.** Protein substances that are made by cells of the immune system. Some cytokines can boost the immune response and others can suppress it.
- cystoscope.** Instrument used to examine the inside of the bladder.
- daily value.** DVs are made up of two sets of references: Daily Reference Values (DRVs) and Reference Daily Intakes (RDIs). Daily Value (DV) began to appear on FDA-regulated product labels in 1994. Today DVs appear on all packaged foods and dietary supplement labels for all essential nutrients. Non-essential compounds like herbs do not have corresponding DV percent.
- dehydroepiandrosterone (DHEA).** It is produced by the adrenal glands and is the most abundant hormone found in the bloodstream. DHEA serves as precursor to male and female sex hormones (androgens and estrogens).
- dementia.** A permanent acquired impairment of intellectual function that results in a marked decline in memory, language ability, personality, spatial skills, and/or cognition (orientation, perception, reasoning, abstract thinking, and calculation). Dementia may be transient, but is usually permanent, and can result from many different causes.

- demulcent.** Soothing, especially to mucous membranes.
- dermis.** The layer of skin that lies underneath the epidermis. Blood and lymphatic vessels and the glands that secrete perspiration and sebum are all found in the dermis.
- detoxification.** The process of reducing the buildup of various poisonous substances in the body. The liver is the major organ of the body involved with this process.
- dietary reference intakes (DRIs).** These can be used for planning and assessing diets for healthy people. The amounts of these nutrients defined by the DRI give us about twice the amount needed, so there is hardly any risk of frank vitamin deficiency such as beriberi, rickets, scurvy, and night blindness. What they do not account for are the amounts needed to maintain maximum health, rather than borderline health. Moreover, they are not good at providing an individual's need but rather population norms.
- disorientation.** The loss of a normal relationship to one's surroundings; the inability to comprehend time, people, and place.
- dithiolthiones.** Phytochemicals found in broccoli that increase levels of enzymes that help protect against certain types of cancer.
- diuretic.** Tending to increase urine flow, or a substance that promotes the excretion of fluids.
- DNA.** Deoxyribonucleic acid. Substance in the cell nucleus that genetically contains the cell's genetic blueprint and determines the type of life form into which a cell will develop.
- docosahexaenoic acid (DHA).** A fatty acid found in the meat of cold-water fish, including mackerel, herring, tuna, halibut, salmon, cod liver, whale blubber, and seal blubber. It has recently been shown to be effective at promoting brain health during infancy and is now found in many infant formulas.
- dosha.** Any of the three types of vital energy in Ayurvedic medicine. It is the balance between the doshas that determines health.
- echocardiogram.** A diagnostic test that uses ultrasound to detect structural and functional abnormalities of the heart.
- edema.** Retention of fluid and salt in the tissues that results in swelling.
- EDTA.** Ethylenediaminetetraacetic acid. An organic molecule used in chelation therapy.
- EEG.** Electroencephalogram. A test used to measure brain wave activity.
- icosapentaenoic acid (EPA).** One of several omega-3 fatty acids used by the body. It is found in cold-water fatty fish and in fish oil supplements, along with docosahexaenoic acid (DHA). It serves as a precursor of bioactive compounds like prostaglandins.
- EKG (or ECG).** Electrocardiogram. A test that monitors heart function by tracing the conduction of electrical impulses associated with heart activity.
- elastin.** A protein that gives tissue its elasticity.
- electrolyte.** Soluble salts dissolved in the body's fluids. Electrolytes are the form in which most minerals circulate in the body. They are so named because they are capable of conducting electrical impulses.
- ELISA.** Enzyme-linked immunoadsorbent assay. A test that determines the presence of a particular protein, such as an antibody, by detecting the presence of an enzyme that is linked to that protein.
- ellagic acid.** A phytochemical found in strawberries and grapes that helps rid the body of free radicals.
- embolus.** A loose particle of tissue, a blood clot, or a tiny air bubble that travels through the bloodstream and, if it lodges in a narrowed portion of a blood vessel, can block blood flow.
- emulsion.** A combination of two liquids that do not mix with each other, such as oil and water; one substance is broken into tiny droplets and is suspended within the other. Emulsification is the first step in the digestion of fats.
- endemic.** Native to or prevalent in a particular geographic region. Often used to describe diseases.
- endocrine system.** The system of glands that secrete hormones into the bloodstream. Endocrine glands include the pituitary, thyroid, thymus, and adrenal glands, as well as the pancreas, ovaries, and testes.
- endorphin.** One of a number of natural hormonelike substances found primarily in the brain. One function of endorphins is to suppress the sensation of pain, which they do by binding to opiate receptors in the brain.
- endoscope.** Instrument for examining the interior of the intestine.
- enteric.** Pertaining to the small intestines.
- enzyme.** One of many specific protein catalysts that initiate or speed chemical reactions in the body without being consumed.
- epidemic.** An extensive outbreak of a disease, or a disease occurring with an unusually high incidence at certain times and places.
- epidermis.** The outer layer of the skin.
- Epstein-Barr virus (EBV).** A virus that causes infectious mononucleosis in 35 to 50 percent of patients and that may cause other health problems as well.
- erythema.** Reddening, especially of the skin.
- essential.** A term for nutrients needed for building and repair that cannot be manufactured by the body, and that therefore must be supplied in the diet. At present, there are some forty-two known essential nutrients.
- essential fatty acids (EFAs).** A term sometimes used to refer to three unsaturated fatty acids—arachidonic acid, linoleic acid, and linolenic acid—that are essential for health and cannot be manufactured by the body.
- exacerbation.** Aggravation of symptoms or an increase in the severity of a disease.
- excision.** Surgical cutting away and/or removal of tissue.

- fat-soluble.** Capable of dissolving in the same organic solvents as fats and oils.
- fatty acid.** Any one of many organic acids from which fats and oils are made.
- FBS.** Fasting blood sugar. The level of glucose present in a blood sample drawn at least eight hours after the last meal.
- fiber.** The indigestible portion of plant matter. Fiber is an important component of a healthy diet because it is capable of binding to toxins and escorting them out of the body. Fiber is often classified into two categories: those that don't dissolve in water (insoluble fiber) and those that do (soluble fiber).
- flatulence.** Excessive amounts of gas in the stomach or other parts of the digestive tract.
- flavonoid.** Any of a large group of crystalline compounds found in plants. Also called bioflavonoid.
- free radical.** An atom or group of atoms that is highly chemically reactive because it has at least one unpaired electron. Because they join so readily with other compounds, free radicals can attack cells and can cause a lot of damage in the body. Free radicals form in heated fats and oils, and as a result of exposure to atmospheric radiation and environmental pollutants, among other things.
- free radical scavenger.** A substance that removes or destroys free radicals.
- fungus.** One of a class of organisms that includes yeasts, mold, and mushrooms. A number of fungal species, such as *Candida albicans*, are capable of causing severe disease in immunocompromised hosts.
- gastritis.** Inflammation of the stomach lining.
- gastroenteritis.** Inflammation of the mucous lining of the stomach and the intestines.
- gastrointestinal.** Pertaining to the stomach, small and large intestines, colon, rectum, liver, pancreas, and gallbladder.
- genetic.** Inherited.
- genistein.** An isoflavone (a type of phytochemical) found in alfalfa sprouts, broccoli, cabbage, collard greens, kale, and soybeans. It aids with symptoms of perimenopause and may prevent some cancers.
- GERD.** Gastroesophageal reflux disease. Medical term for a syndrome characterized by frequent indigestion or heartburn.
- gingivitis.** Inflammation of the gums surrounding the teeth.
- gland.** An organ or tissue that secretes a substance(s) for use elsewhere in the body rather than for its own functioning.
- globulin.** A type of protein found in the blood. Certain globulins contain disease-fighting antibodies.
- glucose.** A simple sugar that is the principal source of energy for red blood cells and the brain.
- gluten.** A protein found in many grains, including wheat, rye, barley, and oats.
- glycemic index.** A numerical system of measuring how much of a rise in circulating blood sugar a carbohydrate triggers—the higher the number, the greater the blood sugar response. Only carbohydrate-containing foods have significant impact on blood sugar levels.
- glycogen.** A polysaccharide (complex carbohydrate) that is the main form in which glucose is stored in the body, primarily in the liver and muscles. It is converted back into glucose as needed to supply energy.
- good manufacturing practices (GMP).** FDA rules that ensure that all supplements are manufactured in a uniform way and that what appears on the label is what is in the product. This helps to assure safety.
- hair analysis.** A method of determining the levels of minerals, including both toxic metals and essential minerals, in the body by measuring the concentrations of those minerals in the hair. Unlike mineral levels in the blood, those in the hair reflect the person's status over several preceding months.
- HDL cholesterol.** A type of lipoprotein (a protein molecule that transports cholesterol in the bloodstream) that is commonly referred to as "good cholesterol" because high levels normally indicate a low risk for heart disease.
- heavy metal.** A metallic element whose specific gravity (a measurement of mass as compared with the mass of water or hydrogen) is greater than 5.0. Some heavy metals, such as arsenic, cadmium, lead, and mercury, are extremely toxic.
- hematocrit.** The percentage of blood (by volume) that is composed of red blood cells.
- hematoma.** A bulge or swelling that is filled with blood. Hematomas are usually the result of a blunt injury or other trauma that causes a blood vessel under the skin to break.
- hemicellulose.** An indigestible carbohydrate resembling cellulose, found in plant cell walls, that absorbs water.
- hemoglobin.** The iron-containing red pigment in the blood that is responsible for the transport of oxygen.
- hemorrhage.** Profuse or abnormal bleeding.
- hepatic.** Pertaining to the liver.
- hepatitis.** A general term for inflammation of the liver. It can result from infection or exposure to toxins.
- herbal therapy.** The use of herbal combinations for healing or cleansing purposes. Herbs can be used in tablet, capsule, tincture, or extract form, as well as in baths and poultices.
- hernia.** A condition in which part of an internal organ protrudes, inappropriately, through an opening in the tissues that are supposed to contain it.
- highly active antiretroviral therapy (HAART).** The new generation HIV/AIDS drug treatment. The aim of HAART is to reduce the amount of virus in the blood to very low or even nondetectable levels, although this doesn't mean the virus is gone. This is usually accomplished with a combination of three or more drugs. Treatment focuses on achieving the maximum suppression of symptoms for as long as possible.

- histamine.** A chemical released by the immune system that acts on various body tissues. It has the effect of constricting the smooth bronchial tube muscles, dilating small blood vessels, allowing fluid to leak from various tissues, and increasing the secretion of stomach acid.
- HIV.** Human immunodeficiency virus. The virus that causes AIDS.
- Hodgkin's disease.** A type of lymphoma (cancer of the lymphatic system).
- homeopathy.** A medical system based on the belief that "like cures like"—that is, that illness can be cured by taking a *minute* dose of a substance that, if taken by a healthy person, would produce symptoms like those being treated. Homeopathy employs a variety of plant, animal, and mineral substances in very small doses to stimulate the body's natural healing powers and to bring the body back into balance.
- hormone.** One of numerous essential substances produced by the endocrine glands that regulate many bodily functions.
- hormone replacement therapy (HRT).** Medications containing female hormones to replace the ones the body is no longer making.
- host.** An organism in or on which another organism lives and from which the invading organism obtains nourishment.
- human growth hormone.** Human growth hormone (HGH) is secreted by the pituitary gland in the brain. Like all hormones, HGH works to regulate the activities of vital organs, and thus helps maintain health throughout the body.
- hyaluronic acid.** An organic acid known as the most effective natural skin moisturizer. It is present in human skin and is able to hold five hundred times its own weight in water.
- hydrochloric acid.** A strong, corrosive inorganic acid that is produced in the stomach to aid in digestion.
- hydrogenation.** A chemical process used to turn liquid oils into more solid form by bombarding the oil molecules with hydrogen atoms. Hydrogenation destroys the nutritional value of the oil and also results in the formation of trans-fatty acids, strangely altered fatty acid molecules that do not occur in nature.
- hypercalcemia.** The presence of abnormally high amounts of calcium in the blood.
- hyperglycemia.** High blood sugar.
- hypertension.** High blood pressure. Generally, hypertension is defined as a regular resting pressure over 140/90.
- hypoallergenic.** Having a low capacity for inducing hypersensitive (allergic) reactions.
- hypocalcemia.** The presence of abnormally low amounts of calcium in the blood.
- hypoglycemia.** Low blood sugar.
- hypotension.** Low blood pressure.
- hypothalamus.** A portion of the brain that regulates many aspects of metabolism, including body temperature and the hunger response.
- idiopathic.** Term describing a disease of unknown cause.
- immune globulin.** A protein that functions as an antibody in the body's immune response. Immune globulins are manufactured by certain white blood cells and found in body fluids and on mucous membranes.
- immune system.** A complex system that depends on the interaction of many different organs, cells, and proteins. Its chief function is to identify and eliminate foreign substances such as harmful bacteria that have invaded the body. The gastrointestinal tract, liver, spleen, thymus, bone marrow, and lymphatic system all play vital roles in the proper functioning of the immune system.
- immunity.** The condition of being able to resist and overcome disease or infection.
- immunodeficiency.** A defect in the functioning of the immune system. It can be inherited or acquired, reversible or permanent. Immunodeficiency renders the body more susceptible to illness of every type, especially infectious illnesses.
- immunology.** The branch of medical science that deals with the functioning of the immune system.
- immunotherapy.** Treatment of disease by using techniques to stimulate or strengthen the immune system.
- incubation period.** The period of time between exposure to an infectious disease and the appearance of symptoms, during which the infection is developing.
- infection.** Invasion of body tissues by disease-causing organisms such as viruses, protozoa, fungi, or bacteria.
- infestation.** An invasion of the body by parasites such as insects, worms, or protozoa.
- inflammation.** A reaction to illness or injury characterized by swelling, warmth, pain, and redness.
- inguinal.** Pertaining to the groin.
- insomnia.** The inability to sleep.
- insulin.** A hormone produced by the pancreas that regulates the metabolism of glucose (sugar) in the body.
- interaction.** A phenomenon that occurs when two or more substances affect one another's activity or combine to create a different effect than any of them would have on its own. Any substance introduced into the body can potentially interact with another substance or substances already present. Drugs, foods, herbs, minerals, and vitamins can all interact with one another.
- interferon.** A protein produced by the cells in response to viral infection that prevents viral reproduction and is capable of protecting uninfected cells from viral infection. There are different types of interferon, designated alpha, beta, and gamma.
- interleukin.** Any of a number of immune system chemicals manufactured by the body to aid in fighting infection.
- intestinal flora.** Any bacteria present in the intestines that are essential for the digestion and metabolism of certain nutrients. They can be "friendly" or "pathogenic."
- intolerance.** Nutritionally, the inability to digest a particular food, usually due to a lack or deficiency of certain enzymes.

- intravenous (IV) infusion.** The use of a needle inserted in a vein to assist in fluid replacement, or to supply nutrition, electrolytes, or medication to the body.
- ischemia.** The condition of being starved for oxygenated blood. Ischemia affecting the heart or brain can cause a heart attack or stroke, respectively.
- isoflavones.** A class of phytochemical that have weak estrogen-like effects; their use should be discussed with a doctor in patients with estrogen-based cancers such as breast cancer.
- IU.** International unit. A measure of potency based on an accepted international standard. Dosages of vitamin A and E supplements, among others, are usually measured in international units. Because this is a measurement of potency, not weight or volume, the number of milligrams in an international unit varies, depending on the substance being measured.
- ketogenic diet.** A high-fat, low-carbohydrate diet that produces acetone or ketone bodies, or mild acidosis.
- lactase.** An enzyme that converts lactose into glucose and galactose. It is necessary for the digestion of milk and milk products.
- lactic acid.** An acid that results from anaerobic glucose metabolism. It is present in certain foods, including certain fruits and sour milk (when milk becomes sour, this means that some of the lactose, or milk sugar, it contained has been converted into lactic acid). Lactic acid is also produced in the muscles during anaerobic exercise. It is the buildup of lactic acid that causes muscle fatigue and cramping during strenuous activity. Synthetic lactic acid is used in food products as a flavoring and preservative.
- lactobacilli.** Any of a number of species of bacteria that are capable of transforming lactose (milk sugar) into lactic acid through fermentation. Lactobacilli are naturally present in the colon and are sometimes referred to as "friendly" bacteria because they aid in digestion and diminish the numbers of disease-causing microorganisms. The two species of lactobacilli most commonly available in supplement form are *L. acidophilus* and *L. bifidus*.
- laser.** Light amplification by stimulated emission of radiation. An instrument that focuses highly amplified light waves. Lasers are used in surgical procedures, especially eye surgery.
- LDL cholesterol.** A type of lipoprotein (a protein molecule that transports cholesterol in the bloodstream) that is commonly referred to as "bad cholesterol" because high levels normally indicate a high risk of heart disease. This is the form of cholesterol thought to clog arteries.
- lecithin.** A mixture of phospholipids that is composed of fatty acids, glycerol, phosphorus, and choline or inositol. All living cell membranes are largely composed of lecithin.
- leukemia.** Cancer of the blood-producing tissues, especially the bone marrow and lymph nodes, resulting in an overabundance of white blood cells. It can be either acute (most common in children) or chronic (most common in adults). It is similar in certain respects to Hodgkin's disease.
- leukoderma.** A deficiency of skin pigmentation, occurring usually in patches. Also known as vitiligo.
- leukotrienes.** A group of hormones that are released in response to inflammation that can be caused by asthma or hay fever.
- lignans.** Phytoestrogens that are found in flaxseeds, whole wheat flour, tea, some fruits, and other cereal grains.
- limbic system.** A group of deep brain structures that, among other things, transmit the perception of pain to the brain and generate an emotional reaction to it.
- limonoids.** Phytochemicals found in citrus fruits that may inhibit the production of cancerous tumors.
- lipid.** Substances found in nature that are soluble in the same organic solvents as fats and oils are. Important nutritional lipids include choline, gamma-linolenic acid, inositol, lecithin, omega-6 fats (such as linoleic acid), and omega-3 fats (such as eicosapentaenoic acid [EPA]).
- lipoprotein.** A type of protein molecule that incorporates a lipid. Lipoproteins act as agents of lipid transport in the lymph and blood.
- lipotropic.** Any of a number of substances that help to prevent the accumulation of abnormal or excessive amounts of fat in the body and enhance fat metabolism. Commonly used lipotropics include choline, inositol, and methionine.
- lutein.** A phytochemical (one of the carotenoids) found in kale, spinach, and other dark green leafy vegetables that is beneficial for the eyes. It may help protect against macular degeneration.
- lycopene.** A phytochemical found in tomatoes that appears to afford protection against prostate cancer and to protect the skin against harm from ultraviolet rays.
- lymph.** A clear fluid derived from blood plasma that circulates throughout the body, is collected from the tissues, and flows through the lymphatic vessels, eventually returning to the bloodstream. Its function is to nourish tissue cells and return waste matter to the bloodstream.
- lymph nodes.** Organs located in the lymphatic vessels that act as filters, trapping and removing foreign material. They also form lymphocytes, immune cells that develop the capacity to seek out and destroy specific foreign agents.
- lymphadenopathy.** Enlargement of a lymph node or nodes as a result of the presence of a foreign substance or disease. This condition is often referred to as "swollen glands."
- lymphocyte.** A type of white blood cell found in lymph, blood, and other specialized tissues, such as the bone marrow and tonsils. There are several different categories of lymphocytes, designated B lymphocytes, T lymphocytes, and null (or non-B, non-T) lymphocytes. These cells are crucial components of the immune system. B lymphocytes are primarily responsible for antibody production, whereas the T lymphocytes are involved in the direct attack against invading organisms. It is the T-helper cell, a subtype of T lymphocyte, that is the primary cell infected and destroyed by human immunodeficiency virus (HIV), the virus that causes AIDS.

- lymphokine.** Any of a group of substances produced by the cells of the immune system when exposed to antigens. They are not antibodies, but rather perform such functions as stimulating the production of additional lymphocytes and activating other immune cells.
- lymphoma.** Cancer of the lymphatic tissues.
- macrobiotics.** A dietary approach adapted from Far Eastern philosophy whose basic principle consists of balancing the yin and yang energies of foods. Yin foods, such as water, are expansive; yang foods, such as salt or meat, are contractile. For the most part, the macrobiotic diet consists of whole grain cereals, millet, rice, soups, and vegetables, with beans and supplementary foods depending on the individual and the condition. Different conditions are considered either yin or yang, so the macrobiotic program must be adapted to each individual.
- macrophage.** A type of immune cell that surrounds and digests foreign materials and cellular debris in the body.
- malabsorption.** Nutritionally, a defect in the absorption of nutrients from the intestinal tract into the bloodstream.
- malaise.** An overall feeling of discomfort, unease, or indisposition that is often an indicator of infection.
- malignant.** Literally, "evil." Used to refer to cells or groups of cells that are cancerous and likely to spread.
- mammography.** An x-ray examination of the breast.
- MAO.** Monoamine oxidase, an enzyme that catalyzes the oxidation of monoamines. An abnormal amount of these enzymes can have adverse psychological effects. Some MAO inhibitors are drugs used as antidepressants.
- melanoma.** A malignant tumor originating from pigment cells in the deep layers of the skin.
- menopause.** The cessation of menstruation, caused by a sharp decrease in the production of the sex hormones estrogen and progesterone. Menopause usually occurs after the age of forty-five or following the removal of the female reproductive organs.
- metabolic syndrome.** A cluster of conditions—increased blood pressure, elevated insulin levels, excess body fat around the waist, and abnormal cholesterol levels—that occur together, increasing the risk of heart disease, stroke, and diabetes.
- metabolism.** The physical and chemical processes necessary to sustain life, including the production of cellular energy from foods, the synthesis of important biological substances, and degradation of various compounds.
- metabolite.** A substance produced as a result of a metabolic process.
- metastasis.** The spread of cancer to a site or sites away from the original tumor.
- microgram.** A measurement of weight equivalent to 1/1,000 milligram.
- milligram.** A measurement of weight equivalent to 1/1,000 gram (a gram is equal to approximately 1/28 ounce).
- mineral.** An inorganic substance required by the body in small quantities.
- monoterpenes.** Phytochemicals found in citrus fruits, eggplant, green vegetables, tomatoes, and yams that act as antioxidants and help protect the immune system.
- motility.** The power to move spontaneously.
- MRI.** Magnetic resonance imaging. A technique used in diagnosis that combines the use of radio waves and a strong magnetic field to produce detailed images of the internal structures of the body.
- mucous membranes.** Membranes that line the cavities and canals of the body that communicate with the air. Examples include the membranes lining the inside of the mouth, nose, anus, and vagina.
- myelin sheath.** A fatty covering that protects nerve cells. Myelin sheaths are noticeably damaged or missing in people with multiple sclerosis.
- naturopathy.** A form of health care that uses diet, herbs, and other natural methods and substances to cure illness. The goal is to produce a healthy body state without the use of drugs by stimulating innate defenses.
- neuropathy.** A complex of symptoms caused by abnormalities in motor or sensory nerves. Symptoms may include tingling or numbness, especially in the hands or feet, followed by gradual, progressive muscular weakness. It is common in people with diabetes.
- neurotransmitter.** A chemical that transmits nerve impulses from one nerve cell to another. Major neurotransmitters include acetylcholine, dopamine, gamma-aminobutyric acid, norepinephrine, and serotonin.
- nonsteroidal anti-inflammatory drugs (NSAIDs).** Drugs that block COX enzymes and reduce prostaglandins throughout the body, which reduces inflammation, pain, and fever.
- nucleic acid.** Any of a class of chemical compounds found in all viruses and plant and animal cells. Ribonucleic acid (RNA) and deoxyribonucleic acid (DNA), which contain the genetic instructions for every living cell, are two principal types.
- nutraceutical.** A food- or nutrient-based product or supplement designed and/or used for a specific clinical and/or therapeutic purpose.
- nutrient.** A substance that is needed by the body to maintain life and health.
- occult blood test.** A test that detects the presence of blood in bodily excretions such as stool, sputum, or urine. It can be one of the first tests used in screening for cancer.
- oncologist.** A cancer specialist.
- oncology.** The medical specialty dealing with cancer.
- organic.** A term used to describe foods that are grown without the use of synthetic chemicals, such as pesticides, herbicides, and hormones.
- osteopathy.** A system of medicine based on the belief that the body is a vital mechanical organism whose structural and functional integrity are coordinated and interdependent,

and that disturbances in the musculoskeletal system can therefore cause disorders elsewhere in the body. Because of this philosophy, although osteopaths can prescribe drugs and perform surgery, they are more likely to recommend physical therapy or musculoskeletal manipulation as the treatment of first choice.

**osteopenia.** Low bone mass.

**osteoporosis.** A disorder in which minerals leach out of the bones, rendering them progressively more porous and fragile.

**oxidation.** A chemical reaction in which oxygen reacts with another substance, resulting in a chemical transformation. Many oxidation reactions result in some type of deterioration or spoilage.

**Pap test.** Microscopic examination of cells collected from the vagina and cervix to test for signs of cancer.

**parasite.** An organism that lives on or in another organism and obtains nourishment from it.

**pathogen.** A toxin or small organism that can cause disease.

**peptide.** A substance composed of two or more amino acids.

**perimenopause.** The period before menopause—possibly starting as much as ten years before—during which women may experience uncomfortable symptoms because of fluctuating hormones.

**peristalsis.** The rhythmic contractions of the muscles of the digestive tract that move matter into the stomach, through the intestines, and, ultimately, out of the body.

**PET scan.** Positron emission tomography scan. A method by which brain sections can be reconstructed using radioactive isotopes for diagnostic purposes. Using several types of isotope, cerebral blood flow, blood volume, oxygen uptake, glucose transport, glucose metabolism can be identified.

**petrolatum.** A semisolid mixture of hydrocarbons, such as Vaseline.

**pH.** Potential of hydrogen. A scale used to measure the relative acidity or alkalinity of substances. The scale runs from 0 to 14. A pH of 7 is considered neutral; numbers below 7 denote increasing acidity and numbers above 7 denote increasing alkalinity. Human blood is around 7.35 to 7.45.

**pharyngitis.** Sore throat.

**phenylketonuria (PKU).** An inherited disorder caused by a lack of an enzyme necessary to convert the amino acid phenylalanine into another amino acid, tyrosine, so that excesses can be eliminated from the body. A buildup of excess phenylalanine in the blood can lead to neurological disturbances and mental retardation.

**phytochemical.** Any one of many substances present in fruits and vegetables (*phyto* means “plant” in Greek). There are hundreds of phytochemicals, and more are being identified every day. Some appear to help protect the body against illness, including such serious diseases as cancer and heart disease.

**pituitary.** A gland located at the base of the brain that secretes a number of different hormones. Pituitary hormones regu-

late growth and metabolism by coordinating the actions of other endocrine glands.

**placebo.** A pharmacologically inactive substance, primarily used in experiments to provide a basis for comparison with pharmacologically active substances.

**plaque.** An unwanted deposit of a certain substance on tissues, often with the potential to cause some type of health problem. The buildup of plaque in the arteries is a leading cause of cardiovascular disease; plaque deposits on the teeth can lead to gum disease; Alzheimer’s disease is associated with the accumulation of characteristic plaques in brain tissue.

**precancerous lesion.** Abnormal tissue that is not malignant, but that may be in the process of becoming so.

**probiotics.** Elements that encourage the growth of beneficial bacteria in the intestine.

**progesterone.** A hormone whose functions include preparing a woman’s body for pregnancy in the second half of the menstrual cycle. Progesterone cream is used in hormone replacement therapy to prevent vaginal atrophy.

**prognosis.** A forecast as to the likely course and/or outcome of a disorder or condition.

**prostaglandin.** Any of a number of hormonelike chemicals that are made in the body from essential fatty acids and that have important effects on target organs. They influence the secretion of hormones and enzymes, and are important in regulating the inflammatory response, blood pressure, and blood-clotting time.

**protein.** Any of many complex nitrogen-based organic compounds made up of different combinations of amino acids. Proteins are basic elements of all animal and vegetable tissues. Biological substances such as hormones and enzymes also are composed of protein. The body makes the specific proteins it needs for growth, repair, and other functions from amino acids that are either extracted from dietary protein or manufactured from other amino acids.

**proteolytic enzymes.** Enzymes that break down dietary proteins, yet do not attack the proteins that make up the normal cells of the body. Proteolytic enzymes may have value in fighting cancer and other diseases.

**pruritus.** Itching.

**pterygia.** A triangular thickening over the cornea of the eye, looking somewhat like a wing.

**pulmonary.** Pertaining to the lungs.

**purulent.** Containing or causing the production of pus.

**radiation.** Energy that is emitted or transmitted in the form of waves. The term is often used to refer to radioactivity; however, radioactivity is a specific type of radiation that comes from the decay of unstable atoms.

**radiation therapy.** A type of treatment, most often used for cancer, that involves the use of ionizing radiation, including Roentgen rays, radium, or other radioactive substances to destroy specific areas of tissue. Also called *radiotherapy*.

- RAST.** Radioallergosorbent test. A blood test that measures levels of specific antibodies produced by the body's immune system, used to test for allergic reactions.
- RDA.** Recommended dietary allowance. The amount of a vitamin or other nutrient that should be consumed daily in order to prevent nutritional deficiency. RDAs are determined by the U.S. Food and Drug Administration.
- red blood cell.** A blood cell that contains the red pigment hemoglobin and transports oxygen and carbon dioxide in the bloodstream.
- remission.** Lessening or reversal of the signs and symptoms of disease. This term is used particularly of serious and/or chronic illnesses such as cancer and multiple sclerosis.
- renal.** Pertaining to the kidneys.
- retinoic acid.** Vitamin A acid. A form of retinoic acid is the active ingredient in the medication Retin-A.
- retrovirus.** A type of virus that has RNA as its core nucleic acid and contains an enzyme called *reverse transcriptase* that permits the virus to copy its RNA into the DNA of infected cells, in effect taking over the cells' genetic machinery. Human immunodeficiency virus (HIV), the virus that causes AIDS, is a retrovirus. Retroviruses are also known to cause certain types of cancer in animals and are suspected of causing forms of cancers in animals.
- RNA.** Ribonucleic acid. A complex protein found in plant and animal cells. RNA carries coded genetic information from DNA, in the cell nucleus, to protein-producing cell structures called ribosomes, where these instructions are translated into the form of protein molecules—the basic component of all living tissue.
- saturated fat.** A fat that is solid at room temperature. Most saturated fats are of animal origin, although a few, such as coconut oil and palm oil, come from plants.
- saturation.** With regard to fats, the term "saturation" refers to the chemical structure of the fatty acid molecules, specifically the number of hydrogen atoms present. Fat molecules that cannot incorporate any additional hydrogen atoms are said to be *saturated*, and these have no double bonds holding the molecule together. Those that could incorporate one additional hydrogen atom and have one double bond are referred to as *monounsaturated*; and those that could incorporate two or more additional hydrogen atoms and have two or more double bonds are referred to as *polyunsaturated*.
- scratch test.** A procedure in which a small amount of a suspected allergen is applied to a lightly scratched area of skin to test for an allergic reaction.
- sebum.** The oily secretion produced by glands in the skin.
- secondary infection.** An infection that develops after and is made possible by the presence or effect of a previous infection, inflammation, or other condition, but that is not necessarily directly caused by it.
- seizure.** A sudden, brief episode characterized by changes in consciousness, perception, muscular motion, and/or behavior. A convulsion is a type of seizure.
- selective serotonin reuptake inhibitors (SSRIs).** A popular class of antidepressant medications.
- serotonin.** A neurotransmitter found principally in the brain that is considered essential for relaxation, sleep, and concentration.
- serum.** The fluid portion of the blood.
- simple carbohydrate.** A type of carbohydrate that, owing to its chemical structure, is rapidly digested and absorbed into the bloodstream. Glucose, lactose, and fructose are examples of simple carbohydrates.
- sorbic acid.** An organic acid used as a food preservative.
- steroid.** One of a group of fat-soluble organic compounds with a characteristic chemical composition. A number of different hormones, drugs, and other substances—including cholesterol—are classified as steroids.
- sterols and stanols.** Plant substances that occur naturally in small amounts in many grains, vegetables, fruits, legumes, nuts, and seeds. They have powerful cholesterol-lowering properties, and the FDA has granted a health claim to foods that contain an effective amount per serving. Manufacturers have started adding them to foods.
- stroke.** An attack in which the brain is suddenly deprived of oxygen as a result of interrupted blood flow. If it continues for more than a few minutes, brain damage and even death may result.
- sublingual.** Literally, "under the tongue." Sublingual medications and supplements often look like tablets or liquids meant for swallowing, but they are designed to be held in the mouth while the active ingredient is absorbed into the bloodstream through the mucous membranes.
- sucralose.** An artificial sweetener, six hundred times sweeter than sugar, used in diet foods. Sucralose is derived from sugar through a patented, multistep process that selectively substitutes three chlorine atoms for three hydrogen-oxygen groups on the sugar molecule. The tightly bound chlorine atoms create a molecular structure that is exceptionally stable and thus sucralose can be used in cooking.
- symptom.** An alteration in normal feeling or functioning experienced as a result of a bodily disorder.
- syncope.** Temporary loss of consciousness; fainting.
- syndrome.** A group of signs and symptoms that together are known or presumed to characterize a disorder.
- synergy.** An interaction between two or more substances in which their action is greater when they are together than the sum of their individual actions would be.
- synthesize.** To create a complex substance by combining simpler elements or compounds.
- systemic.** Pertaining to the entire body.
- T cell.** A type of lymphocyte that is a crucial part of the immune system. T cells can attack foreign cells, cancer cells, and cells infected with a virus.
- telangiectasia.** A vascular lesion formed by the dilation of a group of small blood vessels. A type of birthmark.

**telomeres.** The tips of chromosomes that keep them from shortening during cell division. Telomeres naturally shorten with age, and poor diet and poor health also can speed the process.

**teratogen.** An agent that causes malformation of a developing embryo or fetus.

**thrombus.** An obstruction in a blood vessel.

**thrush.** A fungal infection caused by *Candida albicans* that is characterized by small whitish spots on the tongue and the insides of the cheeks. It occurs most often in infants and in persons with compromised immune systems.

**thymol.** White crystals obtained from oil of thyme. This is an alternative treatment for hookworm.

**topical.** Pertaining to the surface of the body.

**toxicity.** The quality of being poisonous. Toxicity reactions in the body impair bodily functions and/or damage cells.

**toxin.** A poison that impairs the health and functioning of the body.

**trace element.** A mineral required by the body in extremely small quantities.

**tremor.** Involuntary trembling.

**triglyceride.** A compound consisting of three fatty acids plus glycerol. Triglycerides are the form in which fat is stored in the body and are the primary type of lipid in the diet. Too much of this type of fat can contribute to the hardening and narrowing of the arteries, and increase the risk of heart disease.

**tumor.** An abnormal mass of tissue that serves no function. Tumors are usually categorized as either benign or malignant (cancerous).

**type A personality.** A personality that tends to be impatient and aggressive. Persons with type A personalities tend to have stronger stress reactions and may be more susceptible to cardiovascular disease.

**type B personality.** A personality that tends to be relaxed and patient, and less reactive to stress. Those with type B personalities may be less prone to develop stress-related illnesses such as high blood pressure and heart disease.

**ultrasound.** Ultra-high-frequency sound waves. Ultrasound technology is used in a number of different medical diagnostic and treatment tools.

**unsaturated fat.** Any of a number of dietary fats that are liquid at room temperature. Unsaturated fats come from vegetable sources and are good sources of essential fatty acids. Examples include flaxseed oil, sunflower oil, safflower oil, and primrose oil.

**urticaria.** Hives.

**vaccine.** A preparation administered to achieve immunity against a specific agent by inducing the body to make antibodies to that agent. A vaccine may be a suspension of living or dead microorganisms, or a solution of an allergen or viral or bacterial antigens.

**vascular.** Pertaining to the circulatory system.

**vein.** One of the blood vessels that returns the blood from the body tissues to the heart.

**venom.** A poisonous substance produced by an animal, such as certain snakes and insects.

**virus.** Any of a vast group of minute, often disease-causing, structures composed of a protein coat and a core of DNA and/or RNA. Because they are incapable of reproducing on their own (they must reproduce inside the cells of an infected host), viruses are not technically considered living organisms. Unlike bacteria, viruses are not affected by antibiotics.

**visualization.** A technique that involves consciously using the mind to influence the health and functioning of the body. Also called creative visualization.

**vital signs.** Basic indicators of an individual's health status, including pulse, breathing, blood pressure, and body temperature.

**vitamin.** One of approximately fifteen organic substances that are essential in small quantities for life and health. Most vitamins cannot be manufactured by the body and so need to be supplied in the diet.

**water-soluble.** Capable of dissolving in water.

**white blood cell.** A blood cell that functions in fighting infection and in wound repair.

**withdrawal.** The process of adjustment that occurs when the use of a habit-forming substance to which the body has become accustomed is discontinued.

**xenophthalmia.** Inflammation of the eye caused by a foreign body.

**yang.** In Chinese medicine, one of the two vital principles that must be in balance to create harmony and balance in the body. Yang is heat, light, and dryness. Yang organs include the spleen, gallbladder, intestines, and the skin.

**yeast.** A type of single-celled fungus. Certain types of yeast can cause infection, most commonly in the mouth, vagina, or gastrointestinal tract. Common yeast infections include vaginitis and thrush.

**yin.** In Chinese medicine, one of the two vital principles that must be in balance to create harmony and balance in the body. Yin is cold, shadow, and moisture. Yin organs include the heart, liver, kidneys, lungs, and bones.

# MANUFACTURER AND DISTRIBUTOR INFORMATION

Below are the manufacturers and distributors of some of the brand-name products mentioned in this book, plus their addresses, Web sites, and phone numbers. This list is not exhaustive. There are many other good products out there. We provide this contact information simply as a resource. None of the manufacturers or distributors mentioned have had any connection with the production of this book. Rather, we list these companies because we believe their products to be effective and of high quality.

Be aware that addresses and telephone numbers are subject to change. Often, your best bet is to use an Internet search engine, such as Yahoo or Google, to find the product using its name. You should find numerous hits that can steer you to a retailer or other supplier.

# HEALTH AND MEDICAL ORGANIZATIONS

The following is a list of organizations that can provide assistance for specific disorders and situations. The services offered by these organizations vary. Some provide information only; others offer various types of referrals, support groups, and even access to medical or social services. In most cases, the organizations' areas of interest are obvious from their names. Where this is not the case, a brief description of the organization's focus is offered. Be aware that contact information is subject to change.

## RESOURCE ORGANIZATIONS

## HEALTH TREATMENT AND RETREAT CENTERS

The following are centers that can provide assistance in maintaining or improving upon your health. The services offered by these organizations vary.

### Alegent Health

Bergan Mercy Medical Center  
7500 Mercy Road  
Omaha, NE 68124  
402-398-6060

### Immanuel Medical Center

6901 North 72nd Street  
Omaha, NE 68122  
402-572-2121  
www.alegent.com

*An integrated, not-for-profit community-based health care system with clinics, hospitals, and other facilities with a wide range of services and an emphasis on prevention, wellness, and health education.*

### Brigham and Women's Hospital

75 Francis Street  
Boston, MA 02115  
617-732-5500  
www.brighamandwomens.org

### BroMenn Healthcare

Department of Cardiology  
P.O. Box 2850  
Bloomington, IL 61702-2850  
309-454-1400  
www.bromenn.org

### Broward General Medical Center

303 SE 17th Street, Suite 306  
Fort Lauderdale, FL 33316  
954-355-4400  
www.browardhealth.org  
*Not-for-profit community health care system.*

### Dana-Farber Cancer Institute

44 Binney Street  
Boston, MA 02115  
866-408-3324; 617-632-3000  
www.dana-farber.org

### Dr. Dean Ornish

Preventative Medicine Research Institute  
900 Bridgeway  
Sausalito, CA 94965  
415-332-2525  
www.pmri.org  
*Offers health retreats for those interested in achieving a healthier lifestyle.*

### Fertility Research Foundation

877 Park Avenue  
New York, NY 10021  
888-439-2999; 212-744-5500  
www.frbaby.com  
*A treatment and research facility specializing in diagnosing and treating infertility problems.*

### The Hippocrates Health Institute

1443 Palmdale Court  
West Palm Beach, FL 33411  
800-842-2125; 561-471-8876  
www.hippocratesinst.org  
*Practices a holistic approach to the treatment of cancer and other illnesses.*

### Johns Hopkins Breast Center

601 North Caroline Street  
Baltimore, MD 21287  
410-614-2853  
www.hopkinsbreastcenter.org

### Johns Hopkins Hospital

600 North Wolfe Street  
Baltimore, MD 21287  
410-955-9500  
http://hopkinsmedicine.org

### Massachusetts General Hospital Cancer Center

55 Fruit Street  
Boston, MA 02108  
800-320-0022  
www.massgeneral.org/cancer/

### Mayo Clinic

200 First Street SW  
Rochester, MN 55905  
507-284-2511; 507-284-9786 (TDD)  
www.mayoclinic.org/rochester

### Mayo Clinic Jacksonville

4500 San Pablo Road  
Jacksonville, FL 32224  
904-953-2000; 904-953-2300 (TDD)  
http://mayoclinic.org/jacksonville

### Mayo Clinic Scottsdale

13400 East Shea Boulevard  
Scottsdale, AZ 85259  
480-301-8000; 480-301-7683 (TDD)  
www.mayoclinic.org/scottsdale

### The McDougall Wellness Center

P.O. Box 14039  
Santa Rosa, CA 95402  
800-941-7111; 707-538-8609  
www.dr.mcdougall.com  
*Offers a twelve-day health-improvement program focusing on diet and lifestyle modifications.*

### Memorial Sloan-Kettering Cancer Center

1275 York Avenue  
New York, NY 10065  
212-639-2000  
www.mskcc.org

### New York-Presbyterian Hospital

622 West 168th Street  
New York, NY 10032  
212-305-2500  
www.nyp.org  
*Offers massage, hypnosis, acupuncture, reflexology, and many other treatments.*

### Ornish Preventative Medicine Research Institute

See Dr. Dean Ornish.

### Pritikin Longevity Center and Spa

19735 Turnberry Way  
Aventura, FL 33180  
800-327-4914; 305-935-7131  
www.pritikin.com

### St. John's Breast Center

St. John's Regional Health Center  
1235 East Cherokee  
Springfield, MO 65804  
417-820-2000  
www.stjohns.com

### Scripps Center for Integrative Medicine

10820 North Torrey Pines Road  
La Jolla, CA 92037  
858-554-3000  
www.scrippsintegrativemedicine.org

### Swedish American Health System

1401 East State Street  
Rockford, IL 61104  
815-968-4400  
www.swedishamerican.org

### Swedish Medical Center

747 Broadway  
Seattle, WA 98122-4307  
206-386-6000  
www.swedish.org

### Walter Reed Army Medical Center

6900 Georgia Avenue NW  
Washington, DC 20307  
202-782-3501  
www.wramc.amedd.army.mil  
*Services only for military health care beneficiaries on active duty or retired military beneficiaries and their spouses and children.*

**Weimar Center of Health and Education**

P.O. Box 486  
Weimar, CA 95736  
800-525-9192

[www.weimar.org](http://www.weimar.org)

*Offers an eighteen-day health-improvement program including hydrotherapy, massage, exercise, and lifestyle counseling.*

**Wildwood Lifestyle Center and Hospital**

435 Lifestyle Lane  
Wildwood, GA 30757  
800-634-9355

[www.wildwoodhealth.org](http://www.wildwoodhealth.org)

**HEALTH SPAS**

Cal-a-Vie Health Spa  
29402 Spa Havens Way  
Vista, CA 92084  
866-772-4283  
[www.cal-a-vie.com](http://www.cal-a-vie.com)

**Canyon Ranch**

165 Kemble Street  
Lenox, MA 01240  
800-742-9000  
[www.canyonranch.com](http://www.canyonranch.com)

**The Golden Door**

P.O. Box 463077  
Escondido, CA 92046-3077  
800-424-0777; 760-744-5777  
[www.goldendoor.com/escondito](http://www.goldendoor.com/escondito)

**Green Valley Spa and Health Resort**

871 West Canyon View Drive  
Saint George, UT 84770  
800-237-1068

[www.greenvalleyspa.com](http://www.greenvalleyspa.com)

**The Heartland Spa**

1237 East 1600 North Road  
Gilman, IL 60938  
800-545-4853

[www.heartlandspa.com](http://www.heartlandspa.com)

**Lake Austin Resort**

1705 South Quinlan Park Road  
Austin, TX 78732  
800-847-5637; 512-372-7300  
[www.lakeaustin.com](http://www.lakeaustin.com)

**L'Auberge Del Mar Resort and Spa**

1540 Camino Del Mar  
Del Mar, CA 92014  
800-245-9757; 858-259-1515;  
800-901-9514 (TDD/TTY)  
[www.laubergedelmar.com](http://www.laubergedelmar.com)

**Mii Amo Spa**

525 Boynton Canyon Road  
Sedona, AZ 86336  
888-749-2137; 928-203-8500  
[www.miiamo.com](http://www.miiamo.com)

**The Raj**

Maharishi Ayurveda Health Center  
1734 Jasmine Avenue  
Fairfield, IA 52556

800-248-9050; 641-472-9580

[www.theraj.com](http://www.theraj.com)

**Spring Creek Ranch**

1800 Spirit Dance Road  
Jackson, WY 83001

800-443-6139; 307-733-8833

# ABOUT THE AUTHOR

Phyllis Balch was a certified nutritional consultant who received her certification from the American Association of Nutritional Consultants, and was a leading nutritional counselor for more than two decades. She came to the field as a result of experiencing directly the benefits of using diet and nutrition as remedies for sickness.

In the 1970s, Balch and her children suffered from a number of undiagnosed (or misdiagnosed) illnesses, and although they had expert medical knowledge very close at hand, their lives continued to be disrupted by these maladies. Balch felt there was something missing in the typical medical approach, which treated the symptoms rather than the cause of illness. Her introduction to the relationship between nutrition and well-being was through Paavo Airola, a well-known naturopath and writer. Balch then pursued her own intensive research into the science of nutrition, and by making radical changes in diet was able to transform her own health and the health of her children.

Convinced that nutrition was, in many cases, the answer to regaining and maintaining health, Balch opened a health food store called Good Things Naturally. In 1983, she published *Nutritional Outline for the Professional and the Wise Man*—now known as *Prescription for Nutritional Healing*—to share her knowledge with a broader audience. Through its first four editions, this book has had millions of readers in many countries, and it has been translated into seven foreign languages.

During her lifetime, Balch continually shared her knowledge with others and persuaded many traditionally schooled medical practitioners to incorporate nutritional healing methods of restoring health into their practice. She was highly sought after as a visiting lecturer and appeared on television and radio programs throughout North America. Balch, who lived in Fort Myers, Florida, and Greenfield, Indiana, died in December 2004 while working on the fourth edition of *Prescription for Nutritional Healing*.

## About Stacey Bell, D.S.C.

In addition to revising the fifth edition of *Prescription for Nutritional Healing*, Stacey Bell has been a registered dietitian for thirty-five years, and has worked in that capacity and conducted clinical research studies for twenty years. She received a doctorate in nutrition from Boston University, with honors, in 1994. For her dissertation, she evaluated the effect of supplemental fish oil on immune function in patients with HIV infection and AIDS. Bell was on the faculty at Harvard Medical School in Boston, and has published more than seventy peer-reviewed scientific articles. Her research interests include obesity, diabetes, cancer, AIDS, burn patients, critical illness, and dietary supplements. A frequent lecturer around the world on many topics related to nutrition, she serves on the board of a nonprofit agency, Kids Can Cook, which offers basic cooking instruction and nutrition education to Boston middle-school-aged children.

*Natural remedies that work*

**The premier bible of natural health, with cutting-edge findings in alternative and preventative therapies—now thoroughly revised and updated.**

*Prescription for Nutritional Healing* is the nation's #1 bestselling guide to natural remedies. Now, wholly revised and updated by expert dietitian and nutritional researcher Stacey J. Bell, D.Sc., R.D., this new fifth edition incorporates the most recent information on a variety of alternative healing and preventive therapies and unveils new scientific findings on vitamins, supplements, and herbs.

In the A-to-Z reference guide to illnesses, you'll find updates including:

- How omega-3 fatty acids and exercise may help those suffering from Alzheimer's
- Strategies for combating prostate cancer
- The latest information on GI problems often associated with autism
- Current advice on the most beneficial nutrients for relieving arthritis
- Leading research on breast cancer, menopause, and bio-identical hormones
- New guidelines for diagnosing and battling diabetes
- And much, much more

With more than 800 pages of comprehensive facts about all aspects of alternative ways to wellness, *Prescription for Nutritional Healing, Fifth Edition*, unites the best of age-old remedies with twenty-first-century science.

**PHYLLIS A. BALCH, CNC**, was a leading nutritional counselor and advocate of natural therapies for more than two decades and spent more than twenty-five years researching natural approaches to health and healing.

**STACEY J. BELL, D.SC., R.D.**, is a registered dietitian and was a nutritional researcher at Harvard Medical School for many years. She has coauthored more than 70 scientific articles, and lectures extensively around the world on most aspects of nutrition.
